  - **First: Generation sulfonylureas compounds**
    - Tolbutamide
    - Chlorpropamide
  - **Second-generation sulfonylureas compounds**
    - Glibenclamide
    - Glyburide
  - **Other drugs**
    - Metformin, phenformin, acarbose.
- Oral hypoglycemic agents act by increasing the sensitivity of pancreatic islet cells and insulin secretion. The peripheral tissues become more sensitive to insulin.
- Contraindicated in Type I of DM, renal and liver disease, and in recurrent episodes of ketoacidosis.

ADRENOCORTICOSTEROIDS AND ANALOGUES

- These are natural hormones produced by the adrenal cortex.
- **Glucocorticoids,** e.g. cortisone and hydrocortisone, betamethasone.
- **Dexamethasone:** Regulate the metabolism of carbohydrates, protein and fat.
- **Mineralocorticoids** e.g. aldosterone and fludrocortisone acetate
- **Deoxycorticosterone:** Increases reabsorption of Na^+ (+water) and excretion of potassium and hydrogen.
- **Prednisone** is a synthetic adrenocorticosteroid.
- **Uses:**
  - **Replacement therapy:** Adrenal insufficiency (Addison's disease).
  - **Rheumatic disorders:** Rheumatoid arthritis and osteoarthritis.
  - **Collagen diseases:** Systemic lupus erythematosus, rheumatic cardiac disease.
  - **Allergic diseases:** Drug hypersensitivity, urticarial transfusion reaction.
  - **Respiratory diseases:** Bronchial asthma, rhinitis.
  - **Malignancies:** Leukemia, lymphoma
  - Nephrotic syndrome, Hematologic diseases, Septic shock, liver cirrhosis.
- **Contraindications:**
  - Peptic ulcer, acute glomerulonephritis, Cushing's syndrome, hyperlipidemia.

POSTERIOR PITUITARY HORMONES

Methylergonovine Maleate (Methergine)

- Oxytocic agent. It is a synthetic agent which stimulates the rate, tone and amplitude of uterine contractions.

Scanned with CamScanner

- Uses:
  - Management and prevention of **postpartum hemorrhage** by producing firm contraction and decrease uterine bleeding.
    - Incomplete abortion.
    - Migraine headache
- **Contraindicated in pregnancy** and prior to **delivery of placenta.**

Note

Use of this substance during labor may result in **uterine tetany** with **rupture, cervical laceration,** embolism of amniotic fluid and **intracranial hemorrhage in infant.**

Oxytocin

- It has uterine stimulant, vasopressin and antidiuretic properties.
- Mimics uterine contractions of normal labor.
- Facilitates ejection of milk from the breasts by stimulating smooth muscles.
- Uses:
  - Antepartum induction or stimulation of labor.
  - Uterine inertia (hypotonic contractions).
  - To hasten uterine involution.
  - Intranasally for postpartum hemorrhage and uterine atony.
- Oxytocin should **never be given IV undiluted** in high concentration.
- **Preparation:** IV infusion is prepared by adding 10 Units (1 mL) of Oxytocin in 1000 mL of normal saline or RL. This solution contains 10 mU of oxytocin per mL.
- **Administration:**
  - Initial dose: 0.5 – 1.0 mU/min (equal to 3-6 mL of diluted solution per hour)
  - At 30 – 60 minutes: 1-2 mU/min
- **Precautions:**
  - Discontinue the infusion immediately in the event of uterine hyperactivity or fetal distress.
  - Except unusual circumstances, oxytocin should not be administered in case of fetal distress, partial placenta previa, hydramnios, borderline cephalopelvic disproportion, prematurity and any other condition which predisposes uterine rupture.

Vasopressin Tannate or Antidiuretic Hormone (ADH)

- Used in neurogenic diabetes insipidus.

CALCITONIN AND CALCIUM SALTS

- Maintenance of **extracellular calcium** levels is controlled by **parathyroid hormone** utilizing a feedback mechanism similar to that of other hormones.
- **Calcitonin:** Calcium regulator.
  - Used in the treatment of hypercalcemia, postmenopausal osteoporosis (with calcium and Vitamin D), hyperparathyroidism, moderate to severe Paget's disease, vitamin D intoxication.
- **Calcium salts:** (Calcium carbonate, calcium gluconate)
  - **Uses (IV):** Acute hypocalcemic tetany (IV) due to renal failure, hypoparathyroidism. During cardiac resuscitation.
  - **IM or IV:** To reduce spasm, to get, relief from sensitivity reactions due to insect bites.
  - **Oral:** Chronic hypoparathyroidism, osteoporosis, osteo malacia, rickets, myasthenia gravis.

THYROID DRUGS

- The thyroid manufactures 2 active hormones, **thyroxine** and **triiodothyronine**, both contain iodine.
- **Hypothyroidism:** Cretinism in infancy and early life, myxedema in adult.
- **Hyperthyroidism:** Graves' disease characterized by protruding eyes and extreme nervousness.
- **Thyroid hormone preparations**
  - Levothyroxine sodium (T_4)
  - Liothyronine sodium (T_3)
  - Liotrix (Mixture of T_4+ T_3)
- **Uses**
  - Replacement therapy in primary and secondary myxedema, nontoxic goiter and chronic thyroiditis.
  - Used with antithyroid drugs for thyrotoxicosis to prevent hypothyroidism.
  - Surgical removal of thyroid gland.
- **Contraindications:** MI, uncorrected adrenal insufficiency.
- **Side effects:** Arrhythmias, palpitations, angina pectoris, dyspnea and hypertension, abdominal cramps, appetite changes, diarrhea and loss of weight, menstrual irregularities.

ANTITHYROID DRUGS

E.g. Methimazole, propylthiouracil (PTU).

- **Used** in hyperthyroidism and in preparing the patient who is undergoing surgery or radioactive iodine therapy.
- **Contraindication:** Lactation and pregnancy

Sodium Iodide I^{131}: Radioactive Agent

- **Indications:** Hyperthyroidism in **thyroid cancer.**
- **Contraindications:** Lactation, Patients under 30 years of age.
- **Side effects:** Bone marrow depression, pain in swallowing, sore throat, sickness, and alopecia.

DIURETICS

- **Carbonic anhydrase inhibitor diuretics:** Acetazolamide
  - Anticonvulsant, diuretic.
  - Limited use as a diuretic. Used in glaucoma.
- **Loop diuretics:** Furosemide (Lasix)
  - Inhibits the reabsorption of sodium and chloride in the ascending loop of Henle that results in the excretion of sodium, chloride and to a lesser degree potassium and bicarbonate ions.
  - It has a slight antihypertensive effect.
  - **Uses:** Edema associated with congestive heart failure, liver cirrhosis, nephrotic syndrome. Acute pulmonary edema and Hypertension.
  - **Contraindications:** Anuria, hepatic coma, severe renal diseases.
  - **Side effects:** Hypokalemia, dehydration, hypovolemia, hyponatremia, hyperglycemia.
- **Osmotic diuretics:** Mannitol, glycerol, isosorbide
  - Decrease the reabsorption of water while increasing the excretion of sodium and chloride.
  - Increases the osmolarity of the plasma.

Scanned with CamScanner

- **Uses:** Acute renal failure. Cerebral edema. Glaucoma and to decrease intracranial pressure.
- **Side effects:** Hypernatremia, electrolyte imbalance, acidosis, dehydration, dry mouth, thirst, edema, hypotension, blurring of vision, headache, dizziness.

- **Potassium - sparing diuretics:** Spironolactone, eplerenone
  - Inhibit sodium exchange for potassium which results in increased secretion of sodium and water and **conservation of potassium.**
  - It is also an **aldosterone antagonist.**
  - It also **interferes** with synthesis of **testosterone.**
  - **Uses:** Edema due to congestive heart failure, liver cirrhosis, nephrotic syndrome, essential hypertension, primary hyperaldosteronism and hypokalemia.
  - **Contraindication:** Acute renal failure hyperkalemia.
  - **Protect drug from light.** Avoid food high in potassium.
- **Thiazides and related diuretics:** Hydrochlorothiazide
  - Promote diuresis by decreasing the rate at which sodium and chloride are reabsorbed by the distal renal tubules of the kidney.
  - **Uses:** Hypertension, Edema due to congestive heart failure, nephrosis, liver cirrhosis and renal failure.

ANTITUBERCULAR DRUGS

Table 12 Categories of TB cases and treatment regimens under RNTCP

Category	Characteristic of TB patient	Treatment regimen		Total duration
		Intensive phase	Continuation phase	
Category I (Red color box) Daily dose	New sputum smear-positive Seriously ill, sputum smear-negative Seriously ill, extrapulmonary	2 (HRZE)	4 HRE	6 months
Category II (Blue color box)	Relapse Treatment failure Treatment after default	2 $(SHRZE)_3$ + 1$(HRZE)_3$	5 $(HRE)_3$	8 months

Note: According to latest guideline category II is longer followed

Note

- A prefix number denotes number of months; suffix denotes number of times a week.
- R-Rifampicin, H-Isoniazid, E-Ethambutol, S-streptomycin, Z-Pyrazinamide

Side Effects of Antitubercular Drugs

Table 13

Antitubercular drug	Major side effects
Streptomycin	Ototoxicity (hearing loss), vestibular damage. It is contraindicated in pregnancy.
Ethambutol	**E:** Eye toxicity (Ocular toxicity) **T:** Toxicity dose and duration dependent **H:** Hyperuricemia **Others:** Blurring and red green color blindness
Rifampicin	**R:** Red discoloration of urine **I:** Induction of liver enzyme **F:** Flu-like symptoms **A:** Abdominal symptoms (nausea, vomiting, saliva, abdominal cramps) **M:** Malaise
Isoniazid	**I:** Insanity (mental disturbance) **N:** Neuritis (peripheral neuropathy) **H:** Hepatitis Others: Skin rash, pellagra like syndrome
Pyrazinamide	**Py:** Problem in liver (hepatitis) **R:** Rashes **A:** Arthralgia **I:** Increase in uric acid levels.

Contd...

ANTICANCER DRUGS

The anticancer drug either kills cancer cells or modify their growth.

Classification of Anticancer Agents

Drugs Acting Directly on Cells (Cytotoxic Drugs)

E.g. cyclophosphamide, chlorambucil, methotrexate, 6-mercaptopurine, thioguanine, azathioprine, vinca alkaloids (vincristine, vinblastine), actinomycin D, doxorubicin, cisplatin, carboplatin.

Drug Altering Hormonal Milieu

E.g. Prednisone, fosfestrol, ethinylestradiol, toremifene, fulvestrant, letrozole, flutamide.

Toxicity Associated with Anticancer Drugs

- Bone marrow depression
- Lymphocytopenia
- Stomatitis
- Nausea, vomiting (most prominent with cytotoxic drugs), diarrhea
- Alopecia

Scanned with CamScanner

- **Oligozoospermia** and impotency in males. **Inhibition of ovulation and amenorrhea** are common in females
- Abortion, fetal death, teratogenesis
- **Hyperuricemia:** Gout and urate stones in the urinary tract may develop.

ANTICOAGULANTS

E.g. Heparin, Low molecular weight heparin, warfarin, etc.

- Uses:
  - For venous thrombus and embolus
  - Treatment and prophylaxis of deep vein thrombosis
  - In disseminated intravascular coagulation
- Antidotes:
  - Antidote of **warfarin** (oral anticoagulant) is vitamin K
  - Antidote of **heparin** is protamine sulfate

THROMBOLYTIC MEDICATIONS

- **Drugs:** Streptokinase, tissue plasminogen activator (tPA), alteplase, urokinase, etc.
- Thrombolytic medications are the drugs which help in breaking of thrombus.
- **Indication:** Early course of myocardial infarctions etc.
- **Contraindications:** active internal bleeding, history of cerebro-vascular accident.

ANTIPLATELET DRUG

E.g. Aspirin, clopidogrel, dipyridamole, abciximab.

- **Indications:** To prevent the adverse clinical sequel of thrombosis in atherosclerotic arteries to heart, brain, limbs etc.

SPECIFIC ANTIDOTES AGAINST POISONING

Table 14

Drug overdose/poisoning	Antidote
Arsenic	Dimercaprol
Atropine	Physostigmine
Barbiturate/Benzodiazepine	Flumazenil
Beta-blockers	Glucagon (IV)
Cisplatin	Mannitol
Copper	D-penicillamine
Heparin	Protamine sulfate
Insulin	Glucose/fruit juice
Iodine	Sodium thiosulfate
Iron	Dimercaprol
Lead	Calcium disodium edetate
Magnesium sulfate	Inj. calcium gluconate 10% IV
Morphine, opioids	Naloxone (Narcan)
Mushroom : Poisoning	Atropine
Neostigmine bromide (used in myasthenia gravis)	Atropine sulfate
Organophosphorus poisoning	Atropine sulfate
Paracetamol	N-acetyl cysteine
Salicylate (Aspirin)	Frusemide + Vit K + $NaHCO_3$/ forced alkaline diuresis with $NaHCO_3$
Warfarin	Vitamin K+ fresh blood

DISEASE AND DRUG OF CHOICES

Table 15

Disease condition	Drug of choice (First line drug)
Acute dystonia	Promethazine/Atropine
Alopecia	Minoxidil (topical), biotin (oral)
Amebiasis	Metronidazole, tinidazole, ornidazole
Anaphylactic shock	Adrenaline
Anginal pain	Nitroglycerin
Anorexia	Cyproheptadine
Anxiety	Alprazolam, etizolam
Anthrax Listeria and leptospirosis Pasteurella Actinomycosis Syphilis	Penicillin
Atypical pneumonia Brucellosis Cholera Plague Relapsing fever Rickettsial infections	Tetracyclines
Bacillary dysentery	Ciprofloxacin, norfloxacin, ofloxacin
Bacterial meningitis	Benzyl penicillin
Bacterial vaginosis	Metronidazole
Bell's palsy	Prednisolone
Campylobacter enterocolitis	Erythromycin
Chancroid	Azithromycin
Chlamydia	Azithromycin
Cholera	Tetracycline or doxycycline
Closure of ductus arteriosus	Indomethacin
Conjunctivitis	Chloramphenicol
Crohn's disease	Steroids
Diabetes insipidus	Vasopressin
Diabetes insipidus (Lithium induced)	Thiazide
Delirium Tremens	Diazepam
Depression phase of bipolar disorder (BPD)	Lamotrigine
Dysmenorrhea	Mefenamic acid + dicyclomine

Contd...

Scanned with CamScanner

Disease condition	Drug of choice (First line drug)
Emergency contraception	Levonorgestrel
Erectile dysfunction	Sildenafil citrate (Viagra)
Filariasis	Diethylcarbamazine citrate (DEC)
Leprosy	Dapsone
Manic phase of BPD	Lithium
Rapid cycling BPD	Sodium valproate
Diagnostic test for myasthenia gravis	Edrophonium
Drug induced parkinsonism	Benzhexol
Febrile seizures	Rectal diazepam
Giardiasis	Ornidazole
Gonorrhea	Ceftriaxone and azithromycin
Gout (Acute)	NSAIDs, Colchicine
Gout (Chronic)	Allopurinol, febuxostat
Huntington's chorea Acute schizophrenia Tourette syndrome Sydenham chorea	Haloperidol
Lithium induced neuropathy	Amiloride
Malaria Malaria in pregnancy	Chloroquine
MRSA (Methicillin-Resistant *Staphylococcus aureus*)	Vancomycin
Neonatal herpes simplex	Acyclovir
Nocturnal enuresis	Desmopressin/Imipramine
Otitis media	Amoxicillin
Partial seizures	Carbamazepine
Pharyngitis	Amoxicillin
Pelvic Inflammatory disease (PID)	Ceftriaxone
Pertussis	Azithromycin
Pneumonia (adult)	Amoxicillin
Pyelonephritis (acute)	Co-trimoxazole
Renal failure with oliguria	Furosemide
Rheumatic fever	Aspirin, amoxicillin, PPF
Rheumatic heart disease	Benzathine penicillin
Salmonella enterocolitis	Ciprofloxacin
Scabies	Ivermectin (oral), permethrin (topical)
Sjogren's syndrome/ radiation induced xerosis	Pilocarpine and cevimeline
Trichomoniasis	Metronidazole
Typhoid	Ciprofloxacin & 3rd generation cephalosporins
Ulcerative colitis	Sulfasalazine (if no response, steroids)
Urinary tract infection (UTI)-adult	Trimethoprim or nitrofurantoin.

Contd...

Disease condition	Drug of choice (First line drug)
Urinary tract infection (UTI)-child	Co-trimoxazole.
Vaginal Candidiasis	Cotrimoxazole (local vaginal pessaries) Fluconazole
Vertigo	Cinnarizine
Worm infestation	Albendazole + ivermectin
Xeropthalmia	Vitamin A
Zollinger Ellison Syndrome	Lansoprazole, levosulpiride

ADVERSE EFFECTS OF SOME COMMON DRUGS

Table 16

Drug	Adverse effects
Alpha Blockers (E.g. Prazosin, Terazosin, Silodosin, etc.)	Postural hypotension
Amantadine	Ankle edema + livedo reticularis (mottled discoloration of the skin)
Amiodarone	Pulmonary fibrosis Peripheral neuropathy Photosensitivity Liver damage Thyroid dysfunction Corneal deposits
Amphotericin B	Nephrotoxicity
Ampicillin	Diarrhea
Bleomycin	Pulmonary fibrosis Mucocutaneous fibrosis
Bromocriptine	Psychosis and mental confusion, pleuro–pulmonary fibrosis
Carbenicillin	Platelet dysfunction at high doses
Clonidine	Mental depression
Clozapine	Myocarditis Cholestatic jaundice Agranulocytosis (most dangerous) Pillow wet syndrome (Hypersalivation)
Cyclophosphamide	Hemorrhagic cystitis
Heparin	Heparin induced thrombocytopenia (HIT)
Lignocaine	Circumoral paresthesia, convulsion
Methicillin	Interstitial nephritis
Methyldopa	Hemolysis in mother
Nitrates	Monday morning headache
Oxacillin	Hepatitis
Phenytoin	Gingival hyperplasia; gum bleeding
Quetiapine	Cataract Priapism
Quinidine	Ventricular tachycardia
Sildenafil citrate (Viagra)	Blue vision defects

Contd.

Scanned with CamScanner

Drug	Adverse effects
Tetracyclines	Tooth discoloration; liver failure in mother
Thalidomide	Potentially teratogenic drug Constipation
Valproate (Valproic acid) [A HOT TEA]	Alopecia, allergy Hyperammonemia Obesity Tremors Teratogenicity Elevated liver enzymes Acute pancreatitis, polycystic ovarian disease (PCOD)

Drug	Adverse effects
Vancomycin	Red man syndrome
Warfarin	Dermal vascular necrosis Purple toe syndrome Teratogenicity

Contd...

DRUGS THAT ARE SAFE AND THAT ARE CONTRAINDICATED IN PREGNANCY

Table 17

Drugs safe in pregnancy (drugs which do not cross placenta)	Drugs contraindicated in pregnancy (drugs which cross placenta) or teratogenic drugs
Heparin	Lithium
Insulin	Ciprofloxacin
Desmopressin	Tetracycline
Chloroquine	Aminoglycosides
Isoniazid, rifampicin, ethambutol	Angiotensin converting enzyme inhibitors
Methyldopa, hydralazine	Atropine
Acyclovir	Metronidazole
Penicillin	Theophylline
Macrolides, most cephalosporins	Chloramphenicol
Quinine	Diazepam, corticosteroids,
Warfarin (can be given in 2nd trimester)	Phenytoin, valproate
Propylthiouracil	Retinoid, tamoxifen, busulfan

DRUGS CONTRAINDICATED DURING BREASTFEEDING

Table 18

Safe during breastfeeding	Contraindicated during breastfeeding
Propylthiouracil	Antithyroid drugs and radioiodine
Insulin	Lithium
Erythromycin, cephalosporin	Tetracycline
Warfarin	Phenindione
Digoxin	Ergotamine, gold salt
Antacids	Anticancer/cytotoxic drugs, e.g. methotrexate, cyclophosphamide

Scanned with CamScanner

Image-Based Questions

1. **Which of the following is incorrect regarding the device in the picture?** *(Refer explanation at the end)*

a. Requires coordination with inspiration
b. Easier to maneuver
c. Known as dry powder inhaler
d. Insulin can be used

2. **The device connected to the metered-dose inhaler (MDI) in the picture is known as:** *(Refer explanation at the end)*

a. Connector
b. Facilitator
c. Spacer
d. Inhaler

3. **The most important component of the anesthetic machine component given in the picture is?** *(Refer explanation at the end)*

a. Calcium hydroxide
b. Potassium hydroxide
c. Sodium hydroxide
d. Water

4. **The cylinder given in the picture is used to store:** *(Refer explanation at the end)*

a. Air
b. Oxygen
c. Entonox
d. Nitrous oxide

5. **The test done in the picture is to test the patency of:** *(Refer explanation at the end)*

a. Ulnar artery
b. Radial artery
c. Ulnar vein
d. Radial vein

Ans.

1. a
2. c
3. a
4. d
5. a

[*Courtesy*: PHOTON-20® 4th ed. by Vivek Jain, CBS Publishers and Distributors Pvt Ltd]

Scanned with CamScanner

Explanations of Image-Based Questions

1. Ans. (a) Requires coordination with inspiration

(Ref: Goodman Gilman 12th E/P1035)

- The device in the picture is a dry powder inhaler, which does not require coordination with inspiration. Rather the inspiratory drive pulls drug out of the device.
- MDIs require coordination with inspiration.

2. Ans. (c) Spacer

(Ref: Goodman Gilman 12th E/P1035)

- Spacer is a device that connects to the MDI and patient inhales drug from the spacer.
- This causes lesser deposition of steroid in oropharyngeal cavity and hence lesser oropharyngeal candidiasis and systemic side-effects are seen.
- This device makes it easier to use MDI in children.

3. Ans. (a) Calcium hydroxide

- The anesthetic equipment given in the picture is carbon dioxide absorbing canister, which has sodalime. The most important component of sodalime is calcium hydroxide.

4. Ans. (d) Nitrous oxide

- Blue colour cylinders are used to store nitrous oxide.

5. Ans. (a) Ulnar artery

- The test shown in the picture is called as Allen's test done to check patency of ulnar artery.

—Arabian proverb

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

PHARMACOKINETICS AND PHARMACODYNAMICS

1. Which route of drug administration provides a rapid response in a patient? *(Daman and Diu NO 2018)*

a. Oral
b. Intramuscular
c. Sublingual
d. Subcutaneous

Explanation:

- Sublingual route offers better dissolution and increased bioavailability. Drugs given by sublingual route bypass hepatic metabolism (first pass metabolism), hence can directly enter the systemic circulation and yield a quick response.
- **Routes of drug administration arranged in order of time until effect:** Intravenous > Intraosseous > Endotracheal > Inhalation > Sublingual > Intramuscular > Subcutaneous > Rectal > Oral > Transdermal

2. The study of absorption, distribution, metabolism and excretion of drugs is referred as:

a. Pharmacology
b. Pharmacokinetics
c. Pharmacodynamics
d. Pharmaceutics

Explanation: Pharmacokinetics refers to what body does to the drug. It facilitates the movement of drug in the body.

3. Which of the following route of drug administration is most likely to lead to the first-pass effect?

a. Sublingual
b. Oral
c. Intravenous
d. Intramuscular

Explanation: Orally administered drugs are absorbed in the intestine and enter portal circulation. This leads to first-pass effect in the liver.

4. What kind of substances cannot permeate membranes by passive diffusion?

a. Lipid-soluble
b. Non-ionized substances
c. Hydrophobic substances
d. Hydrophilic substances

Explanation: Hydrophilic substances can permeate membranes by active transport and not by passive diffusion. Other mentioned substances can permeate through passive diffusion.

5. Which of the following factor may affect the drug absorption rate from I.M injection site?

a. Muscle tone
b. Muscle strength
c. Amount of body fat at injection site
d. Blood flow to the injection site

Explanation: Amount of blood flow to the site of injection determines the rate of absorption of drug into the circulation. Amount of body fat may determine the size of the needle to be used. Muscle tone and strength do not have any effect on drug absorption.

6. Unwanted but unavoidable pharmacodynamic effects of a drug at therapeutic dose is known as

a. Hypersensitivity
b. Toxic effects
c. Side effects
d. Idiosyncrasy

Explanation: Side effects are undesired but often unavoidable pharmacodynamic effects that occur at therapeutic dose. Idiosyncrasy refers to individual's peculiar sensitivity to a drug. Drug intolerance is defined as a lower threshold to the normal pharmacologic action of a drug.

7. Physician prescribes an infusion of 1800 mL of I.V. Fluid over 24 hours, with half of this amount to be infused over first 10 hours. The client should receive how many millilitres of I.V. Fluid per hour during the first 10 hours?

a. 60 mL
b. 90 mL
c. 100 mL
d. 120 mL

Explanation:

- 1800 mL in 24 hours
- Determine how many mL in 10 hours.
- 1800/2 = 900 mL
- 900 mL in 10 hours
- 900/10 = 90 mL in one hour.

8. Which of the following site must be avoided while giving I. M. injection to a 2-year-old child?

a. Deltoid muscle
b. Dorsogluteal muscle
c. Ventrogluteal muscle
d. Vastus lateralis muscle

Explanation: Dorsogluteal muscle is not sufficiently developed to be safe injection site for infants and small children. Other mentioned sites are safe for I.M injection in a 2-year-old child.

9. Route of administration of BCG vaccine is

a. Intradermal
b. Subcutaneous
c. Intramuscular
d. Oral

Explanation: BCG, Mantoux and Drug sensitivity test are administered intradermally. The needle is inserted at 15 degree angle.

10. A drug can: *(ESIC Chennai May 2012)*

a. Diagnose disease
b. Cure disease
c. Prevent disease
d. All of the above

Ans.

1.	c
2.	b
3.	b
4.	d
5.	d
6.	c
7.	b
8.	b
9.	a
10.	d

Scanned with CamScanner

11. The study of absorption, distribution, metabolism and excretion of drug is referred as
a. Pharmacopia
b. Pharmacokinetics
c. Pharmacodynamics
d. Pharmacognosy

12. Pharmacodynamic includes
a. Drug elimination b. Drug excretion
c. Drug absorption d. Mechanism of action

13. All are local routes of drug administration EXCEPT
a. Topical b. Intra-articular
c. Oral d. Intra-vaginal

14. Which of the following is the most preferred route of administration in an unconscious patient?
a. Inhalation route b. Enteral route
c. Oral route d. Parenteral route

15. The maximum volume of a drug that can be injected through intramuscular injection is
a. 2 mL b. 5 mL
c. 10 mL d. 20 mL

16. Injection of a drug directly into joints is termed as
a. Intra-articular b. Intra-arterial
c. Intraossicular d. Intramedullary

17. Administration of drug into the spinal cavity is termed as _____ route
a. Intra-articular b. Intra medullary
c. Intra osseous d. Intrathecal

18. Which of the following route of administration refers to introduction of drug directly into the bone marrow? *[ESI Staff Nurse Exam 2010]*
a. Intra articular b. Intramedullary
c. Intra peritoneal d. Intrathecal

19. Application of a drug on the skin with friction is known as
a. Inhalation b. Infiltration
c. Infusion d. Inunction

20. Administration of a drug in liquid form into a body cavity or body orifice is known as
a. Inhalation b. Infiltration
c. Insertion d. Instillation

21. The most important route of excretion of drugs:
a. Through kidney b. Saliva and sweat
c. Exhaled air d. Faeces

22. Which of the following is excreted is saliva?
a. Tetracycline b. Ampicillin
c. Lithium d. Choloramphenicol

Explanation: Lithium, theophylline and phenytoin are few of the drugs that are excreted in saliva.

23. Loading dose of a drug is given:
a. To achieve high concentration in short time
b. Rapid onset of action
c. Less complication
d. All

24. The maximum effect of a drug is defined by:
a. Therapeutic index b. Potency
c. Efficacy d. Adversity

25. The reason for deep IM injection of iron preparation is to
a. Enhance absorption of the medication
b. Ensure higher bioavailability
c. Provide more even distribution of the drug.
d. Prevent the drug from tissue irritation

26. The rate of drug absorption is greatest in the _____. *(RRB SSNE, 2015)*
a. Large intestine b. Stomach
c. Gallbladder d. Small intestine

27. Drugs used for rare disease are known as:
a. Orphan drugs b. Rare drugs
c. Over the counter drugs d. Emergency drugs

28. Which of the following is true of placebo?
a. Placebo is a dummy medication
b. Placebo is the inert material added to drug for making
c. Placebo do not produce any effect
d. All patients respond to placebo

29. Which of the following parameter is the most reliable indicator of adequate I.V. infusion?
a. Blood pressure of 120/80 mm of Hg
b. Normal skin turgor
c. Pulse rate – 70-80/min
d. Urine output of 30 mL/hr

30. One tablespoon is equal to
a. 5 mL b. 15 mL
c. 25 mL d. 30 mL

31. Two teaspoonful is equal to
a. 6 mL b. 10 mL
c. 20 mL d. 30 mL

32. One pint =
a. 250 mL b. 300 mL
c. 500 mL d. 750 mL

33. The abbreviation h.s. means
a. At bed time b. Early morning
c. After meals d. Before meals

34. 'gtt' means
a. A drop b. mL
c. An ounce d. gallon

ANTIBIOTICS

35. Which test result should a nurse review to determine if the antibiotic prescribed for the patient will be effective? *(NCFL 2019)*
a. Serologic test b. Sensitivity test
c. Serum osmolality d. Sedimentation rate

Explanation: A sensitivity test or culture and sensitivity test will determine the "sensitivity" of bacteria to antibiotics and also determines the ability of the antibiotics to kill the bacteria. The results obtained from this test can help to explore which drugs are more effective in treating the infection.

36. Which of the following statement is NOT correct about cephalosporins
a. They are bacteriostatics
b. They are β-lactam group of antibiotics
c. They have wider spectrum of activity than penicillins
d. None of the above

Explanation: Cephalosporins are bactericidals. They belongs to β-lactam group of antibiotics and are having wider antibacterial spectrum than penicillins.

37. Which of the following drug is recommended along with intravenous administration of quinine sulfate for treatment of malaria? *(RPSC NG-II, 2007)*
a. Calcium gluconate b. Hydrocortisone
c. Multivitamin d. Glucose

Ans.

11.	b
12.	d
13.	c
14.	d
15.	b
16.	a
17.	d
18.	b
19.	d
20.	d
21.	a
22.	c
23.	a
24.	c
25.	d
26.	d
27.	a
28.	a
29.	d
30.	b
31.	b
32.	c
33.	a
34.	a
35.	b
36.	a
37.	d

Scanned with CamScanner

Explanation: Quinine sulfate administration may cause low blood sugar (hypoglycemia). So Glucose has to be administered to counter hypoglycaemic effect of quinine.

38. Which of the following aminoglycoside antibiotic has the broadest spectrum of antibacterial action?
a. Amikacin b. Gentamicin
c. Neomycin d. Streptomycin

Explanation: Amikacin has the broadest spectrum (coverage) against bacterias among aminoglycosides because it is resistant to aminoglycoside inactivating enzymes.

39. Which of the following antimalarial drug is safe during pregnancy
a. Chloramphenical b. Quinine
c. Chloroquine d. Primaquine

Explanation: Chloroquine or hydroxychloroquine are considered safe to use in all trimesters of pregnancy. Chloramphenical is not an antimalarial drug. Quinine and primaquine are avoided during pregnancy.

40. Which of the following tetracycline antibiotic does not require dose reduction in patients with renal failure?
a. Doxycycline b. Meclocyline
c. Tetracycline d. Methacycline

Explanation: Doxycycline primarily excreted in bile to feces. So renal failure does not lead to toxicity of doxycycline.

41. Metronidazole is effective antibacterial agent against all of the following EXCEPT
a. H. pylori eradication
b. Pseudomembranous colitis
c. Streptococcal pneumonia
d. Ulcerative gingivitis

Explanation: Metronidazole is an antimicrobial agent and is not active against Streptococcal pneumonia. Beta-lactam antibiotic (e.g. Cephalosporins) is the drug of choice in this condition.

42. Which of the following antimalarial drug is safe for a child with GPD (glucose-6-phosphate dehydrogenase) deficiency?
a. Methoquine b. Quinine
c. Mefloquine d. Chloroquin

Explanation: Mefloquine is considered to be a safe drug to be used in children with glucose-6 phosphate dehydrogenase deficiency. Other drugs given above are contraindicated to use in this condition.

43. Which of the following aminoglycoside drug has the maximum potential for ototoxicity?
a. Amikacin b. Kanamycin
c. Gentamycin d. Streptomycin

Explanation: Amikacin has the highest potential to cause ototoxicity among aminoglycoside antibiotics. Neomycin has the maximum potential to cause nephrotoxicity.

44. Simple herpes virus infection is treated with
a. Stavudine b. Ganciclovir
c. Acyclovir d. Lamivudine

Explanation: Acyclovir is the drug of choice in treating simple herpes virus infection.

45. Deficiency of which of the following cation may cause amphotericin B toxicity when the drug is administered?
a. Magnesium
b. Calcium
c. Sodium
d. Potassium

Explanation: If amphotericin B is administered when the patient is hyopkalemic, it may cause toxicity of amphotericin B.

46. Which of the following drug may cause "Gray baby syndrome"? *(ESI 2009)*
a. Chloramphenicol b. Penicillin
c. Doxycycline d. Kanamycin

Explanation: Gray baby syndrome is a rare but serious side effect that occurs in newborn infants (especially premature infants) following the intravenous administration of chloramphenicol, an antimicrobial agent.

47. _____ is used as dusting powder in surgical gloves
a. Talk powder b. Boric acid powder
c. Zinc powder d. Lactulose powder

48. The drug used by Health workers in the management of Acute respiratory illness is:
a. Cotrimoxazole b. Chloramphenicol
c. Benzyl Penicillin d. Gentamycin

49. Drug of choice for rheumatic fever is: *(Recent Question 2012)*
a. Cephalosporin b. Penicillin
c. Streptomycin d. Gentamycin

50. All of the following antibiotics acts by inhibiting protein synthesis in bacteria EXCEPT
a. Amikacin b. Gentamycin
c. Clindamycin d. Cefotaxime

51. Drug of choice for syphilis is
a. Ciprofloxacin b. Cotrimoxazole
c. Doxycycline d. Penicillin

52. Drug of choice for syphilis in a pregnant lady is:
a. Penicillin b. Azithromycin
c. Tetracycline d. Ceftriaxone

53. Drug of choice in treatment of typhoid fever is
a. Ampicillin b. Ceftriaxone
c. Ciprofloxacin d. Methicillin

54. Which of the following drugs can cause cartilage damage in children?
a. Cotrimoxazole b. Penicillin
c. Ciprofloxacin d. Metronidazole

55. Which of the following antimalarial drug is not safe to prescribe to a pregnant women
a. Chloroquine b. Primaquine
c. Quinine d. Quinidine

56. Which of the following drug is recommended as an additive along with IV quinine therapy for antimalarial treatment?
a. Glucose
b. Potassium
c. Magnesium Sulfate
d. Granulocyte colony stimulating factor

57. The substances derived from living organisms that are used to kill or prevent the growth of bacteria is known as:
a. Antibiotics b. Antidotes
c. Antihistamines d. Antipyretics

Ans.

57.	a

Scanned with CamScanner

58. Cotrimoxazole is a combination of which of the following two drugs
a. Sulphonamide and penicillin
b. Ciprofloxacin and methoxazole
c. Trimethoprim and Sulpamethoxazole
d. Tetracycline and carbaxazole

59. One of the major side effect of sulphonamides is
a. Ototoxicity b. Renal calculi
c. Tinnitus d. Vertigo

60. Drug contraindicated in infants:
a. Ciprofloxacin b. Barbiturate
c. Theophylline d. Chloroquine

61. Test dose of penicillin is administered through _____route
a. Intradermal b. Intramuscular
c. Intravenous d. Subcutaneous

62. Which among the following penicillin has the longest duration of action?
a. Potassium phenethicillin b. Benzathine penicillin
c. Procaine penicillin -G d. Benethamine penicillin

63. Which of the following is NOT a natural penicillin
a. Ampicillin b. Benzyl penicillin - G
c. Benzathine penicillin d. Procaine penicillin - G

64. Drug of choice for primary syphilis is:
a. Ampicillin
b. Benzathine penicillin
c. Erythromycin
d. Tetracycline

65. Drug of choice for chemoprophylaxis against rheumatic fever is:
a. Penicillin V b. Erythromycin
c. Benzathine penicillin d. Procaine penicillin

66. Which of the following antimicrobial agent is most useful in the treatment of amoebic dysentery
a. Cefotaxime b. Ciprofloxacin
c. Metronidazole d. Ofloxacin

67. Drugs useful against bacteria resistant to penicillin include
a. Cephalosporin b. Erythromycins
c. Amoxyicillin d. Both A and B

68. Ototoxicity is maximum with:
a. Streptomycin b. Kanamycin
c. Tobramycin d. Amikacin

69. Which of the following group of drug causes ototoxicity and nephrotoxicity?
a. Aminoglycosides b. Fluoroquinolones
c. Penicillins d. Sulfonamides

70. Drug of choice for prophylaxis of meningococcal meningitis is:
a. Penicillin b. Erythromycin
c. Septran d. Rifampicin

71. In leprosy, the best bactericidal agent is:
a. Clofazimine b. Dapsone
c. Rifampicin d. Ethionamide

72. Drug of choice for malaria during pregnancy is:
a. Chloroquine b. Quinine
c. Primaquine d. Mefloquine

73. Tetracycline is used for prophylaxis of *(AIIMS 2003)*
a. Leptospirosis b. Cholera
c. Meningitis d. Brucellosis

74. Treatment of drug resistant malaria is:
a. Quinine b. Pyrimethamine
c. Mefloquine d. All

75. Chloroquine is a/an _____ drug
a. Antimalarial b. Antimicrobial
c. Antiviral d. Antiamoebic

76. Primaquine is contraindicated in deficiency of:
a. Glucose-6-Phosphate
b. Glucose-6-phosphate dehydrogenase
c. Alpha ketoglutarate dehydrogenase
d. Pyruvate kinase

77. Clotrimazole is: *(ESIC Chennai May 2012)*
a. Antiprotozoal drug
b. Antibacterial drug
c. Antiviral drug
d. Antifungal drug

78. Which of the following is NOT an antifungal agent?
a. Fluconazole b. Ketoconazole
c. Tinidazole d. Clotrimazole

79. Amphotericin B is a:
a. Azole b. Benzofuran
c. Fungicidal d. Fungistatic

ANTITUBERCULAR DRUGS

80. Which of the following is a common side effect of streptomycin *(ESI-2010)*
a. Damage to facial nerve
b. Damage to 8th cranial nerve
c. Bone marrow depression
d. Hypersensitivity

Explanation: Antibiotics in the aminoglycoside class (Streptomycin, Gentamicin, tobramycin) may cause damage to 8th cranial nerve which results in loss of hearing, balancing problems, neuromuscular blockage, peripheral neuropathy, dizziness and vomiting.

81. Which of the following antitubercular drug causes red orange discoloration of urine?
[Bhopal Memorial Hospital Nursing Tutor, 2013]
a. Isoniazid b. Ethambutol
c. Streptomycin d. Rifampicin

Explanation: Rifampicin causes red orange discoloration of urine

82. The anti-tuberculosis drug that has the potential for damage to the 8th cranial nerve is
a. Isoniazid (INH) b. Ethambutol hydrochloride
c. Rifampicin d. Streptomycin

Explanation: Streptomycin (aminoglycoside) causes damage to the 8th cranial nerve (ototoxicity). This leads to loss of hearing. Vertigo, tinnitus, hearing loss and ataxia are some of the symptoms of ototoxicity.

83. Ototoxicity is a common side effect of the drug streptomycin. This is due to the damage to
a. 4th Cranial nerve
b. 8th Cranial nerve
c. 7th Cranial Nerve
d. 10th Cranial Nerve

Explanation: The most common side effect of Streptomycin and Gentamicin (aminoglycosides) is the 8th cranial nerve damage (ototoxicity). The 8th cranial nerve is the vestibulocochlear nerve which is responsible for hearing and balancing.

Ans.

Scanned with CamScanner

84. All of the following antitubercular drugs crosses blood-brain barrier EXCEPT
a. Isoniazid b. Rifampicin
c. Pyrazinamide d. Streptomycin

Explanation: Each antitubercular drug differs in its ability to cross the blood-brain barrier and achieve sufficient intracerebral concentrations to kill bacilli. Isoniazid and pyrazinamide pass freely into the cerebrospinal fluid (CSF), whereas CSF concentrations of rifampicin are probably <10% of serum concentrations. Streptomycin and Ethambutol, the other first-line treatment agents, probably only penetrate the blood-brain barrier in the presence of inflammation during the early stages of treatment.
Remember: Streptomycin is no longer considered as an ATT drug.

85. Which of the following antitubercular drug causes peripheral neuropathy?
a. Isoniazid b. Pyrazinamide
c. Rifampicin d. Dapsone

Explanation: Prolonged use of Isoniazid (INH) leads to deficiency of pyridoxine hence causes peripheral neuropathy.

86. Prolonged use of isoniazid (INH) leads to deficiency of
a. Niacin b. Cyanocobalamin
c. Folic acid d. Pyridoxine

Explanation: Prolonged treatment with the drug Isoniazid (INH) will cause deficiency of pyridoxine which leads to peripheral neuropathy.

87. Which of the following anti tubercular drugs is contraindicated in a pregnant woman?
a. Pyrazinamide b. Isoniazid
c. Rifampicin d. Streptomycin

Explanation: Streptomycin can cause fetal harm (8th cranial nerve damage to fetus) when administered to a pregnant woman. So use of streptomycin during pregnancy is absolutely contraindicated.

88. The drug of choice for prophylaxis of tuberculosis is
a. Streptomycin b. Ethambutol
c. Isoniazid (INH) d. Rifampicin

Explanation: Isoniazid (INH) is the drug of choice for chemoprophylaxis. All of the other drugs listed can be used in the treatment of tuberculosis.

89. The purpose of combination drug therapy in the treatment of tuberculosis is to reduce
a. The duration of treatment b. Adverse effects of the drugs
c. Dosage of drugs d. Drug resistance

Explanation: Use of combination of drugs reduces the risk of drug resistance by infective organism.

90. Retrobulbar neuritis is a side effect of which of the following drug?
a. Ethambutol b. Isoniazid
c. Streptomycin d. Pyrazinamide

Explanation: Ethambutol causes optic neuropathy (retrobulbar neuritis) in 1-5% of patients using the antituberculosis drugs.

91. Rifampicin is used for prophylaxis of: *(Recent Question 2012)*
a. Gonorrhea b. Malaria
c. Leprosy d. Meningococcal meningitis

92. Which of the following antitubercular drug is an amino-glycoside
a. Rifampicin b. Isoniazid
c. Ethambutol d. Streptomycin

93. Which of the following antitubercular drug causes damage to 8th cranial nerve?
a. Rifampicin
b. Isoniazid
c. Pyrazinamide
d. Streptomycin

94. Streptomycin is not administered orally because
a. It gets deactivated during first-pass metabolism
b. It can cause gastric ulcer
c. It can cause gastric bleeding
d. It is not absorbed orally

95. Which of the following antitubercular drugs is associated with red green colour blindness?
a. Cycloserine b. Isoniazid
c. Pyrazinamide d. Ethambutol

96. INH induced peripheral neuropathy results from deficiency of:
a. B1 b. B2
c. B6 d. B12

97. Peripheral neuritis is a side effect of which antitubercular drug
a. Rifampicin b. Isoniazid
c. Streptomycin d. Ethambutol

98. Peripheral neuritis caused by isoniazid can be prevented by providing
a. Niacin b. Aspirin
c. Pyridoxine d. Thiamine

99. Bacteriostatic antitubercular drug is:
a. Isoniazid b. Rifampin
c. Streptomycin d. Ethambutol

100. Red orange discoloration of urine is caused by
a. Rifampicin b. Isoniazid
c. Ethambutol d. Pyrazinamide

101. All of the following are the side effects of Rifampicin EXCEPT
a. Anorexia
b. Dizziness
c. Orange colored urine
d. Hypertension

102. Which of the following anti tubercular drug is responsible for retro-bulbar neuritis or optic neuritis?
a. Rifampicin
b. Isoniazid
c. Pyrazinamide
d. Ethambutol

103. Which of the following laboratory test must be ordered before the patient started on isoniazid (INH) therapy?
a. Bleeding time and Coagulation time
b. Liver Function test
c. Renal Function Test
d. Serum electrolytes

ANTIRETROVIRAL DRUGS (ART DRUGS)

104. Which of the following is anti-retro-viral agent? *(RAK MSC 2018)*
a. Acyclovir b. Rifampicin
c. Nevirapine d. Cifran

Ans.

84.	d

103.	b
104.	c

Scanned with CamScanner

Explanation:

- **Nevirapine** is an anti-retroviral agent and categorized as a non-nucleoside reverse transcriptase inhibitor. **It is** more potent than zidovudine in inhibiting HIV-1, but do not inhibit HIV-2. A dose of 200 mg is taken once a day daily for 14 days, then dose is increased to 200 mg twice a day.
- **Acyclovir is an** antiviral drug used in the treatment of herpes simplex virus infections, herpes zoster (shingles), and varicella zoster (chickenpox). **Rifampicin** is an antitubercular drug. ***Cifran* (ciprofloxacin) is an** antimicrobial drug that belongs to quinolone family.

105. Which of the following drug is used in HIV positive patients to control the progress of AIDS? *(ESI 2009)*

a. Ampicillin b. Zidovudine
c. Gentamycin d. Acyclovir

Explanation: Zidovudine is an antiretroviral agent, also called as a nucleoside reverse transcriptase inhibitor (NRTI). It works by blocking HIV reverse transcriptase, an HIV enzyme. This prevents HIV from replicating, hence lowers the amount of HIV in the blood.

106. Zidovudine, an antiretroviral drug acts by

a. Stimulating the immune system
b. Interfering with viral replication
c. Promoting excretion of viral antibodies
d. Destroying the outer wall of the virus and kills it

Explanation: Zidovudine interfere with viral replication by inhibition of DNA synthesis in HIV.

107. Which of the following instruction is appropriate for to teach the client who was prescribed zidovudine 200 mg?

a. Take zidovudine on an empty stomach
b. Take zidovudine with meals
c. Take zidovudine at every four hours round the clock
d. Take over-the-counter to treat minor adverse reactions

Explanation: To be effective, zidovudine must be taken at every 4 hours around the clock.

108. Side effect of the antiretroviral drug zidovudine includes

a. Neutropenia b. Nephrotoxicity
c. Ototoxicity d. Splenomegaly

Explanation: Treatment with Zidovudine (antiretroviral agent) leads to reduced neutrophils in blood (neutropenia).

109. Which of the following drug is NOT an Antiretroviral agent?

a. Zidovudine b. Nevirapine
c. Lamivudine d. Acyclovir

110. Most common side effect of an antiretroviral drug zidovudine is

a. Myopathy b. Bone marrow depression
c. Hemolytic anemia d. Hepatotoxicity

ANTIEPILEPTICS

111. Which of the following drugs is associated with the reaction of Stevens-Johnson syndrome? *(Safdarjung NO 2018)*

a. Valproic acid
b. Quinidine
c. Isoniazid
d. Procainamide

Ans.

105. b
106. b
107. c
108. a
109. d
110. b
111. a
112. b
113. a
114. b
115. b
116. a
117. d
118. c

Explanation:

- Stevens-Johnson syndrome (SJS) is one of the most severe adverse drug reactions occurring in pediatric population. It is a type III reaction (Retarded, Arthus)
- Many drugs including antibiotics, NSAIDs, and anticonvulsants can cause SJS. However, anticonvulsants (e.g. Valporic acid) are the commonest group of drugs causing Stevens–Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN).

112. Phenytoin is used in the treatment of

a. Petit mal epilepsy b. Grand mal epilepsy
c. Myoclonic seizures d. All of the above

Explanation: Phenytoin is the drug of choice for Grand mal epilepsy.

113. The drug of choice for partial seizures is

a. Carbamazepine b. Barbiturates
c. Diazepam d. Lamotrigine

Explanation: Carbamazepine is the drug of choice for the treatment of partial seizures. It is also used as an antimanic drug.

114. Therapeutic serum level of phenytoin in the treatment of seizure is

a. Below 5 mcg/mL b. 10-20 mcg/mL
c. 25-35 mcg/mL d. 40-50 mcg/mL

Explanation: In the treatment of seizure, serum therapeutic level of phenytoin must be maintained around between 10 and 20 mcg/mL for effectiveness.

115. Magnesium sulfate is administered to a client with preeclampsia to

a. Increase diuresis
b. Prevent seizures
c. Reduce blood pressure
d. Slow the process of labor

Explanation: Chemically, magnesium is similar to that of calcium and, therefore magnesium will act like calcium in the body. So magnesium will block seizure activity by interfering with signal transmission at the neural musculature junction.

116. Megaloblastic anemia is caused by

a. Phenytoin toxicity b. Long term aspirin use
c. NSAIDs d. Opioid analgesics

Explanation: Phenytoin (dilantin) causes megaloblastic anemia due to decreased folate absorption.

117. Best prophylaxis for a 3-year-child with febrile seizures:

a. Benzodiazepines
b. Paracetamol q6h
c. Paracetamol and nitrazepam
d. Phenobarbitone

Explanation: Phenobarbitone is effective in preventing the recurrence of simple febrile seizures in children.

118. All of the following are the side effects of Phenytoin, EXCEPT *(AIIMS Rishikesh 2015)*

a. Ataxia b. Hirsutism
c. Hypoglycemia d. Gum Hypertrophy

Explanation: Side effects of Phenytoin includes gingival hyperplasia, Hirsutism, and ataxia. It can cause Hyperglycemic.

Scanned with CamScanner

119. The drug of choice in the management of preeclamsia is
a. Magnesium Sulfate b. Calcium gluconate
c. Sodium bicarbonate d. Sodium nitroprusside

Explanation: Magnesium sulfate ($MgSO_4$) is the agent most commonly used for treatment of eclampsia and prophylaxis of eclampsia in patients with severe preeclampsia.

120. Which of the following drugs is implicated in the causation of osteomalacia of the bone?
a. Phenytoin b. Steroids
c. Heparin d. Estrogen

121. Drug of choice for status epilepticus is
a. Carbamazepine b. Diazepam
c. Phenytoin sodium d. Valporic acid

122. Which of the following antiepileptic is preferred when an epileptic patient is not responding to phenytoin
a. Carbamazepine b. Clonazepam
c. Diazepam d. Sodium Valproate

123. Intravenous phenytoin should not be infused rapidly because it can cause
a. Hypertension and Syncope
b. Hypotension and cardiac dysrhythmia
c. Hypertension and atrial fibrillation
d. Hypotension and hypoglycemia

124. Drug of choice for epilepsy in pregnancy is:
a. Lamotrigine b. Sodium valproate
c. Phenobarbitone d. Phenytoin

125. Drug of choice in treatment of partial complex seizures:
a. Carbamazepine b. Sodium valproate
c. Ethosuximide d. Phenytoin

DRUGS ACTING ON CARDIOVASCULAR SYSTEM

126. The side-effect of nitroglycerin is: *(Safdarjung NO 2018)*
a. Vomiting b. Diarrhea
c. Headache d. Constipation

Explanation: Nitroglycerin acts as a vasodilator due to its smooth muscle relaxant action. They reduce both after and preload with coronary blood flow redistribution.

Side effects of Nitroglycerin
- Throbbing **headache**, fullness of head.
- Postural hypotension.
- Methemoglobinemia
- Skin rashes
- Tachyphylaxis → Tolerance (to prevent this, everyday nitrate free interval is indicated).
- Dependence → Sudden withdrawal leads to vascular spasm → Myocardial infarction and Sudden death.

127. A drug ending in the suffix (pril) is considered a_____. *(Safdarjung NO 2018)*
a. Antidepressant
b. ACE inhibitor
c. Antifungal
d. Beta agonist

Explanation: ACE inhibitors include drugs like Captopril, Enalapril, Lisinopril, Ramipril, Fosinopril, Quinapril, Trandolapril, imidapril, Perindopril. Angiotensin-converting enzyme (ACE) inhibitors are drugs often used to treat high blood pressure.

128. Digoxin is not given when heart rate is *(AIIMS 2011)*
a. Below 50 b. Below 60
c. Above 70 d. Above 80

Explanation: Digoxin should not be given if the heart rate is below 60 beats per minute because digoxin further reduces the heart rate and it could be dangerous.

129. The drug that increases both systolic and diastolic blood pressure for prolonged period is
a. Dopamine b. Ephedrine
c. Epinephrine d. Dobutamine

Explanation: The mechanism of action of ephedrine relies on its indirect stimulation of the adrenergic receptor system by increasing the activity of norepinephrine at the postsynaptic α and β receptors. It increases BP by direct and indirect action and has longer duration of action than epinephrine.

130. Dopamine is preferred in the management of shock because it
a. Decreases cardiac output
b. Has prolonged action
c. Has peripheral vasoconstriction effect
d. Has renal vasodilatory effect

Explanation: Dopamine at low doses acts on D1 receptors which causes renal vasodilation which improves renal perfusion and saves it from damage due to shock.

131. Which of the following drugs should be first administered in a patient admitted with a diagnosis of acute myocardial infarction? *(RPSC NG-II, 2007)*
a. ACE inhibitor b. Aspirin
c. Calcium channel blocker d. Statin

Explanation: Aspirin is a powerful antiplatelet agent, with a rapid onset of action, which reduces mortality by 20%. All patients with a suspected myocardial infarction should be given aspirin. Aspirin, 150-300 mg, should be swallowed as early as possible. General practitioners should give aspirin or advise the patient to take an aspirin when they are called by a patient who may be suffering a myocardial infarction. There is no need to wait for an electrocardiograph (ECG). If the patient has not already taken aspirin, it should be given in the ambulance or emergency room.

132. Which electrolyte imbalance may predispose the patients to digitalis toxicity?
a. Hypercalcemia b. Hypermagnesemia
c. Hypokalemia d. Hypernatremia

Explanation: Conditions that may predispose a patients to digitalis toxicity include hypokalemia, hypomagnesemia, hypothyroidism, hypoxemia, myocardial disease, myocardial ischemia, and altered autonomic tone.

133. Calcium channel blockers which are used in the treatment of hypertension include:
a. Prazosin b. Enalapril
c. Captopril d. Nifedipine

Explanation: Nifedipine is a calcium channel blocker used in the treatment of hypertension. Prazosin is an alpha blocker. Enalapril and Captopril belongs to ACE inhibitors.

Ans.

119.	a
120.	a
121.	b
122.	a
123.	b
124.	a
125.	a
126.	c

131.	b
132.	c
133.	d

Scanned with CamScanner

134. Which of the following drugs is administered sublingually for the management of angina pectoris? *(DSSSB 2013)*
a. Aspirin
b. Nitroglycerine
c. Atenolol
d. Warfarin

Explanation: Sublingual administration bypasses the first-pass metabolism of the drug in the liver. Sublingual nitroglycerine is rapidly absorbed into circulation through blood vessels in sublingual mucosa and is useful for the management of angina pectoris.

135. Which of the following drugs is NOT a plasma expander?
a. Dextran
b. Mannitol
c. Human albumin
d. Hexa starch

Explanation: Dextran, Human albumin and Hexa starch are plasma expanders. Mannitol is an osmotic diuretic.

136. Which of the following drug is withheld if the patient's pulse is less than 60/min?
a. Digoxin
b. Dobutamine
c. Nifedipine
d. Phenytoin

Explanation: Digoxin should not be given if the heart rate is below 60 beats per minute; because digoxin further reduces the heart rate and it could be dangerous.

137. The inotropic agent that can only be administered intravenously for heart failure is
a. Digoxin
b. Dobutamine
c. Nifedipine
d. Atenolol

Explanation: Dobutamine is a cardiac inotrope useful in the acute treatment of congestive heart failure Dobutamine can only be administered IV. Digoxin and nifedipine can be administered orally. Atenolol is not an inotropic agent.

138. Digoxin (Digitalis) is the drug of choice for
a. Angina pectoris
b. Congestive heart failure
c. Hypertension
d. Myocardial infarction

Explanation: Digoxin, a cardiac glycoside used in the treatment of congestive heart failure. It acts by increasing the force of contraction ventricle.

139. A client is receiving I.V. calcium gluconate for pregnancy induced hypertension (PIH). Plan of care throughout injection of the drug must include
a. ECG monitoring
b. CVP readings
c. Ventilator assistance
d. Continuous CPR

Explanation: ECG monitoring is required when calcium is administered by intravenous injection because the potential side effect of calcium gluconate administration is cardiac arrest.

140. Which of the following receptor is activated by low doses of dopamine?
a. Dopaminergic
b. Beta 1
c. Beta 2
d. Alpha

Explanation: Dopamine activates dopaminergic receptor only at low doses. At normal or high doses it activates alpha and beta 1 receptors.

141. Plasma expanders are used in:
a. Severe anemia
b. Circulatory shock
c. Chronic renal failure
d. Congestive Heart Failure

Explanation: Plasma expanders are used in circulatory shock. Plasma volume expanders increase the oncotic pressure in the intravascular space.

142. The main drug of choice for Heart Failure is: *(DSSSB PHN, 2015)*
a. Decadron
b. Digoxin
c. Morphine
d. Efcorlin

143. The procedure which involves giving a synchronized counter-shock to convert an undesirable rhythm to stable rhythm is: *(DSSSB PHN, 2015)*
a. Defibrillation
b. Cardiac stimulator
c. Pacemaker
d. Cardioversion

144. Identify the calcium channel blocker from the following: *(DSSSB PHN, 2015)*
a. Nifedipine
b. Atenolol
c. Lasix
d. Mannitol

145. Which among the following medicines is used for the pharmacologic closure of patent ductus arteriosus? *(Kerala PSC, Nov 2014)*
a. Methoxamine
b. Ecosprin
c. Indomethacin
d. Prostaglandin

146. A patient can become toxic on a normal dose of digitalis when ---------- is present. *(Kerala PSC, Nov 2014)*
a. Hyperkalemia
b. Hypertension
c. Hypokalemia
d. Hypotension

147. Verapamil is: *(JIPMER 2012)*
a. Beta adrenergic Blocker
b. H_2 receptor antagonist
c. Cardiac glycoside
d. Calcium channel blocker

148. Dobutamine causes:
a. Increased cardiac output
b. Marked increase in HR
c. Increased total peripheral resistance
d. Marked increase in BP

149. The route of administration of nitroglycerine is
a. Inhalation
b. Intramuscular
c. Subcutaneous
d. Sublingual

150. A 53-year-old male patient is brought into emergency room with acute myocardial infarction. Which of the following drug should be administered first
a. ACE inhibitor
b. Aspirin
c. Calcium channel blocker
d. Statin

151. Which of the following instruction is appropriate in regard to nitroglycerine (NTG) for a patient with angina pectoris
a. To take it before meals
b. To take with a glass of water
c. To store in amber colored bottle and keep it away from sunlight
d. None of the above

152. Nurse teaches the client with angina about common expected side effects of nitroglycerine including
a. High blood pressure
b. Stomach cramps
c. Headache
d. Shortness of breath

Ans.

152.	c

Scanned with CamScanner

153. Therapeutic serum level of digoxin is
a. 0.25 to 0.5 ng/mL
b. 0.5 to 2 ng/mL
c. 1.5 to 3.0 ng/mL
d. 2.0-3.5 ng/mL

154. Digoxin acts by
a. Increasing myocardial contractility
b. Decreasing myocardial contractility
c. Increasing heart rate
d. Increasing preload

155. Digoxin is withheld when the pulse rate of patient is
a. Below 60
b. Below 70
c. Below 80
d. Below 90

156. Which of the following is an early indication of digitalis toxicity?
a. Visual aberration
b. Fatigue
c. Seizures
d. Headache

157. Atenolol is a/an
a. α-adrenergic blocker
b. β-blocker
c. Anticholinergic agent
d. Cholinergic agent

158. Which of the following is NOT indicated in digitalis poisoning:
a. Potassium
b. Hemodialysis
c. Phenytoin
d. Lidocaine

159. Therapeutic plasma level of digoxin:
a. 0.1 – 0.3 ng/mL
b. 0.8 – 1.5 ng/mL
c. 1.2 – 2 ng/mL
d. >2.4 ng/mL

160. Drug of choice of hypertension in pregnancy is:
a. Methyldopa
b. Thiazide
c. Nifedipine
d. Labetalol

161. Which of the following drug is used as an antihypertensive?
a. Anticholinergics
b. Mydriatics
c. Vasodilators
d. Vasopressin

162. Which of the following is a protective lipoprotein?
a. LDL
b. IDL
c. VLDL
d. HDL

163. The action of cardiotonics is to
a. Decrease the force of contraction of heart
b. Increase the force of contraction of heart
c. Treat rheumatic heart disease
d. Treat primary hypertension

164. A client with heart failure has digoxin ordered. What would the nurse expect to find when evaluating for the therapeutic effectiveness of this drug?
a. Diaphoresis with decreased urinary output
b. Increased heart rate with increase respirations
c. Improved respiratory status and increased urinary output
d. Decreased chest pain and decreased blood pressure

165. Which of the following drug would be least effective in lowering a client's serum potassium level
a. Glucose and insulin
b. Polystyrene sulfonate
c. Calcium gluconate
d. Aluminum hydroxide

166. Which of the following condition may predispose a patient to digoxin toxicity?
a. Hyperkalemia
b. Hypokalemia
c. Hypernatremia
d. Hyponatremia

DRUGS ACTING ON CNS AND PSYCHOPHARMACOLOGY

167. Propranolol can be used to allay anxiety associated with: *(Safdarjung NO 2018)*
a. Chronic neurotic disorder
b. Schizophrenia
c. Short-term stressful situations
d. Endogenous depression

Explanation:
- Beta-blocker like propranolol is useful in short term stressful situation (performance or situational anxiety). It does not affect psychological symptoms like worry, fear, etc.
- Usually not administered on a chronic basis for treating anxiety, rather before stressful events, for example, public speaking or acting.

168. Increased suicidal tendency is associated with
a. Low levels of serotonin
b. High levels of serotonin
c. Low levels of dopamine
d. High levels of dopamine

Explanation: Low levels of serotonin (5-HT) in brain are associated with depression and suicidal behavior. High level of serotonin is associated with anxiety.

169. Which of the following medication is used in the management of raised ICP? *(RPSC NG-II, 2007)*
a. Diazepam
b. Phenytoin
c. Mannitol
d. Furosemide

Explanation: Mannitol is an osmotic diuretic agent. Its osmotic properties take effect in 15–30 minutes when it sets up an osmotic gradient and draws water out of neurons. Mannitol is therefore best used by bolus administration where an acute reduction in ICP is necessary.

170. Disulfiram, an antabuse drug used in Alcohol Dependence Syndrome acts by deactivating
a. Acetaldehyde dehydrogenase
b. GABA
c. Acetylcholine
d. Choline-esterase

Explanation: Alcohol is broken down by the enzyme alcohol dehydrogenase to acetaldehyde, which is then converted by the enzyme acetaldehyde dehydrogenase to the harmless acetate (acetic acid). Disulfiram irreversibly deactivates the enzyme acetaldehyde dehydrogenase that leads to accumulation of acetaldehyde. This is termed as Disulfiram Ethanol Reaction (DER). This manifests with unpleasant symptoms.

171. Which of the following drug crosses blood-brain barrier?
a. Glycopyrrolate
b. Dopamine
c. Streptomycin
d. Propranolol

Explanation: Propranolol crosses blood-brain barrier. Dopamine, streptomycin and glycopyrrolate do not cross blood-brain barrier.

172. Frequent serum level monitoring is required when the patient is on
a. Amitriptyline
b. Haloperidol
c. Lithium
d. Lorazepam

168.	a
169.	c
170.	a
171.	d
172.	c

Scanned with CamScanner

Explanation: Lithium has very low therapeutic index. The therapeutic range for lithium is 0.6 - 1.2 mmol/L. Within this range, most people will respond to the drug without symptoms of toxicity. Below this range, it will not produce therapeutic effect whereas lithium level above this range leads to toxic effects on patients. So it is essential to regularly monitor serum level of lithium to ensure that it remains within therapeutic range.

173. The therapeutic level of serum lithium is

a. 0.25-0.5 mEq/L
b. 0.6-1.2 mEq/L
c. 1.5-2.5 mEq/L
d. 2.0-3.0 mEq/L

Explanation: The therapeutic serum drug value of lithium is 0.6-1.2 mEq/L (maintenance). During acute phase: 1.0-1.5 mEq/L.

174. Imipramine is an antidepressant of _____ group *(RML 2002)*

a. Tricyclic antidepressant (TCA)
b. Selective serotonin reuptake inhibitor (SSRI)
c. Monoamine oxidase inhibitor (MAOI)
d. Non-selective serotonin reuptake inhibitor

Explanation: Imipramine is a tricyclic antidepressant (TCA) of the dibenzazepine group. Imipramine is mainly used in the treatment of major depression and enuresis (inability to control urination).

175. All the following are the actions of acetylcholine EXCEPT

a. Contraction of detrusor muscle
b. Decrease in heart rate
c. Dilatation of pupil
d. Increased salivation

Explanation: Acetylcholine is a miotic agent thus causes constriction of pupil. Mydriatic agents (Atropine) causes dilation of pupil.

176. A patient with substance use disorder presents with increased lacrimation, abdominal cramping, agitation, and rhinorrhea. These symptoms indicates withdrawal of

a. Opioid
b. Cocaine
c. Nicotine
d. Marijuana

Explanation: Withdrawal symptoms of opioid includes sweating, lacrimation, diarrhea, abdominal cramping, muscle aches, yawning, rhinorrhea, fever, agitation, goose bumps, and insomnia.

177. Deficiency of which of the following neurotransmitter is associated with depression?

a. Acetylcholine
b. Norepinephrine
c. Dopamine
d. Serotonin

Explanation: Low serotonin (5-HT) levels are found to be the cause of many cases of mild to severe depression

178. Disulfiram (antabuse) is used in

a. Withdrawal phase of Alcohol Dependence Syndrome
b. Maintenance phase of Alcohol Dependence Syndrome
c. Treatment of alcohol intoxication
d. All of the above

Explanation: Benzodiazepines is used during withdrawal phase of treatment of Alcohol Dependence Syndrome (ADS). Disulfiram is a deterrent agent used during the maintenance phase of the treatment.

179. Drug-induced Parkinsonism is treated by

a. Anticholinergics
b. Anticholinesterases
c. Cholinergic drugs
d. Hydralazine

Explanation: Drug induced parkinsonism is treated with anticholinergic drugs. For example, trihexyphenidyl, benztropine, amantadine etc.

180. Extrapyramidal symptoms (EPS) are associated with

a. Anxiolytics
b. Antipsychotic
c. Antidepressants
d. Antimanics

Explanation: Extrapyramidal symptoms (EPS) are one of the major complication of using Antipsychotic drug.

181. Lithium therapy during pregnancy increases the chance of _____ in fetus

a. Anencephaly
b. Neural tube defects
c. Defects in extremities
d. Cardiac malformations

Explanation: Women treated with lithium during pregnancy are at risk for Ebstein's anomaly of the fetus. Ebstein's anomaly is a congenital malformation of the heart.

182. Cocaine intoxication causes

a. Visual sensations
b. Tactile sensations
c. Olfactory sensations
d. Kinetic sensations

Explanation: Cocaine toxicity causes tactile stimulations.

183. Dry mouth during antidepressant therapy is caused by blockade of

a. Muscarinic acetylcholine receptors
b. Dopaminergic receptors
c. GABA receptors
d. Serotonergic receptors

Explanation: Antidepressants causes blockage of the muscarinic acetylcholine receptors which interferes with the salivary secretion.

184. Which of the following drugs induces sleep?

a. Hypnotics
b. Analgesics
c. Antipyretics
d. Antihistamines

185. Diagnosis of myasthenia gravis is by using:

a. Edrophonium
b. Neostigmine
c. Succinylcholine (Sch)
d. Atropine

186. Immune suppressive therapy is effective in patient with myasthenia gravis because it

a. Promotes the removal of antibodies
b. Stimulates the production of Ach at the synoptic cleft
c. Decreases the production of autoantibodies that attack the acetylcholine
d. Inhibits the breakdown of acetylcholine at the NMJ.

187. Drug of choice in acute central anticholinergic syndrome is:

a. Neostigmine
b. Physostigmine
c. Tacrine
d. 4-amino pyridine

188. Drug used for postoperative reversal of muscular paralysis:

a. Neostigmine
b. Pyridostigmine
c. Physostigmine
d. D tubocurarine

189. Major neurotransmitter in parasympathetic

a. Acetylcholine
b. Adrenaline
c. Noradrenaline
d. Dopamine

190. Organophosphate inhibits:

a. Anionic site of AChEs
b. Esteric site of AChEs
c. ACh
d. None

191. Drug of choice in treatment of myasthenia gravis is:

a. d-tubocurarine
b. Hexamethonium
c. Pyridostigmine
d. Gallamine

Ans.

173. b
174. a
175. c
176. a
177. d
178. b
179. a
180. b
181. d
182. b
183. a
184. a
185. a
186. c
187. b
188. a
189. a
190. b
191. c

Scanned with CamScanner

192. Acetylcholine is not used commercially because:
a. Long duration of action
b. Costly
c. Rapidly destroyed in the body
d. Crosses blood brain barrier

193. Atropine does not cause:
a. Increase bowel sound
b. Decrease bowel sound
c. Hypotension
d. Tachycardia

194. Pin point pupil suggests poisoning with:
a. DDT
b. Opiates
c. Belladonna
d. Barbiturates

195. Drug of choice in nocturnal enuresis is:
a. Imipramine
b. Diazepam
c. Amoxapine
d. Desmopressin

196. Which one of the following acts commonly both on parasympathetic and sympathetic division?
a. Atropine
b. Pilocarpine
c. Acetylcholine
d. Adrenaline

197. Which of the following class of drugs constricts the pupil?
a. Mydriatics
b. Miotics
c. Both mydriatics and miotics
d. None of the above

198. The action of mydriatics is
a. Contraction of arteries
b. Constriction of the pupil
c. Dilation of arteries
d. Dilation of the pupil

199. Barbiturates are contraindicated in older persons because it cause
a. Convulsions
b. Delirium
c. Panic attack
d. Urinary incontinence

200. Mannitol decreases the intraocular pressure by:
a. Withdrawing water from vitreous
b. Increasing uveoscleral outflow
c. Increasing aqueous through trabecular meshwork
d. Inhibiting the enzyme anhydrase in the ciliary body

201. Which of the following drug is administered to reduce the elevated intracranial pressure?
a. Hydralazine
b. Mannitol
c. Nitrofurantoin
d. Sodium nitroprusside

202. Which of the following is an osmotic diuretic? *(JIPMER 2012)*
a. Lasix
b. Spironolactone
c. Aldactone
d. Mannitol

203. Which among the following drugs is used in the treatment of alcohol dependence? *(Kerala PSC, Nov 2014)*
a. Disulfiram
b. Lithium
c. Carbamazepine
d. Verapamil

204. An irreversible side effect of antipsychotics is: *(Recent Question 2012)*
a. Akathisia
b. Tardive dyskinesia
c. Tremor
d. Sleeplessness

205. With barbiturate and benzodiazepine abuse and dependency, sedative intoxication is generally associated with: *(LNJP H D 2012)*
a. Slurred speech
b. Impairment in attention and speech
c. Uncoordinated motor movements
d. All of the above

206. The drug which is used to create aversion in Alcohol Dependence:
a. Apomorphine
b. Propranolol
c. Diazepam
d. Disulfiram

207. Drug used in uncomplicated alcohol withdrawal:
a. Diazepam
b. Clonidine
c. Propranolol
d. Methadone

208. Disulfiram inhibits:
a. Alcohol dehydrogenase
b. Aldehyde dehydrogenase
c. G6PD
d. Acetate dehydrogenase

209. Ethanol is given in methyl alcohol poisoning because:
a. It inhibits aldehyde dehydrogenase
b. It inhibits aldehyde synthetase
c. It binds to alcohol dehydrogenase stronger than methanol
d. None

210. Anxiolytic drug with antidepressant action is :
a. Lorazepam
b. Diazepam
c. Alprazolam
d. Triazolam

211. Flumazenil is:
a. Diazepam inverse agonist
b. Diazepam antagonist
c. Opioid antagonist
d. Opioid inverse agonist

212. Neural tube defect is due to:
a. Valproate
b. Phenytoin
c. Diazoxide
d. None

213. All of the following drugs can cause neuroleptic malignant syndrome except:
a. Amantadine
b. Domperidone
c. Haloperidol
d. Metoclopramide

214. Oculogyric crisis is known to be produced by all of the following except:
a. Trifluoperazine
b. Atropine
c. Prochlorperazine
d. Perphenazine

215. All of the following may be seen with neuroleptic malignant syndrome except:
a. Hypothermia
b. Altered consciousness
c. Muscle rigidity
d. Involuntary movements

216. Clozapine is an example of:
a. Antipsychotic
b. Antidepressant
c. Mood stabilizer
d. Anxiolytic

217. Which of the following drug is an example of Tricyclic Antidepressant (TCA)?
a. Imipramine
b. Sertraline
c. Hydralazine
d. Fluoxetine

218. Lithium is used in a pregnant woman. Which of the following congenital anomaly occurs in foetus:
a. Tetralogy of Fallot
b. Tricuspid atresia
c. Ebstein's anomaly
d. Pulmonary stenosis

219. Long term use of lithium causes:
a. Peripheral neuropathy
b. Hypothyroidism
c. Anemia
d. Jaundice

220. The therapeutic serum level of lithium is
a. 0.3-0.6 mEq/L
b. 0.6-1.2 mEq/L
c. 1.2-1.8 mEq/L
d. 1.8-2.5 mEq/L

221. Treatment of choice of bipolar mood disorder:
a. Fluoxetine
b. Imipramine
c. Lithium
d. Chlorpromazine

222. Lithium monitoring is done because of:
a. Low therapeutic efficacy
b. Very low therapeutic index
c. Adverse effects
d. Long half-life

Scanned with CamScanner

223. Which of the following antidepressants cause urine retention:
a. Imipramine b. Fluoxetine
c. Dothiepin d. Risperidone

224. Anti-depressant drug that can safely be used in children is:
a. Imipramine b. Fluoxetine
c. Dothiepin d. Chlorpromazine

225. Which of the following is most commonly used worldwide for maintenance therapy of opioid dependence:
a. LAMA b. Methadone
c. Naloxone d. Pethidine

226. Schizophrenia is treated by:
a. Antidepressants b. Antipsychotics
c. Antiepileptics d. Mood stabilizers

227. Neuroleptic malignant syndrome is characterized by:
a. Hypothermia b. Labile blood pressure
c. Bradycardia d. Flaccidity

228. Features of opioid intake are all of the following except:
a. Feeling of relaxation b. euphoria
c. Analgesia d. Dilated pupils

229. Drug of choice for prophylaxis of mania is:
a. Lithium b. Haloperidol
c. Clozapine d. Carbamazepine

230. Drug used in the treatment of Attention Deficit Hyperactivity Disorder (ADHD) is
a. Carbamazepine b. Levodopa
c. Methylphenidate d. Diazepam

231. Therapeutic drug monitoring must be done for:
a. Penicillin b. Lithium
c. Erythromycin d. Lignocaine

Ans.

ANALGESICS AND ANTIPYRETICS

232. Withdrawal symptoms do NOT usually occur in case of which of the following medications? *(AIIMS-BBS SNO 2019)*
a. Monoamine oxidase inhibitors.
b. Non-steroidal anti-inflammatory drugs
c. Selective serotonin reuptake inhibitors
d. Tetracyclic anti-depressants

Explanation: Withdrawal symptoms do NOT usually occur in case of Non-steroidal anti-inflammatory drugs (NSAIDs. All other given drugs are antidepressants with a side effect of withdrawal symptoms on abrupt discontinuation of drug.

233. Which of the following is NOT an adverse effect of morphine? *(AIIMS-BBS SNO 2019)*
a. Euphoria
b. Respiratory stimulation
c. Nausea
d. Histamine release

Explanation: Morphine belongs to opioid analgesics. Respiratory depression is an expected adverse effect of opioids (morphine). So Respiratory stimulation is not an expected adverse effect. Other side effects include Low blood pressure, nausea, vomiting, constipation, euphoria and drowsiness.

234. Which of the following analgesic is preferred in elderly patients? *(AIIMS-2011)*
a. Aspirin b. Morphine
c. Diclofenac sodium d. Ampicillin

Explanation: Diclofenac sodium is a nonsteroidal anti-inflammatory drug (NSAID). It is recommended for old age people because of its analgesic effect with less side effects. Ampicillin (option d) is an antibiotic, so not correct. Aspirin is risky in old age people as it increases the chances of gastric ulcer.

235. Morphine is contraindicated in which of the following condition? *(ESI 2010)*
a. Angina
b. Bronchial asthma
c. Appendicitis
d. Myocardial infarction

Explanation: Morphine is a opioid derivative that causes respiratory depression. So it is contraindicated in patients with Bronchial asthma.

236. Paracetamol is an *(RPSC NG-II, 2010)*
a. Antipyretic b. Antitussives
c. Antibiotic d. Antiemetic

Explanation: Paracetamol (acetaminophen) is an antipyretic (reduce fever) and analgesic (reduce pain) agent.

237. Drugs used to reduce the increased temperature of the body are called as
a. Antibiotics b. Analgesics
c. Antipyretics d. Antihistamines

238. A client receiving morphine sulfate should be observed for: *(Kerala PSC, Nov 2014)*
a. Respiratory depression b. Blood dyscrasias
c. Gastritis d. Jaundice

239. Opioids are obtained from: *(Staff Nurse G II 2014)*
a. Erythroxylum coca b. Claviceps purpurea
c. Cannabis sativa d. Papaver somniferum

240. Dose of acetyl salicylic acid is: *(JIPMER 2012)*
a. 10 mg/kg/dose b. 500 mg/dose
c. 100 mg/kg/dose d. 50 mg/kg/dose

241. NSAIDs are used in all except:
a. As analgesic
b. In peptic ulcer
c. Rheumatoid arthritis
d. Osteoarthritis

242. Which of the following drug is an example of Synthetic opioid analgesic
a. Aspirin b. Morphine
c. Fentanyl d. Indomethacin

243. Analgesics are prescribed to *(RPSC NG-II, 2010)*
a. Induce sleep b. Give rest
c. Relieve pain d. Kill pathogens

244. Drugs used to relieve pain are known as:
a. Antibiotics b. Analgesics
c. Antipyretics d. Antihistamines

245. Contraindications to aspirin are all except:
a. Peptic ulcer b. Bleeding tendencies
c. Chicken pox d. Rheumatoid Arthritis

246. Which one of the following is aspirin?
a. Methyl salicylate b. Para amino benzoic acid
c. Para amino salicylic acid d. Acetyl salicylic acid

247. Tramadol is:
a. Antiflatulent b. Antireflux drug
c. Beta blocker d. Opioid analgesic

Scanned with CamScanner

248. **All of the following drugs are useful in the treatment of gout arthritis EXCEPT**
   a. Allopurinol b. Colchicine
   c. Probenecid d. Acetazolamide

249. **Drug useful for gout:**
   a. Pyrazinamide b. Rifampicin
   c. Allopurinol d. Naloxone

DRUGS ACTING ON RESPIRATORY SYSTEM

250. **The action of the drug pseudoephedrine is** *(ESI 2009)*
   a. Antimanic b. Decongestant
   c. Antihistamine d. Antiemetic

Explanation: Pseudoephedrine is a sympathomimetic drug which acts as a stimulant and decongestant. It is used to treat nasal and sinus congestion.

251. **Which of the following drug is not available as metered dose inhaler (MDI)?** *(LNJP H D 2012)*
   a. Albuterol b. Salbutamol
   c. Aminophylline d. Terbutaline

252. **Most common dose related side effects of salbutamol is:**
   a. Nervousness b. Palpitations
   c. Restlessness d. Tremors

253. **Most common effect of inhalational beclomethasone is:**
   a. Adrenal suppression
   b. Oropharyngeal candidiasis
   c. Bronchoconstriction
   d. Hepatitis

254. **Drug of choice in theophylline poisoning:**
   a. Cortisone b. Propranolol
   c. Thyroxine d. Phenytoin

255. **Which of the following is bronchodilator?**
   a. Corticosteroids
   b. Salmeterol
   c. Ketotifen
   d. Sodium cromoglycate

256. **Which of the following drug is an example of mucolytics**
   a. Bromhexine b. Codeine phosphate
   c. Levocetirizine d. Pheniramine maleate

257. **The administration of histamine in man can produce:**
   a. Bronchodilation
   b. Vasodilation
   c. Negative chronotropic action
   d. Reduced secretion of intrinsic factors

DRUGS ACTING ON GASTROINTESTINAL SYSTEM

258. **Lansoprazole is not used in which of the following cases?** *(Safdarjung NO 2018)*
   a. Gastritis
   b. Peptic Ulcers
   c. Zollinger-Ellison syndrome
   d. Thalamus hypertrophy

Explanation:
- Lansoprazole is a proton pump inhibitor (PPI). It Inhibits gastric acid secretion from the stomach. PPIs are used to treat Peptic ulcer disease, Gastroesophageal reflux disease (GERD), Stress ulcers, Zollinger-Ellison syndrome (ZES) and Aspiration pneumonia.
- Dose: 15 mg and 30 mg.

259. **Which of the following food enhances the absorption of an iron supplement** *(Safdarjung NO 2018)*
   a. Baked potato b. Orange juice
   c. Green beans d. Fortified Milk

Explanation:
- Orange juice contains vitamin C (ascorbic acid). Ascorbic acid enhances iron absorption by two ways:
  1. Prevents formation of insoluble and nonabsorbable iron compounds
  2. Reduces ferric to ferrous iron. This is required for the iron uptake into the mucosal cells.

Factors that increase absorption of an iron supplement:
1. Acid and reducing substances
2. Vitamin C
3. Meat (increase HCL acid and facilitate absorption)
4. Empty stomach.

Factors that interfere with absorption of an iron supplement:
1. Alkalis (antacids)
2. Phosphates (egg yolk)
3. Phytates (most plant sources, maize, wheat)
4. Tetracycline
5. Food in stomach.

260. **Which of the following drug is an example of proton pump inhibitor?**
   a. Pantoprazole b. Famotidine
   c. Ranitidine d. Sucralfate

Explanation: Pantoprazole and omeprazole are proton pump inhibitors (PPI) which inhibits the production of hydrochloric acid in the stomach.

261. **The drug used for prevention and treatment of nausea & vomiting is known as** *(DSSSB 2013)*
   a. Antitussives b. Antibiotics
   c. Antiemetics d. Antipyretics

Explanation: An antiemetic is a drug that is effective against vomiting and nausea. Antiemetics are typically used to treat motion sickness and the side effects of opioid analgesics, general anesthetics, and chemotherapy directed against cancer.

262. **The drug used in the treatment of hook worm infestation is** *(DSSSB 2008)*
   a. Albendazole
   b. Bephenium hydroxynaphthoate
   c. Mebendazole
   d. Piperazine citrate

Explanation: Albendazole is the treatment of choice for hook worm infestation. Single dose of 400 mg orally is effective.

263. **Misoprostol, a prostaglandin analogue is useful as:**
   a. Uterine relaxant b. Antiulcer
   c. Bronchodilator d. Vasodilator

264. **Drugs used to prevent or relieve nausea and vomiting are known as**
   a. Antacids b. Antiemetics
   c. Antitussives d. Emetics

265. **Drugs used in the treatment of worm infestations are known as**
   a. Antibiotics b. Anthelmintics
   c. Antimicrobials d. Antiprotozoal

266. Drug of choice for ascariasis:
a. Piperazine citrate
b. Bephenium hydroxynaphthoate
c. Mebendazole
d. Albendazole

267. Out of the following, which medicines are used for intestinal evacuation? *(RRB SSNE, 2015)*
a. Cathartics b. Carminatives
c. Astringents d. Antimycotics

268. If gut motility is increased then: *(RRB SSNE, 2015)*
a. Drug absorption is decreased
b. Drug absorption is increased
c. Drug absorption is not affected
d. Nothing definite can be said

269. Iron is stored in:
a. RBC
b. Reticuloendothelial system
c. Plasma
d. All

270. Iron is absorbed actively in the:
a. Stomach b. Duodenum
c. Terminal ileum d. Proximal ileum

271. Appropriate site for administering iron injection (Dextran) is
a. Anterior thigh b. Dorsogluteal muscle
c. Ventrogluteal muscle d. All of the above

272. Drug of choice for Zollinger-Ellison syndrome:
a. Antihistaminics b. Proton pump inhibitors
c. Dopamine agonists d. Antacids

273. Glucose is added in ORS to:
a. Improve taste
b. Decrease bacterial colonization of GIT
c. Increase the Stability
d. Increase the absorption of sodium

274. Intervention for a patient who has swallowed an acid includes all of the following EXCEPT
a. Stimulation of vomiting
b. Aspirating secretions from the pharynx if respirations are affected
c. Neutralizing the chemical with alkaline solution
d. Washing the esophagus with large volumes of water via gastric lavage

275. Which of the following drug is a proton pump inhibitor?
a. Ranitidine b. Cimetidine
c. Cetirizine d. Omeprazole

276. Long term use of omeprazole can cause
a. Vitamin B12 Deficiency b. Folic acid deficiency
c. Iron deficiency anemia d. Thiamine deficiency

277. Sucralfate is useful in the treatment of
a. Fluid deficit b. Fluid overload
c. Peptic ulcer d. Peritonitis

278. Vitamin D causes:
a. ↑ Intestinal absorption of calcium
b. ↓ Intestinal absorption of calcium
c. ↓ Intestinal absorption of phosphate
d. ↓ Renal absorption of calcium

279. Which of the following vitamin is known as anti-sterility vitamin
a. Thiamine b. Niacin
c. Vitamin D d. Vitamin E

HYPOGLYCEMIC AGENTS

280. An insulin drip is initiated for a patient with 40 U of insulin in 100 mL of normal saline solution. The I.V. is being infused via an infusion pump and the pump is currently set at 20 mL/hour. How many units of insulin is infused each hour?
a. 4 U b. 8 U
c. 0.4 U d. 0.8 U

Explanation:
- 100 mL normal saline contains = 40 U of insulin
- 1 mL normal saline contains = 40/100 = 0.4 U
- 20 mL normal saline contains = 0.4 × 20 = 8 U

281. Which of the following action is correct in regard to insulin administration?
a. Inject insulin at an angle of 45° into deltoid muscle
b. Take insulin after the first meal of the day
c. Draw up clear insulin first when mixing two types of insulin in one syringe
d. Shake the insulin vial vigorously before withdrawing medication.

Explanation: When mixing two types of insulin, the clear (regular) insulin should be drawn first into syringe. Insulin typically administered before first meal of the day. Insulin vial must be gently (in case of NPH) rolled in between palms before withdrawing medication. It should not be vigorously shaked.

282. Which of the following drugs has reducing effect on proteinuria in a normotensive diabetic patient?
a. Beta blockers b. ACE inhibitors
c. Loop diuretics d. Osmotic diuretics

Explanation: ACE stands for 'angiotensin-converting enzyme'. ACE inhibitors are a group of medicines that are used for two reasons: to treat high blood pressure and to reduce protein in the urine (proteinuria). They are used in various illnesses, including heart failure, kidney problems and diabetes.

283. Which of the following type of insulin is prescribed for a client with diabetic ketoacidosis?
a. Long acting insulin b. Human Regular insulin
c. Lente insulin d. Human NPH insulin

Explanation: Regular insulin acts rapidly and should be used for diabetic coma and diabetic ketoacidosis to achieve immediate action.

284. Which of the following adverse effect is NOT likely to be caused by insulin therapy
a. Allergic reactions b. Hyperglycemia
c. Lipodystrophy d. Blurred vision

Explanation: Insulin causes hypoglycemia not hyperglycemia.

285. Which of the following anti-diabetic drugs can cause vitamin B12 deficiency?
a. Glipizide b. Acarbose
c. Metformin d. Pioglitazone

286. Lactic acidosis is a side effect of:
a. Acarbose b. Metformin
c. Chlorpropamide d. Glibenclamide

287. Insulin causes all of the following except:
a. Glycogenesis b. Glycolysis
c. Lipogenesis d. Ketogenesis

Scanned with CamScanner

288. All are used in diabetic ketoacidosis except:
a. Insulin b. I.V. fluids
c. Sodium bicarbonate d. Glucagon

289. Which of the following is a Rapid acting insulin
a. Regular insulin b. Humalog Novolog
c. Lente insulin d. Semilente insulin

290. Which of the following is a Short acting insulin
a. Regular insulin b. NPH
c. Lente insulin d. Semilente insulin

291. Insulin causes:
a. Na^+ entry into cells b. K^+ exit from cells
c. Na^+ exit/K^+ entry d. K^+ entry into cells

292. Insulin overdose can be treated by administration of
a. 50% dextrose I.V.
b. 5% dextrose in Normal Saline I.V.
c. Oral hypoglycemic agents
d. Ringer lactate solution I.V.

293. Indications of newer insulin include all expect:
a. Insulin resistance b. Lipodystrophy
c. Pregnancy d. Diabetic kidney disease

294. Which of the following type of insulin can be administered through intravenous route (I.V) in emergency conditions?
a. Humulin lente b. Humulin ultralente
c. Insulin semilente d. Regular insulin

295. What is the best reason for the nurse in instructing the patient to rotate injection sites for insulin?
a. Lipodystrophy can result and is extremely painful
b. Poor rotation technique can cause superficial hemorrhaging
c. Lipodystrophic areas can result, causing erratic insulin absorption
d. Injection sites can never be reused

296. Which of the following can cause lactic acidosis?
a. Biguanides b. Glibenclamtide
c. tolbutamide d. Chlorpropamide

HORMONES

297. The pharmacological action of adrenaline includes *(ESI 2009)*
a. Vasoconstriction b. Increase in heart rate
c. Vasodilation d. Both A and B

Explanation: Epinephrine (Adrenaline) reaction with α receptors causes vasoconstriction while reaction with β1 receptor causes increase in heart rate and cardiac output.

298. Epinephrine reacts with which of the following receptors?
a. Adrenergic receptors b. Cholinergic receptors
c. Muscarinic receptors d. Nicotinic receptors

Explanation: Epinephrine (also known as Adrenaline) has adrenergic effect. Adrenergic receptors respond to sympathetic stimulation and blood-borne epinephrine. Epinephrine release is a vital component of the fight-or-flight response of the sympathetic nervous system.

299. Corticosteroids suppresses
a. Baroreceptors b. Pain receptors
c. Immune response d. Neural transmission

Explanation: Corticosteroids suppresses immune response in the body. Other physiological processes includes stress response, regulation of inflammation, carbohydrate metabolism, and protein catabolism.

300. A client reported that she has missed a single dose of her combined oral contraceptive pills (OCP). Which of the following advice is appropriate for this patient?
a. Take 2 pills the next day and continue with the course.
b. Take 2 pills every day for the remaining part of the course
c. Discontinue the course and use barrier method for the rest of the cycle.
d. Continue with the course without regard to the missed dose.

Explanation: If one tablet is missed, it should be taken as soon as it is remembered, alternatively 2 tablets can be taken the following day.

301. A patient in the second stage of labor is given which of the following injections to improve uterine contractions?
a. Diazepam
b. Methergine
c. Phenergan
d. Oxytocin

Explanation: Oxytocin mimics uterine contractions of normal labor. It is used for antepartum induction or stimulation of labor.

302. Mifepristone is an example of
a. Progesterone antagonist
b. Estrogen antagonist
c. Progesterone agonist
d. Estrogen supplement

Explanation: Mifepristone is a progesterone antagonist, also known as RU-486, is a medication typically used with misoprostol to bring about Medical Termination of Pregnancy (Abortion).

303. For a client with hyperthyroidism, treatment is most likely to include
a. A thyroid hormone antagonist
b. Thyroid extract
c. A synthetic thyroid hormone
d. Emollient lotions

Explanation: Thyroid hormone antagonists block thyroid hormone synthesis and reduce increased production of thyroid hormone.

304. Which of the following action is NOT caused by oxytocin
a. Lactogenesis
b. Ejection of breast milk
c. Contraction of myoepithelial cells
d. Uterine contraction

Explanation: Prolactin is a hormone responsible for lactogenesis (milk production). Other actions are caused by oxytocin.

305. Use of oral contraceptive pills by women reduces the risk of
a. Breast cancer b. Ovarian cancer
c. Cervical cancer d. Uterine cancer

Explanation: Use of oral contraceptive pills protects the women against ovarian cancer.

306. Which of the following drug may cause contraceptive failure if taken along with oral contraceptive?
a. Isoniazid b. Ethambutol
c. Rifampicin d. Pyrazinamide

Explanation: Rifampicin enhances metabolism of oral contraceptives causing contraceptive failure.

307. In which of the following condition, the drug epinephrine is not used?
a. Anaphylaxis
b. Local homeostasis
c. Chronic bronchial asthma
d. All of the above

308. Mineralocorticoid causes:
a. Na^+ reabsorption b. Glycogen synthesis
c. Gluconeogenesis d. Lipolysis

309. Prolactin secretion is inhibited by:
a. Dopamine antagonist b. GABA
c. Neurophysin d. Bromocriptine

310. All are released from pituitary except:
a. GH b. Prolactin
c. ADH d. Glucagon

311. Growth hormone release is controlled by:
a. GHRH b. Dopamine
c. FSH d. CRH

312. The drug of choice for the treatment of thyrotoxicosis during pregnancy is:
a. Carbimazole b. Iodine therapy
c. Propylthiouracil d. Methimazole

313. Drug which causes hypothyroidism is?
a. Carbamazepine b. Lithium
c. Sulphur d. Methotrexate

314. Thyroxine is synthesized from:
a. Cysteine b. Arginine
c. Tyrosine d. Alanine

315. L-thyroxine is used in:
a. Thyroid storm b. Cretinism
c. Endemic goiter d. Graves' disease

316. Which is fastest calcium lowering agents?
a. Calcitonin b. Plicamycin
c. Etidronate d. Zoledronate

317. Estrogen therapy is contraindicated in patient with
a. Pelvic inflammatory disease
b. Dysmenorrhea
c. Cervical cancer
d. Liver disease

318. Which of the following drug induces ovulation?
a. Clomiphene citrate b. Mifepristone
c. Misoprostol d. Ritodrine

319. A serious adverse effects of the drug oxytocin is
a. Hypertension b. Uterine rupture
c. Fluid deficit d. Convulsion

320. Mifepristone is an example of
a. Prostaglandin
b. Vasodilator
c. Estrogen antagonist
d. Progesterone antagonist

321. All are side effects of steroids, given in anti-inflammatory dosages, except:
a. Diabetes mellitus b. Hyperkalemia
c. Osteoporosis d. Na^+ and water retention

322. Corticosteroid which is given by inhalation route is:
a. Prednisolone b. Beclomethasone
c. Dexamethasone d. Hydrocortisone

323. All are side effects of steroids except:
a. Diabetes
b. Osteoporosis
c. Fragile skin
d. Hypotension

324. Which of the following is the side effect of steroids due to its mineralocorticoid component?
a. Skin striae
b. Hypertension
c. Osteoporosis
d. Moon face

325. Prolonged testosterone treatment to a man results in:
a. Increased spermatogenesis
b. Increased sperm motility
c. Azoospermia
d. Increased gonadotropins

326. Drug of choice for acute adrenal insufficiency is:
a. Oral prednisone b. IV hydrocortisone
c. IV betamethasone d. IV dexamethasone

327. Somatostatin secreted by which type of cells in pancreas?
a. Gamma cells b. Delta cells
c. Alpha cells d. Beta cells

328. Complications of aerosol steroids use includes:
a. Oral candidiasis b. Cushing's syndrome
c. Decreased ACTH d. Systemic complications

329. One of the following is not true about melatonin:
a. Induces sleep
b. Used in treatment of jet lag syndrome
c. Is secreted by pituitary
d. Is a pineal hormone

DIURETICS

330. Which of the following is NOT an osmotic diuretic
a. Furosemide b. Glycerol
c. Isosorbide d. Mannitol

Explanation: Furosemide is a loop diuretic. All other drugs given above are osmotic diuretics.

331. The diuretics should be administered early in the morning to
a. Prevent drug-food interaction
b. Prevent nausea and vomiting
c. To avoid nocturia
d. To promote absorption

Explanation: Diuretics increases the urine excretion. If the drug is administered in the evening/night, it may result in nocturia. Nocturia is a condition in which the patient need to get up many times during the night to urinate. So it is recommended to administer diuretics early in the morning.

332. When administering loop diuretic to a client, the nurse anticipates that the client may develop which electrolyte imbalance?
a. Hyperkalemia b. Hypernatremia
c. Hypokalemia d. Hypervolemia

Explanation: Loop diuretic inhibits the reabsorption of sodium and chloride in the ascending loop of Henle resulting in the excretion of sodium, chloride and to a lesser degree potassium and bicarbonate ions.

333. Gynecomastia is one of the side effect of
a. Spironolactone b. Rifampicin
c. Penicillin d. Bumetanide

Explanation: Spironolactone (potassium sparing diuretic) causes gynecomastia as a side effect.

Scanned with CamScanner

334. In patient with chronic renal failure, all of the following drugs likely to cause raise in potassium level EXCEPT
a. ACE inhibitors b. Beta blockers
c. Lasix (Furosemide) d. Spironolactone

Explanation: Lasix (furosemide) causes balanced excretion of potassium through kidney hence the chances of causing hyperkalemia is less. Spironolactone is a potassium sparing diuretic hence retains potassium.

335. The diuretic used in the treatment of open angle glaucoma is
a. Furosemide b. Acetazolamide
c. Spironolactone d. Mannitol

336. Drugs which increase urinary excretion is known as
a. Antidiuretics b. Diuretics
c. Laxatives d. Vasopressin

337. Which of the following is an example of urinary antiseptic
a. Cresol b. Furosemide
c. Nitrofurantoin d. Hypochlorite

338. Maximum Na^+ reabsorption occurs at:
a. Proximal tubule b. Loop of Henle
c. Distal tubule d. Collecting duct

339. Side effects of thiazides may include:
a. Hypokalemia b. Hyperuricemia
c. Hyperglycemia d. All of above

340. Potassium sparing diuretics is:
a. Spironolactone b. Triamterene
c. Amiloride d. All of the above

341. The nurse must take the following precaution when the patient is receiving furosemide
a. Advise the patient to quit smoking
b. Advise the patient to do regular aerobic exercises
c. Advise the patient for low calorie diet
d. Check blood sugar and urine sugar of the patient

342. ADH acts on:
a. Proximal convoluted tubule
b. Distal convoluted tubule
c. Loop of Henle
d. Collecting duct

343. Side effect of diuretic administration includes all EXCEPT
a. Hypotension b. Postural hypotension
c. Dehydration d. Hypernatremia

CHEMOTHERAPEUTIC AGENTS AND IMMUNOSUPPRESSANTS

344. Anticipatory nausea and vomiting occurs
a. One week after chemotherapy
b. Before chemotherapy administration
c. During chemotherapy administration
d. Within the first few hours after chemotherapy

Explanation:
- Anticipatory nausea and vomiting associated with chemotherapy occurs prior to administration of chemotherapy.
- Tips: Note the key word "anticipatory". Understanding the meaning of anticipation leads to option B

345. Ondansetron administered before chemotherapy is to prevent
a. Alopecia b. Anemia
c. Pain d. Vomiting

Explanation: Ondansetron is an antiemetic agent which prevents nausea and vomiting.

346. Methotrexate acts by inhibition of
a. Aldose dehydrogenase
b. Aldehyde dehydrogenase
c. Dihydrofolate reductase
d. Sterol synthesis

Explanation: Methotrexate acts by inhibition of folate metabolism, blocking dihydrofolic acid reductase, thereby inhibiting synthesis of purines and pyrimidines and decreasing DNA and RNA synthesis.

347. Which of the following anticancer drug causes 'Hand and foot syndrome' as a side effect?
a. Vincristine b. Vinblastine
c. Capecitabine d. Methotrexate

Explanation: One of the side effects of treatment with capecitabine is hand-foot syndrome.

348. Which of the following drug is NOT contraindicated in a lactating mother
a. Bromocriptine b. Amiodarone
c. Ibuprofen d. Retinoids

Explanation: Bromocriptine inhibits lactation. Amiodarone has a long half-life, iodine-containing molecule, and may affect thyroid function in infant. Retinoids are potential for serious adverse effects. Ibuprofen is safe during lactation.

349. Anticancer drug of plant source *(AIIMS, Rishikesh 2015)*
a. Vincristine b. Isotretinoin
c. bleomycin d. Methotrexate

350. Drug of choice in breast carcinoma is
a. Fluorouracil b. Tamoxifen citrate
c. Vincristine d. Vinblastine

351. What is the effect of cyclosporine in a patient undergone renal transplantation? *(Recent Question 2019)*
a. Immunosuppressant b. Anti-inflammatory
c. Antibacterial d. Diuretic

352. Drug used to treat itching is known as
a. Analgesic b. Anti-infective
c. Antispasmodic d. Antipruritic

353. All are uses of antihistaminic except:
a. Urticaria b. Motion sickness
c. Pruritus d. Glaucoma

354. Antihistaminic used in motion sickness is:
a. Cetirizine
b. Meclizine
c. Diphenhydramine
d. Fexofenadine

ANTICOAGULANT AND ANTIPLATELET DRUGS

355. Which of the following drug is used to prevent blood clotting during hemodialysis procedure?
a. Aspirin b. Heparin
c. Protamine sulfate d. Coumadin

Explanation: Anticoagulation in routine hemodialysis consists of a standard dose of heparin given as a bolus at the start of the dialysis treatment with a mid-treatment dose to maintain suitable anticoagulation.

Scanned with CamScanner

356. Use of aspirin in the children with viral disease is associated with
a. Hematuria
b. Reye's syndrome
c. Metabolic acidosis
d. Renal tubular acidosis

Explanation: Reye's syndrome seems to be triggered by using aspirin to treat a viral illness or infection — particularly flu (influenza and chicken pox—in children and teenagers who have an underlying fatty acid oxidation.

357. Warfarin acts as an anticoagulant by blocking the synthesis of: *(DSSSB PHN, 2015)*
a. RBC's
b. Vitamin E
c. Hemoglobin
d. Vitamin K

358. Which of the following is not a direct acting anti-platelet agent?
a. Aspirin
b. Clopidogrel
c. Atorvastatin
d. Ticlopidine

359. Heparin is the most widely used antithrombotic agent. It acts by activating:
a. Plasmin
b. Antithrombin III
c. Fibrinolysin
d. Factor X

360. Which of the following is vitamin K-dependent clotting factors?
a. Factor VII
b. Factor I
c. Factor XI
d. Factor XII

361. Which of the following is not an oral anticoagulant?
a. Warfarin
b. Dicumarol
c. Phenindione
d. Heparin

362. Aspirin is contraindicated in a patient who in on treatment with:
a. Prednisolone
b. Warfarin
c. Theophylline
d. Oral contraceptives

363. The client on Coumarin therapy should be instructed to avoid which of the following over-the-counter medication?
a. NSAID
b. Cough medicines
c. Histamine blockers
d. Laxatives containing Magnesium salts

364. A client is being maintained on heparin therapy for deep vein thrombosis. The nurse must closely monitor which of the following laboratory values?
a. Bleeding time
b. Platelet count
c. Activated PTT
d. Clotting time

365. Which of the following drug is used to prevent blood clotting during hemodialysis?
a. Coumarin
b. Heparin
c. Protomine Sulfate
d. Warfarin

366. Which one of the following antiplatelets is a prodrug?
a. Aspirin
b. Dipyridamole
c. Ticlopidine
d. Abciximab

ANTIDOTES

367. Antidote for overdose of Warfarin is *(AIIMS, 2010)*
a. Protamine sulfate
b. Heparin
c. Atropine sulfate
d. Vitamin K

Ans.

356.	b
357.	d
358.	c
359.	b
360.	a
361.	d
362.	b
363.	a
364.	c
365.	b
366.	c
367.	d
368.	a
369.	b
370.	b
371.	a
372.	d

Explanation: Vitamin K is an antidote of warfarin. Protamine sulfate is an antidote to heparin. Atropine sulfate is an anti-cholinergic agent.

368. The drug administered during acute anaphylactic reaction is *(AIIMS 2011)*
a. Adrenaline
b. Aminophylline
c. Atropine
d. Furosemide

Explanation: Injection of epinephrine (Adrenaline) is the first-aid medication of choice for anaphylaxis, as recommended in all anaphylaxis guidelines. Adrenaline helps to relieve the symptoms of anaphylaxis by causing vasoconstriction, and opening up airways. This prevents the blood pressure from dropping and makes breathing easier.

369. Antidote for organophosphorous poisoning is *(RPSC NG-II, 2007)*
a. D- Penicillamine
b. Atropine
c. Magnesium sulfate
d. Physostigmine

Explanation:
- Organophosphorus (OP) poisoning commonly results from exposure to pesticides. OP inhibits acetylcholinesterase, leading to accumulation of acetylcholine in the body. Atropine sulfate, an anticholinergic agent is used to counter the cholinergic effects produced by accumulated acetylcholine.
- Protocol to administer Atropine in case of OP poisoning:

Inject 1.8-3 mg (3-5 mL) of atropine bolus.
- Check pulse, blood pressure and chest crackles after 5 minutes.
- Aim for heart rate >80 beats per minute, SBP >80 mm Hg, and a clear chest (atropine won't dry focal areas of aspiration).
- Double the atropine dose at every five minutes if the objectives are not achieved
- Review patient at every 5 minutes.
- Once these parameters start improving, repeat last same or smaller dose of atropine.
- If improvement in these parameters is persistent and satisfactory after 5 minutes, now atropine infusion can be planned.
- Ignore pupils—they take time to dilate.

370. Antidote for Heparin is:
a. Vitamin K
b. Protamine Sulfate
c. Vitamin
d. Coumadin

Explanation: Protamine sulfate is an antidote to heparin which reverses the anticoagulant effects of heparin by binding to it. Dose: 1.0-1.5 mg per 100 units of heparin that had been administered in last 4 hours). PTT should be monitored at 5–15 minutes after dose then in 2–8 hours afterward.

371. The drug of choice in mushroom poisoning is
a. Atropine
b. Neostigmine
c. Physostigmine
d. Epinephrine

Explanation: In mushroom poisoning that produces primarily muscarinic effects, atropine is the drug of choice.

372. The antidote for paracetamol poisoning is
a. Atropine
b. Naloxone
c. Vitamin K
d. N-Acetylcysteine

Explanation: N-Acetylcysteine is an antidote for paracetamol poisoning.

Scanned with CamScanner

373. Antidote for benzodiazepines
a. Flumazenil b. N-Acetylcysteine
c. Naloxone d. Atropine

Explanation: Flumazenil is the antidote for benzodiazepines. It is the drug of choice for benzodiazepine overdose/poisoning.

374. Patient who is allergic to intravenous contrast media are also usually allergic to
a. Eggs b. Latex
c. Milk d. Shellfish

Explanation: Shellfish and contrast media both contains iodine. Patients are frequently asked about iodine or seafood (shellfish) allergy before IV contrast media is injected. Person who is allergic to shellfish is likely to be allergic to contrast media.

375. Severe allergic reaction to a drug is known as
a. Anaphylaxis b. Adverse effect
c. Drug interaction d. Toxicity

Explanation: Anaphylaxis is an allergic reaction to an antigen (e.g. an antibiotic) to which the body has become hypersensitive. It typically causes a number of symptoms including an itchy rash, throat swelling and low blood pressure.

376. Sensitivity or allergic reaction to the drug is tested by administering the drug
a. Intradermally b. Subcutaneously
c. Intramuscularly d. Intravenously

Explanation: Sensitivity or allergic reaction to drug is tested by administering the drug intradermally usually with a very minimal dose (0.01-0.1 mL).

377. Atropine is useful in organophosphate poisoning because it:
a. Reactivates acetyl cholinesterase
b. Competes with acetylcholine release
c. Binds with both nicotinic and muscarinic acetylcholine receptors
d. Is a competitive antagonist of acetylcholine

378. Treatment of atropine toxicity:
a. 2-Pralidoxime b. Naloxone
c. Flumazenil d. Physostigmine

379. Drug of choice for anaphylactic shock:
a. Adrenaline b. Antihistaminic
c. Glucocorticoids d. Epinephrine

380. First drug to be used in anaphylactic shock is:
a. Intramuscular adrenaline b. I.V. corticosteroid
c. Theophylline d. Antihistaminic

381. Drug of choice to treat drug induced anaphylactic shock is
a. Adrenaline b. Betamethasone
c. Dopamine d. Noradrenaline

382. The antidote to warfarin is: *(Kerala PSC, Nov 2014)*
a. Heparin b. Vitamin K
c. Vitamin B12 d. Iron

383. The antidote of organophosphorus poisoning is: *(Staff Nurse G II 2014)*
a. Adrenaline b. Atropine
c. Sodium bicarbonate d. Dopamine

384. Substances used to counteract the effects of poison are called as
a. Antibiotics b. Anticholinergics
c. Antiemetics d. Antidotes

385. The antidote of heparin is
a. Coumarin b. Protamine sulfate
c. Vitamin-K d. Aspirin

386. Antidote for organophosphorus poisoning is:
a. Atropine b. Neostigmine
c. Succinylcholine d. D-Tubocurarine

387. N-acetyl cysteine is an antidote for poisoning due to:
a. Paracetamol b. Datura
c. Aspirin d. Propranolol

388. Early features of aspirin poisoning is/are:
a. Throbbing headache
b. Rash
c. Ringing sensation in ear
d. Metabolic acidosis

389. Following are the name of drugs and its antidotes. Which of the following combination is NOT correct?
a. Benzodiazepines – Flumazenil
b. Paracetamol – Acetyl Cystine
c. Warfarin – Protamine sulfate
d. Opioid - Naloxone

390. Following are the types of poisoning and its antidotes. Which of the following combination is NOT correct?
a. Organophosphorus poisoning – Atropine sulfate
b. Heavy metal poisoning – Chelating agents
c. Methanol poisoning - Ethanol
d. Mushroom poisoning - Dopamine

391. Antidote for opioids is
a. Atropine sulfate b. Flumazenil
c. Neostigmine d. Naloxone

392. Antidote for digoxin toxicity is
a. Digoxin immune FAb b. Dobutamine
c. Flumazenil d. Adrenaline

393. Hemodialysis is useful in all of the following except:
a. Barbiturate poisoning
b. Methanol poisoning
c. Salicylate poisoning
d. Digoxin poisoning

394. Atropine is most sensitive to:
a. Mucous and pharyngeal secretions
b. Heart
c. Pupil
d. GI Tract motility

395. The following is the most commonly used embedding agent:
a. Paraffin wax
b. Formaldehyde
c. Glutaraldehyde
d. Resins

LOCAL ANESTHETICS

396. The nurse has applied EMLA cream as ordered. How does the nurse assess that cream has achieved its purpose? *(AIIMS Raipur NO 2019)*
a. Assess the skin for redness
b. Note any blanching of the skin
c. Lightly tap the area where the cream is applied
d. Gently poke the individual with a needle

Explanation: Eutectic mixture of local anesthetics (EMLA) is a combination of prilocaine and lidocaine. Lightly tapping the area where the cream is applied is the correct way to assess whether the cream has achieved its purpose or not.

Ans.

373.	a
374.	d
375.	a
376.	a
377.	d
378.	d
379.	a

395.	a
396.	c

Scanned with CamScanner

397. Which of the following local anesthetic agent has shorter duration of action?
a. Lidocaine b. Procaine
c. Bupivacaine d. Ropivacaine

Explanation: Procaine exerts shorter local anesthetic action. Procaine is preferred local anesthetic agent in patient with liver disease. It is not used these days.

398. The local anesthetic which also acts as an antiarrpythmic agent
a. Cocaine b. Lidocaine
c. Bupivacaine d. Ropivacaine

Explanation: Lidocaine acts as local anesthetic as well as anti-arrpythmic agent.

399. Atropine is commonly used prior to administration of inhalant anesthetics to reduce
a. Muscle tone b. Secretions
c. Nausea and vomiting d. All of the above

Explanation: Atropine is an anticholinergic agent which reduces secretions in respiratory tract.

CONTRACEPTIVES

400. OCPs can cause all except:
a. Mastalgia
b. Dysmenorrhea
c. Chloasma
d. Breakthrough bleeding

401. Mala- N contains:
a. Ethinyl estradiol 0.3 mg
b. Norethisterone 1 mg
c. D-norgestrel 0.5 mg
d. D-norgestrel 0.3 mg

402. Ergometrine is used in:
a. Postpartum hemorrhage
b. Induction of labor
c. Breast engorgement
d. Contraception

403. Side effect of oral contraceptives are all except:
a. Irregular bleeding
b. Headache
c. Venous thrombosis
d. Increased risk of ovarian cancer

404. The progesterone only emergency contraceptive pills act by all of the following EXCEPT
a. Altered cervical secretion
b. Inhibition of ovulation
c. Anti-implantation effect
d. Inhibition of LH secretion

405. "Oral contraceptive pills" protect against:
a. Thrombosis
b. Ovarian cancer
c. Cancer cervix
d. Hepatocellular adenoma

406. Adverse effects of oral contraceptive pills include all EXCEPT
a. Swelling of ankles and feet
b. Tenderness of breast
c. Abdominal cramping
d. Weight loss

407. Failure of oral contraceptives occur when used with any of these except:
a. Aspirin b. Tetracycline
c. Phenytoin d. Rifampicin

TERATOGENICITY

408. The ability of the drug to cause foetal damage is called as
a. Amniotic b. Fetotoxic
c. Ototoxic d. Teratogenicity

409. Teratogenicity refers to
a. Toxic action on the liver
b. Toxic action on fetus
c. Toxic action on blood system
d. Toxic action on kidneys

Explanation: Teratogenic drugs crosses placental barrier and cause damage to the growth and development of fetus.

410. Consumption of which of the following drug by a mother during pregnancy may cause phocomelia to the fetus?
a. Tetracycline
b. Thalidomide
c. Warfarin
d. Doxycycline

Explanation: Even a single dose of thalidomide taken during pregnancy can cause severe birth defects including phocomelia or death of the unborn baby. Phocomelia is a birth defect in which the hands and feet are attached to abbreviated arms and legs.

411. Which of the following drug is contraindicated in pregnancy?
a. ACE inhibitors b. Beta blockers
c. Heparin d. Hydralazine

Explanation: ACE inhibitors are contraindicated in pregnancy due to its potential for teratogenicity.

412. Which of the following drug is contraindicated in pregnancy?
a. Methyl dopa b. Clonidine
c. Amlodipine d. Enalapril

Explanation: Diuretic like ACEI and ARB inhibitors are teratogenic, hence contraindicated in pregnancy.

"A person cannot accumulate a fortune very well when he is sick."
—P. T. Barnum

4 COMMUNITY HEALTH NURSING

SYNOPSIS

CONCEPTS OF HEALTH

Health: It is a state of complete physical, mental and social well-being and not merely an absence of disease or infirmity (WHO 1948).

Following are the changing concepts of health:

- **Biomedical concept:** This has been viewed that health is an absence of disease and if one was free from disease then the person was considered as healthy. This concept has its basis in germ theory.
- **Ecological concept:** This has been viewed that health is a dynamic equilibrium between man and his environment and disease is maladjustment of the human being to the environment.
- **Psychosocial concept:** According to this concept health is influenced by social, psychological, cultural, economic and the political factors.
- **Holistic concept:** This model is a synthesis of all the above concepts. It recognizes the strength of social, economic, political and environmental influences on health. This approach implies that all sectors of society have an impact on health.

DIMENSIONS OF HEALTH

- Physical dimension
- Mental dimension
- Social dimension
- Spiritual dimension

CONCEPT OF DISEASE

- A condition in which body function is impaired.
- A maladjustment of human to the environment.

Causes

- Supernatural causes and karma
- Theory of humors (fluid)
- Theory of contagion
- Germ theory
- Epidemiological triad
- Multi-factorial causation
- Web of causation

Disease: Biological concept -physiological/psychological dysfunction

Illness: Socio-pathological concept - subjective feeling of not being well.

Sickness: Biological concept of social dysfunction

DETERMINANTS OF HEALTH

Table 1

Determinants	Factors
Biological	Genetic make-up, Growth and Development
Behavioral and sociocultural conditions	Life style, personal habit (smoking, drinking), nutritional status, sleep pattern, physical activity
Environment	**Internal environment:** Each and every body tissue and its functioning **External environment (macro environment):** All that external to the individual and can be divided as physical, biological, chemical and psychosocial **Domestic environment (micro environment):** Way of living and lifestyle such as eating habits, smoking, drinking, use of drugs, etc.
Socioeconomic conditions	Per capita GNP, education, nutrition, employment, housing, political system of country and occupation
Health services	Affordability, Accessibility and Availability of healthcare services. E.g. Access to and availability of vaccination
Aging of the population	Major concern of rapid population aging is the increased prevalence of chronic diseases and disabilities
Gender	Many programs have been established for female empowerment that focus on nutritional and reproductive health among females
Other factors	Factors such as revolution in information and communication also help us to access good health

CONCEPT OF WELL-BEING

PQLI: Physical quality of life index
HDI: Human development index

Scanned with CamScanner

Target High - Fifth Premium Edition

Three indicators of human development index:
1. Life expectancy index
2. Education index
3. CNI index

INDICATORS OF HEALTH OR (HEALTH INDEX/INDICES)

Indicators are required not only to measure the health status of the community but also to compare the health status of one country with that of another, for the assessment of healthcare needs, for allocation of scarce resources and for monitoring and evaluation of health service activities and programs.

- **Health Indices:** It is a pleural form of health index (indicator)

Mortality Indicators

- **Crude death rate:** Number of death per 1000 population per year in a given community.
- **Infant mortality rate:** It is a ratio of death under 1 year of age in a given year to the total number of live births in the same year. Usually expressed as a rate per 1000 live birth.

Note

Universally accepted indicator of health status of whole population.

- **Child mortality rate:** Number of death at 1-5 years of age in a given year per 1000 children in that age group at the midpoint of the year concerned.
- **Under five proportionate mortality rate**
- **Maternal mortality rate (MMR)**
- **Disease specific mortality rate**
- **Proportional mortality rate**

Morbidity Indicators

- Incidence and prevalence.
- Notification rate.
- Attendance rate at outpatient department, health center etc.
- Admission, **readmission** and discharge rate.
- Duration of stay in the hospital.
- Absence from work.

Disability Rate

Commonly used disability rates fall into two categories: Event type indicators and person type indicators.

Event Type Indicators

- Number of days of restricted activity.
- Disability leading to confinement to bed.
- Workless days within a specific period.

Person Type Indicators

- **Limitation of mobility:** For example confined to bed, confined to house, special aid in getting around either inside or outside.
- **Limitation of activity:** Limitations to perform the basic activities of daily living.

Sullivan's index: Expectation of life free of disability. It is computed by subtracting from the life expectancy from the probable duration of bed disability and inability to perform major activities.

Nutritional Status Indicators

It is a positive health indicator and other three important indicators are as follows:

- Anthropometric measurement of preschool children (height, weight and mid upper arm circumference).
- Heights of children at school entry.
- Prevalence of low birth weight.

Healthcare Delivery Indicators

- Doctor-population ratio
- Doctor-nurse ratio
- Population-bed ratio
- Population per health subcenter
- Population per traditional birth attendant.

Utilization Rate

In order to obtain additional information on health status, the extent of use of health services is often calculated.

- Proportion of children who are fully immunized against 6 vaccine preventable diseases.
- Proportion of women who receive antenatal care
- Percentage of population using various family planning method
- Bed-occupancy rate
- Average length of stay
- Bed turnover ratio.

Indicators of Social and Mental Health

It includes information regarding suicide, homicide, other act of violence and other crime, road traffic accidents, juvenile delinquency, alcohol and drug abuse, smoking, consumption of tranquillizer, obesity, etc. These indicators provide a guide to social action for improving the health of people.

Environmental Indicators

It reflects to the quality of physical and biological environment in which diseases occurs and in which people live. For example, pollution of air and water, radiation, solid waste, noise, exposure to toxic substance in food or drink. Among these most useful indicators are those measuring the proportion of population having access to safe water and sanitation facility.

Socioeconomic Indicators

They do not directly measure health. It includes:

- Rate of population increase
- Per capita GNP (Gross National Product)
- Level of unemployment
- Dependency ratio
- Literacy (especially female literacy)
- Family size
- **Housing:** Number of persons per room
- Per capita calorie availability.

Health Policy Indicators

Single most indicator of health policy indicators is political commitment. The relevant indicators are:

- Proportion of GNP spent on health services
- Proportion of GNP spent on health-related activities (water, sanitation, housing, nutrition and community development)

Scanned with CamScanner

- Proportion of total health resources devoted to primary healthcare.

LEVELS OF HEALTHCARE

- **Primary healthcare:** This is the first level of contact between individual and health system where essential healthcare is provided. A majority of prevailing problems can be satisfactorily dealt at this level. This level of healthcare is closest to the people. In Indian context this care is provided by primary health centers and sub centers with community participation.
- **Secondary healthcare:** This level deals with more complex problems, care comprises essentially curative services and is provided by district hospital and community health centers. This level serves as the first referral level in the health system.
- **Tertiary healthcare:** This level offers super-specialist care. Care is provided by regional teaching hospitals and central level institutions. These institutions along with specialized care are also providing planning and managerial skills and teaching for specialized staff.

HEALTH FOR ALL

- In **May 1977**, WHO assembly decided that the main goal of government and WHO in the coming years should be attainment of health by all people of the world by 2000 AD, that will permit them to lead a socially and economically productive life.
- The essential principle of health for all is the concept of equity in health, that is all people should have an opportunity to enjoy good health.
- Alma-Ata declaration statement is placing **"people's health in people's hands".**

MILLENNIUM DEVELOPMENT GOAL

- Declaration was on **September 2000**
- Government set date of **2015** to meet the millennium development goal, previously

Goals

- Eradicate extreme poverty and hunger
- Achieve universal primary education
- Promote gender equality and empower women
- Reduce child mortality
- Improve maternal health
- Combat HIV/AIDS, malaria and other diseases
- Ensure environmental sustainability
- Develop a global partnership for development

SUSTAINABLE DEVELOPMENT GOALS (SDG)

- It has **17 goals** and **169 targets set by United Nations in 2015** for the year 2030.
- "Global **Goals** for **Sustainable Development**" is another name used.
- Universal call to action to end poverty, protect the planet and ensures that all people enjoy peace and prosperity
- In relation to health, third goal is "to be active" and it has 13 targets.
- 13 targets are focusing the following areas:
  1. Reduce MMR (70 per 100,000 live births)
  2. Newborn and under 5 children
  3. End the epidemic of HIV/AIDS, TB, malaria
  4. Non communicable disease and mental health
  5. Road traffic accidents
  6. Universal access to sexual and reproductive health care services
  7. Substance abuse
  8. Universal health coverage
  9. Environmental pollution
  10. Tobacco control
  11. Research on vaccines for Communicable and Non-communicable diseases
  12. Health financing for health work force
  13. Strengthen the capacity of developing countries to manage global health risks.

CONCEPT OF PREVENTION

LEVELS OF PREVENTION

Table 2 Levels of prevention and mode of intervention

Levels of prevention	Definition and concept	Mode of intervention	Stage of the disease
Primordial prevention (Normal individual)	Prevention of development of risk factors. Consist of actions and measures that inhibit the emergence of risk factors in the form of • Environment • Economic conditions • Social conditions • Behavioral conditions • Cultural patterns	• Individual and Mass Education • Life style adaptation from childhood	Life time

Contd...

Scanned with CamScanner

Levels of prevention	Definition and concept	Mode of intervention	Stage of the disease
Primary prevention ↓ Before the disease occurrence	Action taken prior to the onset of disease • Focus on positive health • Promote wellbeing and quality of life	Health promotion and specific protection. **Approaches:** • Population strategy • High risk strategy	Pre-pathogenesis phase
Secondary prevention ↓ during disease process	• Actions halt the disease progress and prevents complications	Early Diagnosis and treatment • Screening test • Case findings	Pathogenesis phase (early)
Tertiary prevention ↓ (after)	• Used when the disease process has advanced beyond its early stages • Defined as all measures available to limit impairments and disabilities and to promote the patient's adjustment to irremediable conditions	• Disability limitation • Rehabilitation	Late Pathogenesis phase

- **Rehabilitation:** Combined and coordinated use of medical, social, educational and vocational measures for training and retreating the individual to the highest possible level of functional ability
- **Population (mass) strategy:** This approach is directed towards population irrespective of individual risk level.
- **High risk strategy:** This is aimed at preventive care to individual at high risk.

- **Health promotion:** It is the process of enabling people to increase control over the determinants of health and there by improve their health.

EPIDEMIOLOGY

It is the branch of medicine, which deals with the incidence, distribution, and possible control of diseases and other factors relating to health.

Focus Area

- Disease frequency
- Distribution of diseases
- Determinants of diseases

Tools of Measurement

- Rate
- Ratio
- Proportions

Key Words

- **Endemic:** Constant presence of disease in a particular geographical area
  - **Hyperendemic:** Disease affects high proportion of the population
  - **Mesoendemic:** Disease affects moderate proportion of population
  - **Hypoendemic:** Disease affects small proportion of population
  - **Haloendemic:** A disease is **holoendemic** when essentially every individual in a population is infected.
- **Epidemic:** Unusual occurrence of a disease. Excess of it's normally expected frequency of occurrence
- **Pandemic** (worldwide): Usually affecting large proportion of the population. It may involve several countries or continents.
- **Sporadic:** It means scattered about. Disease occurs in an irregular pattern in a community.
- **Exotic:** A disease is imported into a country. Unusual presence of a disease in a country.
- **Zoonosis:** A communicable disease transmitted from a vertebrate animals to man. E.g. Rabies, Bovine Tuberculosis, Plague.
  - **Anthropozoonoses:** Infection transmitted from vertebrate animals to men
  - **Zooanthroponoses:** Infection transmitted from men to vertebrate animal.
  - **Amphixenoses:** Infection transmitted in a mixed direction. i.e. man animal
- **Epizootic:** It is an outbreak (epidemic) of disease in an animal population
- **Enzootic:** It is an endemic occurring in animals
- **Epornithic:** Outbreak of disease in Bird population
- **Infection:** Entry and development (or multiplication) of an infectious agent in the body of man (animals).
- **Contamination:** Presence of an infectious agent on a body surface, clothes, etc.
- **Infestation:** Lodgment, development and reproduction of arthropods
- **Contagious disease:** Transmitted through contact
- **Host:** Person or animal that affords place to an infectious agent under normal condition.
  - **Obligate host:** All stages of development of organism occurs in same host
  - **Definitive host:** Maturation and sexual stage development of organism occurs in host
  - **Intermediate host:** Larva stage (or asexual state)

Scanned with CamScanner

- **Transport host:** Acts as carrier but no development of organism occurs in transport host.
- **Vector of infection:** An insect or any living carrier that transports an infectious agent is known as vector.

Figure 1 ■ Types of vector transmission

- **Reservoir:** Any person, animal, arthropod or plant in which an infectious agent normally lives and multiplies.
- **Virulence:** It is the degree of pathogenicity of a infectious agent. It is the proportion of clinical cases resulting in severe clinical manifestation.
- **Pathogenicity:** It is the ability to induce clinically apparent illness.
- **Incubation period:** time from exposure to development of disease or appearance of the first sign of symptom
- **Latent period:** The period between exposure and onset infectiousness.
- **Communicable period** (infectious period): Length of time a person can transmit a disease.
- **Incidence:** Number of new cases
- **Prevalence:** Number of new cases and old cases
- **Epidemic curve:** A histogram that shows the course of an epidemic by plotting the number of cases by time of onset.
- **Nosocomial infection** (Hospital acquired infection): Infection in patient which originates in a hospital setting.
- **Opportunistic infection:** Infection occurs due to defect in host defense.
- **Iatrogenic infection:** Physician induced infection due to diagnostic or therapeutic procedures.
- **Eradication:** Termination of infection from the route cause. E.g. Small pox
- **Elimination:** Refers to the reduction to zero new cases in defined geographical area.
- **Control:** the reduction of disease incidence, prevalence, morbidity, or mortality to a locally acceptable level.
- **Extinction: The specific infectious agent no longer exists in nature or laboratory.**

Mortality Rate and Ratios

Table 3

Mortality rate and ratios	Definition	Formula
Crude death rate	The number of death (from all causes) per 1000 estimated mid-year population in 1 year, in a given place.	$\frac{\text{Number of deaths}}{\text{Mild-year population}} \times 1000$
Case fatality ratio	It represents the killing power of a disease. It is simply the ratio of death to the cases. It is closely related to virulence.	$\frac{\text{Total number of deaths due to particular disease}}{\text{Total number of cases due to same disease}} \times 1000$
Proportional mortality rate	It is sometimes useful to know what proportion of total death is due to a particular disease or a cause.	$\frac{\text{Number of deaths from the specific disease in a year}}{\text{Total deaths from all cause}} \times 1000$
Under five proportionate mortality rate		$\frac{\text{Number of deaths under 5 years of age in the given year}}{\text{Total number of death during the same period}} \times 1000$
Proportional mortality rate for aged above 50 years		$\frac{\text{Number of deaths of person above 50 years}}{\text{Total deaths of all age group in that year}} \times 1000$
Survival rate	It is the proportion of survivors in a group (e.g. Patients) studied and followed over a period	$\frac{\text{Total no. of patients alive after a particular time period}}{\text{Total number of patients diagnosed or treated}} \times 1000$

Contd...

Scanned with CamScanner

Mortality rate and ratios	Definition	Formula
Maternal Mortality Rate (MMR)	It is the number of female deaths in a year per 100,000 live births due to birth or pregnancy-related complications	$\frac{\text{Number of maternal deaths}}{\text{Total number of live births during the same year}} \times 100{,}000$
Infant Mortality Rate (IMR)	Number of deaths per 1,000 live births of children under one year of age.	$\frac{\text{Deaths among children < 1 year}}{\text{Number of live births}} \times 1{,}000$

INCIDENCE AND PREVALENCE OF DISEASE

- **Incidence:** It is the number of new cases occurring in a defined population during a specified period of time.
  Incidence =

$$\frac{\text{Number of new cases of specific disease during a given period of time in the given year}}{\text{Population of risk during that period}} \times 1000$$

- **Prevalence:** It refers to all current cases (old and new) existing at a given point of time, or over a period of time in a given population. It is mainly of two types. They are point prevalence and period prevalence.
- **Point prevalence:** Number of all current cases (old and new) of a disease at one point of time, in relation to defined population.
  Point Prevalence =

$$\frac{\text{Number of all current cases (old and new) of a specified disease existing at a given point of time}}{\text{Estimated population at the same point of time}} \times 100$$

- **Period prevalence:** It measures the frequency of all cases (old and new) existing during a defined period of time expressed in relation to a defined population
  Period prevalence =

$$\frac{\text{Number of existing cases (old and new) of a specified disease during a given period of time}}{\text{Estimated mid interval population at risk}} \times 100$$

Figure 2 ■ Incidence and prevalence of disease

Relationship between Prevalence and Incidence

Prevalence depends upon two factors, **the incidence and duration of illness.** Given the assumption that the population is stable and incidence and duration of illness are unchanging, the relationship between incidence and prevalence can be expressed as:

P = I × D
P = Prevalence
I = Incidence
D = Duration of illness

EPIDEMIOLOGICAL METHOD

1. Observational studies	
• Descriptive study	
• Analytical studies	
• Ecological/correlational	With population as a unit of study
• Cross sectional/ prevalence	With individual as a unit of study
• Case control/case reference	With individual as a unit of study
• Cohort/follow-up	With individual as a unit of study
2. Experimental studies/interventional studies	
• Randomized controlled trials/clinical trial	With patients as a unit of study
• Field trials/community interventional studies	With healthy people as unit of study
• Community trials	With community as unit of study

Observational Studies

Descriptive Studies

These are usually the first phase of an investigation. These studies are concerned with observing the distribution of disease or health related characteristics in human populations and identifying the characteristic with which the disease in question seems to be associated.

Phases of Descriptive Study

1. Defining the population to be studied
2. Defining the disease under the study
3. Describing the disease by
   - Time
   - Place
   - Person
4. Measurement of disease
5. Comparing with known indices
6. Formulation of an **etiological** hypothesis

Analytical Studies

Analytical Epidemiology

This is the second most major type of epidemiological studies. In contrast to descriptive study that looks at entire population, in analytical studies the subject of interest is the individual within the population. The object is not to formulate but to test hypothesis.

Scanned with CamScanner

cause ← Effect

Case Control Study

These are often called as retrospective studies and are common approaches to test casual hypothesis. This method has three distinct features:

1. Both exposure and outcome have occurred before the start of the study
2. The study proceeds backward from effect to cause
3. It uses a control or comparison group to support or refute an inference.
4. It is also known **prevalence study.**

Cohort Study

cause → effect

It is another type of analytical study, usually undertaken to obtain additional evidences to support the existence of an association between suspected cause and disease. This study is known by other names also such as prospective study, longitudinal study, incidence study and forward looking study.

Distinguishing features of these methods:

- The cohorts are identified before the appearance of the disease under investigation.
- The study group so defined is observed over a period of time to determine the frequency of disease among them.
- The study proceeds from cause to effect.

Elements of Cohort Study

- Selection of study subjects
- Obtaining data on exposure
- Selection of comparison group
- Follow-up
- Analysis.

Experimental/Interventional Studies

Randomized Control Trial (RCT)

- It is really an epidemiological experiment
- To assess the new programs or new therapies
- RCT is not the method of evaluation.

Steps

- Drawing up a protocol
- Selecting references and experimental populations
- Randomization
- Manipulation or intervention
- Follow-up
- Assessment of outcome

Blinding

- **Single blind trial:** Researcher knows which subjects are receiving treatment or placebo whereas the subjects are not aware.
- **Double blind trial:** Neither the researcher nor the subjects know what the subjects are receiving (placebo or treatment)
- **Triple blind trial:** Neither the subject, nor the person administering treatment, nor the evaluator of outcome are aware which subjects are receiving treatment or placebo.

RELATIVE RISK (RISK RATIO)

It is the incidence of disease or death among exposed and non-exposed.

Relative risk =

$$\frac{\text{Incidence of disease among the exposed}}{\text{Incidence of death or disease among the non-exposed}}$$

Attributed Risk

It is the difference in the incidence rate of disease or death between an exposed group and non-exposed group.

Attributed risk =

$$\frac{\text{(Incidence of disease rate among the exposed—incidence of disease rate among the non-exposed)}}{\text{Incidence rate among the exposed}} \times 100$$

Epidemiological Triad

Figure 3 ■ Epidemiological triad

Scanned with CamScanner

Surveillance and Monitoring for Disease

- **Screening:** It is the search for unrecognized disease or defect by means of rapid application of test, examinations or other procedures in apparently healthy individuals.
- **Quarantine:** It is a strict isolation imposed to prevent the spread of disease. Isolation/restriction of a person or domestic animal exposed to communicable disease for a period of time not longer than usual incubation period of the disease.
- International Health Regulation (IHR) entered into force from 15th June 2007. It requires 176 member countries to report certain disease outbreaks and public health events to WHO.
- **Monitoring:** Performance and analysis of routine measurement to detect changes in the environment and health status of population e.g. monitoring of air pollution, ongoing measurement of performance of health service.
- **Surveillance:** To watch over with great attention. Continuous screening of the factors that determine the occurrence and distribution of diseases.

Types of Surveillance

- **Passive surveillance:** Regular reporting of disease data by all institutions that see patients and are part of reporting network is known as passive surveillance.
- **Active surveillance:** Systematic collection of data (agency initiated). e.g. field surveys.
- **Sentinel surveillance:** Reporting by specified units from defined area. A method of identifying missing cases.
- **Syndromic surveillance: Surveillance** using health-related data that precede diagnosis and signal a sufficient probability of a case or an outbreak to warrant further public health response.
- **Sensitivity:** The term sensitivity was introduced by **Yerushamly**. It is defined as the ability of a test to identify correctly all cases those who have the disease that is true positive. A 90% sensitivity means that 90% of the diseased people screened by this test will be identified as positive and 10% of patients who have the disease will be identified as negative.
- **Specificity:** It is the ability of a test to correctly identify those who do not have disease that is true negative. A 90% specificity means 90% of the non-diseased person will give true negative result. 10% of non-diseased people screened by this test will be wrongly classified as diseased when they are not actually negative.

ICE BERG PHENOMENON

- Disease in the community is compared with an Ice berg.
- **Floating tip:** Physician can see disease in the community (clinical cases).
- **Submerged portion:** Invisible (hidden part) cases of disease - latent, unapparent, presymptomatic, undiagnosed and carrier in the community.
- **Water line:** Between apparent and subclinical cases or unapparent disease (subclinical cases).

Scanned with CamScanner

IMMUNITY

- Immunity is the ability of an organism fight against a disease.

- **Active immunity:** It is the immunity which an individual develops as a result of an infection or by specific immunization and is usually associated with presence of antibodies or cells having a specific action on the micro-organism concerned with a particular infectious disease or its own toxin. It can be acquired in 3 ways:
  1. Following clinical infection for example, chicken pox, rubella and measles.
  2. Following subclinical or inapparent infection. e.g.: polio, diphtheria.
  3. Following immunization with an antigen which may be a killed vaccine or a live attenuated vaccine.

  Humoral immunity, cellular immunity and combination of above two also comes under active immunity.
  - **Humoral immunity:** It comes from B cell which proliferates and manufacture specific antibodies after antigen presentation by macrophages. The antibodies are located in the immunoglobulin fraction of serum and are of five main types, they are **IgG, IgM, IgA, IgD and IgE.**
  - **Cellular immunity:** Although antibodies are quiet effective in combating most infectious disease, humoral immunity does not cover all the situation that one find in infectious disease. Some pathogens such as ***M. leprae, M. tuberculosis*** and ***S. typhi*** escapes the bactericidal action of leukocyte. Here the activate T cell perform phagocytic action.
- **Passive immunity:** When antibodies produced in one body are transferred to another to induce protection against disease, it is known as passive immunity. Here the body does not produce its own antibodies but depends upon ready-made antibodies. Passive immunity can be induced:
  - By administration of an antibody containing preparation (immunoglobulin or antiserum).
  - By transfer of maternal antibodies across the placenta. Human milk also contains protective antibodies (IgA).
  - By transfer of lymphocytes to induce passive cellular immunity.
- **Herd immunity:** It is the level of resistance of a community or a group of people to a particular disease.

Immunizing Agents

These agents can be mainly classified as vaccines, immunoglobulin, and antisera.

Vaccines

It is an immune biological substance, designed to produce specific protection against a given disease. It stimulates the production of protective antibodies and other immune mechanisms.

- **Live vaccines**
  - These type of vaccines are prepared from live organisms. These organisms lost their capacity to produce a full blown disease but retain their immunogenicity.
  - Live vaccines should not be administered to an individual with immunodeficiency, immune suppression, malignancy or on therapy with corticosteroids, alkylating agents, antimetabolite or on radiation.
  - When two live vaccines need to be administered either administer them simultaneously at two different sites or maintain a gap of four weeks between the administrations of two vaccines.
  - Live vaccines will achieve its immunization with single dose, exception is polio vaccines which require three or more doses at spaced interval to produce effective immunity.
  - Live vaccines must be stored properly to maintain its potency.
- **Inactivated or killed vaccines**
  - Organisms killed by heat or chemicals when infected into the body stimulate immunity. They are usually safe but are less effective than live vaccines.
  - In most cases these kind of vaccines require a booster dose.
  - The duration of immunity following killed vaccines vary from months to many years.
  - The only absolute contraindication against killed vaccines are severe general or local reaction to the previous dose.
- **Toxoid**
  - Certain organisms produce exotoxins (diphtheria, tetanus). The toxins produced by these organisms are detoxified and used in the preparation of vaccines.
- **Cellular fractions**
  - In certain instances vaccines are prepared from extracted cellular fractions. For example, meningococcal, pneumococcal.
- **Combinations vaccines**
  - If more than one immunizing agent is included in a single vaccine they are called as combination vaccines. The aim of combination vaccine is to simplify administration, reduce cost and minimize the number of contact of patient with health system. For example, **DT, DPT, MMR. Pentavalent vaccine.**

Scanned with CamScanner

Immunoglobulin

The human immunoglobulin system composed of major five immunoglobulin, IgG, IgA, IgD, IgM, IgE.

- **IgG:** Major immunoglobulin in serum. It consists of 85% of total serum immunoglobulin. It is the only immunoglobulin which can cross the placenta.
- **IgM:** Accounts for 10% serum immunoglobulin. It represents the antibody that promptly formed with exposure to antigen. Its presence may be indicative of recent infection.
- **IgA:** About 15% of total serum immunoglobulin. It is found relatively in larger quantities in body secretions.

Table 4 Immunizing agents

Types of vaccines	Examples
Live attenuated (Mnemonic: MY ROME TRIP)	M — Mumps Y — Yellow fever R — Rubella O — Oral Polio; Oral Typhoid M — Measles E — Endemic Typhus T — TB Vaccine (BCG) ~~R — Rubella~~ I — Influenza P — Plague
Inactivated/killed vaccines	Typhoid Cholera Pertussis CS meningitis Plague Rabies Salk (polio vaccine) Influenza Hepatitis A Hepatitis B Japanese encephalitis
Toxoids	Diphtheria Tetanus
Immunoglobulin	
Human immunoglobulin	Hepatitis A Measles Rabies Tetanus Mumps Hepatitis B Varicella Diphtheria
Non-human	Diphtheria Tetanus Gas gangrene Botulism Rabies

Table 5 Comparison between live and killed vaccines

Characteristics	Killed vaccine	Live vaccine
Number of doses	Multiple	Single
Need for adjuvant	Yes	No
Duration of immunity	Shorter	Longer
Effectiveness of protection	Lower	Greater
Immunoglobulin produced	IgG	IgA and IgG
Mucosal immunity produced	Poor	Yes
Cell-mediated immunity produced	Poor	Yes
Residual virulent virus in vaccine	Possible	No
Reversion to virulence	No	Possible
Excretion of vaccine and transmission to non-immune contact	No	Possible
Interference by other virus in the host	No	Possible
Stability at room temperature	High	Low

Contd...

COLD CHAIN

- Cold chain is a system of storage and transport of vaccines at low temperature from the manufacturer to the actual vaccination site. The cold chain system is necessary because vaccine failure may occur due to failure of storage and transport under strict temperature controls.
- Vaccine stored in the freezer compartment are **polio and measles.**
- Vaccine which must be stored in the cold part and never allowed to freeze are **BCG, DPT, DT, TT, typhoid and diluents.**
- Vaccines must be protected from sunlight and prevented from contact with antiseptics.
- At health center most of the vaccine (except polio) can be stored up to 5 weeks, if refrigerator temperature is strictly kept between 4°C and 8°C.
- Storage of opened vial:
  With preservatives: up to **three hours**
  Without preservatives: up to **one hour**

The Cold Chain Equipment

- Walk in cold room
- Deep freezer
- Small deep freezer
- Cold boxes
- Vaccine carrier
- Day carrier
- Ice packs.

Ice-lined Refrigeration: (ILR)

- Important in the cold chain link
- Maintains temp between +2°C and +8°C
- Small size ILR in PHC level
- ILR is divided into two parts
  - **Upper part:** Storing for freeze sensitive vaccines. E.g. DPT, TT, hepB, IPV, Pentavalent
  - **Lower part:** OPV, BCG, measles, Ig

VVM

- Vaccine vital monitoring
  It is a label containing a heat-sensitive material to check the status of vaccines viability.

Scanned with CamScanner

How to read a VVM

✓	Inner square is lighter than outer circle. **If the expiry date has not been passed, USE the vaccine.**
✓	At a later time, inner square is lighter than outer circle, **If the expiry date has not been passed, use the vaccine.**
✗	**Discard point:** Inner square matches colour of outer circle. **Do not use the vaccine. Inform your supervisor.**
✗	**Beyond the discard point:** Inner square darker than outer circle. **Do not use the vaccine. Inform your supervisor.**

Vaccine Vial monitor

Stage 1 = Good: Utilize

Stage 2 = Good: Utilize

The central square is ligher than the surrounding circle

Stage 3 = bad: Don't Utilize

Stage 4 = bad: Don't Utilize

The central square is equal to, or darker than the surrounding circle

Vaccine Storage

Do's

- Keep the equipment in cold room away from direct sunlight and at least 10 cm away from wall.
- Keep the equipment through voltage stabilizer.
- Keep vaccines neatly with space between stacks for circulation of air.
- Keep the equipment locked and open only when it is necessary.
- Defrost periodically.
- Supervise the temperature record.
- If vaccines are in carton make holes on side of the carton for cold air circulations.

Don'ts

- Do not keep any other things other than vaccine in these boxes.
- Do not store any other drug.
- Do not keep drinking water or food in them.
- Do not keep more than 1 month requirements in PHC
- Do not keep expired date vaccines.

Classification of Adverse Events following Immunization

Table 6

Type of reaction	Explanation
Vaccine reaction	Event caused or precipitated by the vaccine when given correctly, caused by inherent properties of vaccine
Program error	Event caused by an error in the vaccine preparation, handling or administration
Coincidental	Events that happens after immunization but not caused by the vaccine-a chance of association
Injection reaction	Events from anxiety about or pain from the injection itself rather than the vaccine
Unknown	Events cause cannot be determined

Scanned with CamScanner

Common Minor Vaccine Reactions

Table 7

Vaccine	Possible minor reactions
BCG	Local reaction (pain, redness and swelling)
Cholera	Oral presentation-none
DTP	Local reaction (pain, redness and swelling), fever
Hepatitis A	Local reaction (pain, redness and swelling)
Hepatitis B	Local reaction (pain, redness and swelling), fever
Hib	Local reaction (pain, redness and swelling), fever
Japanese encephalitis	Local reactions, low grade fever, myalgia, GI upset
Measles/MMR	Local reaction (pain, redness and swelling), irritability, malaise and non-specific symptoms, fever
Pneumococcal	Local reaction (pain, redness and swelling)
OPV	None
IPV (poliomyelitis)	None
Rabies	Local or general reaction
Meningococcal disease	Mild local reaction
TT	Local reaction (pain, redness and swelling), malaise, non-specific symptoms
Tick borne encephalitis	Local reaction (pain, redness and swelling)
Yellow fever	Headache, influenza like symptoms, Local reaction (pain, redness and swelling)

Contd...

Rare Vaccine Reactions

Table 8

Vaccine	Reaction
BCG	Suppurative lymphadenitis, BCG osteitis, disseminated BCG infection
Hib	None
Hepatitis B	Anaphylaxis
Measles/MMR	Febrile seizure, thrombocytopenia, severe allergic reaction, encephalopathy
OPV	Vaccine associated poliomyelitis
TT	Brachial neuritis, anaphylaxis
DT	Same as that of TT
Pertussis/DPT	Inconsolable screaming, seizure, hypotonic or hypo responsive episode, anaphylaxis, encephalopathy

Contraindication to Vaccination

Table 9

Vaccine	Contraindication
All	An anaphylactic reaction following previous dose of vaccine is a true contraindication to further immunization with the antigen concerned
Live vaccines (MMR, BCG, yellow fever)	Pregnancy, total body radiation
Yellow fever	Egg allergy, immunodeficiency
BCG	Symptomatic HIV infection
Influenza, yellow fever	History of anaphylaxis reaction following egg allergy
Pertussis	Anaphylactic reaction to previous dose Evolving neurological disease

National Immunization Schedule (NIS)

- Under Universal Immunization Program (UIP), Government of India is providing vaccination to prevent seven vaccine preventable diseases, Diphtheria, Pertussis, Tetanus, Polio, Measles, Hepatitis B and Tuberculosis.

Table 10 National immunization schedule

Vaccine and its presentation	Protection	Route	Number of doses	Schedule
BCG (Bacillus Calmette Guerin) Lyophilized vaccine	Tuberculosis	Intradermal	1	• At birth (Up to 1 year if not given at birth)
OPV (Oral Polio Vaccine)-Liquid vaccine	Poliomyelitis	Oral	5	• At birth for institutional Deliveries • Primary three doses at 6, 10 & 14 week • One booster dose at 16–24 month of age.
Hepatitis B–Liquid Vaccine	Hepatitis	Intramuscular	4	• At birth (within 24 hours) for institutional deliveries • Primary 3 doses at 6, 10 and 14 weeks

Contd...

Scanned with CamScanner

Vaccine and its presentation	Protection	Route	Number of doses	Schedule
DPT (Diphtheria, Pertussis and Tetanus Toxoid)–Liquid vaccine	Diphtheria, Pertussis and Tetanus	Intramuscular	5	• 3 doses at 6, 10 and 14 weeks • 2 Booster dose at 16–24 month and 5–6 years of age
Measles - Lyophilized vaccine	Measles	Subcutaneous	2	• At 9–12 months of age • 16–24 months of age
TT (Tetanus Toxoid) – Liquid vaccine	Tetanus	Intramuscular	2 2	• 10 years and 16 years of age • For pregnant woman, 2 doses given (one dose if previously vaccinated within 3 years)
JE (Japanese Encephalitis) Vaccination (In selected high disease burden areas) Lyophilized vaccine.	Japanese encephalitis (Brain fever)	Subcutaneous	2	• At 9–12 months of age • At 16–24 months of age
Hib (given as pentavalent containing Hib+DPT+Hep B) in 8 stages Liquid vaccine	Hib Pneumonia Hib Meningitis	Intramuscular	3	• 6, 10 and 14 weeks of age

Source: National Health Portal of India

In addition,

- JE vaccination is provided in 113 districts and additional 62 new JE endemic districts have been identified
- JE second dose has been introduced under UIP in these endemic districts from April, 2013.
- Pentavalent vaccine introduced in 8 states, i.e. Tamil Nadu, Kerala, Haryana, Jammu & Kashmir, Gujarat, Karnataka, Goa and Puducherry.

Note

A Detailed National Immunization Schedule with Dose, Diluents, Routes and sites is given in Appendices (Page no. ~~A-68~~) A-72

Key Points

- Inactivated polio vaccine is known as **SALK**
- Oral polio vaccine is known as **SABIN**
- **Hepatitis B** virus was discovered by **Blumberg**
- **Hepatitis C** virus was identified in the year of **1989**
- **First major epidemic** because of **hepatitis E** was reported in **New Delhi in winter 1995–1996.**
- A vast international campaign was held by WHO between **1967** and **1979** led to eradication of smallpox.
- On **5 July 1975** India was proclaimed to be no longer a smallpox endemic country.

COMMUNICABLE DISEASES

Table 11 Communicable disease – a summary

Disease	Causative agent	Incubation period	Mode of transmission	Sign and symptoms	Complications
Smallpox	Variola virus		Respiratory	Fever, typical rash occur in centrifugal distribution	
Chickenpox	Varicella-zoster	14–16 days	Person to person by droplet	Vesicular rashes; Pleomorphism is a characteristic feature of the rash in chickenpox fever, malaise	**Reye's syndrome:** occurs during recovery from viral disease. Disseminated Intravascular Coagulation (DIC) may occur

Contd...

Scanned with CamScanner

Disease	Causative agent	Incubation period	Mode of transmission	Sign and symptoms	Complications
Measles (Rubeola)	Myxoviruses	10–14 days	Droplet	Fever, coryza, nasal discharge, cough, redness of eyes, lacrimation, vomiting, diarrhea, **koplik's spot**, maculopapular rashes begins behind the ear and spread rapidly in few hours over face and neck and extend down to the body taking 2–3 days to progress to the lower extremities.	Otitis media Conjunctivitis Pneumonia
Rubella (germen measles)	RNA virus of toga virus family.	2–3 weeks Average 18 days	Droplet	Coryza, sore throat, low grade fever, lymphadenopathy, rash	Arthralgia Thrombocytopenic purpura
Mumps	Genus rubulavirus of the family paramyxoviridae	2–3 weeks usually 18 days	Droplet	Pain and swelling in either or both parotid gland but may also involve sublingual and submandibular glands, ear ache, pain and stiffness on opening the mouth	Orchitis Ovaritis and oophoritis Pancreatitis (children)
Influenza	Type A, Type B, Type C viruses in the orthomyxoviridae family	18–72 hours	Droplet	Inflammation and necrosis of superficial epithelium of respiratory tract, fever, chills, aches, pain, cough, generalized weakness	Reye's syndrome Pneumonia Acute sinusitis and bronchitis
Diphtheria	Corynebacterium diphtheria	2–6 days	Droplet infection	Sore throat, difficulty swallowing, low grade fever, throat may show mild erythema, localized exudate, pseudo membrane, difficulty with vision, speech and swallowing, toxins produced by the bacteria may cause nerve damage resulting in often paralysis of soft palate, eye muscles and extremities	Neurological problems (encephalopathy, convulsions), infantile spasms
Pertussis (whooping cough)	*B. pertussis*	7–14 days	Droplet and direct contact	Lacrimation, sneezing, coryza, anorexia, malaise, hacking night cough, deep high pitched inspiration (whoop), vomiting, cyanosis, apnea, hemorrhage, epistaxis, hemoptysis, cerebral hemorrhage, convulsions, coma.	Bronchitis (common), Bronchiectasis, epistaxis and hemoptysis, Subconjunctival hemorrhage
Meningococcal meningitis	*N. meningitidis*	3–4 days	Droplet	Headache, vomiting, stiff neck, photophobia, various neurological sign	Total hearing loss, Balance and coordination problems, Septicemia, Arthritis
Severe acute respiratory syndrome (SARS)	New strain of coronavirus	2–7 days	Close contact with the patients infected material	Fever, malaise, chills, headache, myalgia, dizziness, cough, sore throat, running nose.	Pulmonary decompensation, ARDS

Contd...

Scanned with CamScanner

Disease	Causative agent	Incubation period	Mode of transmission	Sign and symptoms	Complications
Tuberculosis	*M. tuberculosis*	3–6 weeks	Droplet infection	Persistent Cough of about 3–4 weeks duration, weight loss, fever, hemoptysis	Spinal pain, Cardiac temponade, Hemoptysis, Lung abscess
Poliomyelitis	Polio virus	7–14 days	Primary mode: Fecal-oral route. Less commonly through droplet	Fever, malaise, anorexia, nausea, vomiting, signs of meningeal irritation, child finds difficulty in sitting, descending paralysis, muscle strength vary in different muscle, cranial nerve involvement is present in bulbar and bulbospinal forms of paralytic poliomyelitis	Pneumonia, Edema, mycocarditis, corpulmonale, soft tissue and bone deformities
Hepatitis A (formerly known as infectious hepatitis, epidemic jaundice)	Hepatitis A virus	10–50 days	Feco-oral route	Nonspecific symptoms such as nausea, vomiting, anorexia, mild fever, jaundice, generalized weakness, aches and pain	Hepatic encephalopathy, Cirrhosis, Liver failure, Fulminant Hepatic failure
Hepatitis B (serum hepatitis B)	Hepatitis B virus	50–180 days	Parenteral route Perinatal transmission Sexual transmission	Jaundice, flu-like sign and symptoms, chronic hepatitis and can lead to complications like, liver cancer, cirrhosis, etc.	
Hepatitis C	Hepatitis C virus	6–7 weeks	Parenteral transmission	Chronic hepatitis, liver cirrhosis, liver cancer	
Hepatitis E (enterically transmitted hepatitis non A non B	Hepatitis E virus	2–9 weeks	Water borne disease (feco-oral route)	Initial phase of mild fever, anorexia, nausea and vomiting, abdominal pain, itching without skin lesions, skin rash, or joint pain Juandice. Hepatomegaly	
Hepatitis D	Hepatitis D virus	2–12 weeks	Parenteral route	Mild-to-severe or even **fulminant hepatitis**	
Hepatitis G	Hepatitis G virus				
Diarrhea	Virus and bacteria		Fecal oral route	Passage of watery stools leading to dehydration which shows signs of sunken eyes, skin pinch goes back slowly, etc.	Acidosis
Cholera	*V. cholera*	Hours to 5 days	Fecally contaminated water, contaminated food and drinks Direct contact	Profuse painless watery diarrhea, vomiting, rice water stool leading to dehydration symptoms presenting as sunken eyes, hollow cheeks, scaphoid abdomen, sub-normal temperature, **washerman's hand and feet**, absent pulse, unrecordable BP, loss of skin elasticity	Severe dehydration, Shock, Renal failure
Typhoid fever (enteric fever)	*S. typhi*	10–14 days	Fecal-oral route or urine-oral route	Malaise, headache, sore throat, cough, abdominal pain, constipation, constipation is present either in the early stage or pea soup diarrhea, fever, abdominal distention, rose spot rashes	Intestinal hemorrhage, Intestinal perforation, Shock

Scanned with CamScanner

NIPAH VIRUS INFECTION

- Nipah virus (NiV) infection is an emerging zoonotic disease which was first recognized in a large outbreak in Malaysia and Singapore from September 1998 to May 1999.
- In India, three outbreaks in humans were reported from Siliguri (2001), Nadia (2007) in West Bengal and Kozhikode (2018) in Kerala.
- Fruit bats of *Pteropus* genus are the natural reservoir of Nipah Virus (paramyxovirus)
- Transmission to humans occurs after direct contact with infected bats, pigs or from human being.
- Incubation period: 4–21 days

Clinical Features

- Moderate to high grade fever, headache, vomiting, cough, breathlessness, change in sensorium, seizures, myalgia, fatigue
- Treatment is limited to supportive care.

GASTROINTESTINAL DISORDERS

Acute Diarrheal Disease

Diarrhea: Passage of watery stools more than 3 times a day. However recent changes indicated that it is the consistency of the stool which is more important than the number of stool per day.

Table 12 Organisms causing diarrhea

Viruses	• Rotaviruses (Most common cause of diarrhea in infants and children) • Astroviruses • Adenoviruses • Calciviruses • Coronaviruses • Norwalk group viruses • Enteroviruses
Bacteria	*Campylobacter jejuni* *E. coli* *Shigella* *Salmonella* *V. cholera* *V. parahaemolyticus* *Bacillus cereus*
Others	*E. histolytica* *Giardia intestinalis* *Trichuriasis* *Cryptosporidium* Spp Intestinal worms

Composition of Reduced Osmolarity ORS

Table 13

Reduced osmolarity ORS	g/L
Sodium chloride	2.6
Glucose anhydrous	13.5
Potassium chloride	1.5
Trisodium citrate, dihydrate	2.9
Total weight	**20.5**

Reduced osmolarity ORS	Mol/L
Sodium	75
Potassium	20
Chloride	65
Glucose anhydrase	75
Citrate	10
Total osmolarity	**245**

Advantages of Reduced Osmolarity ORS

Reduced osmolarity ORS is more stable and results in less stool output, probably because of direct effect of **trisodium citrate** in increasing the water and salt absorption in intestine.

When zinc is supplied during an acute episode of diarrhea, it reduces episodes, duration and severity.

FOOD POISONING

Food poisoning is the ingestion of food or drinks contaminated either with living bacteria or their toxins or inorganic chemical substance derived from plants and animals.

Types of Food Poisoning

Bacterial and nonbacterial

- **Bacterial:** Caused by ingestion of food contaminated with living bacteria or their toxins.
- **Non-bacterial:** Caused by chemicals such as arsenic, certain plant and sea food.

Bacterial Food Poisoning

Table 14 Summary of bacterial food poisoning

Agent	Source	Incubation period	Mechanism of food poisoning	Signs and symptoms
Salmonella typhimurium *S. choleraesuis* *S. enteritidis*	Primarily disease of animal and men gets infection from farm animal and poultry	12–24 hours	The organism after ingestion multiply and gives rise to acute enteritis and colitis	Fever, chills, vomiting, nausea, profuse watery diarrhea

Contd...

Scanned with CamScanner

Agent	Source	Incubation period	Mechanism of food poisoning	Signs and symptoms
Staphylococcal food poisoning	*S. aureus* are ubiquitous in nature and found on the skin and in the throat and nose of men and animals. Cows suffering from mastitis have been reasonable for the outbreak of disease	1–6 hours	Food poisoning occurs from the cooking of food on which bacteria have grown. Since the toxin is heat resistant it can remain in the food after organism have died. The toxin act directly on the CNS and intestine	Vomiting, abdominal cramps, diarrhea, blood and mucus may appear in severe cases It rarely causes fever
Botulism *Clostridium botulinum*	The organism widely distributed in soil and dust and intestinal tract of animal and enter in food as spores	12–36 hours	The toxin is prepared in food under suitable anaerobic conditions. Toxin act on the parasympathetic nervous system Antidote for botulism poisoning is Guanidine hydrochloride	Dysphagia, diplopia, ptosis, dysarthria, blurring of vision, muscle weakness, quadriplegia
Cl. Perfringens (Welchii)	It has been found in the faces of animals, soil, water and air, majority of the outbreaks occurred because of the ingestion of meat, meat dishes and poultry. The usual story is that food has been prepared 24 hours or more before consumption	6–24 hours	The spores are able to survive cooking, if the cooked meat and poultry are not cooled enough they will germinate and produce toxins as alpha toxins and theta toxins	Diarrhea, abdominal cramps, little or no fever, nausea vomiting are rare
Cereus food poisoning *Bacillus cereus*	It is ubiquitous in soil and in raw dried and processed foods. The spores can survive cooking and germinate and multiply when the food is held at favorable temperature	Emetic form 1–6 hours Diarrheal form 12–24 hours	Two forms of disease are there one is emetic form and other is diarrheal form	**Emetic form:** Upper GI sign and symptoms **Diarrheal form:** Diarrhea, abdominal pain, nausea with little or no vomiting, no fever

PARASITIC INFECTIONS

Amebiasis

- It is cause by the **protozoan parasite** ***Entamoeba histolytica.***
- Man is the only reservoir of infection.
- Period of communicability is as long as the cysts are excreted.
- Amebiasis is closely related to poor sanitation and socio economic status.
- Mode of transmission are fecal oral route, sexual transmission (oral-rectal contact) and vectors (such as flies, cockroaches and rodents are capable of carrying cyst and contaminating food and drink).
- Prevention measures are proper sanitation, water supply, food hygiene and health education.

Ascariasis

- It is an infection of the intestinal tract of adult caused by *Ascaris lumbricoides.*
- Mode of transmission is fecal-oral route.
- Preventive measure is proper sanitary, disposal of human excreta.

Hookworm (Infective Larvae)

- This can be defined as any infection caused by ***Ancylostoma duodenale*** **and** ***Necator americanus.*** Worms are mainly attached to the jejunum of intestine.
- Hook worm enter the body usually by penetrating the skin of feet.
- Mainly recommended antithelminthic agents for hook worm infestation are Albendazole, Mebendazole, Levimisole and Pyrantel.
- **Preventing measure:** To avoid walking bare foot.

Dracunculiasis

- It is also known as **guinea worm** disease.
- It is a vector borne parasitic disease mainly of subcutaneous tissue (usually leg and foot).
- Once the agent enter in the body, the gravid female makes its own way down to the infected person's lower limb and cause subsequent blister formation.
- Once this blister comes in contact with water it breaks and release up to 1 million parasites. These parasites are ingested by Cyclops. When person drink this contaminated water with cyclops, it can lead to the development of the disease, i.e. Cyclops dies in the stomach due to acid reaction and parasites are released into the gut.
- Mode of transmission is water, the person who drinks the contaminated water will develop the disease.

Target High - Fifth Premium Edition

ARTHROPOD-BORNE INFECTIONS

Table 15 Diseases caused by arthropods

Arthropod	Disease transmitted
Mosquito	Malaria, filaria, viral encephalitis, dengue fever, West Nile, viral hemorrhagic fever (yellow fever, dengue)
Housefly	Typhoid and paratyphoid fever, diarrhea, dysentery, cholera, gastroenteritis, amebiasis, helminthic infestation, polio, conjunctivitis, trachoma, anthrax, yaw
Sandfly	Kala-azar, oriental sore, sandfly fever, oraya fever
Tsetse fly	Sleeping sickness
Louse	Epidemic typhus, relapsing fever, trench fever, pediculosis
Rat flea	Bubonic plague, endemic typhus, chiggerosis, *Hymenolepis diminuta*
Blackfly	Onchocerciasis
Reduviid bug	Chagas disease
Hard tick	Tick typhus, viral encephalitis, viral fever, viral hemorrhagic fever (kyasanur forest disease) tularemia, tick paralysis, human babesiosis
Soft tick	Q fever, relapsing fever
Trombiculid mite	Scrub typhus, rickettsial-pox
Itch mite	Scabies
Cyclops	Guinea worm disease, fish tapeworm
Cockroaches	Enteric pathogen

Dengue

The Dengue Syndrome

- **Classical dengue** or break bone fever is an acute viral infection caused by four serotypes (1, 2, 3 and 4) of dengue viruses.
- Mode of transmission is via ***Aedes aegypti mosquito.***
- Reservoir of infection is both men and mosquito and transmission cycle is man-mosquito-man.
- The signs and symptoms are chills with high fever, intense headache, muscle and joint pain, retro-orbital pain, photophobia, extreme weakness, anorexia, constipation, altered taste sensation, abdominal tenderness, dragging pain in inguinal region, sore throat.

Dengue Hemorrhagic Fever (DHF)

This is a severe form of disease in which **person is affected with more than one type of dengue viruses.**

- It is also transmitted by ***Aedes aegypti.***
- **Sign and symptoms** are mainly high grade fever, facial flushing, headache, anorexia, vomiting, epigastric discomfort, tenderness in the right costal margin, generalized abdominal pain are common.

  Leucopenia: WBC ≤ 5000 cells/mm³

  Thrombocytopenia: Platelet count < 150000 cells/mm³
- The major pathological changes occur during DHF is plasma leakage and abnormal hemostasis manifested by raising hematocrit value and moderate to marked thrombocytopenia.

Clinical Criteria for Diagnosing DHF

- **Fever:** Acute, high, continuous lasting for 2–7 days.
- **Hemorrhagic manifestations:** Positive tourniquet test (more than 20 petachiae per 2.5 cm), petachiae, purpura, ecchymosis, epistaxis, gum bleeding, hematemesis, melena.
- **Enlargement of liver.**

Laboratory Findings

- Thrombocytopenia
- Hemoconcentration.

Dengue Shock Syndrome (DSS)

All the above clinical criteria and manifestation of shock such as rapid weak pulse, hypotension, presence of cold clammy skin and restlessness.

Treatment

Management is symptomatic and supportive. Bed rest, antipyretics, fluid and electrolyte maintenance are advised. Fluid replacement should be based on vitals monitoring and hematocrit values. Plasma transfusion is indicated.

Malaria

- Malaria is a protozoan infection caused by an organism known as ***Plasmodium.***
- The vector of this condition is **female mosquito Anopheles.**
- Three distinct stages of infection are present in this case, they are **cold stage, hot stage** and **sweating stage.**
- **Agent:** *Plasmodium vivax, Plasmodium falciparum, Plasmodium malariae* and *Plasmodium ovale.*
- Malarial parasite undergoes two distinct stages of development, they are asexual cycle (human being) and sexual cycle (mosquito). Man is the intermediate host and mosquito is the definitive host.
- **Asexual life cycle (schizogony) in human being** has got phases, they are hepatic phase, erythrocyte phase and gametogany.
- Sexual life cycle is also known as **sporogony.**
- Newborn infant has high resistance to *P. falciparum* infection because of the high concentration of fetal hemoglobin.
- Individual with sickle cell trait has milder form of disease as compared to a person with normal hemoglobin.
- **Modes of transmission** are vector borne (transmitted by female anopheles mosquito), direct transmission (hypodermic intramuscular and intravenous injection of blood or plasma) and congenital malaria (newborn affected with malaria but it is very rare).
- **Incubation period** vary from species to species, *P. falciparum* [12 (9–14) days], *P. vivax* [14 (8–17) days], quartan malaria [28 (18–40) days] and for *P. ovale* [17 (16-18) days].
- **Cold stage (1/4 to 1 hour) sign and symptoms:** Headache, nausea, chilly sensation, vomiting, skin feels cold in the early part of disease. In hot stage (2–6 hour) patient feels burning hot spot, skin is dry to touch, headache, nausea, pulse and respiration become rapid. In **sweating stage (2–4 hour)** fever comes down, profuse sweating, skin is cool and moist, patient feel relieved and often falls asleep.
- **Complication associated with *P. falciparum* infection** are cerebral malaria, acute renal failure, liver damage, GI symptoms, dehydration, collapse, anemia, blackwater fever, etc.

Scanned with CamScanner

- **Complications associated with *P. vivax, P. ovale, P. malariae*** are anemia, splenomegaly, enlargement of liver, herpes, renal complication etc.
- **Diagnosis** is based on blood film examination. **Thick and thin film.** Thick film is more reliable in searching for parasite, while thin film is more valuable in identifying the species.
- All fever cases should be investigated for malaria either by microscopy or by rapid diagnostic kit (**RDK**)
- First line **treatment** for malaria is choloroquine. In choloroquine resistant *P. falciparum* cases first lien of treatment is **Artesunate combination therapy consisting of artesunate + sulphadoxine/ sulphalene + pyrimethamine.** In case of resistant to all these drugs and to treat severe complicated cases **quinine** is the drug of choice.
- Chloroquine has fewer side effects such as nausea, vomiting, blurring of vision and headache. Person who all are exposed to large cumulative dose have been reported with retinal damage.
- Chloroquine should not be given empty stomach.

API → Annual parasite index

$$\text{API} = \frac{\text{Conformed cases during one year}}{\text{Population under surveillance}} \times 1000$$

Note

API ≥ per 1000 population per year have been classified as high risk areas in India, and eligible for vector control

Lymphatic Filariasis

- It means **infection caused by three nematodes namely W. bancrofti, B. malayi and B. timori.** All three infections are transmitted to man by the bite of infective mosquitoes.
- Microfilariae deposited near the site of puncture and they finally reach the lymphatic system.
- The objective of any lymphatic filariasis disability prevention program should be increased to access is hydrocelectomy.
- **Diethylcarbamazine** (DEC) is safe and effective and is the most widely accepted treatment of choice especially for Bancroftian filariasis.

Yellow Fever

- It is **caused** by an agent known as **Flavivirus fibricus** formerly classified as **group B arbovirus.**
- In forest region monkeys and forest mosquito act as reservoir of infection. In urban region the reservoir of infection is man and *Aedes aegypti* mosquitoes.
- Control of yellow fever in jungle region is not possible, virus maintain itself in the animal kingdom.
- Yellow fever in urban region can be controlled through rapid immunization of population at risk as well as vector control.

ZOONOSES

Rabies

- It is also known as **hydrophobia** affecting CNS and caused by **Lyssavirus type 1.**
- It is transmitted to man by bite or lick of animals.
- **Classical hydrophobia** is clinically characterized by long and variable incubation period, a short period of illness and encephalitis resulting in death of the person.
- All **warm** blooded animals including man are susceptible for disease.
- **Mode of transmission** are animal bite, licks, aerosols and person to person contact.
- Usual **incubation period** is 3–8 weeks following exposure.
- Rabies virus replicate at the site of introduction, connective tissue or muscles and enter the peripheral nerves and ascends towards CNS. Invasion of salivary gland is crucial for disease transmission of virus to another person.
- **Sign and symptoms** include headache, malaise, sore throat, slight fever, patient is intolerant to noise, bright light or a cold drought of air, aerophobia, spasm of pharyngeal and neck muscles, dilatation of pupil, increased perspiration, salivation, lacrimation, swallowing liquid become unsuccessful.

Currently we are using three type of vaccines and these are:

- **Nervous tissue vaccine:** It is developed from fixed virus grown in the brain of adult sheep or other animals.
- **Duck embryo vaccine:** Attempt is made to develop this vaccine in order to eliminate the neuroparalytic factors contained in the brain tissue vaccine.
- **Cell culture vaccine:** These are more potent and much safer than conventional brain tissue vaccine. Further immunization requires injection of smaller volume with relatively few side effects. These are of two type they are **human diploid cell vaccine** and second **generation tissue culture vaccine.**

Intramuscular Rabies Vaccine Schedule Recommended by WHO

The vaccine schedule recommended consists of 6 doses 1 ml each on day 0, 3, 7, 14 and 28. Booster dose is recommended on day 90. Injections are given intramuscularly on deltoid region not to be given in buttocks.

Reduced Multisite Intramuscular Regimen (2-1-1)

In this schedule first dose is given on right arm and left arm on day followed by one dose in the deltoid region via I/M route on day 7 and day 21.

Intradermal schedule: Two intradermal regimen are there, they are 2 site intradermal regimen and 8 site intradermal regimen.

2 Site Intradermal Regimen

This regimen endorsed by WHO expert committee on rabies. It consists of one dose (0.1 mL or 0.2 mL) of vaccine given at each of two sites on day 0, 3, 7 and one site on day 28 and 90.

8 Site Intradermal Method

After reconstitution of vaccine 0.1 mL of reconstituted vaccine is given at each of 8 site using content of whole vial. Inject intradermally over deltoid, lateral thigh, suprascapular region and lower quadrant of abdomen. On day 7, 0.1 mL of vaccine is given at each of the 4 site over deltoid and thighs. On day 28 and 90, 0.1 mL of vaccine is given at one site over deltoid.

Adverse effect of vaccination are local redness, pain, headache and fever.

Scanned with CamScanner

Brucellosis

- It is also known as **undulant fever.** It is occasionally transmitted to man by direct or indirect contact with infected animals.
- **Condition** is characterized by profuse sweating, arthritis and enlarged spleen.
- Causative organism is *B. meltensis, B. abortus, B. suis* and *B. canis.*
- **Main reservoir** of human infection are cattle, sheep, goats, swine, buffalo, horse and dogs.
- **Mode of transmission** are direct contact, food borne infection, air borne infection.
- **Incubation period** vary from 1–3 weeks.
- **Clinical manifestation** includes swinging pyrexia, sweating, arthralgia, lower back pain, headache, insomnia, splenomegaly, hepatomegaly, and leukopenia.

Leptospirosis

- It is considered as the most wide spread disease transmitted from animal to man.
- **Causative agent** is leptospira, it is excreted from the urine of infected animal for a long period of time.
- The organism is visible by dark field illumination and silver staining.
- Mode of transmission are direct contact, indirect contact and droplet infection.
- Diagnosis made by isolating the organism from blood and urine of infected person.
- Agglutination, indirect hemagglutination, Immunofluorescent antibody and ELISA **tests** are also available.
- Penicillin is the **drug of choice.**

LEPROSY (HANSEN'S DISEASE)

- Chronic infective disease caused by organism called as ***M. leprae.*** It affect mainly the **peripheral nerves** and also affect the skin, muscles, bones, testis and internal organ.
- **Two polar forms** of disease are lepromatous leprosy and tuberculoid leprosy.
- **Lazarine Leprosy:** Seen in association with **HIV**
- **Clinical characteristics** are hypopigmented patches, partial or total loss of cutaneous sensation, presence of thickened nerves, presence of acid fast bacilli in the skin and nasal smears.
- The **signs** of advance disease include presence of nodules or lumps especially in the skin of face and ears; plantar ulcers, loss of fingers and toes, nasal depression, foot drop, claw toe and other deformities.
- **Agent:** *M. leprae*, an acid fast bacilli and occur in human host both intracellularly and extracellularly.
- **Sources of infection:** Man and wild animals.
- **Portal of exit:** Nose is the major portal of exit. Millions of *M. leprae* leased when patient sneeze or blow the nose.
- **Mode of transmission:** Droplet infection; contact transmission; other routes (transmitted by insect vector or by tattooing needles).
- **Incubation period:** 3–5 years or more for lepromatous cases.
- **Diagnosis:** Clinical examination (presence of hypopigmented patch with partial or total loss of sensation) bacteriological examination (skin smear, nasal smear or blow, nasal scraping).
- **Lepromin test**
  - 0.1 ml of lepromin into the inner aspect of the forearm
  - Read reaction at 48 hours and 21 days interval. **Early Fernandez reaction** (leprosy) or **late Mitsuda reaction** (in tuberculoid form of leprosy) occurs in positive cases.

- **Treatment** is multidrug therapy. Till recently chemotherapy for leprosy has relied on **dapsone.**
- At present only small number of **drugs** are available and are Rifampicin, Dapsone, Clofazimine, Ethionamide and Prothionamide, quinolones, minocycline, clarithromycin.

TETANUS

- **Causative agent:** *Clostridium tetani*, gram positive aerobic, spore bearing organism.
- The spores are terminal and give organism a drum stick appearance.
- **Reservoir** of organism is soil and dust.
- **Incubation period** is 6–10 days.
- Tetanus bacilli produce exotoxin with astounding lethal capacity, it affect motor end plate of skeletal system, spinal cord, brain and sympathetic system.
- Infection is acquired by contamination of wound by spores.
- **Types of tetanus**
  - **Traumatic:** Major cause of tetanus.
  - **Puerperal:** Tetanus following abortion more frequently than normal labor.
  - **Otogenic:** It is a rare portal of entry, introduction of foreign material such as pencils, matches and beads may introduce infection.
  - **Idiopathic:** There is no definite history of any injury.
  - **Tetanus neonatorum:** The common route of infection is umbilical stem after birth. First symptom being seen by 7th day of life. Clean delivery and cord care will help to reduce the incidence of tetanus neonatorum in newborn baby.
  - **Prevention:** Active immunization with tetanus toxoid.

SEXUALLY TRANSMITTED DISEASES (STDs)

Table 16 Common sexually transmitted diseases and their pathogens

Pathogen	Disease or syndrome
Neisseria gonorrhoeae	Gonorrhoea, urethritis, cervicitis, epididymitis, salpingitis, PID, neonatal conjunctivitis
Treponema pallidum	Syphilis
Haemophilus ducreyi	Chancroid
Chlamydia trachomatis	LGV, urethritis, cervicitis, proctitis, epididymitis, infant pneumonia, Reiter's syndrome, PID, neonatal conjunctivitis
Calymmatobacterium granulomatis	Donovanosis
Herpes simplex virus	Genital herpes
Hepatitis B virus	Acute and chronic hepatitis
Human papilloma virus	Genital and anal warts
HIV	AIDS
Molluscum contagiosum	Genital *Molluscum contagiosum*
Candida albicans	Vaginitis
Trichomonas vaginalis	Vaginitis

Scanned with CamScanner

NONCOMMUNICABLE DISEASE

Table 17 Few noncommunicable diseases

Disease	Risk factors
Coronary heart disease	**Non-modifiable:** Age, sex, family history, genetic factors, **Modifiable:** Cigarette smoking, high BP, elevated serum cholesterol level, diabetes, obesity, sedentary lifestyle, stress
Hypertension	**Non-modifiable:** Sex, genetic factors, ethnicity **Modifiable:** Obesity, high salt intake, increased amount of saturated fat, decreased dietary fiber intake, high alcohol intake, sedentary life style
Stroke	Hypertension, cardiac abnormality, diabetes, elevated blood lipid, glucose intolerance, obesity, smoking

Rheumatic Heart Disease

- **Rheumatic fever:** It is a febrile disease affecting the connective tissue particularly in heart and joints initiated by the infection caused by group A beta hemolytic streptococci.
- **Agent:** Group A streptococci.

Clinical Manifestation

- **Major manifestations:** Carditis, polyarthritis, chorea, erythema marginatum, subcutaneous nodule.
- **Minor manifestations:** Fever, arthralgia, increased ESR and leukocyte count.
- **Lab studies:** Rising antistreptolysin O, streptococcal antibody, positive throat culture, recent scarlet fever.
- **ECG changes:** Prolonged PR interval.
- **Treatment:** Antibiotic management with penicillin group of drugs. If patient is having allergy to penicillin then erythromycin is the drug of choice.

Cancer

- Cancer can be defined as uncontrolled growth of cells with the ability to invade adjacent tissues and even organ.
- Cancer is the **second leading cause of death globally**; nearly 1 in 6 deaths is due to cancer
- **Causes of cancer**
  - **Environmental factors:** Tobacco, alcohol, dietary factors, occupational exposure, viruses, parasites (schistomiasis), custom habit and life style, others (sunlight, radiation, air and water pollution, medications)
  - **Genetic factors**
- **Treatment:** It is multi-modality approach, including radiation therapy, chemotherapy, surgical removal, etc.
- Freedom from cancer pain is now considered as a right of cancer patient.

Table 18 Cancer statistics in India/World

Gender	Category	India	World
Both sexes (overall)	Most common cancer	Breast	Lung
	Second most common cancer	Cervix	Breast
	Most common cancer deaths	Breast	Lung
Men	Most common cancer	Lip/ Oral Cavity	Lung
	Second most common cancer	Lung	Prostate
	Most common cancer deaths	Lung	Lung
Women	Most common cancer	Breast	Breast
	Second most common cancer	Cervix/ Uterus	Colorectum
	Most common cancer deaths	Breast	Breast

Diabetes Mellitus

It is a heterogeneous group of disease characterized by hyperglycemia. The characteristic signs include 3Ps i.e. Polyuria, Polydipsia and Polyphagia.

WHO Classification of Diabetes Mellitus

Diabetes mellitus (DM)

- Insulin dependent DM (IDDM)
- Non-insulin dependent DM (NIDDM)
- Malnutrition related DM (MRDM)
- Gestational DM (GDM)
- Other type (secondary to pancreatic, hormonal drug-induced, genetic and other abnormalities)
- Impaired glucose tolerance (IGT)

Table 19 Differences between Type I and Type II DM

Characteristics	Type 1 (IDDM)	Type 2 (NIDDM)
Age	<20 years	>45 years
Onset	Abrupt	Gradual
Sex	Male > female	Female > male
Family history	Sometimes	Frequently
Leukocyte antigen	Present	Not present
Presenting sign and symptoms	3P's (Polyuria, Polydipsia, Polyphagia)	Related to long-term complication
Weight	Underweight	Overweight
Serum insulin	Low to absent	High or low
Islet cell antibody	80–85%	<5%
Insulin need	Always	Sometimes
Oral hypoglycemic agent	Ineffective	Effective
Diet	Ineffective	Effective
Ketoacidosis	Common	Infrequent
Micro vascular complications	Rare at diagnosis	Present at the time of diagnosis

Scanned with CamScanner

Urine Test for Diabetes Mellitus in Community

Benedict's Test

- Benedict's test is used to test for presence of glucose in Urine sample.
- Components of Benedict's solution: Anhydrous Sodium Carbonate, Sodium citrate, and Copper sulfate pentahydrate. The solution is blue in color.
- Reaction:
- Procedure: 1 ml (8 drops) of urine sample is mixed with 5 ml of Benedict's solution in a test tube. The mixed solution is heated for 3 to 5 mins. Observe the color change in the solution of test tubes.
- **Interpretation**

(*Abbreviation*—ppt: precipitation)

Obesity

It is the abnormal growth of adipose tissue or an increase in fat cell number. Obesity is often expressed in terms of BMI.

BMI = weight in kilogram/(height in meter)^2

WHO Classification of BMI for Adult

Table 20

Classification	BMI
Underweight	<18.50
Normal range	18.50–24.99
Overweight	≥25.00
Pre-obese	25.00-29.99
Obese class 1	30.00-34.99
Obese class 2	35.00-39.99
Obese class 3	≥40.00

Broca Index (BI)

Broca Index is an estimation of ideal body weight using height measurement only.

BI = Height (cm) - 100

Blindness

Epidemiological Determinants

- **Age:** About 30% of the blind in India lost their vision before they reach the age of 20. Among these, majority are under 5 age-children.

- **Primary eye care:** Wide range of conditions can be treated or prevent at grass route level by locally trained primary healthcare workers. For this purpose they are provided with essential drugs, topical tertracycline, vitamin A, eye bandages, shields etc.
- **Secondary care:** Definitive management of common blindness causing conditions such as cataract, trichiasis, glaucoma, etc. This care is provided at PHC or district hospital where eye centers or eye clinics are established.
- **Tertiary care:** They provide sophisticated eye care such as retinal detachment surgery, corneal grafting, and other complex forms of care.

Specific Health Programs to Combat Blindness

- **Trachoma control:** Mass campaigns with topical tetracycline and improvement of socioeconomic conditions have markedly reduced the incidence severity of trachoma and associated bacterial conjunctival infection. The trachoma control program was launched in 1963 and later merged with national program for control of blindness.
- **School eye health services:** Students are taught about the importance of good posture, good lighting, avoidance of glare, proper distance and angle between books and eyes.
- **Vitamin A prophylaxis**
  - 1st Dose (1 ml or 1 lakh IU orally) is given at the completion of 9 months (with measles)
  - 2nd dose at 18 months (2 ml or 2 lakh IU orally)
  - 3rd dose to 9th dose: once every six months up to the age of 5 years (i.e. at 24, 30, 36, 42 and 48, 54, 60 months)
- **Occupational health services:** To prevent occupational eye hazards.

HEALTH PROGRAMS IN INDIA

Please refer Appendices (Page no. A-69) A-109

DEMOGRAPHIC TRENDS IN INDIA

Sex ratio: The number of females per 1000 male.
Dependency ratio: Persons above 65 years of age and children below 15 years of age are considered as **dependent population.**
The dependency ratio can be further classified as **younger age (0-15) dependency ratio** and **older age (>65 years) dependency ratio.**
Density of population: Number of persons living per square kilometer.
Family size: It refer to the total number of persons in the family.
Life expectancy (expectation of life): At a given age it can be defined as the average number of years which a person of that age may expect to live, according to the mortality pattern prevalent in that country.
Fertility: It means the actual bearing of the children. Some demographers use the word natality instead of fertility.

Note

Refer to Appendices for recent statistics (Page no. A-67)

DEMOGRAPHIC CYCLE

Table 21 Five stages of demographic cycle

Stage	Birth Rate	Death Rate	Effect on population
First stage (High Stationary)	**High**	**High**	Population stationary (India until 1920)
Second stage (Early Expanding)	**Unchanged**	**Decline**	Population expands (Many Asian countries in this stage now)
Third stage (Late expanding)	**Begins to decline**	**Further declines**	Population Expands (slower than 2nd stage) (Currently, India is at this stage)
Fourth stage (Low stationary)	**Low**	**Low**	Stationary (European countries, e.g. Sweden, Belgium, Denmark, Switzerland)
Fifth Stage (Declining)	**Lower than death rate**	**Higher than birth rate**	Declining (East European countries, e.g. Germany, Hungary)

Fertility Related Statistics

Table 22

Indicators	Definitions and formulae
Birth rate	Number of birth per 1000 estimated mid-year population in a given year. $\frac{\text{Number of live births during the year}}{\text{Estimated mid-year population}} \times 1000$
General fertility rate (GFR)	The number of live birth per 1000 women in the reproductive age group (15 – 44 or 49 years) in a given year. $\frac{\text{Number of live births in an area during the year}}{\text{Mid-year population age 15–44 (or 49) in the same area in the same year}} \times 1000$
General marital fertility rate	Number of live birth per 1000 married women in the reproductive age group (15–44 or 49) in a given year. $\frac{\text{Number of live births in a year}}{\text{Mid-year married female population in the age group 15–49 years}} \times 1000$

Contd...

Scanned with CamScanner

Indicators	Definitions and formulae
Age specific fertility rate	A more precise measure of fertility rate. Number of live birth in a year to 1000 women in any age specific group. $\frac{\text{Number of live births in a particular age group}}{\text{Mid-year female population of same age group}} \times 1000$
Age specific marital fertility rate	It is the number of live birth in a year to 1000 married women in any specified age group $\frac{\text{Number of live births in a particular age group}}{\text{Mid-year married female population of the same age group}} \times 1000$
Net reproduction rate	It is defined as the number of daughters, a new born girl will bear during her life-time, assuming fixed age specific fertility and mortality rate.
Child-women ratio	Ratio of children under 5 years per 1000 women of reproductive age (15–49 yrs).
Pregnancy rate	Ratio of number of pregnancies in a year to married women in the age of 15-44 (or 49) years. The number of pregnancies includes all live birth, still-birth or abortion or had not yet terminated.
Abortion rate	It is the annual number of all type of abortion, usually per 1000 women of childbearing age (usually defined as age of 15–49 years)
Abortion ratio	It is number of abortions performed during a particular time period by number of live birth over the same period.
Marriage rate	It is the number of adults getting married in a year per 1000 population
Crude marriage rate	$\frac{\text{Number of marriages in a year}}{\text{Mid-year population}} \times 1000$
General Marriage	$\frac{\text{Number of marriages within one year}}{\text{Number of unmarried persons of age 15–49}} \times 1000$
Eligible couple	It refer to currently married couple where the wife is in the reproductive age, which is generally assumed to lie between the age of 15 and 49.
Couple protection rate	It is an indicator of contraceptive practices in the community. It is defined as the percentage of eligible couple effectively protected against child birth by one or the other approved method of family planning.

NATIONAL POPULATION POLICY 2000

- India launched family planning program in 1952
- The first **National Population Policy** was formulated and tabled in Parliament in 1976.
- Population policy generally refers to the policies intended to decrease the birth rate and growth rate.
- **National population policy 2000**: Target free approach in administering family planning services.

CONTRACEPTIVE METHOD (FERTILITY REGULATION METHOD)

- It is a preventive measure which helps the women to avoid unwanted pregnancies and plan the wanted pregnancy.
- Broadly, contraceptive methods are classified into two types, i.e. Spacing method and Terminal Method.

Spacing Method

- **Barrier method**
  - Physical method (condom, diaphragm, female condom, vaginal sponge)
  - Chemical method
  - Combined method
- **Intrauterine devices** (lippes loop, Cu-T)
  - IUD mainly works by changing the intra-uterine environment and make it spermicidal
  - Non-medicated IUDs cause a sterile inflammatory response to make it spermicidal

Scanned with CamScanner

- Copper containing IUDs release free copper that causes alteration in cervical mucous and endometrial secretions.
- **Hormonal methods**
- Combined methods (MALA-N, MALA-D), **Progestogen** only pills, post-coital contraception, once a month pill, male pill.
- Levonorgestrel tablets, 0.75 mg is a progestin-only emergency contraceptive pill used for prevention of pregnancy following unprotected intercourse
- Miscellaneous (abstinence, coitus interrupts, safe period, natural family planning method).

Table 23 Life time of various copper IUDs

Copper IUDs	Life time
Cu 250	3 years
Cu-T 380, 375	5 years
Cu 380A	8 years
TT 380 slimline	10 years

Terminal Method

- Male sterilization (Vasectomy)
- Female sterilization (Tubectomy)

ABORTION

It is defined as the termination of pregnancy before the fetus becomes viable (capable of living independently). The **medical termination of pregnancy act** was established in 1971.

ANTENATAL CARE

The primary aim of antenatal care is to achieve a healthy mother and a healthy baby at the end of pregnancy.

Antenatal Visit

- Minimum of 4 antenatal visits
- Suggested schedule
  - *1st visit within 12 weeks of pregnancy (as soon as pregnancy is suspected)*
  - *2nd visit between 14 and 26 weeks*
  - *3rd visit between 28 and 34 weeks*
  - *4th visit between 36 weeks and term*

PRENATAL ADVICES

- **Diet:** On an average normal healthy women gain weight of 10-12 kg during pregnancy
  - Calorie requirement
    - Pregnant women require an additional 300 Kcal per day
    - 1800 calories per day during the first trimester
    - 2200 calories per day during second trimester
    - 2400 calories per day during third trimester
  - Iron and folic acid (for 100 days starting from 14-16 weeks of pregnancy)
    - Iron – 100 mg per day
    - Folic acid – 500 mcg per day
- **Personal hygiene:** Personal cleanliness, sleep (8 hours/day at least 2 hours after meal) quit smoking and alcohol, good oral care, sexual intercourse should be restricted especially during the last trimester.
- **Drugs:** Without any prescription from doctor, medication intake should be restricted to all pregnant women.
- **Radiation:** Exposure to radiation is dangerous for fetus. Exposure to radiation should be avoided during the pregnancy.
- **Warning signs:** Swelling of the feet, fits, headache, blurring of vision, bleeding or discharge from vagina.
- **Child care:** Advice regarding care of child, nutritional maintenance, etc.

Calculation of number of expected pregnancies per year

Expected no of live birth/year (Y) =

$$\frac{\text{Birth rate per 1000 population} \times \text{Population (size) of the area}}{1000}$$

The total number of expected pregnancies (Z) = Y + 10% of Y

Calculation of expected date of delivery (EDD)

Naegele's rule: It is a standard way of calculating EDD for a pregnancy.

EDD: First day of last menstrual cycle + 9 months + 7 days.

INTRANATAL CARE

5Cs
- Clean surface
- Clean hands
- Clean cord cut (blade)
- Clean cord tie
- Clean cord stump

MOTHER AND CHILD HEALTH (MCH)

The main aim is to provide care to vulnerable population (children <5 years and women in the reproductive age group 15–44) in order to decrease the disability and death.

- Components of MCH include:
  - Maternal health
  - Family planning
  - Child health
  - School health
  - Handicapped children.
  - Care of children in special setting such as day care centers.

Recent Trends in MCH Services

- Integration of care
- Risk approach
- Manpower changes
- Primary healthcare

Indicators of MCH Services

- Maternal mortality rate
- Mortality in infancy and childhood
  - Perinatal mortality
  - Neonatal mortality
  - Post neonatal mortality
  - Infant mortality
  - 1-4 year mortality rate
  - Under 5 mortality rate
  - Child survival rate

Scanned with CamScanner

Infant Mortality Rate (as per 2016 Sample Registration System)

- Infant mortality Rate (IMR) in India is 34 per 1000 live births
- Lowest IMR was registered in the state of Goa (8 per 1000), followed by Kerala and Puducherry (10 per 1000 each)
- Highest IMR was registered in the state of Assam and Odisha (44 per 1000 each).

Source: Sample Registration System, 2016

Maternal Mortality Rate (MMR) (as per 2016 Sample Registration System)

- India has registered a 22% decline in MMR since 2013.
- MMR in India 130 per 1,00,000 live birth in 2015-2016.
- Kerala registered lowest MMR in the country (46 per 10,0000 live births)
- Three states [Kerala (46), Maharashtra (61) and Tamilnadu (66)] have already achieved SDG target.
- Highest MMR is registered in the state of Assam (237 per 10,0000 live births)

$$\text{Maternal mortality rate} = \frac{\text{Total number of female deaths due to complications of pregnancy/childbirth within 42 days of delivery from puerperal causes in an area during a given year}}{\text{Total number of live birth in the same area and year}} \times 1{,}00{,}000$$

Universal Children's Day

November 14 is observed as universal children's day. It was started by UNICEF and international Union for Child Welfare. In 1954, the UN Assembly passed the formal declaration.

Table 24 Some important policies related to children and year of implementation

Year	Policy
1974	National Policy for Children
1986	National Policy on Education
1979	The National Children's Fund
2002	National Health Policy
2003	National Charter for Children
2005	Commission for the Protection of Child Right Act
2005	National Plan of Action for Children

REPRODUCTIVE CHILD HEALTH PROGRAM (RCH)

Historical Background

- 1952: National Family Planning Program
- 1977: National Family Welfare Program
- 1985: Universal Immunization Program
- 1992: Child Survival and Safe Motherhood Program
- 1997: RCH–Phase I
- 2005: RCH–Phase II

Components of RCH

There are 4 components of RCH Phase I as follows:

- **RCH–Phase I**
  - Year of establishment: 15.10.1997
  - Focused on 4 components
- **RCH–Phase II**
  - Started in 1st April 2005
  - Focus on reducing neonatal and child mortality and morbidity
  - Emphasis on rural health care
- **Components (3 Es)**
  - Essential obstetric care
  - Emergency obstetric care (EmOC)
  - Emphasis on strengthening of referral system

New Initiatives Under RCH

1. Training of MBBS doctors in life saving anesthetic skills for emergency obstetric care
2. Setting up of blood storage centers at FRUs
3. **Janani Suraksha Yojana (JSY):** Free of cost institutional delivery
4. **Vandemataram Scheme:** Provision of safe motherhood service free of cost
5. Safe abortion services
6. Integrated Management of Neonatal and Childhood Illness (IMNCI)
7. Janani Shishu Suraksha Karyakaram (JSSK) (2011)
8. Child health components–newborn care: is given in table as follows:

Table 25 Newborn care

Health facility	All newborns at birth	Sick newborn
PHC/SC	Newborn Care Corner (NBCC) in Labour room	Prompt referral
CHC/FRU	Newborn Care Corner CR labor room and in OT	Newborn stabilization Unit (NBSU)
District hospital	Newborn Care Corner CR labor room and in OT	Special newborn care unit (SNCU)

Scanned with CamScanner

9. Navjat Shishu Suraksha Karyakram (NSSK, 2009): Training of health personnel in basic newborn care and resuscitation.
10. Rashtriya Bal Suraksha Karyakram (RBSK 2013): Focus on early detection of 4 D and its management
    - Defects at birth
    - Diseases in children
    - Deficiency conditions
    - Development delays
11. RMNCH + A: Reproductive, Maternal, Newborn Child and Adolescent health (2013). 12th Five Year Plan Initiative.
12. **India Newborn Action Plan (INAP, 2004):** Focus on single digit neonatal mortality

RCH Package

- For mother
  - Early registration, vaccination, Iron and folic acid, institutional delivery, emergency management, referral and transport
- For Children
  - Essential newborn care, exclusive breast feeding, growth monitoring, immunization, vitamin A prophylaxis, Oral Rehydration Therapy, Treatment of anemia, Management of diarrhea and Respiratory Tract infections
- For eligible couples
  - Availability of contraceptive methods, safe MTP services
- Other services
  - Management of RTIs and STIs, Adolescent health, women empowerment gender equity, male participation

UNDER 5 CLINIC

Under 5 clinic is a center, where preventive, promotive curative, referral and educational service are provided to under 5 children under one roof.

Functions/Components

- Care in illness
- Growth monitoring
- Preventive care
- Family planning
- Health education

UNICEF's GOBI – FFF Programs

G – Growth monitoring
O – Oral rehydration
B – Breastfeeding
I – Immunization
F – Family planning
F – Female education
F – Food supplements

NUTRITION AND HEALTH

Nutritional Assessment (ABCDE)

A – Anthropometric measurements (Assessment)
B – Biochemical assay
C – Clinical examination
D – Diet survey
E – Ecological assessment

Protein Energy Malnutrition

(Weight As % of the Standard - Grade of Malnutrition)

Table 26 Classification of protein energy malnutrition

ICMR classification	Gomez classification
• Normal – 80% and above	• >90% → Normal
• Grade I → 70–80%	• 75–89% → 1st degree
• Grade II → 60–70%	• 60–74% → 2nd degree
• Grade III → 50–60%	• Below 60% → 3rd degree
• Grade IV → Below 50%	

Age-Independent Anthropometric Indicators

- **Bangle Test:** If a bangle of 4 cm internal diameter crosses elbow
- **Shakir's tape:** Plastic tape with color zones (see figure below)
- **Quac Stick:** Rod with markings for Height and Arm circumference
- **Nabarrow's thinness chart:** Graphic chart for Wt/Ht
- **MAC: Height Ratio:** Normal if >0.32; severe malnutrition if < 0.29
- **Ponderal Index:** Weight (g)/(Height in cm)^3 × 100
- **Dughadale ratio:** Weight (kg)/(height in cm)$^{1.6}$; normal if > 0.79

Figure 4 ■ Mid-upper arm circumference (MUAC) measuring tape: Shakir's tape

Scanned with CamScanner

Interpretation of Color Coding (Shakir's Tape Measurement)

Red	<12.5cm	Wasted	Severe Protein Energy Malnutrition (PEM)
Yellow	12.5 – 13.5 cm	Borderline	Mild-moderate PEM
Green	>13.5	Normal	Normal

Vitamins

These are organic compounds classified as essential nutrients. They fall in the category of micronutrients. They are chiefly classified as:

- Fat soluble vitamins (vitamins A, D, E, K).
- Water soluble vitamins (vitamin B group and vitamin C).

Vitamins, functions, sources and deficiency diseases: Please refer Appendices (Page no. ~~A-70~~)

Community Nutrition Program

Table 27 Community nutrition program has been given in tabular form as follows:

Program	Explanation
Vitamin A Prophylaxis Program	Control of blindness through administration of vitamin A preparations
Prophylaxis against Nutritional Anemia	Distribution of iron and folic acid to pregnant women and children (1–12 years). ICDS, MCH, PHC are engaged in the implementation of this program
Control of Iodine Deficiency Disorders	Identification of goiter endemic region and supply of iodized salt and to assess the impact of goiter control measures
Special Nutritional Program	Launched in 1970 for the nutritional benefit of children below 6 years of age, pregnant and nursing mothers. Supplementary food supply having about 300 kcal and 10–12 g of protein per children per day
Balwadi Nutrition Program	Started in 1970 for the benefit of children in the age group of 3–6 years
ICDS Program	Started in 1975, there is strong nutritional component in this program in the form of supplementary nutrition, vitamin A prophylaxis, iron and folic acid distribution. Beneficiaries are children below 6 years of age and adolescent girls 11–18 years, pregnant and lactating mothers
Mid-day Meal Program	Launched in 1961. The major objective of this program is to attract more children for admission to school and retain them so that literacy improvement of children could be brought about.
Mid-day Meal Scheme	It is also known as National Program of Nutritional Support to Primary Education. Launched in 1995 and revised in 2004. The main objective is being universalization of primary education by increasing enrolment, retention and attendance and simultaneously impacting on nutrition of students up to middle level classes

DISASTER MANAGEMENT

Figure 5 ■ Management sequence of a sudden onset disaster

Disaster Impact and Response

- Search, rescue and first aid
- Field care
- **Triage:** Classify the victims according to the seriousness of injury.
- **Tagging:** All the patients should be provided with a tag which contains their name, age, etc.
- Identification of dead

At the time of disaster, **Simple Triage and Rapid Transport (START)** can be used to categorize clients

Red	• Critically ill clients who need immediate care
Yellow	• Client is not in immediate danger but require care/ treatment • Injured clients whose medical care needs can be delayed
Green	• Client who can ambulate and care for their own injuries • Clients whose treatment can be delayed until critical injuries have been treated
Black	• Clients with severe injuries who are expected to die

Scanned with CamScanner

Rehabilitation

- Restoration of predisaster conditions. It starts from the time of disaster.

Disaster Mitigation

- It involves the measures, which are adapted to prevent hazard from causing emergency or to lessen the likely effect of emergencies.

Disaster Preparedness

These are the activities to strengthen the capacity and capability of country to manage efficiently all type of emergencies.

OCCUPATIONAL HAZARDS

- **Physical hazards:** Heat and cold; light; noise; vibration; UV radiation; ionizing radiation.
- **Chemical hazards:** Exposure to chemicals such as acids, base, corrosive materials and other toxic compounds.
- **Biological hazards:** Infective and parasitic agents in the place of work
- **Mechanical hazards:** Hazards in the industry because of machinery and other moving parts
- **Psychosocial hazard:** It occurs because of the failure of workers to adapt with an external environment. Frustration, lack of job satisfaction, insecurity and poor human relationship are some of the examples.

Diseases Due to Physical Agent

Table 28

Physical agent	Disease
Heat	Hyperpyrexia, heat exhaustion, heat syncope, heat cramp, burns
Cold	Trench foot, frost bite, chilblains
Light	Occupational cataract, miner's nystagmus
Noise	Occupational deafness
Radiation	Cancer, leukemia, aplastic anemia, pancytopenia
Mechanical factors	Injuries, accidents
Electricity	Burns

Diseases Due to Chemical Agents

Table 29

Agent	Disease
Gases	CO_2, CO, HCN, CS_2, NH_3, N_2, H_2S, HCl, SO_2, these gases cause poisoning
Coal dust	Anthracosis
Silica	Silicosis
Asbestos	Asbestosis, cancer lung
Iron	Siderosis
Cane fiber	Bagassosis
Cotton dust	Byssinosis
Tobacco	Tobaccosis
Hay or grain dust	Farmer's lung

Prevention of Occupational Hazards

- Pre-placement examination
- Periodical examination
- Medical and health services
- Notification
- Supervision of working environment
- Maintenance and analysis of record
- Health education and counseling

Besides these above mentioned points, few acts are present which protect the employees.

The Factories Act (1948)

- The Act defines factory as an establishment where 10 or more employees are there and electricity power is used and 20 or more workers where electricity power is not used.
- This Act covers the areas like health, safety and welfare, employment of young persons, hours of work, leave and wages, occupational disease and employment in hazardous processes.

The Employee State Insurance Act (ESI) 1948

- It is an important Act for the measurement of social security and health insurance.
- It provides certain cash and medical benefits to industrial employees in case of sickness, maternity and employment injury.

Benefits to Employee

- Medical benefit
- Maternity benefit
- Dependents benefit
- Rehabilitation allowance
- Sickness benefit
- Disablement benefit
- Funeral expenses

HEALTH POLICY AND PLANNING

National Health Policy 2002 Goals Achieved by 2015

Table 30

Targeted year	Policy
2005	Eradicate polio and yaws
2005	Eliminate leprosy
2010	Eliminate Kala-azar
2015	Eliminate lymphatic filariasis
2007	Achieve zero level of growth in HIV/AIDS
2010	Reduce mortality rate 50% on account of TB, malaria, other vector and water borne disease
2010	Reduce prevalence of blindness to 0.5%
2010	Reduce IMR to 30/100 and MMR to 100/lakh
2010	Increase utilization of public health facilities from current level of <20% to >75%
2005	Establish an integrated system of surveillance national health account and health statistics
2010	Increase health expenditure by government as a % of GDP from existing 0.9% to 2.0%
2010	Increase share of central grants to constitute at least 25% of total health spending
2005	Increase state health spending from 5.5% to 7% of the budget
2010	Further increase of 8% of the budget

Health Planning in India

Please refer Appendices (Page no. A-71)

Five-Year Plans

Planning Commission was established on March 15, 1950 as an advisory institution to form five plans. The broad objective for the health programs during the five year plans have been given below:

1. Control and eradication of major communicable disease
2. Strengthening of the basic health service through the establishment of PHC and SC
3. Population control
4. Development of health manpower resources

Table 31 Five year plans

S. No	Plan	Time period
1.	First five year plan	1951–1956
2.	Second five year plan	1956–1961
3.	Third five year plan	1961–1966
4.	Annual plan	1966–1969
5.	Forth five year plan	1969–1974
6.	Fifth five year plan	1974–1979
7.	Outlay	1979–1980
8.	Sixth five year plan	1980–1985
9.	Seventh five year plan	1985– 1990
10.	Annual plan	1990–1991
11.	Annual plan	1991–1992
12.	Eighth five year plan	1992–1997
13.	Ninth five year plan	1997–2002
14.	Tenth five year plan	2002–2007
15.	Eleventh five year plan	2007–2012
16.	Twelfth five year plan	2012–2017

Contd...

Note

Govt. of India established NITI Aayog (National Institution for Transforming India) on **January 1, 2015,** as replacement for the Planning Commission.

HEALTHCARE OF THE COMMUNITY

Levels of Healthcare

- **Primary care level (essential healthcare)**
  - First level of contact of individual, family and community with national health system.
  - At this level healthcare is most effective.
  - In India, primary healthcare is provided by PHC and SC with the help of multipurpose health workers, village, health guide and trained dais.
- **Secondary care level (intermediate)**
  - This level deals with more complex problems
  - In India this kind of care is provided by CHC and district hospital
  - This level at last is the first referral level
- **Tertiary care level**
  - It is more specialized level of care which provides specific facilities and attention of highly specialized health workers
  - In India, this kind of care is provided by regional or central level institution.

Scanned with CamScanner

PRIMARY HEALTHCARE

- Following an international conference at Alma-Ata, a new approach to healthcare came into action and this was called as primary healthcare.
- Alma-Ata conference defines primary healthcare as an essential healthcare; made universally accessible to individuals and acceptable to them through their full participation and at a cost that the community and country can afford.

Principles of Primary Healthcare

- **Equitable distribution:** Health services must be shared equally by all people in perspective of their ability to pay and all must have access to health services.
- **Community participation:** The involvement of individuals, families and communities in promotion of their own health and welfare.
- **Intersectoral coordination: Coordination between** related sectors and aspects of national and community development, in particularly agriculture, animal husbandry, food industry, education housing, public works, communication and other sectors.
- **Appropriate technology:** Technology with resources that a community and country can afford
- **Focus on prevention:** Promote health and healthy lifestyles with emphasis on prevention.

Eight Essential Elements of Primary Healthcare

E	Education about health problems and methods of identifying, prevention and control
L	Locally endemic disease prevention and treatment
E	Expanded program of immunization against major infectious disease
M	Maternal and Child Health including family planning
E	Essential drug arrangement
N	Nutritional and Food Supply
T	Treatment of common infections
S	Safe water supply and sanitation control

HEALTHCARE SYSTEM

Primary Health Center

First contact point between village community and the medical officer is Primary Health Center.

Staffing Pattern

- Medical officer 1
- Nurse Midwife 1
- Pharmacist 1
- Health worker Female (ANM) 1
- Block Extension Educator 1
- Health Assistant (F)/LHV 1
- Health Assistant (Male) 1
- UDC and LDC 2 (1 each)
- Lab technician 1
- Driver (if vehicle is there) 1
- Class IV 4
- Total number of staffs 14

Community Health Center (CHC)

It has 30 in-door beds with one OT, X-ray, Labor room and Laboratory facilities.

Staffing

- Medical Officer (Surgeon, Obstetrician, Physician and Pediatrician) 4
- Nurse Midwife (staff nurse) 7
- Dresser 1
- Pharmacist/compounder 1
- Laboratory Technician 1
- Radiographer 1
- Ward boys 1
- Dhobhi 1
- Sweepers 1
- Mali 1
- Chowkidar 1
- Aya 1
- Peon 1
- **Total** 25

Sub-Center

First contact point between primary health care system and community. Type A sub-center provides basic services and Type B sub-center provides MCH services + Basic services

Staffing

- Health worker (female)/ANM 1
- Health worker (male) 1
- Voluntary worker 1
- **Total** 3

Table 32 Distribution of subcenter, PHC and CHC according to population

Name of the center	Hill/tribal area	Plain's area
One Subcenter	3,000 population	5,000 population
One Primary Health Center	20,000 population	30,000 population
One Community Health Center	80,000 population	1,20,000 population

Average Number of Villages Covered

- Subcenter – 4 villages
- PHC – 27 villages
- CHC – 133 villages

Gross Root Level Workers

- Village health guide
- Local dais
- Anganwadi workers
- ASHA (Accredited Social Health Activist)
- USHA (Urban Social Health Activist)

Scanned with CamScanner

Table 33 Following table contains summarized information about gross rent level workers

Village health guide (VHG)	Local dais
• **Training:** 200 hours • **Stipend:** 200/month • **Work:** 2–3 hours per day • **Salary:** 50/month • **For drugs:** 600/annum	• **Training:** 1 month/30 days • **Stipend:** 300/month • **1 week:** 4 days in field and 2 days in PHC/SC • Rs 10/delivery • Rs 3/registration
Anganwadi workers (AWW)	**ASHA–Rural areas**
• **1 AWW:** for 1000 population • **100 workers:** 1 project • **Training:** 4 months • **Salary:** 1500/month	1–1000 population She should be from local area Formal education Upper 8th stdv

Golden points to remember

- The three features of a community are location, population and social system.
- The world health day is celebrated on **April 7th.**
- World Tuberculosis day is celebrated on **March 24th.**
- World AIDS day is celebrated on **1st December.**
- Prevention of risk factors refer to primordial prevention. Example: Lifestyle modification.
- **Immunization and fortification of food** with specific nutrients are an example of **primary prevention.**
- Wearing seat belts, safety helmets and other safety equipment's are the examples of **primary health promotion behavior**
- Early diagnosis (screening) and primary treatment (basic treatment) of the disease are known as **secondary prevention.**
- Medical therapy (hospital care), surgical treatment and rehabilitation are the examples of **tertiary level prevention.**
- The ideal **weight** of an adult person is calculated on the basis of **height.**
- The study of distribution and determinants of the disease is called **epidemiology**
- Chain of infection includes agent, susceptible host, portal of entry, mode of transmission, portal of exit and reservoir.
- **Incidence** is defined as number of new cases that occur over a given period of time
- **Prevalence** is the number of cases (old + new cases) in a population in a given period of time.
- **Point prevalence** is defined as proportion of population which has condition in specific point in time.
- **Period prevalence** is defined as proportion of a population which has the condition at some point of time during the given period.
- A sudden outbreak of disease in the community in excess than the normal expectation is known as **epidemic.**
- **Pandemic:** When an epidemic spreads throughout the world (worldwide).
- **Endemic**: A disease that exists permanently **in a** particular geographical region or population.
- **Entomology** is a scientific study of insects, a branch of zoology
- The WHO initiative 'Right to Sight' is named as **Vision 2020.** It is a global initiative for the elimination of avoidable blindness.
- India is currently in late expanding stage (third stage) of demographic cycle. In this stage, birth rate begins to decline and death rate further decreases (from 2nd stage).
- **Sex ratio** is defined as the number of female individuals for every 1000 male individuals.
- **General fertility rate** refers to number of live births per 1000 females in reproductive age group.
- **Mass drug administration** is given to control filaria and malaria in many countries but in India it is done in case of lymphatic filaria only.
- The content of Drug Kit A provided at Subcentre includes ORS, tablet iron and folic acid, vitamin A solution and tablet cotrimoxazole.
- The population covered by the primary health center is 30,000 in plain areas and 20,000 in tribal area.
- **Bhore Committee** (1946) is known as **"Health Survey & Development Committee".**
- **Mudaliar Committee** (1962) is known as **"Health Survey & Planning Committee".**
- One **basic health worker** for 10,000 population was recommended by **Chadha Committee (1963).**

Contd...

Scanned with CamScanner

- **Kartar Singh Committee (1973)** recommended that ANMs were to be converted to MPW (F).
- The **Rural Health Scheme** was based on the recommendation of **Srivastava Committee**
- MPWs (multipurpose worker) team include one male health worker and one female health worker which cover 5,000 population in rural areas.
- The newborn birth to be registered in India within 21 days of birth.
- **UNICEF (United Nation International Emergency fund)** was established in 1946.
- **Telemedicine hub** refers to the primary clinical site from where the health provider renders health services to the remote places.
- Antiviral agents used for prevention and treatment of **swine flu** are Oseltamivir (Tamiflu) and Zanamivir (Relenza).
- A **characteristic** feature of the rash in **chickenpox** is its **pleomorphism** (all stages of rash may be seen simultaneously).
- India was free from smallpox in April 1977 but it was officially declared in December 1979.
- Smallpox was officially declared eradicated by the World Health Organization (WHO) on 8th May, 1980
- **BCG, Hepatitis B, OPV** vaccines are recommended at birth according to National Immunization Schedule.
- The system of storing and transporting vaccines is termed as Cold chain
- The vaccination can be used if the center square is white in the Vaccination Vial Monitor (VVM)

- **Oral Polio Vaccine** (OPV) is live vaccine (Sabin) and **Inactivated Polio Vaccine** (IPV) is a killed vaccine (Salk).
- The diluent used for reconstitution of BCG vaccine is normal saline.
- **Pulse Polio Immunization** was introduced in 1995.
- **Hepatitis A** and **Hepatitis E** viruses are mainly transmitted through feco-oral route.
- **Hepatitis B** and **C** are transmitted through blood-to-blood contact.
- **Hepatitis D** only occurs in people who are infected with the **hepatitis B** virus because HDV require help of HBV to replicate.
- The time interval between the invasion by an infectious agent and the appearance of first sign of disease is called **incubation period.**
- **DOTS (Directly Observed Treatment for Short course)** is a strategy used by World Health Organization (WHO) to decrease the number of tuberculosis (TB) patients.
- **Dengue** is spread through the bite of the female *Aedes aegypti* mosquito. This mosquito is a daytime feeder. Biting period is early in the morning.
- ***Culex vishnui*** mosquito from the Culicidae family is the most common vector causing the **Japanese encephalitis virus (JEV)** in India, Sri Lanka.
- **Schick test** is intradermal test used to confirm the diagnosis of **diphtheria.**
- **Trachoma** is contagious and affects the conjunctiva of the eye, cornea and eyelids. It is caused by the Chlamydia trachomatis bacteria.
- **Gonorrhea** is a sexually transmitted infection caused by bacteria ***Neisseria gonorrhoeae.***
- **Measles** is caused by Rubeola virus.
- Amoebiasis is caused by ***Entamoeba histolytica.***
- Glucose is added in ORS solution because it increases the sodium absorption.
- A freshly prepared **ORS solution (Oral rehydration solution)** should be used within 24 hours.
- During cholera outbreak, the best emergency sanitation measures to be adopted will be provision of chlorinated water.
- Most common cause of blindness in India is Cataract (62%) followed by refractive errors (20%).
- Mid-day meal program was **introduced in 1961** to improve the school attendance by providing supplementary food from school.

Contd...

Scanned with CamScanner

- Recommended Dietary Allowance (RDA) Value for protein is 0.8 grams of protein per kilogram of body weight.
- Egg protein is considered as 'reference protein'. It contains all nine essential amino acids, non-essential amino acids and its net protein utilization is highest.
- The objective of the mid-day meal program is to provide half of the daily requirement for proteins and one third of daily requirement of calories.
- The method of waste disposal in which waste is disposed along with night soil is known as **Composting.**
- The Asian 'Tiger Mosquito' (***Aedes albopictus***) is a small black and white mosquito.
- Zinc phosphide is an efficient rodenticide. Rodents include rats, mice, squirrels, beavers, etc.
- Eating maize alone leading to pellagra because maize is a poor source of niacin and tryptophan.
- The contraceptive method that also offers protection against sexually transmitted infection is Latex condom.
- Intrauterine devices (IUDs) insertion is scheduled within 7 days from the starting of period.
- **Excessive menstrual bleeding is the most common side effects of IUDs.**
- **The Pearl Index** is the measure of the safety of contraceptives. The smaller the Pearl Index, the safer the method of contraception. For example, Pearl Index 3 refers to 3 contraceptive failure out of 100 women using a specific contraceptive method.
- Integrative approach is a family therapy approach that focuses on both the biological and the psychosocial components of a problem.
- High amount of fluoride causes dental and skeletal fluorosis. The water safety limit is from 0.1 to 1.0 ppm.
- The steps of large scale water purifications: **Storage → Filtration → Disinfection**
- Residual Chlorine after chlorination of water should be greater than or equal to 0.5 mg/L (0.5 ppm) after 1 hour
- Inhalation of cotton fiber dust over the long period of time results in **Byssinosis**
- Monday fever is the other name for byssinosis
- The most satisfactory method of waste disposal where suitable land is available is controlled tipping
- A method used for individual health education in the community is Counselling and Interview.

Image-Based Questions

1. **Identify the national health program depicted**

a. Rashtriya Swasthya Suraksha Karyakram
b. Rashtriya Bal Swasthya Karyakram
c. Rashtriya Kishor Swasthya Karyakram
d. Navjat Shishu Suraksha Karyakrama

2. **Identify the disease for which program is depicted in symbol**

a. Iodine deficiency
b. Noncommunicable diseases, cancer, diabetes
c. Deafness
d. Road traffic accidents

3. **Services provided at facility shown in symbol** *[Recent Question 2014]*

a. DOTS services
b. HIV Counselling
c. RTI/STI services
d. First aid services

4. **The logo shown in the picture belongs to**

a. Ayushman Bharat
b. National Green Tribunal
c. Jan Dhan Yojana
d. Atal Pension Yojana

5. **The logo shown in the picture indicates**

a. Ayushman Bharat
b. NRHM
c. Jan Dhan Yojana
d. Atal Pension Yojana

6. **The logo shown in the picture is associated with**

a. Make in India project
b. Skill India Mission
c. Industrial revolution
d. Old age pension scheme

7. **The logo image shown in the picture is associated with**

a. Sansad Adarsh Gram Yojana
b. Swachh Bharat Mission
c. Shramew Jayate Yojana
d. Atal Pension Yojana

8. **The logo shown in the image is associated with _____ scheme**

a. Skill India Mission
b. Hridaya Plan
c. Beti Bachao Beti Padhao
d. Shramew Jayate Yojana

Ans.

1. c
2. c
3. c
4. a
5. c
6. b
7. b
8. c

9. Identify vector shown in photograph

a. Culex
b. Mansonia
c. Sandfly
d. House fly

10. Identify the parasitic insect

a. Scabies mite
b. Bed bug
c. Mansonia
d. Head lice (Pediculus capitis)

11. Microscopic image shown in the picture is

a. Scabies mite
b. Bed bug
c. Mansonia
d. Pediculus capitis

12. Parasitic insect shown in the picture is

a. Scabies mite
b. Head lice
c. Pubic lice
d. Pediculus humanus capitis

13. The lesion on the skin is most likely a

a. Folliculitis
b. Scabies skin lesion
c. Erythema
d. Cellulitis

14. Identify the national health program depicted by the symbol

a. IDSP
b. NPCDCS
c. RCH
d. National Deworming Program

15. Identify the scheme/program/plan launched by government of India

a. Beti Bachao Beti Padhao Andolan
b. SarvaShikshaAbhiyan
c. ICDS
d. National Iron Plus Initiative

16. Identify the legislation/scheme shown in symbol

a. RTI Act 2005
b. RSBY 2008
c. NREGA 2005
d. Factory Act 1948

17. Statutory body (shown in symbol) has been established under the act passed in

a. 2000
b. 2002
c. 2006
d. 2013

18. Identify the strip shown in photograph *[Recent Question 2012, 2017]*

a. Combined OCP
b. Iron Folic acid tablets
c. DOTS
d. MDT

19. Identify the symbol

a. Vitamin A in Immunization
b. Defluoridation of water
c. Iodization of salt
d. Iron fortification of salt

20. Identify the organization depicted by symbol

a. National Planning Commission (NPC)
b. National Disaster Management Authority (NDMA)
c. Unique Identification Authority (UIDAI)
d. ESI Corporation

21. Content composition of Pills shown in photograph

a. 15 mcg Estrogen, 300 mcg Progesterone
b. 150 mcg Estrogen, 30 mcg Progesterone
c. 30 mcg Estrogen, 150 mcg Progesterone
d. 300 mcg Estrogen, 15 mcg Progesterone

22. Identify the contraceptive device shown in the image

a. CuT 7
b. CuT 220 B
c. CuT 380 A
d. Progestasert

23. Duration for usage of Barrier methods is recommended after a client underwent the procedure shown in the image

a. 30 days
b. 60 days
c. 90 days
d. 12 months

24. Identify the symbol shown in photograph:

a. MDT
b. DOTS
c. ART
d. Anti-malaria therapy

25. **Identify the national health Program depicted by the symbol:**

a. RNTCP
b. NIDDCP
c. NRHM
d. NVBDCP

26. **Identify the national health program depicted by the symbol:**

a. IDSP
b. RCH
c. NPCB
d. NVBDCP

27. **Identify the scheme program plan launched by government of India:**

a. Mission Indradhanush
b. Kangaroo Mother Care
c. Reproductive and Child Health
d. India Newborn Action Plan

28. **Identify the program associated with the symbol shown:**

a. NPCDCS
b. NIDDCP
c. National Tobacco Control Program
d. JSY Scheme

29. **Identify the campaign depicted by the symbol:**

a. Beti Bachao Beti Padhao Andolan
b. Sarva Shiksha Abhiyan
c. Kishori Shakti Yojana
d. Save the girl child

30. **Location of organization depicted by symbol in photograph is:**

a. New Delhi
b. Kolkata
c. Mumbai
d. Chennai

31. **Number of vaccine vials that can be kept in the equipment shown in photograph:**

a. 1 – 2
b. 2 – 4
c. 6 – 8
d. 16 – 20

32. **Identify the contraceptive device shown in photograph:**

a. Female condom
b. Diaphragm
c. Vaginal sponge
d. Vaginal ring

41. How can the efficacy of the contraceptive in figure be improved:

a. By using water based lubricant
b. By using oil based lubricant
c. By using spermicidal jelly
d. By making small hole near teat

42. Identify the contraceptive in figure:

a. Male condom
b. Diaphragm
c. Female condom
d. Graffenberg ring

43. Identify the contraceptive shown in figure:

a. Dutch Cap
b. Cervical Cap
c. Diaphragm
d. Vaginal sponge

44. The symbol shown in figure is related to?

a. National Human Rights Commission
b. Sarva Siksha Abhiyan
c. National Literacy Mission
d. International Yoga Day

45. The diagram shown in figure represents:

a. Ideal Tubectomy time estimation
b. BBT Method
c. Cervical mucus method
d. Rhythm method

46. The symbol shown in figure is related to?

a. NUHM
b. Smart city
c. NHAI
d. Swachh Bharat

47. Identify the scheme/ program/ plan launched by Government of India *(Refer explanation at the end)*

a. HIV/AIDS
b. ICTC
c. ART
d. PPTCT

48. Identify the scheme shown in symbol *(Refer explanation at the end)*

a. SABLA scheme
b. Kishori Shakti Yojana
c. Janani Suraksha Yojana
d. Menstrual Hygiene Scheme

MULTIPLE CHOICE QUESTIONS (Including Explained and Practice Questions)

INTRODUCTION TO COMMUNITY HEALTH NURSING

1. **Quality and quantity of an individual's inter-personal ties and extent of involvement with the community is known as:** *(AIIMS BPL NO 2018)*
   a. Mental dimension of health
   b. Physical dimension of health
   c. Spiritual dimension of health
   d. Social dimension of health

Explanation: Social dimension is related to social wellbeing that creates integration and adjustment with the individual and community. Mainly it is defined the Quality and quantity of an individual's inter-personal ties and extent of involvement with the community.

2. **The functions of community are:** *(AIIMS Raipur Grade II 2017)*
   A. It provides space for socialize and recreation
   B. It provides safety and security
   C. Socialization and Education for its members
   D. Provides opportunity for interaction among members
   a. A, B, C b. B, C, D
   c. A, C, D d. A, B, C, D

Explanation: The functions of community include socialization, social control, social participation and mutual support

3. **In demographic stages "when birth rate begins to decline and death rate further decreases" is said to be:** *(RAK MSc 2018)*
   a. High stationary stage
   b. Early expansion stage
   c. Late expansion stage
   d. Low stationary stage

Explanation: According to History of world's population since 1650 suggest the 5 stages of demographic cycle:

- First stage called as High stationary stage. In this birth rate is high and death rate is also high that will cancel each other, and the population remains stationary.
- Second stage is also called as Early expanding stage. In this the death rate begins to decline and birth rate remains same.
- Third stage also called as Late expending stage. In this the death rate decreases still further and birth rate display as fall.
- Fourth stage is also called as Low stationary stage. In this the birth rate is low and death rate is also low this results population becomes stationary.
- Fifth stage also called as declining stage. In this birth rate is decreasing than the death rate and population is declining.

4. **As per WHO 2000 report, India's health expenditure was**
   a. 3.2% of Gd.
   b. 4.3% of GDP
   c. 6.7% of Gd.
   d. 7.2% of GDP
5. **Father of Indian Surgery is**
   a. Dhanvantari
   b. Charaka
   c. Sushruta
   d. Atreya
6. **Ageism is characterized by**
   a. Denial of negative stereotypes regarding aging
   b. Positive attitudes toward the elderly based on age
   c. Negative attitudes towards the elderly based on age
   d. Negative attitudes toward the elderly based on physical disability
7. **Entomology is the science that studies:** *(RRB SSNE 2015)*
   a. Behavior of human beings
   b. Insects
   c. Behaviour of ants
   d. Formation of rocks
8. **Head Quarters of World Health Organization (WHO) is situated at _____**
   a. New York, United States of America
   b. London, England
   c. Geneva, Switzerland
   d. Paris, France
9. **UNICEF was established in ..... year**
   a. 1946 b. 1948
   c. 1952 d. 1955
10. **The germ theory of disease was propounded by**
    a. Robert Koch b. Hippocrates
    c. Louis Pasteur d. August Weismann
11. **Who discovered tuberculin skin test?**
    a. Von Pirquet b. Louis Pasteur
    c. Ronald Ross d. Edward Jenner
12. **Limit for registration of birth is**
    a. 7 days b. 14 days
    c. 21 days d. Any of the above
13. **Census population count is in reference to**
    a. 1st march b. 1st July
    c. 30th June d. 1st January
14. **Census is conducted in every_____ years in India:**
    a. 10 b. 25
    c. 15 d. 20
15. **First census in India was done in**
    a. 1861 b. 1871
    c. 1881 d. 1891

16. **WHO established in the year of .....**
    a. 1920 b. 1948
    c. 1954 d. 1960
17. **Which of the following is not a complete sterilization agent**
    a. Glutaraldehyde
    b. Hydrogen peroxide
    c. Absolute alcohol
    d. Sodium hypochlorite
18. **Which of the following is true about Global Warming?**
    a. CO_2 is a major greenhouse gas
    b. Stratosphere ozone layer is harmful
    c. CFC increases Stratosphere ozone layer
    d. Kyoto protocol called for 20% reduction in Greenhouse emissions
19. **Air velocity is measured by:**
    a. Hygrometer b. Psychrometer
    c. Anemometer d. Wet bulb thermometer
20. **According to WHO, a child with IQ level between 35-50 falls under which of the following category of mental retardation?**
    a. Mild b. Moderate
    c. Severe d. Profound

DETERMINANTS AND INDICATORS OF HEALTH

21. **The concept of health which emphasizes that health is a 'sound mind in a sound body in a sound family in a sound environment' is** *(AIIMS Bhopal Grade-I 2018)*
    a. Ecological concept b. Physical concept
    c. Psychological concept d. Holistic concept

Explanation: The health has been described by various scientists according to their concept of viewing the health. The ecologist viewed health as a harmonious equilibrium between man and environment. The physical concept of health describes health as a state of well-functioning of the body and psychological concept describes health as absence of mental illness. The Holistic concept of health is viewed as a multidimensional process involving wellbeing of the whole person in the context of his environment

22. **All the following components are used in Kuppuswamy classification of socio-economic status EXCEPT:**
    a. Family income b. Education
    c. Occupation d. Number of children

Explanation: Component of Kuppuswamy scale includes: education, occupation and income. Kuppuswamy classification is used in urban and periurban areas which consider the education of the head of family, occupation of head of the family and per capita monthly income

23. **The world health day is observed on .....:**
    a. 7th April
    b. 4th May
    c. 17th August
    d. 1st December

Explanation: The World Health Organization observes World Health Day on 7th of April every year.

24. **The subjective component of well-being is referred to as:**
    a. Physical quality of life
    b. Quality of work
    c. Quality of life
    d. Standard of living

Explanation: Subjective well-being is called as quality of life.

25. **The process of continuous progressive improvement of the health status of a population is:**
    a. Block development
    b. Community development
    c. Health development
    d. Society development

Explanation: Health development is the progressive improvement of health status of a population.

26. **Health means absence of disease is the concept of:**
    a. Biomedical
    b. Ecology
    c. Holistic
    d. Psychosocial

Explanation: Health means absence of disease is the biomedical concept.

27. **Ongoing measurement of performance of a health service refers to:**
    a. Evaluation b. Monitoring
    c. Scrutinization d. Surveillance

Explanation: Ongoing measurement of performance of health services is known as surveillance.

28. **What is the theme for 2016 world health day?**
    a. Halt the rise: Beat diabetes
    b. Food safety
    c. Vector-borne diseases: small bite, big threat
    d. Healthy heart beat, Healthy blood pressure

Explanation:
- **2016:** Halt the rise: beat diabetes
- **2015:** Food safety
- **2014:** Vector-borne diseases: small bite, big threat
- **2013:** Healthy heart beat, Healthy blood pressure

29. **Forerunner of modern public health is:** *(JIPMER 2012)*
    a. Phoebe b. Nightingale
    c. Serelette d. Louis Pasteur's
30. **'Health is the absence of disease'. This is the concept of**
    a. Interpersonal model b. Holistic model
    c. Biomedical model d. Ecology model
31. **The subjective component of well-being is known as**
    a. Quality of nutritional intake
    b. Quality of life
    c. Standard of living
    d. All of the above
32. **Which of the following is NOT a method of health promotion except**
    a. Behavioral modification b. Lifestyle modification
    c. Immunization d. Nutritional education
33. **Human Development Index (HDI) does not include:**
    a. Mean Years of schooling b. Life expectancy at birth
    c. Real GDP per capita d. Adult literacy rate
34. **One characteristic of the integrative model of health care is**
    a. Increased cost
    b. A focus on physical disease states.
    c. An integration of mind-body-spirit
    d. The plan of care is directed by the health care provider

    a. .500
    b. 0.586
    c. 0.505
    d. 0.540
36. **Nursing interventions directed at health promotion in the older adult are primarily focused on**
    a. Disease management.
    b. Controlling symptoms of illness.
    c. Teaching positive health behaviors
    d. Teaching regarding nutrition to enhance longevity
37. **Which of the following functions of community health nurse enables community empowerment?**
    a. Helping people in achieving personal hygiene
    b. Forming partnerships with people
    c. Decision making for people in the community.
    d. Accepting responsibility for people's action
38. **The floating tip of the iceberg represents**
    a. Latent cases
    b. Clinical cases
    c. Undiagnosed cases
    d. None of the above
39. **Most important health status indicator of a country:**
    a. Life expectancy at birth
    b. Maternal mortality rate
    c. Total fertility rate
    d. Infant mortality rate
40. **Which one of the following is NOT a socio-economic indicator?**
    a. Literacy rate
    b. Family size
    c. Housing
    d. Life expectancy at birth
41. **In which stage of the demographic cycle in India currently?**
    a. High stationary
    b. Late expanding
    c. Early stationary
    d. Low stationary
42. **Best indicator for growth measurement is**
    a. Height
    b. Weight
    c. Arm circumference
    d. None
43. **Road to health card or the growth chart was first designed by:**
    a. Edwin Chadwick
    b. David Morley
    c. Gopalan
    d. CE Winslow
44. **All are true about growth chart except;**
    a. It is a tool for educating mothers
    b. The position of dots is more important than direction
    c. Between top 2 lines, it shows 'Road-to -Health' or 'zone of normality'
    d. Lowermost line corresponds to children below 3 percentile
45. **Deficiency in Weight for Height in a 3 year old child indicates:**
    a. Acute malnutrition
    b. Chronic malnutrition
    c. Concomitant acute and chronic malnutrition
    d. Under weight
46. **When is the World Health Day celebrated?**
    a. 24th April
    b. 7th April
    c. 7th May
    d. 1st December
47. **Deficient in weight for height in a 3 years old child indicates:**
    a. Acute malnutrition
    b. Chronic malnutrition
    c. Concomitant acute and chronic
    d. Under weight
48. **WHO growth chart is:**
    a. International based
    b. National Based
    c. Home based
    d. Community based
49. **Mid-arm Circumference is constant during:**
    a. 0-6 months
    b. 1-5 years
    c. 5-10 years
    d. 10 years
50. **Growth chart used in India has curves:**
    a. 2
    b. 3
    c. 4
    d. 5
51. **At birth head circumference is about**
    a. 32 cm
    b. 34 cm
    c. 36 cm
    d. 38 cm
52. **WHO Growth Chart has got information for all except:**
    a. Immunization procedures
    b. Child spacing
    c. History of sibling health
    d. History of maternal health
53. **Occupational health practice mainly refers to**
    a. Pre-employment examination

LEVELS OF HEALTHCARE AND LEVELS OF PREVENTION

54. **Philosophy of Primary Health Care are as follows EXCEPT** *(ESIC 2019)*
    a. Equity and justice
    b. Intersectoral approach
    c. Primary prevention
    d. Inter-relationship of health and development

Explanation: Philosophy of Primary Health Care is based on the values of equity, social justice, solidarity, Intersectoral approach and inter-relationship of health and development, Further, at its core is a focus on population health, illness prevention, and health promotion.

55. **Secondary prevention is:** *(ESIC 2019)*
    a. Safe water supply, Vector and animal reservoir control
    b. Early detection (diagnosis) of disease and Prompt treatment
    c. Good living and working condition
    d. Nutritional counseling

Explanation: Secondary prevention aims to reduce the impact of a disease or injury that has already occurred. This is done by detecting (early diagnosis) and promptly treating disease or injury as soon as possible to halt or slow its progress.

Figure: The 3 levels of prevention

Scanned with CamScanner

56. Population covered by a sub-center in hilly area: *(RAK MSc 2018)*

a. 5000 population
b. 3000 population
c. 10,000 population
d. 30,000 population

Explanation: Sub center is a peripheral area of the village having health care delivery system. One sub center covers 5000 in plain area and 3000 population in hilly and tribal area. It works at the grass-root level and main function is to provide primary health care services and some preventive, promotive and curative services. One PHC contains six Sub centers.

57. Which of the following is NOT a content of Drug Kit A provided at subcenter? *(AIIMS BPL NO 2018)*

a. Oral rehydration salt
b. Tab Co-trimoxazole
c. Tablet paracetamol
d. Vitamin A Solution

Explanation:

Contents of Kit-A

Contents	Quantity
Oral rehydration salt	150 packets
Tablet IFA	15000 tablets
Tablet IFA	13000 tablets
Vitamin A solution	6 bottles of 100 mL each
Tab co-trimoxazole for pediatric use	1000 tablets

58. One PHC covers a population of: *(Safdarjung NO 2018; DSSSB PHN, 2015; RRB Feb 2012)*

a. 50,000
b. 30,000
c. 10,000
d. One lakh

Explanation: As a basic unit of health care, PHC covers 20000 population in hilly and tribal areas and 30,000 for plan areas.

59. The principles of primary health care include *(AIIMS Raipur Grade II 2017)*

A. Equitable distribution
B. Community participation
C. Coverage and accessibility
D. Appropriateness and continuity

a. A, B, C
b. B, C, D
c. A, C, D
c. A, B, C, D

Explanation: The principles of primary health care include intersectoral coordination, Appropriate technology, equitable distribution and community participation.

60. The following are the functions of Male health workers as a Health Team member "Except" *(AIIMS Raipur Grade II 2017)*

a. Conduct survey of the Sub center and maintain record of all families
b. Provide nutrition advice and Immunization to mothers and Children
c. Maintain information of all vital events
d. Promote health education activities

Explanation: The functions of health worker include community service provider, facilitator, health counselor, co-researcher, member of a team and health educator

61. In India, which one is the following is the first referral unit? *(AIIMS Raipur Staff-Nurse Grade I-2018)*

a. Sub center
b. Primary health centers
c. Community health centers
d. Regional hospital

Explanation: As per RCH, first referral unit is a community health center which has the facilities for obstetric surgery, blood transfusion, anesthesia, specialist pediatric care, operation theatre and required equipment. This center also has the facilities for MTP, tubectomy, vasectomy and pediatric care for high risk neonates and other severe problems of early childhood.

62. Which of the following is not a content of Drug Kit A provided at subcenter? *(AIIMS Bhopal Nursing Officer, 2018)*

a. Oral rehydration salt
b. Tab co-trimoxazole
c. Tablet paracetamol
d. Vitamin A solution

Explanation:

Kit A	Kit b
ORS	Tab. methylergometrine maleate
Iron folic acid large and small tablets	Tab. paracetamol
Vit A solution	Inj. methylergometrine maleate
Tab. co-trimoxazole	Tab. mebendazole
	Tab. dicyclomine HCl
	Ointment povidone iodine
	Cetrimide powder
	Cotton bandage
	Absorbent cotton

63. Following are the elements of primary health care : EXCEPT *(DSSSB 2006)*

a. Health education
b. Intersectoral coordination
c. Cost effectiveness
d. Provision of essential drugs

Explanation: Cost-effective care is that judged to provide good health value for expenditure. Health value refers to the benefits of a particular medical intervention, which might include longer life, better quality of life, or both. Expenditures should include not only the costs of a test or treatment itself, but the subsequent costs it might cause, including additional medical interventions, work disability, costs of long-term care, and so forth.

64. Primary health care is: *(DSSSB 2004)*

a. Health for all
b. Health for those who are in need
c. Health for an area of 30,000 population
d. Health for children attending primary school

Explanation: In 1978, 134 health ministries signed the Alma Ata Declaration. The Declaration set a deadline of the year 2000 for achieving a level of health that would enable all of the world's people to lead a socially and economically productive life. The strategy to achieve this goal was focused on primary healthcare with the emphasis on community participation and tackling the underlying causes of disease such as poverty, illiteracy and poor sanitation. Many now argue that globalization has become an additional threat to the achievement of the health-for-all principle contained in the declaration, with an estimated 800 million people still lacking access to even the most basic health services. However, those who see greater benefits from globalization feel that it can, in fact, make the health-for-all principle a reality.

Ans.

56. b
57. c
58. b
59. a
60. b

64. a

Scanned with CamScanner

65. ASHA (Accredited social health activist) workers are functioning at:
a. Community level
b. Village level
c. PHC level
d. District level

Explanation: Accredited social health activists (ASHAs) is community health workers instituted by the government of India's Ministry of Health and Family Welfare (MoHFW) as part of the National Rural Health Mission (NRHM)

66. Prevention of risk factors related to a disease condition is known as.....
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

Explanation: Primordial prevention is defined as prevention of risk factors themselves, beginning with change in social and environmental conditions in which these factors are observed to develop, and continuing for high risk children, adolescents and young adults

67. ASHA workers performance is monitored through:
a. Number of deliveries attended
b. Number of home visits done
c. Reduction in IMR
d. Number of training hours attended

Explanation: ASHA workers performance is monitored through reduction in IMR.

68. The human resource available in subcenter is:
a. Multipurpose health worker
b. Physician
c. Anganwadi worker
d. Medical officer

Explanation: Multipurpose health worker (Female), Multipurpose health worker (Male) and voluntary worker consist the human resource available in the sub center

69. In health care delivery system grass root level workers includes.....
a. Anganwadi workers
b. ASHA
c. Village health guide
d. All of the above

70. Primary health care includes all except: *(RAK MSc 2018)*
a. Low cost
b. Equitable distribution
c. Community participation
d. Latest technology

71. The Multipurpose Worker in general serves a rural population of: *(DSSSB PHN, 2015)*
a. <500
b. 1000
c. 3000
d. 5000

72. Which one of the health services is not available in rural health unit? *(Banaras HU 2015)*
a. Maternal and child health work
b. Communicational disease control work
c. Environmental sanitation work
d. Cancer treatment facility

73. In the prevention of communicable disease, the primary prevention results from *(Banaras HU 2015)*
a. Immunizations
b. Early diagnosis
c. Strict isolation
d. Treatment of disease

74. Population covered by an Anganwadi worker is: *(Kerala PSC, Nov 2014)*
a. 2000
b. 3000
c. 1500
d. 1000

75. The three tier system of local self-government at block level is: *(Staff Nurse G II 2014; JIPMER 2012)*
a. Panchayat Samiti
b. Gram Sabha
c. Nyaya Panchayat
d. Zilla Parishad

76. The backbone of public health nursing is: *(JIPMER 2012; Staff Nurse G II 2014)*
a. Home visit
b. Recording
c. Health education
d. Immunization

77. Main intervention in primordial prevention is:
a. Health education
b. Immunization
c. Early diagnosis
d. Early screening

78. Pap smear screening is an example of:
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

79. Which of the following action by a public health nurse is likely to encourage community participation?
a. Invite people from NGOs
b. Refer to the physician for prescription
c. Listen to people when they relate their problems
d. Encourage sponsorship for participation

80. All of the following are the essential elements of primary health care, EXCEPT:
a. Multi-sectoral Approach
b. Qualification of health providers
c. Community participation
d. Appropriate technology

81. Which of the following mission must be emphasized to strengthen health care system in the country?
a. Increasing opportunity to be healthy
b. Financing National Healthcare Programs
c. Let people manage their own health
d. Supporting environment for healthy habits

82. The focus of secondary health care is
a. Early detection
b. Early diagnosis and treatment
c. Prevention of risk factors
d. Immunization for preventable diseases

83. During home visit, Nurse Mala found no signs of dehydration in 7 weeks old child who had diarrhea for last 2 weeks. The child is having:
a. Persistent diarrhea
b. Acute diarrhea
c. Dysentery
d. Severe dysentery

84. All of the following are principles of primary health care, EXCEPT:
a. Accessibility
b. Inequitable distribution
c. Appropriate use of technology
d. Intersectoral collaboration

85. An example of Primary Prevention strategies is:
a. Early diagnosis
b. Hospitalization and treatment
c. Rehabilitation
d. Health Education

86. Prevention of risk factors is known as:
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

Scanned with CamScanner

87. Which of the following is NOT an example of primary prevention
a. Breast self-examination
b. Smoking cessation
c. BCG vaccination
d. Vitamin A supplementation

88. Which of the following is considered as secondary prevention strategies
a. Physiotherapy for arthralgia
b. Surgery for cataract
c. DOTS therapy for a tuberculosis patient
d. All of the above

89. Early diagnosis of disease is known as _____ strategy
a. Primary prevention
b. Secondary prevention
c. Tertiary prevention
d. Rehabilitation prevention

90. Example of primary prevention strategies include
a. Colonoscopy at age 50.
b. Avoidance of tobacco products.
c. Intake of a diet low in saturated fat in a patient with high cholesterol.
d. Teaching the importance of exercise to a patient with hypertension.

91. Prevention of emergence of risk factor is:
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

92. Immunization is:
a. Primary prevention
b. Secondary prevention
c. Tertiary prevention
d. Disability limitation

93. Iodized salt in iodine deficiency control programme is:
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

94. Level of prevention that includes Specific protection is
a. Primordial b. Primary
c. Secondary d. Tertiary

95. When you immunize a child for measles what type of prevention are you doing?
a. Primordial prevention b. Health promotion
c. Specific protection d. Secondary Prevention

96. Monitoring of blood pressure is which level of prevention?
a. Primordial b. Primary
c. Secondary d. Tertiary

97. Pap smear test for detection of carcinoma of cervix is which level of prevention?
a. Primordial b. Primary
c. Secondary d. Tertiary

98. Patient is on psychotherapy, what is the level of prevention
a. Primordial b. Primary
c. Secondary d. Tertiary

99. Screening of the disease is which type of prevention?
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

100. Target group in secondary prevention
a. Healthy individuals b. Patients
c. Animals d. Children

Explanation: Secondary prevention emphasizes early disease detection and its target is healthy-appearing individuals with subclinical forms of the disease. Secondary prevention often occurs in the form of screenings.

Ref: Kisling L.A., Das J.M. Prevention strategies. (https://www.ncbi.nlm.nih.gov/books/NBK537222/)

101. Disability limitation is which mode of prevention?
a. Primordial prevention b. Primary prevention
c. Secondary prevention d. Tertiary prevention

102. Primordial prevention is done in population
a. With risk factors
b. Without risk factors
c. Whole population with low prevalence of disease
d. Population with disease

103. Which of the following is primordial prevention?
a. Action taken prior to the onset of disease
b. Prevention of emergence of development of risk factors
c. Action taken to remove the possibility that a disease will ever occur
d. Action that halts the progress of a disease

104. Chemoprophylaxis is _____ level of prevention
a. Primary b. Secondary
c. Tertiary d. Quaternary

105. ASHA is located at
a. Subcenter b. PHC
c. CHC d. Village

106. ASHA worker works for ..... Population
a. 3000 b. 1000
c. 5000 d. 400

107. In which five year plan programme ASHA was introduced?
a. 8th five year plan b. 9th five year plan
c. 10th five year plan d. 11th five year plan

108. How much population is covered by one Anganwadi Unit?
a. 500 b. 800
c. 1000 d. 1200

109. Population covered in sub-center is
a. 3000-5000 b. 20,000-30,000
c. 80,000-1,20,000 d. >1,20,00

110. Population covered by primary health center in plain area is
a. 3000-5000 b. 30,000
c. 80,000- 1,20, 000 d. >1,20,000

111. How much population is covered by one PHC in hilly and tribal area?
a. 5000-15000 b. 20000
c. 25000 – 30000 d. 30000 – 40000

112. Population covered in community health center is:
a. 5000-6000 b. 20,000-30,0000
c. 80,000- 1,20,000 d. >1,20,000

113. Other name of multipurpose worker's committee is
a. Bhore committee b. Kartar Singh committee
c. Mudaliar committee d. Mukerji committee

114. Other name of 'health survey and development committee' is
a. Bhore committee
b. Karthar singh committee
c. Mudaliar committee
d. Mukerji committee

a. Bhore committee
b. Karthar Singh committee
c. Mudhaliar committee
d. Mukerji committee

116. Chadah committee was appointed in the year ____
a. 1960 b. 1963
c. 1965 d. 1968

117. Drug-kit B is given at
a. PH b. Subcenter
c. CH d. FRU level

118. All of the following are the functions of PHC except
a. Providing medical care b. Performing surgeries
c. Health education d. Referral services

119. Community mental health services does not involve
a. Early diagnosis
b. Treatment with modern psychoactive drugs
c. Psychosurgery
d. Referral services

120. Primordial prevention means
a. Prevention of complications
b. Prevention of infections
c. Preventions of emergence of risk factors
d. None of the above

EPIDEMIOLOGY

121. A village was divided into 5 sub-groups, for a survey. The sample was drawn by selecting people randomly from these subgroups. What type of sampling was done?
a. Simple random sampling
b. Stratified random sampling
c. Cluster sampling
d. Systematic random sampling

122. In a research study, first schools are sampled, then sections and finally student. This type of sampling is known as:
a. Stratified sampling
b. Simple random sampling
c. Cluster sampling
d. Multi stage sampling

123. Stratified sampling is ideal for
a. Hetrogeneous data b. Homogenous data
c. Both d. None

124. Simple random sampling is ideal for
a. Vaccinated people
b. Heterogeneous population
c. Homogenous population
d. All of the above

125. Outbreak of disease in the community in excess the normal expectation is: *(RAK MSc 2018)*
a. Epidemic b. Pandemic
c. Sporadic d. Endemic

Explanation:
- **Epidemic-** Epidemic is the outbreak of particular diseases in the community in excess form from the normal expectation.
- **Pandemic-** Pandemic is the outbreak of the disease from one country to another country means all over the world.
- **Sporadic-** Sporadic is the prevalence at intervals of a single particular disperses case of a disease.
- **Endemic-** A continuous presence of a particular disease with in a particular geographical area is called as endemic.

126. The agent factor responsible for the occurrence of a disease includes: *(AIIMS Raipur Grade II 2017)*
A. Biological and physical agents
B. Mechanical and chemical agents
C. Vertical and inoculation agents
D. Nutrient and living agents
a. A, B, C b. B, C, D
c. A, B, D d. A, C, D

Explanation: According to Beings theory factors responsible for occurrence of disease are Biological factors, behavioural factors, environmental factors as physical, chemical and biological aspects of environment, immunological factors, nutritional factors, Genetic factors, social factors, spiritual factors, service factors related to various aspects of health services.

127. The following are the data collection techniques used in the community assessment, EXCEPT *(AIIMS Raipur Grade II 2017)*
a. Making appropriate judgments
b. Organization and comparisons of problem
c. Effective communication
d. Investigation and measurements

Explanation: There are various techniques used in community assessment for collection of data includes questionnaires, focus group, interviews, case studies, observations. Organization and comparisons of problems is not a data collection technique but a method of analysis.

128. Providing health education about the environmental hygiene to the community people is an example of *(AIIMS Raipur Grade II 2017)*
a. Social communication
b. Structural communication
c. Therapeutic communication
d. Formal communication

Explanation: Social communication or pragmatics is the way in which children uses language with social situations. Structural communication is an instructional approach which provides a stimulated dialogue between author of instructional materials and students. Therapeutic communication is the face to face process of interacting that focuses on advancing physical and emotional wellbeing of patient. Formal communication is exchange of official information vertically or horizontally.

129. The constant presence of infection in a given geographical area without any external input is known as.....
a. Epidemic
b. Endemic
c. Pandemic
d. Sporadic

Explanation: An infection is said to be endemic in a population when that infection is maintained in the population without the need for external inputs. Epidemic is the rapid spread of infectious disease to a large number of people in a given population within a short period of time.
- A pandemic is an epidemic of world-wide proportions.
- Sporadic refers to diseases that is occurring at irregular intervals or only in a few places

Scanned with CamScanner

130. Sporadic means:
a. Sudden outbreak of disease in a given area.
b. Infectious disease that has spread through human populations across a large region; for instance multiple continents, or even worldwide
c. Disease occurs at irregular intervals or only in few places in scattered or isolated manner
d. Constant presence of infection in a given geographical area without any external input

Explanation: Option A is epidemic, Option B is pandemic, Option C is sporadic, Option D is endemic

131. Outbreak of disease in bird population is:
a. Epidemic
b. Endemic
c. Zoonoses
d. Epornithic

Explanation: Outbreak of disease in bird's population is epornithic. Zoonoses means a disease which transmits from animal to human being. Epidemic is the sudden outbreak of disease. Endemic means constant presence of infection in a geographical area without external input.

132. The continuous, systematic collection, analysis and interpretation of health-related data needed for the planning, implementation, and evaluation of public health practice is known as:
a. Incidence
b. Monitoring
c. Surveillance
d. Community assessment

Explanation:
- The given sentence is the definition of surveillance. Incidence is the measure of the probability of occurrence of a given medical condition in a population within a specified period of time.
- Community based monitoring is a form of public oversight driven by local information needs and is not systematic. A community assessment is basically a description of a community and its people.

133. Submerged portion of the iceberg represents:
a. Undiagnosed cases
b. Clinical cases
c. Dead cases
d. Treated cases

Explanation: The submerged portion of the iceberg represents the hidden mass of the disease (e.g., subclinical cases, carriers, undiagnosed cases). The floating tip represents what the physician sees in his practice/chamber/hospital etc.

134. Quarantine stands for:
a. Time period between infection and confirmatory diagnosis
b. Time period between diagnosis and initiation of treatment
c. Time period between infection and multiplication of organism
d. Longest incubation period

Explanation: A period of time during which a vehicle, person, or material suspected of carrying a contagious disease is detained at a port of entry under enforced isolation to prevent disease from entering a country. There is restriction on healthy contacts. Time of restriction is a longest incubation period.

135. Father of epidemiology is:
a. John Snow
b. Joseph Lister
c. Karl Landsteiner
d. Robert Hook

Explanation: John Snow is the father of epidemiology.

136. Sentinel surveillance is used to .....
a. Know the total number of affected people
b. Know the hidden cases in the community
c. Compare the incidence
d. Measure incidence and prevalence

Explanation: Public health surveillance is the continuous, systematic collection, analysis and interpretation of health-related data needed for the planning, implementation, and evaluation of public health practice.

There are 3 types of surveillance.
1. Sentinel Surveillance.
2. Accelerated Disease Control - National Active.
3. National Passive.

A sentinel surveillance system is used when high-quality data are needed about a particular disease that cannot be obtained through a passive system.

Active surveillance involves visiting health facilities, talking to health-care providers and reviewing medical records to identify suspected cases of disease under surveillance.

Regular reporting of disease data by all institutions that see patients (or test specimens) and are part of a reporting network is called passive surveillance.

137. The constant presence of a disease or infection within a given geographic area is called as:
a. Pandemic
b. Sporadic
c. Epidemic
d. Endemic

Explanation: A disease that is endemic is found in a certain geographic region or in a specific race of people.

138. The screening of the immigrants for infectious disease is:
a. Mass screening
b. Prescriptive screening
c. Prospective screening
d. Selective screening

Explanation: Screening of immigrants for infection is known as prospective screening.

139. Tear out by roots is the literal meaning of:
a. Elimination
b. Eradication
c. Isolation
d. Transmission

Explanation: Tear out by roots means eradication of the disease.

140. Robert Koch discovered the etiologic agent of *(Banaras HU 2015)*
a. Typhoid
b. Small pox
c. Tuberculosis
d. Polio

141. Constant presence of a disease within a geographic area: *(Kerala PSC, Nov 2014)*
a. Epidemic
b. Endemic
c. Sporadic
d. Pandemic

142. A person with no sign of disease but may transmit, it is called: *(ESIC Chennai May 2012)*
   a. An allergic person
   b. Immune person
   c. A resistant person
   d. A carrier person

143. Following is a contagious disease: *(ESIC Chennai May 2012)*
   a. Filaria
   b. Tuberculosis
   c. Malaria
   d. Hookworm infestation

144. Decrease in the incidence of a disease to a level where it ceases to be a public health problem is: *(RRB Feb 2012)*
   a. Elimination
   b. Control
   c. Surveillance
   d. Eradication

145. Basic unit of the society *(RRB Feb 2012)*
   a. Individual
   b. Family
   c. PHC
   d. County

146. HIV prevalence can be assessed by
   a. Sentinel surveillance
   b. Active surveillance
   c. Central register
   d. State register

147. All are true about incidence EXCEPT
   a. Denominator includes population at risk
   b. Numerator includes number of new cases
   c. Does not include unit of time
   d. It is a rate

148. Number of current cases (new and preexisting) at a specified point in time divided by population at the same specified point in time is referred as
   a. Point prevalence
   b. Period prevalence
   c. Lifetime prevalence
   d. Prevalence estimate

149. Number of current cases (new and preexisting) over a specified period of time divided by average or mid-interval population
   a. Point prevalence
   b. Period prevalence
   c. Lifetime prevalence
   d. Total prevalence

150. The number new cases occurring in a defined population during a specified period of time is known as
   a. Incidence
   b. Point prevalence
   c. Period prevalence
   d. Current prevalence

151. Time interval between primary and secondary case is known as
   a. Extrinsic incubation period
   b. Intrinsic incubation period
   c. Serial interval
   d. Window period

152. Epidemiological triad comprise of all expect:
   A Host
   b. Environmental factor
   c. Agent
   d. Investigator

153. Which of the following is the most logical sequence?
   a. Impairment – Disease – Disability – Handicap
   b. Disease –Impairment – Disability – Handicap
   c. Disease –Impairment – Handicap – Disability
   d. Disease– Handicap –Impairment – Disability

154. 'Silent epidemic' of the century is
   a. Coronary artery disease
   b. Chronic liver disease
   c. Chronic obstructive lung disease
   d. Alzheimer's disease

155. Time between infection and maximum infectivity is known as
   a. Incubation period
   b. Serial interval
   c. Generation time
   d. Communicable period *(AIIMS 1999)*

156. Missed cases are identified by
   a. Active surveillance
   b. Passive surveillance
   c. Sentinel surveillance
   d. Prevalence rate

157. Blood banks get permission to operate from:
   a. NACO
   b. ICMR
   c. DGHS, Ministry of health
   d. Drug controller general of India

VITAL STATISTICS

158. In which Century the Vital Statistics was originated? *(Safdarjung NO 2018)*
   a. Eighteen Century
   b. Seventeen Century
   c. Nineteen Century
   d. Sixteen Century

Explanation: The origin of vital statistics begins at early stages from 1854 with named James Stark for Register House in Edinburgh city associated with the Scottish Registration Act. He created the concept of vital statistics in 1854.

159. Vital statistics include the following EXCEPT *(ESIC 2019)*
   a. Life expectancy
   b. Birth rate
   c. Education rate
   d. Morbidity and mortality statistics

Explanation: Vital statistics includes life expectancy, birth rate, death rate and other morbidity and mortality statistics. Education rate or literacy rate are considered as demographic data.

160. The newborn birth to be registered in India within: *(RAK MSc 2018)*
   a. 7 days
   b. 21 days
   c. 30 days
   d. 45 days

161. The female health worker (MPW) does not do: *(RAK MSc 2018)*
   a. Distribution of condom
   b. Birth and death registration
   c. Malaria surveillance
   d. Supervision of health volunteer

162. Denominator while calculating maternal mortality rate is:
   a. Total number of deliveries
   b. Total number of live birth
   c. Total number of maternal death
   d. Midyear population

Explanation: MMR = total number of female death due to complications of pregnancy, child birth or within 42 days of delivery from puerperal causes in an area during a given year/total number of live birth

163. Commonest cause of neonatal morbidity in India is: *(RRB SSNE 2015)*
   a. Diarrheal diseases
   b. Birth injuries
   c. Congenital anomalies
   d. Prematurity and low birth weight

164. The commonest cause of maternal morbidity in India is: *(RRB SSNE 2015)*

a. Anemia
b. Hemorrhage
c. Abortion
d. Sepsis

165. The major cause of infant mortality rate in India is: *(LNJP H D 2012)*

a. Diarrhea
b. Respiratory infection
c. Congenital anomalies
d. Prematurity

Ref: K. Part. Social and Preventive Medicine. 24th Ed. Pg. 605.

Explanation: The most common cause of Infant Mortality Rate in INDIA is in Following order

- Low Birth Weight - 57%
- Respiratory infection - 17%
- Congenital malformation - 5%
- Diarrheal diseases - 4%

Among the given options, Respiratory infection is the most common cause of Infant mortality in India.

166. Sex ratio is defined as: *(AIIMS-BBS SNO 2019)*

a. The number of female individuals for every 1000 male individuals
b. The number of male individuals for every 1000 female individuals
c. The number of female individuals for every 100 male individuals
d. The number of male individuals for every 100 female individuals.

167. For calculation of incidence denominator is taken as

a. Midyear population
b. Population at risk
c. Total number of cases
d. Total number of deaths

168. Kaplan Meier method is for?

a. Survival
b. Incidence
c. Prevalence
d. Frequency

169. Prevalence is a

a. Rate
b. Ratio
c. Proportion
d. Mean

170. Which of the following used to estimate the morbidity in a community?

a. Prevalence rate
b. Active surveillance
c. Passive surveillance
d. Sentinel surveillance

171. Denominator in Crude Birth Rate:

a. Mid-year population
b. Total number of birth
c. 1000 Live birth.
d. Total number of live birth in a year

172. True about General fertility rate is

a. Indicator complete family size
b. Measure of fertility
c. Not better than crude birth rate
d. All of the above

173. General fertility rate (GFR) is:

a. Number of live birth in women in the reproductive age-group 15-44 years
b. Number of live birth in unmarried women in the age group 15-44 years
c. Number of children a women would have if she were to pass through her reproductive years
d. Number of abortions, usually per 1000 women of child bearing age

174. Which of the following fertility rates include mortality in it:

a. TFR
b. GFR
c. NRR
d. GRR

175. Dependency ratio numerator is:

a. Less than 15 years and more than 65 years.
b. Mid-year population
c. Less than 15 years
d. More than 65 years

176. The denominator used to calculate literacy rate of Indian population is:

a. Population aged 18 year or more
b. Population aged 7 year or more
c. School going population
d. Total midyear population

177. Maternal mortality rate definition includes all except

a. Death in pregnancy
b. Death during pregnancy
c. Death within 6 weeks post delivery
d. Death within 6 months post delivery

178. Maternal Mortality Ratio is calculated by:

a. Maternal deaths/ live birth
b. Maternal deaths/ 1000 live births
c. Maternal deaths/ 100000 live births
d. Maternal deaths/ 100000 populations

179. Maternal Mortality Ratio (MMR) is expressed as

a. Per 100,000 live births
b. Per 1000 live births
c. Per 100,000 births
d. Per 1000 population

180. About Maternal Mortality Rate which of the following is true?

a. It is a rate not ratio
b. Numerator includes complications related death up to 42 days after pregnancy
c. Denominator includes stillbirth and abortions
d. Expressed as rate per 1000 live birth

181. Neonatal death is defined as death of a live born neonate –

a. In the first 28 days after birth
b. In the first 3 months of life
c. In the first 6 months of life
d. In the first year of life

182. Most common cause of infant mortality in India is

a. Low birth weight
b. Respiratory disease
c. Diarrheal disease
d. Congenital anomalies

Ref: K. Part. Social and Preventive Medicine. 24th Ed. Pg. 605.

Explanation: The most common cause of Infant Mortality Rate in INDIA is in Following order

- Low Birth Weight - 57%
- Respiratory infection - 17%
- Congenital malformation - 5%
- Diarrheal diseases - 4%

183. All the following are the parts of Infant mortality, EXCEPT

a. Early neonatal mortality
b. Perinatal mortality
c. Post neonatal mortality
d. Late neonatal mortality

Scanned with CamScanner

184. In a population of 5000, with birth rate of 30/1000 population, 15 children died during first year life in a year: of these 9 died during first month of life. What is the infant mortality rate in this population?

a. 100 b. 60
c. 150 d. 45

Explanation:

Birth rate = 30/1000
In 5000 population, no. of live birth= (30/1000) × 5000 = 150
No. of death before 1 year of age = 15
IMR = (No. of death of children less than one year of age/No. of live birth in the same eyar) × 1000
IMR = (15/150) × 1000 = 100

185. Infant mortality rate (IMR) is defined as number or deaths of infants under age one per:

a. 1000 births
b. 1000 live birth
c. 1000 midyear population
d. 1000 women of reproductive age group

186. To achieve net reproduction rate of 1, the couple protection rate should be? *(RRB Feb 2012)*

a. 50% b. 65%
c. 55% d. 60%

187. Annual Under five deaths globally reported are:

a. 6 million b. 8 million
c. 10 million d. 12 million

188. Physical quality of life is a consolidated index of

a. MMR, IMR and life expectancy at age 5 years
b. Infant mortality, life expectancy at age one and literacy
c. IMR, MMR and life expectancy at age 14 years
d. MMR, NRR and Life expectancy at age of 60 years

189. Perinatal mortality rate includes:

a. 37 weeks to 1st week after birth
b. 28 weeks to 1st week after birth
c. 20 weeks to 1st week after birth
d. Before preterm labor

190. Still birth rate includes fetal death after –

a. 20 weeks b. 24 weeks
c. 28 weeks d. 32 weeks

191. All of the following are common cause of postneonatal infant mortality in India, except –

a. Tetanus
b. Malnutrition
c. Diarrheal diseases
d. Acute respiratory infection

192. Infant mortality rate is no. of infant death per:

a. 1000 total birth
b. 1000 live birth
c. 1000 pregnancy
d. None

193. Present IMR in India as per the latest data is

a. 34 per 1000 live births
b. 36 per 1000 live births
c. 39 per 1000 live births
d. 40 per 1000 live births

194. Incidence of chromosomal abnormalities in India is

a. 1- 2 per 1000 live births
b. 2-3 per 1000 live births
c. 5-6 per 1000 live births
d. 8-9 per 1000 live births

195. Degree of freedom for 2 × 2 contingency table is:

a. 1 b. 0
c. 2 d. 4

196. Chi square test is for

a. Standard error of mean
b. Standard error of proportion
c. Difference between population means
d. Difference between population proportion

197. Not required for Chi square test

a. Null hypothesis
b. Degree of freedom
c. Means in different groups
d. Proportion in different groups

198. Degree of freedom of contingency table with 3 rows and 6 columns is

a. 2 b. 3
c. 10 d. 18

199. Chi square test 5 rows / 4 columns, degree of freedom is

a. 9 b. 12
c. 16 d. 20

200. If the distribution of Intra-ocular pressure (IOP) seen in 100 glaucoma patients has an average 30 mm with a SD of 1.0, what is the lower limit of the average IOP that can be expected 95% of times?

a. 29 b. 26
c. 32 d. 259

201. Which is the best distribution to study the daily admission of head injury patients in a trauma care center?

a. Normal distribution b. Binomial distribution
c. Uniform distribution d. Poisson distribution

202. In the left skewed curve, true statement is

a. Mean = median b. Mean < Mode
c. Mean > mode d. Mean = mode

203. For a negatively skewed data mean will be

a. Less than median b. More than median
c. Equal to median d. One

204. Confidence limit is calculated by using

a. Mean and standard error
b. Mean and standard deviation
c. Median and standard deviation
d. Median

205. A Child's weight for height is more than 2SD of men, and his height for age is less than 2SD of mean. He is classified as:

a. Normal
b. Stunted
c. Wasted
d. Wasted and stunted

206. In WHO "Road to Heath" chart, upper and lower limit of represents

a. 30 percentile for boys and 3 percentile for girls
b. 50 percentile for boys and 3 percentile for girls
c. 30 percentile for boys and 5 percentile for girls
d. 50 percentile for boys and 5 percentile for girls

207. If the birth weight of each of the 10 babies born in a hospital in a day is found to be 2.8 kg, then the standard deviation of this sample will be

a. 2.8 b. 0
c. 1 d. 0.28

208. Most reliable measures of central tendency in a normally contributed data is:

a. Mean b. Median
c. Mode d. Standard deviation

Scanned with CamScanner

209. Mean, Median and Mode are –
a. Measures of dispersion
b. Measures association between two variables
c. Test of significance
d. Measures of central tendency

210. Most frequently occurring value in a group of data: *(TNPSC 2015)*
a. Mean b. Mode
c. Median d. Standard deviation

211. Which type of variable "Social Class" is, if it has four categories-I to V and Class I is the highest social class and Class V is the lowest?:
a. Dichotomous b. Nominal
c. Ordinal d. Interval

212. A physician, after examining a group of patients of a certain disease, classifies the condition of each one as 'Normal', 'Mild', 'Moderate' or 'Severe'. Which one of the following is the scale of measurement that is being adopted for classification of the disease condition?
a. Normal b. Interval
c. Ratio d. Ordinal

213. In a study following interpretation are obtained: Satisfied, Very satisfied, Dissatisfied. Which type of scale is this?
a. Nominal b. Ordinal
c. Interval d. Ratio

214. All of the following are example of nominal scale except:
a. Race b. Sex
c. Body weight d. Occupation

215. Histogram is used to present which kind of the data
a. Nominal
b. Continuous
c. Discrete
d. Any of above

216. The best graphic representation of frequency distribution of data gathered of a continuous variable is:
a. Simple bar b. Histogram
c. Line diagram d. Multiple bar

217. Trends can be represented by
a. Scatter diagram b. Bar diagram
c. Line diagram d. Pie chart

IMMUNIZATION

218. A clinic nurse prepares to administer an MMR (Measles, Mumps, Rubella) vaccine to a five-year-old. The nurse administers this vaccine: *(RAK MSc 2018)*
a. Intramuscularly in the anterolateral aspect of the thigh
b. Intramuscularly in deltoid muscle
c. Subcutaneously in the outer aspect of the upper arm
d. Subcutaneously in the gluteal muscle

Explanation: Measles, mumps, and rubella virus vaccine is a live vaccine to prevent infection of measles, mumps, and rubella viruses.

- The dosage for MMR is 0.5 mL. Vaccine is administered by the subcutaneous route.
- The minimum age for MMR is in 12 months of age.
- The second dose of vaccine is given at 4 to 6 years of age.
- The minimum gap between MMR doses is 4 weeks.
- The recommended injection site in small children is the anterolateral aspect of the thigh and for older children it is in the posterior (outer) triceps of the upper arm.

219. All of the following are the role of community nurse in school Health program, EXCEPT *(ESIC 2019)*
a. Assist In school medical examination and follow up
b. Assist in screening physical mental and other special examination of children in school
c. Assist in communicable disease control
d. To provide immunization to the children

Explanation: To provide immunization to the children is not the responsibility of the school health nurse in school health program. The immunization is covered in the anganwadi program, a day in the week is fixed for immunization.

220. Immunity acquired through natural infection is:
a. Artificial active immunity
b. Herd immunity
c. Natural Active immunity
d. Specific human immunity

Explanation: Immunity that occurs after the person is exposed to a specific disease is called as natural active immunity e.g. Chickenpox. If immunity developed after immunization then it is known as artificial active immunity.

221. BCG is .....
a. Live attenuated vaccine b. Inactivated vaccine
c. Killed vaccines d. Toxoids

Explanation: BCG vaccine is line attenuated vaccine, which provides protection against Tuberculosis.

222. The vaccine that leaves permanent scar in babies is:
a. Measles b. Pentavalent
c. DPT d. BCG

Explanation: Administering BCG vaccine produces a permanent scar. BCG immunization forms a superficial abscess, which begins 2 weeks after immunization. The abscess heals without treatment, but with the formation of a permanent scar.

223. Influenza – A (H1N1) vaccine was approved in the year:
a. 2009 b. 2010
c. 2012 d. 2004

Explanation: Vaccine against H1N1 influenza was approved in the year of 2009.

224. Smallpox was eradicated from the world in the year .....:
a. 1980 b. 1981
c. 1982 d. 1983

Explanation: In 1980 smallpox was eradicated from the world.

225. Frozen DPT vaccine should be:
a. Discarded
b. Rolled between palms until it reaches room temperature
c. Immersed in hot water
d. Kept out until it reaches room temperature

Explanation: Frozen DPT vaccine should be discarded.

226. Polyvalent vaccine means.....
a. Single strain of single microorganism
b. Two or more strains of same microorganism
c. Antibody of single microorganism
d. None of the above

Ans.

209.	d
210.	b
211.	c
212.	d

220.	c
221.	a
222.	d
223.	a
224.	a
225.	a
226.	b

Scanned with CamScanner

Explanation:

- Mixed viruses are also called as 'Polyvalent vaccines'. If vaccine is prepared from more than two strain of same species then it is known as polyvalent.
- A **monovalent** vaccine is designed to immunize against a single antigen or single microorganism. A **multivalent or polyvalent** vaccine is designed to immunize against two or more strains of the same microorganism, or against two or more microorganisms.

227. Anti-rabies vaccine is made from:

a. Wild viruses
b. Live attenuated viruses
c. Mixed viruses
d. Killed viruses

Explanation: Anti-rabies vaccine is an active immunizing agent used to prevent infection caused by the rabies virus. Anti-rabies vaccine is a type of killed/inactivated vaccine.

228. Which of the following vaccine is most sensitive to heat?

a. Pertussis vaccine
b. Typhoid vaccine
c. Polio vaccine
d. BCG vaccine

Explanation: OPV is the most heat sensitive vaccine and have temperature sensitive label called as vaccine vial monitor (VVM). Since this vaccine is heat sensitive it is stored in freezer compartment.

229. In cold chain process the walk in cold rooms, stores vaccine up to .....months

a. 4 months
b. 6 months
c. 3 months
d. 1 month

Explanation: In walk in cold room vaccines can be stored up to 3 months.

230. Route of administration of Hepatitis B Vaccine is.....

a. Intradermal
b. Subcutaneous
c. Intramuscular
d. Intravenous

Explanation: Hepatitis B vaccine is administered via intramuscular route in the deltoid region of arm. BCG vaccine is administered through intradermal route. MMR vaccine is administered through Subcutaneous route. Vaccines should not be administered Intravenously.

231. Expansion of BCG vaccine is:

a. Bacillus Calmette-Guérin
b. Bacillus Calmette-Guereo
c. Bacilli Calmette-Guerreror
d. Bacilli Calmette-Gurein

Explanation: Camille Guerin and Albert Calmette produced BCG vaccine at Pasteur Institute in Paris.

232. BCG vaccine is available in powder form. It is reconstituted with _____

a. Distilled water
b. Normal saline
c. 5% Dextrose solution
d. Ringer lactate solution

Explanation: Normal saline 1 mL is used to dilute BCG vaccine, it is available along with the vaccine

233. Measles vaccine are stored in .....part of refrigerator.

a. Chilled tray
b. Deep freezer
c. Tray below the freezer
d. Shelves in the door

Explanation: Measles and Polio vaccines are very sensitive to heat and maintain their potency at 2-8 degree Celsius. Hence it is stored in deep freezer.

234. Adjuvant used in DPT vaccine is.....

a. Zinc phosphate
b. Aluminum phosphate
c. Aluminum hydroxide
d. Both B and C

Explanation: Aluminum phosphate and aluminum hydroxide both are used as adjuvant in vaccine

235. Which of the following vaccine is contraindicated during pregnancy?

a. MMR
b. Hepatitis B
c. DPT
d. DT

Explanation: MMR is a live vaccine, if it is given during pregnancy it can affect the fetus. So it is contraindicated during pregnancy.

236. Herd immunity is not useful in prevention of.....

a. Polio
b. Rubella
c. Tetanus
d. Measles

Explanation: Heard immunity is a form of indirect protection from infectious disease that occurs when a large percentage of a population has become immune to an infection, thereby providing measure of protection for individual who are not immunized. Herd immunity does not apply to all diseases, just those that are contagious meaning that they can be transmitted from one individual to another. Tetanus for example, is infectious but not contagious, so herd immunity does not apply.

237. Administration of readymade antibody creates: *(AIIMS 2010)*

a. Active acquired immunity
b. Passive acquired immunity
c. Active natural immunity
d. Passive natural immunity

Explanation: Artificially acquired passive immunity is a short-term immunization by the injection of antibodies, such as gamma globulin, that are not produced by the recipient's cells.

238. Measles vaccine is: *(ESI 2009)*

a. Live viral vaccine
b. Live bacterial vaccine
c. Killed vaccine
d. Toxoid

Explanation: Measles is a live viral vaccine. Measles mumps rubella vaccine MMR vaccine is a live attenuated viral vaccine used to induce immunity against measles, mumps and rubella.

239. All the vaccines are in national immunization schedule. EXCEPT

a. BCG
b. Pentavalent
c. Pneumococcal
d. OPV

Ans.

227. d
228. c
229. c
230. c
231. a
232. b
233. b
234. d
235. a
236. c
237. b
238. a
239. c

Scanned with CamScanner

Explanation: According to the National immunization schedule BCG is given at birth.

- **OPV:** Birth dose for institutional deliveries, Primary three doses at 6, 10 and 14 weeks and one booster dose at 16-24 months of age. Given orally. Pentavalent (containing Hib+DPT+Hep B) is given at 6, 10 and 14 weeks of age. **(Pentavalent vaccine** introduced in 8 states i.e. Tamil Nadu, Kerala, Haryana, J and K, Gujarat, Karnataka, Goa and Puducherry.)

Pneumococcal vaccine is not a part of national immunization schedule.

240. Universal immunization program (UIP) was launched in the year of.....:

a. 1974 b. 1978
c. 1985 d. 1992

Explanation: Expanded program of immunization launched by WHO in May 1974. It is launched in India in January 1978. EPI emphasis on children <5 yr and pregnant women. UIP launched on November 19, 1985. UIP emphasize on children <1 yr of age.

241. Live vaccine is:(Karnataka PSC)

a. DPT
b. Hepatitis-B
c. TT
d. BCG

Explanation: BCG is a live attenuated vaccine. Other live vaccines includes polio (sabin), MMR, measles vaccine. Live, attenuated vaccines contain a version of the living microbe that has been weakened in the lab so it can not cause disease.

242. Which of the following vaccine is contraindicated in pregnancy?

a. Rubella b. Measles
c. Varicella d. All of the above

Explanation: Live vaccines are contraindicated in pregnancy. Above mentioned vaccines are live vaccines and all are contra indicated in pregnancy.

243. Measles vaccine is administered by:

a. Intradermal route
b. Intravenous route
c. Oral route
d. Subcutaneous route

Explanation: Route of choice for administering measles is subcutaneous route.

244. A killed vaccine is: *(Safdarjung NO 2018)*

a. OPV
b. BCG
c. MMR
d. Rabies

245. Which of the following diseases are known as six killer diseases in children?

a. Whooping cough, Yellow fever, Hepatitis, TB., Smallpox, Tetanus
b. Diphtheria, Whooping cough, Measles, Polio, TB. Tetanus
c. Diphtheria, Yellow fever, TB, Leprosy, Malaria, Cholera
d. Whooping cough, Diphtheria, Malaria, Smallpox, TB. Chickenpox.

Explanation: These six disease are killer diseases, national immunization program also aim at reducing the incidences of these disease.

246. Cold Chain System is the process of preserving ---------

a. Blood specimen for malarial parasite
b. Chemotherapeutic agents
c. Sputum specimens
d. Vaccines

Explanation: Cold chain transport system is used to store and transport vaccine from site of manufacture to site of administration without losing potency of the vaccine.

247. Which is the recommended site of administration of DPT in infants?

a. Gluteal muscles
b. Deltoid muscles
c. Lateral aspect of mid-thigh
d. Forearm

Explanation: Lateral aspect of mid-thigh in infant is the safest area for administering vaccine. It will promote vaccine absorption as well as minimize the chances of nerve injury.

248. What reaction might occur due to Tetanus vaccine?

a. Febrile seizures b. Brachial neuritis
c. Hypotonic d. Encephalopathy

Explanation: Brachial neuritis is the reaction occurring towards tetanus vaccine.

249. Pulse Polio Immunization was introduced in: *(Safdarjung NO 2018)*

a. 1995
b. 1999
c. 2000
d. 2001

250. System of storage and transport of vaccines at low temperature from the manufacturer to the vaccination site is called: *(Safdarjung NO 2018; LNJP H D 2012; DSSSB PHN, 2015)*

a. Deep small freezers b. Cold room
c. Cold chain d. Deep freezers

251. The Inactivated Polio Vaccine (IPV) should be preserved at: *(LNJP H D 2012)*

a. 2 to 8°C b. Below 0°C
c. −2 to −8°C d. 0 to 4°C

252. Viral proteins called interferons helping innate immunity are classified under: *(Kerala PSC, Nov 2014)*

a. Physical barriers b. Physiological barriers
c. Cytokine barriers d. Cellular barriers

253. Which among the following vaccines is stored in the freezer? *(Kerala PSC, Nov 2014)*

a. Measles b. Typhoid
c. DPT d. TT

254. Salk vaccine is given for the prevention of: *(Kerala PSC, Nov 2014)*

a. Measles b. Mumps
c. Polio d. Rabies

255. Immunization of DPT should be administered by: *(Kerala PSC, Nov 2014)*

a. Intradermal b. Intramuscular
c. Subcutaneous d. Intravenous

Ans.

240. c
241. d
242. d
243. d
244. d
245. b
246. d
247. c
248. b
249. a
250. c
251. a
252. c
253. a
254. c
255. b

Scanned with CamScanner

256. The age of administration of measles vaccine is: *(Staff Nurse G II 2014, LNJP H D 2012)*
a. 18 months b. 6 months
c. 3 months d. 9 months

257. Dose of BCG vaccination is: *(JIPMER 2012)*
a. 0.5 mL s/c b. 0.5 mL I/D
c. 0.1 mL I/D d. 1 mL I/M

258. B.C.G. vaccine is given to protect the child against: *(ESIC Chennai May 2012)*
a. Diphtheria b. Tuberculosis
c. Tetanus d. Typhoid

259. Example of a live vaccine are: *(LNJP H D 2012)*
a. Hepatitis B b. Rabies
c. Measles d. Typhoid vaccine

260. Varicella vaccine is
a. Killed vaccine b. Live attenuated vaccine
c. Immunoglobulin d. None

261. Small pox vaccine was invented by ?
a. Louis Pasteur b. Edward Jenner
c. Paul Eugene d. John Snow

262. Cold Chain System is the process of
a. Storing blood specimen for MP and MF
b. Refrigerating chemotherapeutic agents
c. Storing sputum specimens
d. Preserving vaccines

263. ILR is designed for
a. Storing vaccines
b. Incubating culture medias
c. Sterilization of rubber gloves
d. Disinfection of sharp materials

264. ILR is a part of
a. Sterilization procedure b. Disinfection procedure
c. Cold chain d. Drug transport

265. Which of the following is a diarrheal preventive vaccine?
a. DPT vaccine b. Rotavirus vaccine
c. MMR vaccine d. Hepatitis B

266. Salk vaccine is a
a. Live vaccine b. Live attenuated vaccine
c. Killed vaccine d. Toxoid

267. OPV is a
a. Live vaccine b. Live attenuated vaccine
c. Killed vaccine d. Toxoid

268. Which of the following is a live attenuated vaccine?
a. BCG b. DPT
c. Hepatitis B d. Tetanus Toxoid

269. At what temperature should polio vaccine be stored?
a. 0 degree Celsius
b. 2-5 degree Celsius
c. 15 degree Celsius
d. -20 degree Celsius

270. Which vaccine must be stored in the freezer compartment?
a. DPT b. Polio
c. BCG d. TT

271. Which of the following vaccine should be stored in the freezer compartment?
a. Polio b. Measles
c. DPT d. Both a and b

272. The route of administration of live attenuated polio vaccine is
a. Intradermal route b. Intramuscular
c. Oral route d. Subcutaneous route

273. First dose of measles vaccine is administered at
a. 6 weeks b. 3 months
c. 6 Months d. 9 months

274. Site recommended for administration of DPT in infants is
a. Deltoid
b. Lateral aspect of thigh
c. Anterior thigh
d. Forearm

275. Which vaccine is contraindicated in pregnancy
a. Rubella b. Diphtheria
c. Tetanus d. Hepatitis B

276. Which are the six killer diseases in children?
a. Whooping cough, Yellow fever, Hepatitis, Mumps, Smallpox, Tetanus
b. Diphtheria, Whooping cough, Measles, Polio, Tuberculosis, Tetanus
c. Tuberculosis, Diphtheria, Malaria, Leprosy, Cholera, Pertussis
d. Whooping cough, Diphtheria, Diarrhea, chicken pox, Tuberculosis, Smallpox.

277. Test used to identify the immunity status against diphtheria is
a. Schick test b. Widal test
c. Mantoux test d. Allen's test

278. The first dose of MMR vaccine is given at the age of :
a. At birth b. 6 month
c. 12-15 months d. 9 months

Explanation: As per the Indian Academy of Pediatrics (IAP) Recommended Immunization Schedule (2014), the first dose of MMR is given at the age of 9 months. MMR vaccine is not a part of the national immunization schedule of India. As per National Immunization Schedule in India, Measles /MR 1st Dose is given at 9-12 months (can be given till 5 years of age).

279. Which of the following vaccines can result a Thrombocytopenia
a. MMR vaccine b. Typhoid vaccine
c. Influenza vaccine d. HiB vaccine

280. MMR vaccine provide protection against all, EXCEPT *(RPSC NG-II-2007)*
a. Mumps b. Meningitis
c. Rubella d. Rubeola

281. At the Primary Health Center (PHC) level, vaccines are stored in the
a. Cold box b. Deep freezer
c. Ice lined refrigerator d. Walk in cold room

282. Under UIP programme which of the following vaccines is administered at 9 months of age?
a. DPT-1 b. BCG
c. Measles d. Hepatitis B-1

283. Zero dose of polio vaccine is given _____
a. Before giving DPT
b. At birth
c. When child is having diarrhea
d. When child is having polio

284. Which of the following statements regarding live vaccines is false:
a. Two live vaccines cannot be administered simultaneously
b. Booster doses are not required when live vaccines are administered
c. Single dose gives lifelong immunity
d. Live vaccine contains both major and minor antigens

Ans.

256.	d
257.	c
258.	b
259.	c
260.	b
261.	b

Scanned with CamScanner

285. All of the following are true about Herd immunity for infectious diseases except:
a. Herd immunity is constant
b. Depends on clinical and sub clinical infections.
c. Influenced by immunization.
d. Depends on presence of alternative host

286. Which of the following is true about BCG vaccination? :
a. Distilled water is used as diluent
b. The site of injection should be cleaned with spirit
c. Mantoux test becomes positive after 48 hours of vaccination
d. WHO recommends Danish 1331 strain for vaccine production

287. Adjuvant used in DPT vaccine is:
a. Zinc b. Aluminum
c. Copper d. Magnesium

288. True about polio vaccination is all except
a. Follow up of AFP every 30 days
b. Salk contains three types of polio virus
c. Pulse polio virus are extra and supplemental
d. Oral polio vaccine provides intestinal immunity also

289. Which of the following is NOT true about Oral Polio Vaccine
a. Induces both local and systemic immunity
b. Maternal antibody is completely protective
c. Live attenuated vaccine
d. Requires subzero temperature for long term shortage

290. All are true about SALK vaccine except:
a. OPV can be given as booster dose
b. Injections during epidemic prevents paralysis
c. Can be given to immunocompromised
d. Easily transported

291. The following vaccine if contaminated can cause Toxic Shock Syndrome:
a. Measles Vaccine b. DPT
c. Hepatitis d. Typhoral

292. Following is a live attenuated vaccine:
a. BCG b. Hepatitis B
c. Japanese encephalitis d. Salk

293. Vaccine preventable neonatal disease is:
a. Tuberculosis b. Measles
c. Pertussis d. Tetanus

294. BCG vaccine is:
a. Killed b. Live attenuated
c. Toxoid d. Cellular fraction

295. BCG is given:
a. Intramuscular b. Intradermal
c. Subcutaneous d. Intravenous

296. Frozen DPT vaccine should be –
a. Shaken thoroughly before use
b. Allowed to melt before use
c. Discarded
d. Brought to room temperature before use

297. The neurological complication of DPT are due to
a. Pertussis b. Diphtheria
c. Tetanus d. All

298. Dose of OPV given at birth in case of institutional deliveries is –
a. Primary dose b. Initial dose
c. Zero dose d. First dose

299. Killed vaccine of polio is:
a. Salk b. Sabin
c. Both d. None

300. Most heat sensitive vaccine is:
a. Measles b. DPT
c. OPV d. Hepatitis B

301. Reconstituted measles vaccine should be used within:
a. 1 hour b. 3 hours
c. 6 hours d. 12 hours

302. All are true about measles vaccine except:
a. Freeze dried live attenuated vaccine
b. Single in dose 0.5 mL
c. Occasionally associated with TSS
d. Contraindicated in pregnancy

303. Active immunization following exposure is given most commonly for:
a. Rabies b. Polio
c. Plague d. Measles

304. 'Tear out by roots' is the literal meaning of
a. Elimination b. Eradication
c. Quarantine d. Isolation

305. Target group for pulse polio immunization is
a. 0-1 years b. 0-3 years
c. 0-5 years d. 0-10 years

306. Pulse polio immunization covers:
a. 0- 5 yr children b. 0- 1 yr children
c. 1- 5 yr children d. 0- 2 yr children

307. One of the reported side effects of Rotavirus vaccination is:
a. Pain b. Aphthous ulcers
c. Gastritis d. Intususception

COMMUNICABLE DISEASES

308. During cholera outbreak, the best emergency sanitation measures to be adopted will be: *(RAK MSc 2018)*
a. Chemoprophylaxis
b. Mass vaccination
c. Disinfection of stool
d. Provision of chlorinated water

Explanation:
- Cholera- is an acute diarrheal disease caused by Vibrio cholera and it is transmitted from men to men by contaminated water, food and drinks and direct contacts with infected person.
- If the cholera disease is endemic in nature the best emergency management is the water control by made safe water by boiling or chlorination.
- Mass vaccination and disinfection of stool are also effective measures, but they are all long-term measures it takes time to see the effect of these measures on population .

309. Mass drug administration is related to which disease? *(AIIMS Raipur NO 2019)*
a. Malaria b. Filaria
c. Polio d. Chickenpox

Explanation:
- Mass drug administration (MDA) is the administration of treatment to every member of a defined population living in a defined geographical area (except those for whom the medicine is contraindicated) at approximately the same time and often at repeated intervals.
- Mass drug administration is also given in malaria in many countries **but in India it is given only in case of lymphatic filaria.**

Ans.

285.	a
286.	d
287.	b
288.	a
289.	b
290.	b
291.	a

307.	d
308.	d
309.	b

Scanned with CamScanner

310. Glucose is added to antidiarrheal solution because: *(RAK MSc 2018)*

a. It tastes sweet
b. Increases absorption of amino acids
c. Increases absorption of sodium
d. All of above

Explanation: Oral rehydration therapy is depending on the glucose observation given orally for the purpose to increase the intestinal absorption of salt and water and it is efficient for managing the fluid and electrolyte imbalance.

311. Which of the following is Zoonotic disease? *(RAK MSc 2018)*

a. Chikungunya
b. Malaria
c. Rabies
d. AIDS

Explanation: Rabies is zoonotic disease mainly transmitted to human from vertebrate animals like dogs, cats or wolves. It is also known as Hydrophobia. It is viral infection of central nervous system. Main causative agent is by Lyssavirus type 1 (RNA virus having bullet shaped neurotropic virus). It is transmitted through the deep bite or scratch and saliva by the infected animals.

312. The effective preventive measures for AIDS are use of condom, which provides protection against: *(RAK MSc 2018)*

a. Inhibition of sperm action
b. Spermicidal action
c. Agglutination of spermatozoa
d. All of the above

Explanation: Preventive measures is used for AIDS is the use of male and female condoms which reduces the risk for spreading the disease by inhibiting the contact of sperm on vaginal wall. Condom is acting as a barrier between sperm and vaginal mucosal wall.

313. Characteristic feature of a zoonotic infection is: *(AIIMS BBS NO 2018)*

a. Swimming pool granuloma
b. Carbuncle
c. Malignant pustule
d. Vincent's angina

Explanation: Malignant pustule is a form of Anthrax infection developed by papule and became vesicles. It is very contagious disease caused by bacterium Bacillus anthracis (Zoonotic disease).

- Aquarium (swimming pool) granuloma - caused by Mycobacterium marinum.
- Carbuncle – caused by Staphylococcus aureus
- Vincent angina or trench mouth - caused by Bacillus fusiformis and Borrelia vincentii.

314. Zinc phosphide is an efficient: *(NCFL 2019)*

a. Rodenticide
b. Insecticide
c. Bactericide
d. Disinfectant

Explanation:

- Zinc phosphide is an efficient rodenticide. Rodents include rats, mice, squirrels, chipmunks, woodchucks, nutria, porcupines and beavers.
- Zinc phosphide will not kill insects, bacteria and microbes.

315. Which of the following diseases causes most death worldwide: *(NCFL 2019)*

a. Cardiovascular disease
b. HIV/AIDS
c. Malaria
d. Tuberculosis

Explanation: According to WHO (2015), the top 5 diseases causing the most deaths worldwide are

1. Ischemic heart disease or coronary artery disease – 8.8 Million deaths
2. Stroke – 6.2 Million deaths
3. Lower respiratory infections – 3.2 Million deaths
4. Chronic obstructive pulmonary disease – 3.1 Million
5. Trachea, bronchus and lung cancers– 1.7 Million deaths

316. The following diseases can be transmitted by water and food, Except: *(AIIMS Bhopal Grade-I 2018)*

a. Hepatitis C
b. Hepatitis A
c. Cholera
d. Poliomyelitis

Explanation: Cholera is a bacterial infection that causes diarrhea. The cholera bacterium (vibrio Cholerae) is usually found in water or food that has been contaminated with feces. Polio virus and hepatitis-A virus also transmitted through water and food via feco-oral route. Hepatitis-C is transmitted through blood and blood products.

317. Which of the following infection of animals primarily can be transmitted through milk? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Tuberculosis
b. Dengue
c. Plague
d. Leptospirosis

Explanation: The infection which transmitted via animal milk is tuberculosis. Dengue fever is spread by aedes aegypti mosquito which is caused by virus. Plague is a bacterial infection caused by Yersinia pestis transmitted by fleas. Leptospirosis is a bacterial infection spread via urine of the infected animal

318. 'Chikungunya' species belongs to which family? *(AIIMS Bhopal Nursing Officer, 2018)*

a. Flaviviridae
b. Togaviridae
c. Bunyaviridae
d. Reoviridae

Explanation: 'Chickungunya' species belongs to Togaviridae family. Dengue and yellow fever species belongs to Flaviviridae family.

319. Scabies is a/an

a. Non-communicable disease
b. Contagious disease
c. Bacterial infection
d. Fungal infection

Explanation: Scabies is a contagious (communicable) disease caused by itch mite. It is capable of spreading rapidly from one person to another by contact or close proximity.

320. The obligate refers to the.....

a. Host in which the parasite remains asexual
b. Temporary host
c. Only host
d. Multiple hosts

Ans.

310. c
311. c
312. a
313. c
314. a
315. a
316. a
317. a
318. b
319. b
320. c

Scanned with CamScanner

Explanation: An obligate host means the single host in which complete life cycle of infecting agent completes. Without this host life cycle of the parasite will not complete.

321. Transport host is one in which.....
a. Parasite passes its sexual stage
b. Parasite remains asexual
c. Organism remain alive but does not undergo develop-ment
d. Life cycle is not complete.

Explanation: Transport host is also known as paratenic host. In this the parasite will infect the host but not undergo any development. One that is used until the appropriate definitive host is reached, but is not necessary to completion of the life cycle of the parasite.

322. Incubatory carrier is.....
a. A person capable of transmitting an infectious agent to others during the incubation period of the disease
b. A person who is continue to shed disease causing agent during the period of recovery
c. A person or other organism that has contracted an infectious disease, but who displays no symptoms. Although unaffected by the disease themselves, carriers can transmit it to others.
d. A person who carry micro organism

Explanation: Option A is incubatory carrier, Option B is convalescent carrier, Option C is healthy carrier or asymptomatic carrier, option D is the simple definition of carrier

323. Mode of spread of whooping cough is:
a. Direct contact
b. Droplet infection
c. Fomite
d. Water borne

Explanation: Whooping cough is transmitted from one person to another by droplets of moisture expelled from the upper respiratory tract through coughing and sneezing.

324. Chain of spread of malaria is .....
a. Man—arthropod—man
b. Man—pig—man
c. Mammal—bird—man
d. Bird—arthropod—man

Explanation: Malaria complete its life in mosquito (asexual life cycle) and human being (sexual cycle). So option A is the correct answer.

325. Which of the following is the method of transmission of infection by vector?
a. Biting
b. Regurgitation
c. Scratching in-of infective feces
d. All of the above

Explanation: Biting, regurgitation, scratching-in of infective feces and contamination of host with body fluids of vectors are the methods of transmission of infection by vector.

326. The maximum size of droplet nuclei that can be inhaled into alveoli of lungs is:
a. 1-2 microns
b. 1-5 microns
c. 5-7 microns
d. 7-10 microns

Explanation: Vehicle of airborne respiratory disease transmission is droplet. 1-5 micron is the size of nuclei that can be inhaled into alveoli of lung easily.

327. Negri bodies are found in which disease condition?
a. Rabies
b. Measles
c. Mumps
d. Pertussis

Explanation: Most characteristics pathological finding in rabies is in the Central Nervous System i.e. Negri body. Negri bodies are eosinophilic, sharply outlined, pathognomonic inclusion bodies (2–10 μm in diameter) found in the cytoplasm of certain nerve cells containing the virus of rabies, especially in Ammon's horn of the hippocampus

328. The other name of pertussis is:
a. Rubella
b. Whooping cough
c. Rubeola
d. Diphtheria

Explanation: Whooping cough is also known as pertussis, which is caused by Bordetella pertussis. Whooping cough (pertussis) is a highly contagious respiratory tract infection. In many people, it is marked by a severe hacking cough followed by a high-pitched intake of breath that sounds like "whoop."

329. Symmetrical unilocular rashes firstly appearing from trunk and then on face, arms and legs is a characteristic of ----------disease.
a. Smallpox
b. Measles
c. Chickenpox
d. Rubella

Explanation: Chickenpox caused by varicella zoster virus presents with clinical feature dew drops kind of rashes firstly appears on trunk and then comes on face, arms and legs

330. Koplik's spot are the clinical feature of.....
a. Measles
b. Pertussis
c. Chickenpox
d. Rubella

Explanation: Koplik spots (also Koplik's sign) are a prodromic viral enanthem of measles manifesting two to three days before the measles rash itself. They are characterized as clustered, white lesions on the buccal mucosa (opposite the lower 1st and 2nd molars) and are pathognomonic for measles.

331. What type of toxin is produced by Clostridium tetani?
a. Exotoxin
b. Endotoxin
c. Organic toxin
d. Inorganic toxin

Explanation: Clostridium tetani produces exotoxins these are the toxoids that are secreted from the bacterial cells whereas, endotoxin present within the cells.

332. Rabies is caused by a virus called:
a. Filarial
b. Lyssavirus type 1
c. Myxovirus
d. Adenovirus

Explanation: Rabies is caused by RNA virus called Lyssavirus type 1, it belongs to family rhabdoviridae-serotype 1.

333. Boiling water helps in killing all organisms: EXCEPT
a. Fungi
b. Bacteria
c. Protozoa
d. Spores

Explanation: Spores serves as a resting stage in life cycle of bacteria during unfavorable environmental conditions.

Ans.

321.	c
322.	a
323.	b
324.	a
325.	d
326.	b
327.	a
328.	b
329.	c
330.	a
331.	a
332.	b
333.	d

Scanned with CamScanner

334. .....disease has received maximum social stigma in India.
a. Tuberculosis
b. Leprosy
c. Polio
d. Cholera

Explanation: Leprosy has very negative image among Indians, it is one of the oldest known diseases in human history, people considered it occurred due to past sins and people suffered from it were called 'lepers' and were isolated from the families, societies and communities.

335. The another name for leprosy is:
a. Hansen's disease
b. Anderson's diseases
c. Chagas disease
d. Slim of disease

Explanation: Leprosy gets its name from Latin word lepraemeans 'Scaly', it is also called as Hansen's disease, named after a Norway physician Gerhard Armauer Hansen who discovered that leprosy was not hereditary but by microorganism.

336. The last known natural case of smallpox was reported in the world in: *(MSc RAK 2010)*
a. 1977
b. 1978
c. 1979
d. 1980

Explanation: Smallpox is an acute contagious disease caused by the variola virus, a member of the orthopoxvirus family. It was one of the world's most devastating diseases known to humanity. It was declared eradicated in 1980 following a global immunization campaign led by the World Health Organization. The last known natural case was in Somalia in 1977. Since then, the only known cases were caused by a laboratory accident in 1978 in Birmingham, England, which killed one person and caused a limited outbreak.

337. Which of the following viral infections is transmitted by tick? *(DSSSB 2008)*
a. Japanese encephalitis
b. Dengue fever
c. Kyasanur forest disease
d. Yellow fever

Explanation: Kyasanur forest disease is transmitted mainly from the hard ticks particularly by H. spinigera and H. turtura.

338. Strategies of leprosy eradication program includes all of the following EXCEPT
a. Early detection and complete treatment of new leprosy cases.
b. Early diagnosis and prompt MDT, through routine and special efforts
c. Strengthening of Disability Prevention and Medical Rehabilitation (DPMR) services.
d. Centralized leprosy services through dedicated hospitals for leprosy treatments

Explanation: Leprosy Elimination in India strategies include :
- Decentralized integrated leprosy services through General Health Care system.
- Early detection and complete treatment of new leprosy cases.
- Carrying out house hold contact survey in detection of Multibacillary (MB) and child cases.
- Early diagnosis and prompt MDT, through routine and special efforts
- Involvement of Accredited Social Health Activists (ASHAs) in the detection and complete treatment of Leprosy cases for leprosy work
- Strengthening of Disability Prevention and Medical Rehabilitation (DPMR) services.
- Information, Education and Communication (IEC) activities in the community to improve self-reporting to Primary Health Center (PHC) and reduction of stigma.
- Intensive monitoring and supervision at primary health center/ community health center.

339. Mumps presents with a clinical feature of .....
a. Fever with enlargement of thyroid glands
b. Fever with non-supportive enlargement of one or both parotid glands
c. Fever with supportive enlargement of parotid glands
d. Fever, cough and enlargement of submandibular glands

Explanation: Mumps is caused by RNA virus belonging to Myxovirus group, it's a self-limiting infectious disease spreads through droplet infection. It is associated with sudden onset of fever with non-supportive enlargement of one or both parotid glands.

340. An infection which is present in an individual but, not sufficient to result in a disease is called as.....
a. Latent infection
b. Clinical infection
c. Subclinical infection
d. Secondary infection

Explanation: Infection means a successful entry, development and or multiplication of organism in the body of living being, but if the organism fails to cause signs and symptoms of disease in the individual, it is called as sub clinical infection.

341. Dehydrated child will have.....
a. Skin pinch goes back slowly
b. Depressed fontanelle
c. Sunken eyes
d. All of the above

Explanation: Dehydrated child will have skin pinch goes back slowly, sunken eyes, depressed fontanels, decreased tears, thirst or unable to drink

342. Most potential agent that can be used in bioterrorism:
a. Viral encephalitis
b. Brucellosis
c. TB
d. Clostridium botulinum

Explanation: The Clostridium botulinum produces an extremely toxic neurotoxin that can cause serious muscle paralyzing in the individual and the ease of production, transport and delivery make this a potential bioterrorism agent. The toxin may be used as an aerosol for people to breathe in or may be put into food supplies.

343. Mode of transmission of leprosy is.....
a. Breast milk
b. Insect bite
c. Droplet infection
d. Both B and C

Explanation: Until recently, the most widely held belief was that the disease was transmitted by direct contact between cases of leprosy and healthy persons. More recently the possibility of transmission by the respiratory route is gaining ground. There are also other possibilities such as transmission through insects which cannot be completely ruled out. (As per WHO)

344. Intervention used under prevention of spreading of AIDS include
a. Treating STD
b. Providing condoms
c. Behavior change communication
d. All of the above

Ans.
334. b
335. a
336. a
337. c
338. d
339. b
340. c
341. d
342. d
343. d
344. d

Scanned with CamScanner

Explanation: All of the above components are used for preventing spread of HIV.

345. Tuberculin test denotes: *(JIPMER 1994)*
a. Previous or present sensitivity to tubercle proteins
b. Patient is resistant to tuberculosis
c. Patient is susceptible to tuberculosis
d. Protective immune status of individual against tuberculosis.

Explanation: A purified protein derivative (PPD) skin test is a test that determines if you suffer from tuberculosis (TB). Tuberculosis is a serious infection, usually of the lungs, caused by the bacteria Mycobacterium tuberculosis

346. The size of respirable dust is:
a. 20 microns
b. 15 microns
c. 10 microns
d. 5 microns

Explanation: Solid dust particles produced during grinding, crushing are suspended in the air. Dust particle larger than 10 microns settles down easily, but dust particle 5 micron and below can be easily inhaled directly into lungs.

347. Which of the following viral infections is transmitted by tick? *(DSSSB 2008)*
a. Japanese encephalitis
b. Dengue fever
c. Kyasanur forest disease
d. Yellow fever

Explanation: Kyasanur Forest disease (KFD) is a tick-borne viral hemorrhagic fever endemic to South Asia The disease is caused by a virus belonging to the family Flaviviridae, which also includes yellow fever and dengue fever.

348. Kala-azar is transmitted by -------
a. Aedes mosquito
b. Tsetse fly
c. Sand fly
d. Mice

Explanation: Sand fly causes kala-azar. Visceral leishmaniasis is spread by sandfly bites. This type of leishmaniasis affects the internal organs, usually the spleen, liver, and bone marrow.

349. Which disease condition is transmitted by Aedes mosquito?
a. Dengue fever
b. Chikungunya
c. Yellow fever
d. All of the above

Explanation: Dengue fever, yellow fever, West Nile fever, chikungunya, eastern equine encephalitis, and Zika virus

350. Koplik's spots are seen in: *(AIIMS 1996)*
a. Rubella
b. Measles
c. Chikungunya
d. Chickenpox

Explanation: Measles is also known as Rubeola. Koplik spots (also Koplik's sign) are characteristic feature of measles manifesting two to three days before the measles rash itself. They are characterized as clustered, white lesions on the buccal mucosa (opposite the lower 1st and 2nd molars) and are pathognomonic for measles.

351. Causative organism of AIDS: *(ESI 2009)*
a. Rabies virus
b. CMV
c. Retro virus
d. Adenovirus

Explanation: AIDS is caused by HIV (Human immunodeficiency virus). This virus belongs to lenti family and it affect the CD4 T cell

352. DOTS is for.....condition *(MSc AIIMS 2005)*
a. Tuberculosis
b. Leprosy
c. Malaria
d. HIV

Explanation: DOTS (directly observed treatment, short-course) is the name given to the tuberculosis control strategy recommended by the World Health Organization

353. Oral rehydration solution does not contain: *(DSSSB 1992)*
a. Sodium chloride
b. Calcium lactate
c. Bicarbonate
d. Glucose

Explanation: Calcium lactate is not a component of ORS solution .

354. Rabies free zone in India is .....:
a. Goa
b. Lakshadweep
c. Arunachal Pradesh
d. Tamil Nadu

Explanation: Lakshadweep is the rabies free zone. In India union territory of Lakshadweep and Andaman and Nicobar islands are free of rabies disease. A "RABIES FREE AREA" has been defined as one in which no case of indigenously acquired rabies has occurred in man or any animal species for 2 years.

355. Among the following identify the most common complication associated with mumps?
a. Aseptic meningitis
b. Mastitis
c. Orchidites
d. Oophoritis

Explanation: Aseptic meningitis is one of the most common complication caused by mumps.

356. Among the following secondary prevention of TB is -------
a. BCG vaccination
b. DOTS treatment
c. Health education
d. Sputum testing

Explanation: Primary prevention addresses the root cause of a disease or injury whereas secondary prevention aims to detect and treat a disease early on.

357. Which of the following is the early sign of leprosy?
a. Loss of sensation
b. Lesions over the skin
c. Thickened painful nerves
d. Sinking of the nose bridge

Explanation: Thickened painful nerves is an early sign of Leprosy. Leprosy is caused by infection with the bacterium mycobacterium leprae. It mainly affects the skin and peripheral nerves. Symptoms include pale or red skin lesions, reduced sensation and numbness.

358. Amebiasis is transmitted through _____ route.
a. Feco-oral
b. Parenteral
c. Vector borne
d. Air borne

Explanation: Amebiasis is a parasitic infection of the intestines caused by the protozoan Amebiasis is usually transmitted by the fecal-oral route, but it can also be transmitted indirectly through contact with contaminated hands.

359. Lepromin test is used to diagnose.....
a. Leprosy
b. Malaria
c. TB
d. HIV/AIDS

Ans.

345.	a
346.	d
347.	c
348.	c
349.	d
350.	b
351.	c
352.	a
353.	b
354.	b
355.	a
356.	b
357.	c
358.	a
359.	a

Scanned with CamScanner

Explanation: The lepromin skin test is used to determine what type of leprosy a person has. A sample of inactivated (unable to cause infection) leprosy-causing bacteria is injected just under the skin, usually on the forearm, so that a small lump pushes the skin up. The lump indicates that the antigen has been injected at the correct depth. The injection site is labeled and examined 3 days, and again 28 days, later to see if there is a reaction.

360. International health regulation is subjected to .....

a. Plague
b. Yellow fever
c. Cholera
d. All of the above

Explanation: All of the above mentioned diseases are subjected to international health regulation.

361. Staining technique used to diagnose TB is known as:

a. Ziehl-Neelsen stain
b. Gram stain
c. Giemsa stain
d. PAS

Explanation: Ziehl-Neelsen stain, also known as the acid–fast stain; a special bacteriological stain used to identify acid-fast organisms, mainly mycobacterium.

362. Spread of communicable disease across a large region, country to country is referred to:

a. Endemic
b. Epidemic
c. Episodic
d. Pandemic

Explanation: Spread of disease among larger population is known as pandemic. Endemic refers to disease or condition that is regularly found among particular people or in a certain area.

Epidemic refers to a widespread occurrence of an infectious disease in a community at a particular time.

Episodic refers to occasional.

363. Diseases which are transmitted by water and food are called as:

a. Vector- borne
b. Air -borne
c. Fomite- borne
d. Vehicle-borne

Explanation: Disease transmitted via food and water is called as vehicle borne.

364. Which is the full form of DOTS chemotherapy?

a. Directly Observed Treatment- Short-course
b. Digitally Operated Treatment Service
c. De-oxygenated Tetracycline – Streptomycin
d. Doxycyclin–Omaprazole–Tetracycline Short course

Explanation: DOTS stand for directly observed treatment short course used to treat tuberculosis.

365. DOTS is a comprehensive strategy to cure TB. The Primary element of DOTS is:- *(AIIMS Raipur Grade II 2017)*

a. Sputum microscopy services
b. Regular drug supply to the patients
c. Health workers counsel and observe their patients swallow each anti-TB medications and monitor progress until cured
d. Political will in terms of manpower

Explanation: The five elements of DOTS are political commitment with increased and sustained financing, case detection through quality assured bacteriology, standardized treatment with supervision, effective drug supply and Monitoring/evaluation system and impact measurement

366. The mosquito that lays eggs singly:

a. Aedes
b. Anopheles
c. Culex
d. Mansonia

Explanation: Mosquito that lays egg singly is known as anopheles.

367. Mass prophylaxis is used in all EXCEPT

a. Rabies
b. Lymphatic filariasis
c. Trachoma
d. Malaria

Explanation: Mass Prophylaxis is the capability to protect the health of the population through the administration of critical interventions in response to a public health emergency in order to prevent the development of disease among those who are exposed or are potentially exposed to public health threats.

368. Identify the sexually transmitted disease among the following:

a. HIV/AIDS
b. Herpes simplex-2
c. Human papillomavirus infection
d. All of the above

Explanation: All of the above mentioned conditions are sexually transmitting diseases.

369. Window period means.....

a. Time period between infection and detection of antibodies
b. Time period between infection and first sign and symptom
c. Time period between diagnosis and treatment
d. None of the above

Explanation: The window period is time between potential exposure to HIV infection and the point when the test will give an accurate result. During the window period a person can be infected with HIV and infectious but have a negative HIV test. The window period for a 4th generation antigen/antibody test is four weeks.

370. Schick's test is used to diagnose.....

a. Diphtheria
b. Pertussis
c. Measles
d. Mumps

Explanation: Schick test, method for determining susceptibility to diphtheria; it laid the basis for inoculation against the disease. A minute amount of diphtheria toxin is injected into the skin of the forearm. Redness at the site of injection after three days indicates a positive reaction (absence of circulating antibody) or a false positive reaction (hypersensitivity to the toxin). A positive reaction can be distinguished by use of a control injection of the same amount of heated toxin (toxoid) into the other forearm. The Schick test was introduced in 1913 by Béla Schick (1877–1967), an Austrian pediatrician.

371. Diseases which is also known as barometer of social welfare is .....

a. TB
b. Typhoid
c. Cholera
d. HIV/AIDS

Ans.

360. d
361. a
362. d
363. d
364. a
365. c
366. b
367. a
368. d
369. a
370. a
371. a

Scanned with CamScanner

Explanation: It is the term used for TB

372. Most common complication associated with chickenpox in children is
a. Secondary bacterial infection
b. Meningitis
c. Orchitis
d. Otitis media

Explanation: Secondary bacterial infection is the most common complication associated with chickenpox in children

373. Complications of chickenpox include
a. Rey's syndrome
b. Pneumonia
c. Cerebellar ataxia
d. All of the above

Explanation: Pneumonic used for complication associated with chickenpox include RAPE
R = Rey's syndrome
A = Acute cerebellar ataxia
P = Pneumonia
E = Encephalitis

374. Isolation required in salmonellosis until.....
a. 3 days after initiating antibiotic therapy
b. 3 consecutive stool sample become negative
c. 3 consecutive blood culture become negative
d. Rashes disappear

Explanation: In salmonellosis and shigellosis infection, isolation is recommended until three consecutive stool sample become negative for the organism.

375. Drug of choice for cholera is
a. Tetracycline
b. Penicillin
c. Chloramphenicol
d. Co-trimoxazole

Explanation: Tetracycline is the drug of choice for cholera. Adult dose is 500 mg BD. Children between 4-13 year the dose is 125 mg, for children younger than 4 year dose is 50 mg.

376. Congenital rubella is diagnosed in infant with the help of ..... antibodies in infant
a. IgM
b. IgG
c. IgE
d. IgA

Explanation: This condition s diagnosing when the infant is having IgM antibodies at the time of birth.

377. Fifth disease is also known as.....
a. Erythema infectiosum
b. Mumps
c. Measles
d. Rubella

Explanation: Erythema infectiosum (also known as fifth disease) is usually a benign childhood condition characterized by a classic slapped-cheek appearance and lacy exanthem. It results from infection with human parvovirus (PV) B19, an erythrovirus

378. The drug of choice falciparum malaria is:
a. Chloroquine
b. Quinine
c. Vancomycin
d. Amphotericin B

Explanation: Chloroquine is a medication used to prevent and to treat malaria in areas where malaria is known to be sensitive to its effects. Certain types of malaria, resistant strains, and complicated cases typically require different or additional medication

379. Chemoprophylaxis of choice in case of meningococcal meningitis is:
a. Chloroquine
b. Tetracycline
c. Rifampicin
d. Penicillin

Explanation: Chemoprophylaxis is recommended for close contacts of persons with meningococcal disease. Rifampicin is the drug of choice. 600 mg BD for 2 days.

380. Lepromin test is usually read after:
a. 1 week
b. 2 weeks
c. 3 weeks
d. 4 weeks

Explanation: A sample of inactivated (unable to cause infection) leprosy-causing bacteria is injected just under the skin, usually on the forearm, so that a small lump pushes the skin up. The lump indicates that the antigen has been injected at the correct depth. The injection site is labeled and examined 3 days, and again 28 days, later to see if there is a reaction.

381. Infectivity of whooping cough is during:
a. During the entire period of illness
b. After the onset of whoop
c. 10 days before and 10 days after the onset of whoop
d. None of the above

Explanation: Pertussis has an average duration of 6 to 8 weeks. The incubation period ranges from 5 to 14 days but is usually 7 to 10 days. Pertussis is most infectious during catarrhal stage. The infective period extends from a week after exposure to about 3 weeks after the onset of the paroxysmal stage.

382. Refrigerated blood for more than 48 hours cannot transmit:
a. HIV
b. Hepatitis B
c. Syphilis
d. Gonorrhea

Explanation: Syphilis is transmitted in fresh blood. Storage of blood will kill the microorganism

383. Classification of leprosy is based upon:
a. Bacteriological status
b. Immunological status
c. Histological status
d. All of the above

Explanation: leprosy classification are based up on clinical, bacteriological, immunological and histological status of the patients.

384. Diphtheria carrier is identified through
a. Throat swab culture
b. Ziehl-Neelsen stain
c. Gram stain
d. Albert stain

Explanation: Swab taken from nose and throat is subjected to culture and then identify the carrier in diphtheria

385. Time period between infection and detection of antibodies against HIV is known as:
a. Acute Infection
b. Chronic Infection
c. Active HIV
d. Window Period

Ans.

372.	a
373.	d
374.	b
375.	a
376.	a
377.	a
378.	a
379.	c
380.	d
381.	c
382.	c
383.	d
384.	a
385.	d

Scanned with CamScanner

Explanation: The window period is time between potential exposure to HIV infection and the point when the test will give an accurate result. During the window period a person can be infected with HIV and infectious but have a negative HIV test. The window period for a 4th generation antigen/antibody test is four weeks

386. Which one of the following disease is not transmitted mainly by Fecal-Oral route: *(Safdarjung NO 2018)*
a. Enteric fever
b. Measles
c. Cholera
d. Hepatitis - A

387. WHO declared global eradication of small pox on *(Safdarjung NO 2018)*
a. 26th October 1977
b. 5th July 1975
c. 17th May 1975
d. 8th May 1980

388. Dengue fever is transmitted by: *(Safdarjung NO 2018)*
a. Culex fatigans
b. Culex vishnui
c. Aedes aegypti
d. Glossina palpalis

389. The infection which is acquired from animals to human is: *(DSSSB PHN, 2015)*
a. Plague
b. Polio
c. Pertussis
d. Malaria

390. Syphilis is caused by: *(DSSSB PHN, 2015)*
a. HIV
b. Papilloma
c. Neisseria
d. Treponema

391. Malaria infection can be transmitted by: *(DSSSB PHN, 2015)*
a. Blood transfusion
b. Bite of infected female anopheles mosquito
c. Vertical transmission through placental defect
d. All of the above

392. Malarial transmission occurs by: *(Banaras HU 2015)*
a. Vector
b. Food and water
c. Air borne
d. Fomite (inanimate object)

393. Which of the following disease is transmitted through dog bite? *(Banaras HU 2015)*
a. Influenza
b. Yellow fever
c. Herpes
d. Rabies

394. Widal test is used for the diagnosis of *(Banaras HU 2015)*
a. Enteric fever
b. Malaria
c. Cholera
d. Plague

395. Which among the following disease is not due to Aedes mosquitoes? *(Kerala PSC, Nov 2014)*
a. Filariasis
b. Yellow fever
c. Dengue fever
d. Chikungunya fever

396. World AIDS day is celebrated every year on: *(Kerala PSC, Nov 2014)*
a. July 11th
b. December 25th
c. December 1st
d. June 5th

397. Which among the malarial parasite is responsible for cerebral malaria? *(Kerala PSC, Nov 2014)*
a. P. vivax
b. P. ovale
c. P. falciparum
d. P. quartan

398. Incubation period of Chikungunya fever is: *(Kerala PSC, Nov 2014)*
a. 10-13 days
b. 1-2 days
c. 14-16 days
d. 4-7 days

399. Causative organism of yellow fever is: *(Staff Nurse G II 2014)*
a. Myxovirus
b. Rhabdovirus
c. Enterovirus
d. Arbovirus

400. Incubation period of chicken pox ranges from: *(Staff Nurse G II 2014)*
a. 20–25 days
b. 30–40 days
c. 6–10 days
d. 14–16 days

401. The characteristic fever found in typhoid is: *(Staff Nurse G II 2014)*
a. Relapsing fever
b. Step ladder fever
c. Intermittent fever
d. Continuous fever

402. Mode of spread of polio infection is: *(Staff Nurse G II 2014)*
a. Through vectors
b. Droplet infection
c. Fecal-oral route
d. Through blood

403. Causative agent of mumps is: *(JIPMER 2012)*
a. Bordetella
b. Paramyxovirus
c. Toga virus
d. H. influenza

404. First AIDS case in India was reported in the year: *(JIPMER 2012)*
a. 1987
b. 1982
c. 1992
d. 2002

405. Which part of body is affected in typhoid: *(ESIC Chennai May 2012)*
a. Lungs
b. Intestines
c. Liver
d. Pancreas

406. Malaria is caused by a: *(ESIC Chennai May 2012)*
a. Protozoa
b. Virus
c. Bacteria
d. Fungi

407. Most common cause of post measles death: *(RRB Feb 2012)*
a. SSPE
b. RTI
c. Weakness
d. Diarrhea

408. Congenital varicella is related with which disease? *(RRB Feb 2012)*
a. Mumps
b. Germen measles
c. Measles
d. Chicken pox

409. Drug of choice for leprosy? *(RRB Feb 2012)*
a. DEC
b. Dapsone
c. Streptomycin
d. Ivermectin

410. Which of the following diseases is known as "Barometer of social welfare"? *(RRB Feb 2012)*
a. Leprosy
b. Tuberculosis
c. Cholera
d. Malaria

411. The procedure of 'Quarantine' was introduced to protect against importation of: *(RRB Feb 2012)*
a. Yellow fever
b. Cholera
c. Leprosy
d. Plague

412. Scarlet fever is caused by
a. S. pyogenes
b. Gonococci
c. Meningococci
d. S. Typhi

413. Which of the following communicable disease has been eradicated from the world
a. Chickenpox
b. Smallpox
c. German measles
d. Poliomyelitis

414. Which of the following disease has been eradicated from India
a. Measles
b. Mumps
c. Guinea worm disease
d. Leprosy

415. Vector responsible for Japanese encephalitis is
a. Anopheles
b. Culex
c. Aedes
d. Mansonoides

416. Life cycle from egg to a complete adult mosquito takes
a. 2-6 days
b. 7-10 days
c. 10-15 days
d. 14-21 days

Ans.

386.	b
387.	d
388.	c
389.	a
390.	d
391.	d
392.	a

Scanned with CamScanner

417. Man is an intermediate host of all of the following, EXCEPT
a. Malaria b. Toxoplasmosis
c. Hydatid disease d. Kala-azar

418. Insecticide used for ultra-low volume fogging is
a. Pyrethrum b. DDT
c. Fenthion d. Malathion

419. Maximum permissible chloride level in a litre of water is
a. 200 mg b. 400 mg
c. 600 mg d. 800 mg

420. Which among the following is the most important treatment of patients with Dengue H-fever?
a. Aspirin for fever
b. Apply ice cap over abdomen to prevent melena
c. Replace body fluids
d. Use NSAIDs to control fever

421. Who found the link between cholera and contaminated water
a. Louis Pasteur b. Ronald Ross
c. Edward Jenner
d. John Snow

422. Malaria parasite was discovered by?
a. Robert Koch b. Louis Pasteur
c. Laveran d. Ronald Ross

423. Which of the following is also called as epidemic parotitis?
a. Measles
b. Chicken pox
c. Mumps
d. Pertussis

424. Which among the following is an airborne disease?
a. Typhoid b. Kala-Azar
c. Tuberculosis d. Malaria

425. Example of a water borne disease is
a. Malaria
b. Cholera
c. Tuberculosis
d. Rabies

426. Which of these diseases is NOT a Water Borne Disease?
a. Typhoid fever
b. Cholera
c. Hepatitis A
d. Tuberculosis

427. Which of the following disease can be diagnosed by Mantoux test?
a. Diphtheria
b. Tuberculosis
c. Pertussis
d. Mumps

428. Which of the following chain of infection is in the correct order?
a. Mode of transmission-Source/reservoir-Host
b. Mode of transmission → Host → Source/reservoir
c. Host → source/reservoir → Mode of Transmission
d. Source/reservoir → Mode of Transmission → Host

429. Quarantine period should be
a. Minimum incubation period
b. Maximum incubation period
c. Period of communicability
d. Median incubation period

430. Which is the main agent of Typhoid fever?
a. Salmonella Typhi
b. Salmonella paratyphi A
c. Salmonella paratyphi B
d. Shigella

431. Chemoprophylaxis can be done for the following EXCEPT
a. Meningitis
b. Typhoid
c. Cholera
d. Diphtheria

432. Which of the following disinfectant is used for blood spill?
a. Glutaraldehyde
b. Phenol
c. Ethanol
d. Sodium hypochlorite

433. Which is the causative organism of Diphtheria?
a. Mycobacterium tuberculosis
b. Treponema pallidum
c. Corynebacterium Diphtheriae
d. Myxovirus parotitis

434. Which of the following is the mode of transmission of Hepatitis A?
a. Sexual contact
b. Use of contaminated needles and syringes
c. Vertical transmission
d. Contaminated food and water

435. Hydrophobia is the clinical feature of
a. Mumps b. Pertussis
c. Rabies d. Tetanus

436. Small pox eradication was NOT due to:
a. Highly effective vaccine
b. Cross-immunity with animal pox virus
c. Subclinical infection does not transmit the disease
d. Lifelong immunity

437. Characteristic rashes present in measles is known as:
a. Koplik spot
b. Pleomorphic
c. Vesicular rashes
d. Flushing

438. Most serious complication of measles is:
a. Koplik spots
b. Parotitis
c. Meningoencephalitis
d. Nephritis

439. In measles Koplik spots are seen in
a. Prodromal stage
b. Post measles stage
c. Eruptive Stage
d. None

440. The most appropriate test to assess the prevalence of tuberculosis infection in a community is:
a. Mass miniature Radiography
b. Sputum examination
c. Tuberculin test
d. Clinical examination

441. Incidence of TB in a community measured by:
a. Sputum smear positivity
b. Positive Tuberculin test
c. Sputum culture
d. Mantoux test positive

442. Full form of DOTS chemotherapy is
a. Directly Observed Treatment- Short-course
b. Digitally Operated Treatment Service
c. Directly Observed Therapy Supervised
d. Directly Observed Treatment Supervised

Ans.

Scanned with CamScanner

443. Sputum examination for AFB is an example of
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

444. Which of the following drug in DOTS therapy can cause deafness?
a. Ethambutol b. Isoniazid
c. Rifampicin d. Streptomycin

445. Which of the following infection of animals primarily can be transmitted through milk?
a. Tuberculosis b. Dengue
c. Plague d. Leptospirosis

446. Which of the following tests is done to test the efficiency of pasteurization of milk
a. Coliform count b. Methylene blue
c. Reduction test d. Indicator test

447. Which of the following test is done to check the presence of tuberculosis in human being?
a. Weston Blot b. Widal test
c. Mantoux test d. ELISA test

448. Case finding in RNTCP is based on:
a. Sputum culture b. Sputum microscopy
c. X-ray chest d. Mantoux test/ PCR

449. All among the following are bactericidal ATT drugs except
a. Rifampicin b. Ethambutol
c. Streptomycin d. Pyrazinamide

450. Dehydration in a child with diarrhea, thirst present, tears absent is:
a. Mild b. Moderate
c. Severe d. None

451. During a home visit, a community health nurse found a child who is suffering from diarrhea and vomiting. What would be the nurse teach the mother to prepare first?
a. Oral dextrose solution
b. Oral rehydration solution
c. Oral saline solution
d. Semi solid food

452. New WHO ORS osmolarity is:
a. 270 b. 245
c. 290 d. 310

453. Which of the following is NOT present in ORS?
a. Glucose b. Calcium gluconate
c. Potassium chloride d. Sodium chloride

454. ORS should be discarded after _____ of preparation
a. 54 hours b. 6 hours
c. 12 hours d. 24 hours

455. Drug of choice for cholera chemoprophylaxis is:
a. Erythromycin b. Ampicillin
c. Ciprofloxacin d. Tetracycline

456. Malaria is transmitted by:
a. Female anopheles b. Male anopheles
c. Culex d. Aedes

457. Which of the following is a zoonotic disease
a. Hydatid cyst b. Malaria
c. Filariasis d. Dengue fever

458. All are anthropozoonotic disease EXCEPT
a. Plague
b. Hydatid disease
c. Dracunculiasis
d. Rabies

459. Zoonotic disease transmitted by arthropods is/ are:
a. Plague b. Melioidioses
c. Rabies d. Leishmaniasis

460. Rabies free country is?
a. China b. Russia
c. Australia d. France

461. Rabies is also known as.....
a. Hydrophobia b. Minamata disease
c. Leptospirosis d. Kawasaki disease

462. Which is not transmitted by Aedes aegypti?
a. Yellow fever b. Dengue
c. Japanese encephalitis d. Filariasis

463. Chikungunya is transmitted by?
a. Aedes b. Culex
c. Mansonoides d. Anopheles

464. An example of epidemic disease is
a. Plague b. Fracture
c. AIDS. d. Hypertension

465. Plague is transmitted by:
a. Hard tick b. Soft tick
c. Rat flea d. Louse

466. The drug of choice for chemoprophylaxis in contacts of a patient of plague is:
a. Penicillin b. Rifampicin
c. Erythromycin d. Tetracycline

467. Kala-azar is transmitted by:
a. Phlebotomus sergenti
b. Phlebotomus argentipes
c. Phlebotomus papatassi
d. All

468. Strategy for prevention of neonatal tetanus include all except:
a. TT to all females in reproductive age group.
b. Giving penicillin to all neonates.
c. 2 doses of TT to all unimmunized pregnant women.
d. Three clean's

469. In Tetanus communicable period is:
a. 7 day b. 10 day
c. 14 day d. None

470. What reaction might occur due to tetanus vaccine?
a. Febrile seizures
b. Brachial neuritis
c. Hypotonic muscles
d. Encephalopathy

471. Lepromin test is used for all of the following except:
a. Classify the lesions of leprosy patients
b. Determine the prognosis of disease
c. Assess the resistance of individuals to leprosy
d. Diagnosis of leprosy

472. Which of the following communicable diseases is treated by the drug Dapsone?
a. Tuberculosis
b. Hepatitis B
c. Leprosy
d. Syphilis

473. Scabies is caused by:
a. Trichophyton b. Dermatophyton
c. Mycobacterium d. Sarcoptes scabiei

474. HIV virus was discovered in the year
a. 1981 b. 1983
c. 1986 d. 1996

Scanned with CamScanner

475. HIV postexposure prophylaxis should be started in:
a. 24 hours b. 48 hours
c. 72 hours d. 6 hours

476. The chance of HIV transmission from mother to child can be reduced by all except:
a. Caesarean section
b. Vitamin A supplementation
c. Stopping breastfeeding
d. Nevirapine mother antenatal and newborn after delivery

477. In which of the following condition breastfeeding is contraindicated?
a. Maternal Ebola virus disease
b. Leprosy
c. Tuberculosis
d. Typhoid

478. First country in South East Asia to report AIDS was:
a. Sri Lanka b. India
c. Thailand d. Bangladesh

479. Window period for HIV infection is :
a. 3-12 Week b. 8-20 Week
c. 6-24 Week d. None

480. HIV is NOT transmitted by:
a. Eating with a person having HIV
b. Unprotected sex
c. Use of unsterile syringes
d. Transfusion of HIV infected blood

481. Which of the following is a sexually transmitted diseases?
a. Fibroid uterus b. Gonorrhea
c. Ovarian cancer d. SLE

482. High prevalence of Tuberculosis found in which of the following group of people?
a. Smokers b. Diabetics
c. Asthmatics d. HIV positive

483. Commonest mode of transmission of AIDS in India is:
a. Transplacental/mother to child
b. Use of unsterile syringes and needles
c. Sexual
d. Blood transfusion

484. Which of the following disease was declared eradicated from world
a. Small pox
b. Guineworm
c. Polio
d. Diphtheria

485. Measles true is
a. Incubation period is 10 days
b. Infectious 4 days before the rash
c. Kopliks spots are seen
d. All of the above

486. Chicken pox rashes first appear in which body part?
a. Trunk and face b. Trunk and legs
c. Trunk and arms d. Arms and legs

487. Measles (rubeola) rashes first appear in which body part?
a. Trunk b. Face
c. Hands d. Legs

488. Rubella (German measles) rashes first appear in which body part?
a. Trunk b. Face
c. Hands d. Legs

489. Keratomalacia is associated with:
a. Diarrhea b. Measles
c. Chickenpox d. A and B

Explanation: Keratomalacia is an eye disorder caused by Vitamin A deficiency. Cornea gets cloudy and softens.

Measles and Diarrhea are associated with Vitamin A deficiency that leads to Keratomalacia.

490. Commonest complication of Mumps is:
a. Pneumonia
b. Encephalitis
c. Aseptic meningitis
d. Pancreatitis

491. Multi drug therapy (MDT) is treatment for -
a. T b. Leprosy
c. HIV d. All of the above

492. In Tuberculosis combination of antimicrobials is used:
a. Delay development of resistance
b. To reduce toxicity
c. To broaden antibacterial spectrum
d. To prevent liberation of toxins from organism.

493. Anti-tubercular drug contraindicated in pregnancy is:
a. Isoniazid b. Rifampicin
c. Streptomycin d. Ethambutol

494. Which type of sample is used to isolate polio virus earliest:
a. Stool b. Blood
c. CSF d. Throat swab

495. Which of the following virus is excreted through feces
a. Hepatitis b. HIV
c. Poliomyelitis d. Hepatitis C

496. Food poisoning within 6 hours of intake of milk is caused by:
a. Staphylococcus aureus b. Bacillus Cereus
c. Clostridium d. Salmonella

497. Food poisoning is caused by all except:
a. Clostridium difficile
b. Bacillus cereus
c. Vibrio parahaemolyticus
d. Staph aureus

498. Chikungunya virus is transmitted through
a. Ades mosquito
b. Chikungunya mosquito
c. Culex mosquito
d. Marsh mosquito

499. Incubation period of Plasmodium vivax is:
a. 5-7 day b. 7-10 day
c. 10-14 day d. 15-30 day

500. The most effective way of preventing tetanus is:
a. Surgical debridement and toilet
b. Hyperbaric oxygen
c. Antibiotics
d. TT

501. 'Five clean practices' under strategies for elimination of neonatal tetanus include all except:
a. Clean surface for delivery
b. Clean hand of attendant
c. New blade for cutting the cord
d. Clean airway

502. A person received complete immunization against tetanus 10 years ago; now he presents with a clean wound without any lacerations from an injury sustained 2.5 hours ago; He should be given:
a. Full course of TT
b. Single dose of TT
c. Human Tetanus globulin.
d. Human Tetanus globulin and Single dose of TT

503. The true statement regarding tetanus is:
a. 5 dose immunization provides lifelong immunity.
b. TT affords no protection in the present injury.
c. TT serves no use once 12 hours have elapsed following injury.
d. TT and Ig may both be given in suspected tetanus.

504. Drug of choice for Scabies is –
a. 25% Benzyl benzoate
b. 5% Permethrin
c. 1%H
d. 5% Sulfur ointment

505. Drug used to prevent vertical transmission of HIV infection in a child of HIV positive pregnant mother is:
a. Single dose of Nevirapine to newborn
b. Nevirapine for 6 weeks to 3 months to newborn
c. Single dose of Zidovudine to newborn
d. Zidovudine for 3 months to newborn

506. Following are major criteria of Jones in Rheumatic Fever except:
a. Carditis
b. Polyarthritis
c. Chorea
d. Elevated ESR

507. Why a TB patient is recommended a regimen of 4 drugs on 1st visit
a. To avoid emergence of resistance
b. To avoid side effects
c. To cure disease early
d. None of the above

508. True about DOTS is:
a. Drugs are given under supervision
b. Streptomycin always given in first 2 months
c. Intermittent regimen followed
d. Same regimen is given in all patient

509. Multidrug resistance in TB is defined as resistance to -
a. Streptomycin, Rifampicin and Isoniazid
b. Streptomycin and Rifampicin
c. Isoniazid and Rifampicin
d. Streptomycin and Isoniazid

510. Anti-tubercular drug not given in children < 6 years age is -
a. Isoniazid b. Rifampicin
c. Streptomycin d. Ethambutol

511. Anti-tubercular drug contraindicated during pregnancy is-
a. Isoniazid b. Rifampicin
c. Streptomycin d. Ethambutol

512. In acute silicosis clinical manifestation is –
a. Hypersensitivity pneumonitis
b. Hypersensitivity pneumonia
c. Pulmonary alveolar proteinosis
d. Forms nodules and causes pneumoconiosis

513. Q fever is transmitted by
a. Mosquitos b. Mites
c. Ticks d. Flea

514. Japanese encephalitis is transmitted by:
a. Mosquito b. Tick
c. Mite d. Rat flea

515. Chikungunya is transmitted by
a. Aedes b. Culex
c. Mansonoides d. Anopheles

516. Which of the following disease is transmitted by mosquitoe
a. Dengue b. Kala-azar
c. Trypanosomiasis d. Listeriosis

517. Transovarian transmission is seen is:
a. Rickettsial disease b. Malaria
c. Filariasis d. None

518. All are "Water-Washed Diseases" except –
a. Trachoma b. Scabies
c. Conjunctivitis d. Yellow fever

519. Scabies, an infection of the skin caused by Sarcoptes scabiei is an example of-
a. Water borne disease b. Water washed disease
c. Water based disease d. Water related disease

520. Mosquito is not associated with transmission of :
a. Malaria
b. Typhus
c. Dengue fever
d. Japanese encephalitis

521. Diseases transmitted by water and food are called as
a. Vector borne diseases
b. Air borne diseases
c. Fomite borne diseases
d. Vehicle borne diseases

522. Which of the following vector causes scabies?
a. Mosquito b. Itch mite
c. Louse d. Sandfly

523. Which of the following is the carrier of Plague virus?
a. Dogs and carnivores
b. Rats and rodents
c. Snakes and Reptiles
d. Frogs and amphibians

524. What is the cause of Kala-azar?
a. Housefly b. Mosquito
c. Sandfly d. Ticks

525. Which of the following would be the right method of choice of discarding the blood soaked-dressing removed from a HIV patient?
a. Pour 1 % hypochlorite on the dressing material and send it for incineration in an appropriate bag.
b. Pour 5 % hypochlorite on the dressing material and send it for incineration in an appropriate bag.
c. Pour 5% Lysol on the dressing material and send it for incineration in an appropriate bag
d. Pour 1% Lysol on the dressing material and send it for incineration in an appropriate bag.

526. ART stands for?
a. Antiretroviral Therapy
b. Antiretroviral Treatment
c. Anti rhesus Treatment
d. All retroviral Therapy

527. Which of the following is not true about Zika Disease?
a. Causes Microcephaly in newborn
b. Caused by a virus and spreads sexually
c. Caused by bacteria and spreads by contamination
d. Mosquitoes are the vectors

528. The following infection is transmitted by Tick
a. Japanese encephalitis
b. Dengue Fever
c. Kyasanur Forest Disease
d. Yellow Fever

Scanned with CamScanner

529. **DOTS is used in the treatment of .....**
   a. Typhoid
   b. Cholera
   c. Dengue
   d. Tuberculosis

530. **Nosocomial infection occurs in:**
   a. Agricultural fields
   b. Crowded places
   c. Hospital
   d. Working place

531. **Nosocomial infections are those which develop:**
   a. Within 24 hours after hospitalization
   b. Within 48 hours of hospitalization
   c. After 48 hours of hospitalization
   d. After 7 days of hospitalization

NONCOMMUNICABLE DISEASES

532. **Ergonomics is a science of:**
   a. Designing the job to fit to the worker
   b. Training the worker to fit to the job
   c. Prevention of occupational diseases
   d. Recruiting the employee to fit for the job

Explanation: Ergonomics is derived from Greek word Ergon meaning work and Nomo's meaning law, so ergonomics is described as science of "designing the job to fit to the worker, and not forcing the worker to fit to the job".

533. **Cutaneous vasoconstriction on exposure to hypothermia results in:**
   a. Immersion foot
   b. Frost bite
   c. Erythrocyanosis
   d. All of the above

Explanation: Working in cold areas causes the person to experience cutaneous vasoconstriction where the blood supply to the lower limbs reduces leading to development of Immersion foot, frostbite, erythrocyanosis and chilblains.

534. **Lead is widely used in variety of industries because of its properties: EXCEPT**
   a. Low boiling point
   b. Anti-corrosive
   c. Non-oxidizing
   d. Mixes with other metals easily

Explanation: Lead is widely used because of its four properties like.
- Low boiling point
- Mixes with other metals easily to form alloys
- Easily oxidized
- Anticorrosive

535. **Appearance of Burton's line in lead poisoning:**
   a. Bluish purple line on gums
   b. Greenish coating on gums
   c. Brown stains on teeth
   d. Pale pinkish gums

Explanation: During inorganic lead poisoning the gums appear in bluish purple in color.

536. **Role of occupational health nurse includes the following EXCEPT:**
   a. Prevention of workplace accidents and injuries
   b. Promotion of health and work ability
   c. Improving environment health for occupational health workers
   d. Improve the productivity outcome of workers

Explanation: As per the recommendation by the WHO, the occupational health nurse role is for:
- Prevention of occupational injury and disease through a comprehensive pro-active occupational health and safety strategy.
- The promotion of health and work ability, by focusing on non-occupational workplace preventable conditions that whilst not caused directly by work, may affect the employee's ability to maintain attendance or performance at work, through a comprehensive workplace health promotion strategy.
- Improving environmental health management, by reducing risk to the working population and the wider community, which contributes to the wider public health agenda.

537. **Continuous vomiting can lead to .....**
   a. Respiratory acidosis
   b. Respiratory alkalosis
   c. Metabolic acidosis
   d. Metabolic alkalosis

Explanation: Vomiting leads to loss of hydrogen ion from the body which in turn causes metabolic alkalosis in the person who is suffering from vomiting.

538. **A 14-year-child having lost his father a year ago, is caught shoplifting. The boy will be sent to**
   a. Orphanage
   b. Remand Home
   c. Prison
   d. Aanganwadi

539. **Most common heavy metal poisoning in the world:**
   a. Lead
   b. Arsenic
   c. Mercury
   d. Cadmium

540. **Which of the following is non natural gas causing greenhouse effect?**
   a. Carbon Dioxide
   b. Methane
   c. Ozone
   d. CFCs

541. **Exposure to noise above ..... cause permanent loss of hearing.**
   a. 85 d
   b. 90 dB
   c. 100 db
   d. 160 dB

542. **The level of noise that can be tolerated without damage to hearing is**
   a. Up to 60 dB
   b. Up to 85 dB
   c. Up to 95 dB
   d. Up to 120 dB

543. **The 'acceptable' noise level is:**
   a. 85 dB
   b. 90 dB
   c. 95 dB
   d. 100 dB

544. **Unit of absorbed radiation is:**
   a. Roentgen
   b. Rad
   c. Rem
   d. Sievert

545. Which of the following would the nurse reinforce after a teaching session as the most important lifestyle modification for the patient whose age is 59. height 5'11", weighs 280 pounds, and is hypertensive? *(RAK MSc 2018)*

a. Reduce weight
b. Restrict salt intake
c. Increase potassium intake
d. Decrease alcohol intake

Explanation: Patient's weight is 280 pounds (127 kg). So the first life style modification needed is to reduce the weight. Though other options are also recommended for a patient with hypertension, the immediate concern is the patient's weight.

546. DDT is a: *(DSSSB)*

a. Contact poison
b. CNS poison
c. Stomach poison
d. None of the above

Explanation: DDT (Dichlorodiphenyltrichloroethane) is a colorless, crystalline, tasteless and almost odorless organochloride known for its insecticidal properties and environmental impacts. DDT has been formulated in multiple forms, including solutions in xylene or petroleum distillates, emulsifiable concentrates, water-wettable powders granules, aerosols, smoke candles and charges for vaporizers and lotions. Because of the high efficiency, DDT acts as a contact poison against several arthropods.

547. SAFE strategy is recommended for the control of Trachoma. SAFE contain all the following components EXCEPT

a. Surgery
b. Annual eye check up
c. Facial cleanliness
d. Environmental hygiene

Explanation: SAFE strategy means S- surgery A- antibiotics F-facial cleanliness E- environmental improvements. The SAFE strategy is an innovative public health approach designed to treat and prevent trachoma. Endorsed by the World Health Organization

548. Leading cause of blindness in India is.....

a. Cataract
b. Trachoma
c. Glaucoma
d. Vitamin A deficiency

Explanation: As per the survey conducted under national program for control of blindness it was found that the main causes of blindness were as follows. Cataract (62.6%) Refractive Error (19.70%) Corneal Blindness (0.90%), Glaucoma (5.80%), Surgical Complication (1.20%) Posterior Capsular Opacification (0.90%) Posterior Segment Disorder (4.70%), Others (4.19%) Estimated National Prevalence of Childhood Blindness /Low Vision is 0.80 per thousand

549. Chronic exposure to poor lighting causes:

a. Miner's nystagmus
b. White finger
c. Cataract
d. Blurring of vision

Explanation: Poor lighting in working area causes eyestrain and on chronic exposure person develops shaking of eyeballs which called Miner's nystagmus.

550. Arc welders are more prone to suffer from..... occupation hazard.

a. Glaucoma
b. Welder' flash
c. Welder's cataract
d. Temporary blindness

Explanation: Arc welder gets exposure to ultraviolet radiation which mainly affects eyes causing conjunctivitis and keratitis.

551. Following are the diseases that comes under pneumoconiosis: EXCEPT

a. Silicosis
b. Asbestosis
c. Siderosis
d. Psittacosis

Explanation: Psittacosis is caused by bacteria called as Chlamydophila psittaci found in the dropping of bird and on the other hand pneumoconiosis is a group of lung diseases that are caused by inhalation of dust particles with size ranging from 0.5 microns–3 microns.

552. Anthracosis is caused due to inhalation of:

a. Coal particles
b. Sugarcane dust
c. Cotton dust
d. Silicon dust particles

Explanation: Inhalation of coal dust particles causes anthracosis. Inhalation of sugar cane dust causes bagossis, cotton dust causes Byssinosis, silicon dust causes silicosis.

553. Bagassosis is caused by inhalation of:

a. Sugarcane dust
b. Cotton dust
c. Jute dust
d. Coal dust

Explanation: Inhalation of sugarcane dust leads to bagassosis

554. Strategies to prevent occupational dermatitis includes:

a. Pre selection examination
b. Application of barrier creams
c. Use of protective equipment and periodic health checkups
d. All of the above

Explanation: Occupational dermatitis is a big health problem in many industries due to causes like heat, cold, chemical agents, and biological agents. It can be prevented by using suitable preventive measures like pre selection screening, application of barrier creams, use of protective equipment and periodic health checkups.

555. Which is the best test to detect iron deficiency in a client? *(Karnataka PSC96)*

a. Ferrous sulfate
b. Serum Ferritin
c. Serum Iron
d. Hemoglobin

Explanation: The amount of ferritin in the blood (serum ferritin level) is directly related to the amount of iron stored in human body. Iron is important for red blood cell production. Doctor may order this test if a client have signs or symptoms of anemia due to low iron.

556. Name the classification developed by WHO for disability:

a. International classification of functioning, disability and health
b. Kuppuswamy classification
c. NYHA classification
d. FAB classification

Explanation: International Classification of Functioning, Disability, and Health (ICF) The ICF is a classification of health and health-related conditions for children and adults that was developed by World Health Organization (WHO) and published in 2001

557. Monday fever is also known as ----------

a. Bagassosis
b. Byssinosis
c. Asbestosis
d. COPD

Explanation: Byssinosis is a disease of the lungs brought on by breathing in cotton dust or dusts from other vegetable fibers such as flax, hemp, or sisal while at work.

Ans.

545. a
546. a
547. b
548. a
549. a
550. c
551. d
552. a
553. a
554. d
555. b
556. a
557. b

Scanned with CamScanner

558. Which of the following agent is responsible for Bagassosis?
a. Smoke b. Silica
c. Sugarcane dust d. Coal

Explanation: Bagassosis is a form of Hypersensitivity pneumonitis caused due to inhalation of sugarcane fiber waste. This disease was first found in India in 1955. This disease basically causes symptoms like shortness of breath and fever.

559. Scotch tape swab is used to identify ----------
a. Tape worm b. Pinworm
c. Angiostoma d. Cryptosporidium

Explanation: Pinworm ova are deposited around the anal orifice. Scotch tape test is done to check for pinworm infestation. The pinworm, also known as threadworm or seat worm, is a parasitic worm. It is a nematode and a common intestinal parasite or helminth, especially in humans

560. As per WHO blindness is if visual acuity less than
a. 6/18 b. 6/24
c. 3/60 d. 6/60

Explanation: WHO has defined blindness as "visual acuity of less than 3/60 (Snellen) or its equivalent".

561. Occupational exposure that may cause sterility in females:
a. Aniline
b. Lead
c. Radon
d. Nickel

562. The most common cause of Urinary Tract Infection (UTI) in community is: *(DSSSB PHN, 2015)*
a. E. coli b. Klebsiella
c. Citrobacter d. Proteus Vulgaris

563. Hookworm penetrates into the body by penetrating the skin of: *(DSSSB PHN, 2015)*
a. Hand b. Foot
c. Ear d. Head

564. Filaria is caused by *(Banaras HU 2015)*
a. Bacteria b. Protozoa
c. Fungus d. Virus

565. Temporary hardness of water is removed by *(Banaras HU 2015)*
a. Boiling b. Filtration
c. SODIS method d. Addition of chlorine

566. Optimum level of fluoride in drinking water per liter is: *(JIPMER 2012)*
a. 1-2 mg b. 0.05 – 0.08 mg
c. 0.7 – 1.2 mg/L d. 0.5 – 0.8 rl

567. 'Monday morning fever' is a common name for: *(RRB Feb 2012)*
a. Asbestosis b. Bagassosis
c. Byssinosis d. Mad Hatter's disease

568. The most effective method of well disinfection is done by: *(RRB Feb 2012)*
a. Chlorine tablets b. $KMnO_4$
c. Per chlorine d. $CaOCl_2$

569. Vitamin D resistant rickets is a (an)
a. X-linked recessive disorder
b. X-linked dominant disorder
c. Autosomal recessive disorder
d. Autosomal dominant disorder

570. The diagram that is used to predict possible genotypes in an offspring is known as:
a. Genogram b. Punnett square
c. Pedigree chart d. All of the above

571. The most characteristic and specific signs of Vitamin-A deficiency is/are
a. Eye lesions b. Color blindness
c. Blurring of vision d. Double vision

572. The most common congenital lesion in North India is
a. Cleft lips and cleft palate
b. Club foot
c. Neural tube defect
d. Congenital heart diseases

573. Which of the following is the major risk factor of candidiasis of oral cavity?
a. Poor personal hygiene
b. Alcoholism
c. Thiamine deficiency
d. Smoking

574. While teaching a patient with COPD regarding exercise, the community health nurse should emphasize
a. Rest in between exercise
b. Avoid exercise
c. Exercise strenuously
d. Take medication in between exercise

575. Childhood obesity prevention is a type of
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention

576. Screening of the immigrants for infectious disease is referred as
a. Primordial screening
b. Prospective screening
c. Prescriptive screening
d. Quarantine screening

577. RDA of iodine for an adult is
a. 50 μg/day b. 75 μg/day
c. 100 μg/day d. 150 μg/day

578. Vitamin A prophylaxis is an example of
a. Primordial prevention
b. Health protection
c. Specific protection
d. Disability limitation

579. Highest source of vitamin A is seen in
a. Cod liver oil b. Green leafy vegetable
c. Amla d. Guava

580. Which of the following disease is caused by deficiency of Thiamine?
a. Wernicke's encephalopathy
b. Cheilosis
c. Pellagra
d. All of the above

581. Deficiency of _____ causes Wernicke's encephalopathy?
a. Niacin b. Phosphorus
c. B12 d. Thiamine

582. Deficiency of which of the following vitamin causes beriberi?
a. Vitamin B1
b. Vitamin B2
c. Vitamin B6
d. Vitamin B12

Scanned with CamScanner

583. In India, goiter is found commonly in
a. Southern region
b. Himalayan region
c. Western region
d. Coastal region

584. While teaching "survival skills" to newly diagnosed type-I diabetic patient, the community nurse should include information about
a. Foot care
b. Eliminating sugar from diet
c. Prevention of hypoglycemia
d. Need to increase rest

585. Which of the following term refers to a fungal infection of foot?
a. Tinea corporis
b. Tinea pedis
c. Tinea capitis
d. Tinea cruris

586. Modifiable risk factors for hypertension is
a. Ethnicity
b. Age
c. Sex
d. Obesity

587. Not included among major criteria in acute rheumatic fever is:
a. Erythema marginatum
b. Polyarthralgia
c. Chorea
d. Pancarditis

588. Not a dietary modification in high risk Cardiovascular Disease group is?
a. LDL Cholesterol less than 100 mg/dl
b. Avoidance of alcohol
c. Saturated fat intake limited to 7% of total calories
d. Salt Intake less than 5 gm/day

589. Modifiable risk factor in CHD are all except:
a. Smoking
b. Obesity
c. Personality
d. Hypertension

590. Ideal cholesterol level should be less than:
a. 200
b. 220
c. 300
d. 350

591. The most common cancer, affecting both males and females worldwide is:
a. Cancer of the pancreas
b. Buccal mucosa cancer
c. Lung cancer
d. Colorectal cancer

592. Most common cancer affecting Indian females is:
a. Cervical cancer
b. Ovarian cancer
c. Breast cancer
d. Colonic cancer

593. Most common cancer among women worldwide is
a. Lung cancer
b. Oral cancer
c. Breast cancer
d. Gastric cancer

594. Glycosylated hemoglobin reflects the mean blood glucose level of previous:
a. 15 days
b. 1 month
c. 3 months
d. 6 months

595. A patient is called obese if BMI is:
a. 20-30
b. >25
c. >30
d. >40

596. BMI for normal weight:
a. 18.5-27.99
b. 18.5-24.99
c. 23.0-24.99
d. >30

597. BMI is also known as:
a. Quetelet Index
b. Lorentz Index
c. Broca Index
d. Corpulence Index

598. BMI (body mass index) is defined as:
a. Weight (kg) /(Height)2 [meters]
b. Weight (kg) /(Height)1.6 (cm)
c. Midarm circumference (cm)/Head circumference (cm)
d. Midarm circumference (cm) between ages of 1 -5 yrs

599. Most common cause of blindness in India is:
a. Cataract
b. Trachoma
c. Vit A deficiency
d. Glaucoma

600. Which vitamin deficiency causes night blindness
a. Vitamin A
b. Vitamin B
c. Vitamin C
d. Vitamin D

601. Vitamin A is also known as
a. Thiamine
b. Cholecalciferol
c. Tocopherol
d. Retinol

602. Which of the following is the macro nutrient?
a. Vitamins
b. Zinc
c. Proteins
d. Calcium

603. What is the normal range of BMI (Body Mass Index)?
a. 0–8
b. 8-15
c. 18-25
d. 25-30

604. Pellagra is characterized by 3Ds. Which of the following describes 3Ds of pellagra?
a. Diarrhea, Dermatitis, Dementia
b. Delusion, Diarrhea, Dementia
c. Deformity, Delusion, Deviated septum
d. Dementia, Delusion, Disarticulation

605. Most common cause of stroke in India is –
a. Cerebral thrombosis
b. Cerebral embolism
c. Cerebral hemorrhage
d. Subarachnoid Hemorrhage

606. Best method of screening for early detection of - carcinoma breast in women aged above 40 years is:
a. Regular X-rays'
b. Self-examination
c. Mammography
d. Regular biopsies

Ref: www.cancer.o

Explanation: Mammography is advised after a woman crosses 4 years of age. If mammography is normal, screening continues eve year.

According to American Cancer Society, Breast self-exam is also longer recommended as an option for women of any age.

607. Which is not a predisposing factor for Carcinoma cervix?
a. Early marriage
b. Early coitus
c. Early child bearing
d. Single child birth

608. Following is not a risk factor for development of diabe mellitus:
a. Sedentary life style
b. Protein energy malnutrition in infancy
c. Excessive intake of alcohol
d. High intake of vitamin-A

609. 'Guthrie Test' is done in neonates for mass screening of -
a. Neonatal Hypothyroidism
b. Phenylketonuria
c. Hemoglobinopathies
d. Congenital Dislocation of Hip

610. Most common neonatal disorder screened is –
a. Neonatal hypothyroidism
b. Phenylketonuria
c. Hemoglobinopathies
d. Congenital dislocation of Hip

611. Benzene is associated with cancer of:
a. Skin cancer
b. Lung cancer
c. Bladder cancer
d. Leukemia

612. All are disease manifestation associated with low temperature except:
a. Frost bite
b. Trench foot
c. Prickles
d. Chill blains

613. The most common early manifestation of chronic bronchitis
a. Frequent productive cough
b. Dyspnea on exertion
c. Cyanosis at feet
d. Blood in sputum

614. Following are chemical agents, that cause occupational dermatitis by local irritation except:
a. Rubber b. X-ray
c. Lime d. Ether

615. Occupational cancer involve following organs except:
a. Lung b. Breast
c. Bladder d. Liver

616. Most common mode of lead poisoning is:
a. Ingestion b. Skin
c. Inhalation d. Faeco-oral

617. Asbestosis is _____
a. A water borne disease b. An occupational disease
c. An airborne disease d. A food borne disease

618. Which occupational disease is caused by extreme cold climate?
a. Occupational cataract b. Miner's nystagmus
c. Pancytopenia d. Frost bite

619. Which of the following disease is caused by inhalation of sugarcane dust?
a. Asbestosis b. Bagassosis
c. Byssinosis d. Silicosis

620. A lung disease caused by prolonged inhalation of cotton fibre dust is
a. Bagassosis b. Byssinosis
c. Farmers lung d. Pneumonia

621. 'Snow storm appearance' in X-ray of an adult male suggests
a. Asbestosis b. Siderosis
c. Anthracosis d. Silicosis

622. Diffuse Mesothelioma is seen with–
a. Asbestos b. Tobacco
c. Arsenic d. TB
e. Histoplasmosis

623. "Farmers lung" is due to inhalation of–
a. Cotton fibre b. Sugarcane dust
c. Hay dust d. Coal dust

624. Main cause of Farmer's lung is:
a. Pneumococcus
b. Mycobacterium tuberculosis
c. Micropolyspora faeni
d. Staphylococcus aureus

HEALTH PROGRAMS, POLICES AND ACTS

625. Which of the following is an international agency which assist in Programme that benefit child health most? *(RAK MSc 2018)*
a. UNO b. WHO
c. UNICEF d. Red Cross

Explanation: UNICEF- United Nation International Child Emergency Fund is specialized for the united nation established in 1946. Main works are maintaining child health, nutrition, maintain family and child welfare and provide formal and nonformal education.

626. One basic health worker (multipurpose worker) for 10000 populations was recommended by: *(AIIMS Nagpur NO 2018)*
a. Chadha committee
b. Mukherjee committee
c. Bhore committee
d. Mudaliar committee

Explanation: Chadha committee in 1963 recommended one basic health worker (multipurpose worker) per 10,000 populations. Multipurpose workers to look after additional duties of collection of vital statistics and family planning in addition to malaria vigilance.

627. All are true about Anganwadi workers except: *(Safdarjung NO 2018)*
a. Part time worker
b. Covers population of 5000
c. Supply Nutrition and educate about vaccination
d. Under controls ICDS

Explanation: All points are true about Anganwadi worker except covers 5000 population. Under the ICDS scheme anganwadi worker covers 1000 population and services given like health check-up, immunization, supplementary nutrition, health education, referral services, preschool nonformal education.

628. All are true of midday school meal Programme except: *(Safdarjung NO 2018)*
a. Should supply one-third daily calories and half of daily protein
b. Substitute for regular food
c. Locally available foods are used
d. Cheap and easy to prepare

629. As per the Mid-day Meal Programme the meals served should supply at least.....of the total energy requirement: *(NCFL 2019)*
a. 1/3rd b. 1/4th
c. 1/6th d. 3/4th

Explanation: As per the set norms, the midday meal is required to meet one-third of energy and one-half of protein requirement (RDA) of school children.

630. The WHO initiative 'Right to Sight' is named as: *(AIIMS-BBS SNO 2019)*
a. Vision 2015 b. Vision 2020
c. Vision 2030 d. Vision 2025

Explanation: The WHO initiative 'Right to Sight' is named as **Vision 2020.** It is a global initiative for the elimination of avoidable blindness, which is a joint Programme of the WHO and the international agency for prevention of blindness. (IAPB)

631. The diseases that comes under National vector borne disease control program are: EXCEPT

a. Filariasis
b. Japanese encephalitis
c. Malaria
d. Swine flu

Explanation: National vector borne disease control program is implemented for prevention and control of vectors borne diseases like malaria, filariasis, Japanese encephalitis, Kala-Azar, dengue and chikungunya.

632. National malaria eradication program was launched in the year:

a. 1953
b. 1958
c. 1970
d. 2002

Explanation: National malaria control program was launched in 1953, but after spectacular results in 5 year period, the program was renamed as malaria eradication program in the year1958. But there was resurgence of malarial cases in the early 1970. In 1999 the whole program was renamed as National Anti-malaria program. Recently in 2002, the program is renamed has National vector borne disease control program.

633. Management of area with Annual Parasite Index (API) less than 2 include: EXCEPT

a. Regular insecticidal spray
b. Passive surveillance
c. Detected cases gets radical treatment
d. Follow -up blood smears are to be collected

Explanation: Areas are categorized under API to control the malaria cases. API if is more than 2 indicates that cases of malaria is more and needs more attention, while area with API less than 2 receives less attention. So, management in area with API <2 includes no regular spraying, passive surveillance, radical treatment of detected cases and follow up of blood smears.

634. Case finding in RNTCP is based on: *(DSSSB)*

a. Sputum culture
b. Sputum microscopy
c. X-ray chest
d. Mantoux test/PCR

Explanation: Laboratory diagnosis of tuberculosis by sputum microscopy. TB is an infectious disease. Transmission occurs when small aerosols containing acid- fast bacilli (AFB) become airborne and are inhaled.

635. Beti bachao beti padhao programme was first launched in which state?

a. Haryana
b. Bihar
c. Uttar Pradesh
d. Delhi

Explanation: Launched in Haryana. "Beti bachao beti Padhao" (BBBP) Yojana (save daughter, educate daughter) to save and empower the girl child is making waves all over the nation

636. JSY stands for: *(Kerala PSC 2002)*

a. Janani Swetchath Yojana
b. Jan surakshaYojana
c. Janani Suraksha Yojana
d. Jan Sulabh- sauchalayYojana

Explanation: Janani Suraksha Yojana (JSY) is a safe motherhood intervention under the National Rural Health Mission (NRHM). It is being implemented with the objective of reducing maternal and neonatal mortality by promoting institutional delivery among poor pregnant women.

637. The act that is recommended for provision of crèches for women in factory:

a. ESI Act 1948
b. The Indian Mines Act 1923
c. The Factories Act 1976
d. CGHS

Explanation: The Factories Act, 1976 made recommendation to provide crèches in factories where more than 30 women workers are employed.

638. ESI ACT, 1948 was last amended in the year:

a. 2008
b. 1998
c. 1989
d. 2010

Explanation: ESI Act was passed in the year 1948 later it was amended in 1975, 1984 and 1989. Recently on 1/5/ 2010 the ESI Act was again revised to increase the benefit for wider group employees.

639. International labor organization is situated in:

a. Geneva
b. Denmark
c. Scotland
d. United states of America

Explanation: International labor organization is a United Nation's agency, was founded in 1919. Its headquarters is in Geneva, Switzerland. It mainly focuses on labor related issues. In 1969, the organization received Nobel Peace Prize.

640. An employer contributes .....percentage of wages for the benefit of employee in every wage period under ESI Act.

a. 1.75%
b. 4.75%
c. 2.35%
d. 3.75%

Explanation: Under ESI Act an employee contributes 1.75% of wages paid and employer contributes 4.75% of wages paid in respect of the employees in every wage period.

641. Midday meal program started in ..... year? *(ESI 2009)*

a. 1960
b. 1961
c. 1995
d. 2001

Explanation: Mid-day meal programme is started in 1961.

642. Health survey and development committee is also known as.....? *(RUHS 2007)*

a. Bhore committee
b. Chadah committee
c. Shrivastav committee
d. Mukharji committee.

643. Bhore Committee was appointed by the Govt. of India in the year: *(Safdarjung NO 2018)*

a. 1933
b. 1953
c. 1943
d. 1963

Explanation: This committee, known as the Health Survey and Development Committee, was appointed in 1943 with Sir Joseph Bhore as its Chairman. It laid emphasis on integration of curative and preventive medicine at all levels. It made comprehensive recommendations for remodeling of health services in India. The report, submitted in 1946, had some important recommendations like

- Integration of preventive and curative services of all administrative levels
- Development of primary health centers in 2 stages

644. Child Survival and Safe Motherhood (CSSM) programme was replaced by which program in India?
a. MCH b. NRHM
c. RCH d. ICDS

Explanation: CSSM is replaced by RCH.

645. In India the target disease included in vision 2020 is:
a. Cataract b. Refractive errors
c. Childhood blindness d. All of the above

Explanation: Target disease areas for Vision 2020 includes Cataract, Refractive error, Trachoma, Childhood blindness, Low vision, Onchocerciasis/river blindness, Glaucoma, Diabetic retinopathy, Age-related macular degeneration, Gender and blindness and Vitamin A deficiency.

646. Which of the following day is celebrated as world environment day? *(Kerala PSC, Nov 2014)*
a. May 1 b. September 5
c. December 1 d. June 5

647. Which of the following is an activity of under-five clinics? *(Staff Nurse G II 2014)*
a. Mid-day meal program
b. Child education
c. Growth monitoring
d. School health services

648. Which of the following is observed as anti-malaria month? *(Staff Nurse G II 2014)*
a. December b. May
c. June d. January

649. The goal of "Health for all by 2000 AD" was mooted in world health assembly in the year: *(Staff Nurse G II 2014)*
a. 1966 b. 1948
c. 1957 d. 1978

650. Alma Ata Declaration was made in: *(JIPMER 2012)*
a. 1948 b. 1978
c. 1967 d. 2002

651. National tuberculosis control program was adopted in India in the year: *(Staff Nurse G II 2014)*
a. 1960 b. 1966
c. 1962 d. 1964

652. Which day is celebrated as labor day: *(ESIC Chennai May 2012)*
a. 1st June b. None of the above
c. 1st May d. 30th May

653. MTP Act (1971) in India specifies all of the following except *(RRB Feb 2012)*
a. Persons who should perform abortion
b. Conditions for abortion
c. Techniques of abortions
d. Place for conducting abortions

654. Rashtriya Swasthya Bima Yojana is a Government run insurance scheme for
a. Poor people
b. Older persons
c. Girl children
d. All women

655. Which of the following is the prime objective of Beti Bachao Beti Padhao Scheme?
a. Financial help for girl child until her 14 years of age
b. Celebrate girl child and enable her education
c. Government of employment for girl children
d. All of the above

656. In which state, Beti Bachao Beti Padhao Scheme was launched?
a. Rajasthan b. Haryana
c. Uttar Pradesh d. Bihar

657. How many districts are selected throughout the country for Beti Bachao Beti Padhao scheme?
a. 50 districts b. 100 districts
c. 200 districts d. 300 districts

658. Name the special deposit account under Beti Bachao Beti Padhao scheme?
a. Suraksha Samriddhi Account
b. Sukanya Samriddhi Account
c. Beti Samriddhi Account
d. Janani Samriddhi Account

659. Pradhan Mantri Suraksha Bima Yojana will cover
a. Death due to accident
b. Disablement due to accident
c. Both disablement and death due to accident
d. Death due to communicable diseases

660. What is the cover amount for full disability in Pradhan Mantri Suraksha Bima Yojana?
a. 1 lakh b. 2 lakhs
c. 4 lakhs d. 5 lakhs

661. Which of the following condition is NOT included as a component of five key areas for action in vision 2020
a. Cataract
b. Refractory error
c. Childhood blindness
d. Viral conjuctivitis

662. Components of RCH 1 include all of the following EXCEPT
a. Family planning
b. CSSM
c. Prevention of STD
d. Emergency obstetric care

663. Component of RCH II include all EXCEPT
a. Emergency obstetric care
b. Essential obstetric care
c. Family planning
d. Strengthening of referral system

664. Vande Mataram scheme is included in
a. RCH program b. JSY program
c. IMNCI program d. ICDS program

665. Urban malaria scheme is based on
a. Epidemiological survey
b. Anti-adult mosquito measure
c. Anti-larval measures
d. Chemoprophylaxis

666. RNTCP case finding is
a. Active b. Passive
c. Active and Passive d. None of the above

667. As per RCH, the community health center is
a. First referral unit
b. Secondary referral unit
c. Tertiary referral unit
d. None of the above

668. Recent Mental Health Act in India is designated as
a. Mental Health Act (2011)
b. Mental Healthcare Act 2017
c. Mental Health and Lunatics Act (2011)
d. Mental Health and Illness Act (2011)

669. National family health survey done in every _____
a. 6 months b. 1 year
c. 5 years d. 10 years

670. National tuberculosis control programme was launched in the year of .....
a. 1962 b. 1992
c. 1995 d. 1997

671. Revised national tuberculosis control programme was launched in the year of .....
a. 1962 b. 1992
c. 1995 d. 1997

672. First round of pulse polio immunization programme was launched in the year of .....
a. 1962 b. 1993
c. 1995 d. 1997

673. NRHM was started in:
a. 2005 b. 2006
c. 2007 d. 2009

674. The main objective of Janani Suraksha Yojana is:
a. Tetanus immunization
b. Institutional deliveries
c. Iron supplementation
d. Nutritional supplementation

675. Full form of ASHA is
a. Accredited Social Health Activist
b. Accredited School Health Act
c. A specific health agent
d. Association of School Health Activist

676. All are included in National Rural Health Mission (NRHM) except:
a. Strengthening of JSY (Janani Suraksha Yojana)
b. Formation of family health and social welfare societies
c. State and district health mission
d. Recruitment and training of ASHA

677. 'JSY' stands for:
a. Janani Suraksha Yojana
b. Janani Samriddhi Yojana
c. Janani Swarojgar Yojana
d. Janani Sampooma Yojana

678. All are correct statement about ASHA except:
a. Female trained village guide
b. One for per village
c. One for per 1000 population
d. Female untrained guide

679. ASHA scheme is associated with:
a. ICd.
b. Rural health mission
c. 20 points programme
d. Minimum needs programme

680. Under NRHM, lowest level at which Health Action Plan is prepared is:
a. State level b. District level
c. Village level d. Sub center level

681. Under National Rural Health mission who will be the link person between community and health care services?
a. Anganwadi worker b. TBA
c. ASHA d. ANM

682. What is the aim of swajal dhara?
a. Providing safe drinking water
b. Promotion of institutional delivery
c. Providing irrigation facilities for barrel lands
d. Interlinking of river project

683. IMNCI refers to
a. Integrated mother and neonatal critical illness
b. Integrated mother and newborn clinical interventions
c. Integrated management of neonatal and childhood illness
d. Integrated management of neonatal and clinical illness

684. A patient treated at home is allotted which color code according to IMNCI coding
a. Pink b. Red
c. Green d. Yellow

685. RCH phase 2 does not include
a. Immunization of pregnant women
b. Treatment of STD/RTI
c. Feed to malnourished children
d. Early registration of pregnancy up to 12-16 weeks

686. IMNCI target group is
a. Up to 5 yrs b. Up to 10 yrs
c. Up to 15 yrs d. Up to 20 yrs

687. IMNCI includes management of all of the following conditions EXCEPT
a. Diarrhea
b. Measles
c. Acute respiratory infections
d. Vitamin A deficiency

688. Kishori Shakti Yojana has been designed to improve nutritional status of
a. Adult men b. Adolescent girls
c. Under five children d. Senior citizens

689. According to IMNCI, fast breathing in 5 months child is defined as
a. >30/min b. >40/min
c. >50/min d. >60/min

690. IMNCI differs from IMCI in all except:
a. Malaria and Anemia are included
b. 0-7 days infants are included
c. Sick neonates are preferred over sick older children
d. Treatment is aimed at more than one disease (condition) at a time

691. Integrated Management of Neonatal and Childhood Illnesses (IMNCI) includes the following except:
a. Malaria b. Respiratory infections
c. Diarrhea d. Tuberculosis

692. Integrated Management of Childhood Illness (IMCI) initiative was taken to prevent morbidity and mortality from all of the following except:
a. Malaria b. Malnutrition
c. Otitis Media d. Neonatal tetanus

693. IMNCI includes all except:
a. Tetanus
b. Acute respiratory tract infection
c. Measles
d. Malaria

694. Kishori Shakti Yojana (KSY) is:
a. Empowerment of females under Maternity Benefit Scheme
b. Adolescent girl's scheme under ICDS
c. Free and compulsory education for girl child
d. Child care home scheme for female juvenile delinquents

695. RNTCP, Category II treatment comprises
a. 2H3R3Z3E3 + 4H3R3
b. 2H3R3Z3E3S3 + 1H3R3Z3E3+ 5H3R3E3
c. 2H3R3Z3E3 + 5H3R3Z
d. None

696. RNTCP case finding is

697. True statement regarding RNTCP includes all except:
a. Sputum microscopy
b. Exclusion of private practitioners
c. Participation of all health workers
d. Provide latest equipment

698. ICDS was launched in
a. 1955 b. 1968
c. 1975 d. 2005

699. Administrative unit of the ICDS project in rural areas is
a. PHC
b. Community development block
c. Zila parishad
d. Gram panchayat

700. The Panchayati Raj consists of 3 tier structure:
a. Panchayat, Panchayat Samiti, Municipal area committee
b. Panchayat, Panchayat Samiti and Zila Parishad
c. Panchayat, Tehsil and Blocks
d. Panchayat, Tehsil Blocks and municipal Board

701. ICDS does not cover:
a. Nutritional supplementation
b. Formal education
c. Health education
d. Immunization

702. Which of the following disease is not included in "Vision 2020- Right to sight" immediate goals?
a. Cataract b. Onchocerciasis
c. Trachoma d. Epidemic conjunctivitis

703. Vitamin A supplement administered under 'National Programme for Prevention of Nutritional Blindness', contains:
a. 25,000 IU/ mL b. 1 Lakh IU/mL
c. 3 Lakh IU/mL d. 5 Lakh IU/mL

704. National malaria control programme was launched in the year of .....
a. 1921 b. 1953
c. 1954 d. 1960

705. Red cross society established in ..... year
a. 1920 b. 1953
c. 1954 d. 1960

706. Red cross society was founded by *(RPSC NG-II)*
a. Alfred b. Hendry Daunt
c. Emyllin d. William James

707. Millennium development goals declared by WHO in the year of .....:
a. 2000 b. 2004
c. 2005 d. 2010

708. Which of following health services provide mid-day meal programme?
a. M b. PHC
c. R d. School Health Services

709. In ICDS all of the following are included except:
a. Immunization
b. Health Education
c. Prevention of iodine deficiency disorders
d. Supplementary nutrition

710. According to ICDS programme, children of age 6 months to 5 years should be supplemented with which of the following?
a. 500 cal + 12-15 g proteins
b. 300 cal + 10-15 g proteins
c. 600 cal + 18-20 g proteins
d. 500 cal + 18-20 g proteins

711. Which of the following is known as 'Heart of ICDS system'?
a. Mother and Children
b. CDPO
c. Primary Health Center
d. Anganwadi

712. Guidelines for Baby friendly hospital initiative includes following EXCEPT:
a. Mothers and infant to be together for 24 hours a day
b. Mother to initiate breast-feeding in 4 hours of normal delivery
c. Giving newborn infants no food or drink other than breast milk
d. Encouraging breast-feeding on demand

713. Under MCH programme, IFA tablets to be given daily to mother has -
a. 60 mg iron + 500 mcg folic acid
b. 100 mg iron + 500 mcg folic acid
c. 60 mg iron +100 mcg folic acid
d. 100 mg iron +100 mcg folic acid

714. Which of the following would contribute to growth monitoring of under-five children?
a. Health education
b. Road to health chart
c. Apgar Score
d. Weight Monitoring

715. The Children's Act was passed in
a. 1960 b. 1969
c. 1971 d. 1986

716. In India the ESI Act was enacted in the year
a. 1947 b. 1948
c. 1950 d. 1952

FAMILY PLANNING AND PERINATAL CARE

717. Gray baby syndrome is caused by .....? *(ESI-2009)*
a. Chloramphenicol b. Amphotericin B
c. Vancomycin d. Tetracycline

Explanation: Gray baby syndrome is a serious side effect that occurs in newborn infants following intravenous administration of antimicrobial chloramphenicol because they lack the necessary liver enzymes to metabolize this drug. Chloramphenicol accumulates in the baby, causing hypotension, cyanosis (blue coloring of lips, nail beds, and skin due to lack of oxygen in the blood), and often death. Chloramphenicol is therefore usually not given to newborns or premature babies.

718. A newly married healthy couple is asking for the best method of contraception and which of the following methods a nurse will advise? *(NCFL 2019)*
a. Barrier method
b. Rhythm method
c. Intrauterine devices
d. Combined Oral Pills

Explanation:
- Combined Oral pills have very low failure rate and a lot of non-contraceptive benefits. So it is a preferred option for a newly married healthy couple.
- Barrier method (condom) has high failure rate. Rhythm method is unreliable. IUD is not a first choice for young and never pregnant women.

Scanned with CamScanner

719. The best time for insertion of I.U.C.D in women is: *(RAK MSc 2018)*

a. Within first week of cessation of menstrual period
b. Fourteen days after menstrual period
c. One week before menstrual period
d. During menstrual period

Explanation: Intrauterine devices made up of by polyethylene or polymers with copper metal or progestogens. The IUD insertion is scheduled within 7-10 days starting of period. Because internal os is slightly open during the first 7 days of periods thereafter the os closes and makes the copper T insertion difficult.

720. Neural tube defect occurs due to lack of _____

a. Folic acid
b. Calcium
c. Niacin
d. Riboflavin

Explanation: Neural tube defects are birth defects of the brain, spine, or spinal cord. They happen in the first month of pregnancy, often before a woman even knows that she is pregnant. The two most common neural tube defects are spina bifida and anencephaly. In spina bifida, the fetal spinal column does not close completely. Taking a prenatal vitamin with the recommended 400 micrograms (mcg) of folic acid before and during pregnancy can help prevent NTD.

721. Baby friendly hospital initiative was started in India in the year:

a. 1993
b. 1991
c. 1996
d. 1990

Explanation: Baby friendly hospital initiative is a global movement, developed jointly by WHO and UNICEF in the year 1990, later it was launched by WHO in 1991. India adopted the same initiative in the year1993 with an objective to reduce infant mortality and morbidity due to improper breastfeeding techniques.

722. Rooming in practice means keeping mother and infant together

a. for 24 hours a day
b. for 8 hours
c. whenever baby demands for feeding
d. whenever infant becomes hypothermic

Explanation: Rooming in is a step taken under baby friendly hospital initiative, in which mother and infant are kept together for 24 hours. This increases neuromotor development, prevents hypothermia and infection. This arrangement gives an opportunity for the mother and father to know their baby. The bond between the parent and the child is well established in roomed-in babies.

723. Exclusive breastfeeding helps mother in, except

a. Prevention of cervical cancer
b. Prevention of breast cancer
c. Act as a contraceptive method
d. Helps in quick and early involution of uterus

Explanation: Exclusive breastfeeding helps mother in preventing breast cancer. Breastfeeding acts as a natural contraceptive, prevents conception and it helps in quick involution of uterus and reduces post-partum bleeding. Cervical cancer is not related with breastfeeding.

724. Prolactin reflex in mother causes:

a. Ejection of milk
b. Production of milk
c. Suppression of milk production
d. Storage of milk

Explanation: As the baby sucks nerve ending in the nipple stimulates anterior pituitary gland resulting in release of prolactin hormone which stimulates alveolar cells to produce milk. Thus, more the baby sucks more milk will be produced.

725. Baby with birth weight of 1000-2000 g are termed as:

a. Low birth weight babies
b. Very low birth weight babies
c. Small for date baby
d. Extremely low birth weight babies

Explanation: Very low birth weight is very fragile and needs intensive neonatal care in hospital.

Birth weight	Grade
>3500 g	Obese
3500-2500 g	Normal birth weight babies
2500-2000 g	Low birth weight baby
2000-1000 g	Very low birth weight baby
<1000 g	Extremely low birth weight babies

726. Vitamin K at birth is administered to .....among newborns.

a. Prevent excessive bleeding
b. Increase immunity
c. Prevent Infection
d. Correct malnutrition

Explanation: Vitamin K is one of the clotting factors that helps in clotting the blood. Newborns at birth are unable to produce adequate amount of Vitamin K because baby's bowel is 'sterile' when inside the uterus (meaning no bacteria) and does not start producing vitamin K until after they are born. Most of the Vitamin K needed by the baby is obtained through a slow buildup of their gut bacteria in the weeks, or months, after the birth.

727. Warm Chain means.....

a. Drying the baby
b. Establishing skin to skin contact with mother and immediate initiation of breastfeeding
c. Warm resuscitation and warm transportation
d. All of the above

Explanation: Warm chain is a set of 10 interlinked procedures carried at birth and later to prevent hypothermia among newborns, it includes:

- Warm delivery room (>25°C)
- Warm resuscitation
- Immediate drying
- Skin-to-skin contact between baby and the mother
- Breastfeeding
- Bathing and weighing postponed
- Appropriate clothing and bedding
- Mother and baby together
- Warm transportation
- Training/awareness of healthcare providers

728. Apgar score helps to assess depression of:

a. Cardiopulmonary functions
b. Psychomotor functions
c. Integumentary functions
d. Cardiopulmonary and neurologic function

Ans.

719.	a
720.	a
721.	a
722.	a
723.	a
724.	b
725.	b
726.	a
727.	d
728.	d

Scanned with CamScanner

Explanation: Apgar Scoring system is used to assess the depression of cardiopulmonary and neurologic functions. It considers signs such as color, heart rate, respiratory rate, muscle tone and reflexes.

729. Apgar score of 4-6 of newborn indicates
a. Severe depression
b. Mild depression
c. Moderate depression
d. No depression

Explanation: Apgar scoring is done by summing of scores obtained under all 5 parameters. Minimum score is 0 and maximum score is 10.

Apgar Score	Level of depression	Level of attention
0-3	Severe	Intensive neonatal care
4-6	Mild	Needs immediate attention, if Apgar score has not changed after 5 minutes should be treated in intensive care
7-10	No depression	No special attention needed

730. Normal umbilical cord contains:
a. 1 arteries and 2 veins
b. 2 arteries and 1 vein
c. 1 arteries and 1 vein
d. 2 arteries and 2 vein

Explanation: Normal newborn gets 2 arteries and 1 vein, abnormality in umbilical artery can be detected during early pregnancy, it is an indication for chromosomal abnormalities, congenital anomalies and potential complication during pregnancy.

731. Primary postpartum hemorrhage occurs within ..... hours of delivery.
a. 6 hours
b. 8 hours
c. 12 hours
d. 24 hours

Explanation: Bleeding more than 500 mL of blood from vagina after delivery is called Post-partum hemorrhage (PPH). If hemorrhage occurs within 24 hours of delivery it is called primary PPH. Secondary is defined as excessive vaginal bleeding from 24 hours after delivery up to 6 weeks postpartum.

732. The management of postpartum hemorrhage includes all, EXCEPT:
a. Bimanual uterine compression
b. Administration of oxytocin
c. Controlled cord traction
d. Administration of progesterone

Explanation: Post-partum hemorrhage is caused by atonic uterus, retained blood clots or placental products, delay in third stage of labor. In such cases, administering 10 IU of oxytocin, giving bimanual compression or using controlled cord traction can help prevent PPH.

733. Detection of high levels of alpha fetoprotein in mother's blood indicates that developing baby has.....
a. Coarctation of aorta
b. Delayed skeletal development
c. Neural tube defect
d. Development of tumor

Explanation: Alpha fetoprotein is a type of protein produced from fetal yolk sac and then later in liver and gastrointestinal sac. It is found in both fetal serum and also in amniotic fluid. If its level is above normal it indicates that developing baby has neural tube defect.

734. Kegel exercises during pregnancy helps in strengthening of:
a. Pelvic floor muscle
b. Psoas muscle
c. Rectus abdominis
d. Quadratus lumborum

Explanation: Kegel exercises are named after Arnold Kegel, who recommended these exercises in 1940's. This exercise helps in strengthening pelvic floor muscles and improves blood circulation to rectum and vagina.

735. Punnett square is useful for .....
a. To determine the probability of an offspring having a particular genotype
b. To determine the incidence of disease condition
c. To determine the surveillance of the disease condition
d. To determine the outcome of a disease condition

Explanation: The Punnett square is a diagram that is used to predict an outcome of a particular cross or breeding experiment. It is named after Reginald C. Punnett, who devised the approach. The diagram is used by biologists to determine the probability of an offspring having a particular genotype.

736. Human milk is rich in all: EXCEPT *(LNJP)*
a. Fat
b. Protein
c. Iron
d. Carbohydrate

Explanation: Milk is rich in all except Iron. Mature human milk contains 3% – 5% fat, 0.8% – 0.9% protein, 6.9%- – 7.2% carbohydrate calculated as lactose, and 0.2% mineral constituents expressed as ash. Its energy content is 60 – 75 kcal/100 mL. Protein content is markedly higher and carbohydrate content lower in colostrum than in mature milk. Iron is deficient in human milk.

737. Exclusive breastfeeding refers to feeding of infant only with breast milk for the period of
a. 3 months
b. 6 months
c. 8 months
d. 12 months

Explanation: As per World Health Organization (WHO) "Exclusive breast-feeding" is defined as no other food or drink, not even water, except breast milk (including milk expressed or from a wet nurse) for 6 months of life, but allows the infant to receive ORS, drops and syrups (vitamins, minerals and medicines).

738. Neonatal tetanus can be prevented through.....
a. Clean surface of delivery
b. Clean hand of the attendant
c. Clean cord tie
d. All of the above

Explanation: Neonatal tetanus prevented by 5 clean: clean hand, clean delivery surface and clean cord care (it includes clean tie for cord and no application on cord stump, clean blade for cutting cord)

739. Commonest side effect of copper – T is ..... *(PGI 2006)*
a. Pain
b. Bleeding
c. Vaginal discharge
d. Pelvic inflammation

Ans.
729. b
730. b
731. d
732. d
733. c
734. a
735. a
736. c
737. b
738. d
739. b

Scanned with CamScanner

Explanation: Most common side effect associated with CU-T is bleeding

740. Which of the following ATT drug is absolutely contra-indicated in pregnancy?
a. Pyrazinamide
b. Rifampicin
c. Streptomycin
d. Ethambutol

Explanation: Streptomycin is absolutely contraindicated in pregnancy. Streptomycin is a bactericidal antibiotic. Adverse effects of this medicine are ototoxicity, nephrotoxicity, fetal auditory toxicity, and neuromuscular paralysis.

741. Best response from a nurse to the women who missed single dose of oral contraceptive pill?
a. Take the missed pill now and continue the course
b. Take 2 pills the next day and continue with the course.
c. Discontinue the course because OCP has no more effect
d. Use barrier technique

Explanation: A women who misses single dose of OCP should take 2 pills on next day and continue with the same cycle.

742. Absolute contraindication to the OCP includes
a. Thromboembolism
b. Liver disease
c. Ca breast
d. All of the above

Explanation: As per WHO

Absolute contraindication to OCP includes the following:
- Less than 6 weeks postpartum
- Smoker over the age of 35 (>15 cigarettes per day)
- Hypertension (systolic >160 mm Hg or diastolic >100 mm Hg)
- **Current or past history of venous thromboembolism (VTE)**
- Ischemic heart disease
- History of cerebrovascular accident
- Complicated valvular heart disease (pulmonary hypertension, atrial fibrillation, history of subacute bacterial endocarditis)
- Migraine headache with focal neurological symptoms
- **Breast cancer (current)**
- Diabetes with retinopathy/nephropathy/neuropathy
- **Severe cirrhosis (Liver disease)**
- Liver tumor (adenoma or hepatoma)

Relative contraindications include the following:
- Smoker over the age of 35 (<15 cigarettes per day)
- Adequately controlled hypertension
- Hypertension (systolic 140–159 mm Hg or diastolic 90–99 mm Hg)
- Migrain headache over the age of 35
- Currently symptomatic gallbladder disease
- Mild cirrhosis
- History of combined OCP-related cholestasis
- Users of medications that may interfere with OCP metabolism

743. On prescription of oral pills to the user, the health worker will ask about the following: EXCEPT *(DSSSB 2010)*
a. Number of live children
b. Calf tenderness
c. Headache
d. Swelling of feet

Explanation: Number of live children is not taken into account while prescribing OCP.

744. Chemical components of Mala-D are _____
a. D–norgestrel and Ethinylestradiol
b. D–norgestrol and progestogen
c. Progestogen
d. Norethisterone Acetate

Explanation: MALA-D contains combination of D–norgestrol and Ethynyloestradiol.

745. Which of the following is the terminal method of contraceptive in male?
a. IUD
b. Chemical methods
c. Vasectomy
d. Condom

Explanation: Terminal method of contraception is vasectomy. Others are temporary method which are all reversible.

746. Eligible couple represents which age group of women?
a. 12-45 years
b. 15-49 years
c. 14-45 years
d. 18-45 years

Explanation:
- **Eligible couple:** A currently married couple wherein the wife (woman) is in the reproductive age (i.e. 15–49 yr. of age).
- **Target couple:** Eligible couples who have 2–3 living children

747. The metal which is commonly used for family planning is: *(DSSSB PHN, 2015)*
a. Copper
b. Aluminum
c. Iron
d. Silver

748. Still birth rate includes fetus dies after: *(RRB SSNE 2015)*
a. 20 weeks
b. 24 weeks
c. 28 weeks
d. 32 weeks

749. Which of the following is a common side effect of an Intrauterine Device? *(RRB SSNE 2015)*
a. Vaginal Bleeding
b. Pelvic Inflammatory disease
c. Uterine perforation
d. Ectopic pregnancy

Ref: K.Park. Preventive Social Medicine. 24th Ed. Pg. 532-533.

Explanation: The commonest side effect of IUD - Increased vaginal bleeding.

- **10 - 20% of IUD removal are due to complaints of increased bleeding.**
- **Pain is second major side effect of IUD.**
- **Pelvic inflammatory disease, uterine perforation and Ectopic pregnancy are more serious side effects but less common compare to vaginal bleeding and pain.**

750. Which of the following method of contraception can prevent sexually transmitted disease? *(Banaras HU 2015)*
a. Oral pills
b. Condom
c. Copper–T
d. Cervical cap

751. Which of the following neoplasm has been associated with the use of oral contraceptives? *(Banaras HU 2015)*
a. Breast cancer
b. Ovarian cancer
c. Endometrial cancer
d. Hepatic adenoma

Ans.

740.	c
741.	b
742.	d
743.	a
744.	a
745.	c
746.	b
747.	a
748.	c
749.	a
750.	b
751.	a

Scanned with CamScanner

752. Which one of the following is not an oral contraceptive pill? *(Banaras HU 2015)*
a. Estrogen only, mini pill
b. Estrogen and progesterone, combined pill
c. Estrogen followed by progesterone, sequential pill
d. Cortisol only pill

753. Eligible couple register is maintained at *(RRB Feb 2012)*
a. Sub center b. CHC
c. PHC d. District headquarters

754. Best indicator of fertility *(RRB Feb 2012)*
a. GFR (General fertility rate)
b. TFR (Total fertility rate)
c. CBR (Crude birth rate)
d. NRR (Net reproductive rate)

755. Medical methods of abortion using a combination of mifepristone and misoprostol is found to be most effective and safe upto _____ of pregnancy
a. 18-22 weeks b. 13-20 weeks
c. 13-18 weeks d. 8-12 weeks

756. Mean birth weight in India is
a. 2.0 – 2.3 kg b. 2.3 - 2.5 kg
c. 2.5 - 2.9 kg d. 3.0 – 3.5 kg

757. Road-to-Health chart was given by
a. David Morley b. John Snow
c. Koch Darwin d. Dukes

758. The best parameter for assessment of chronic malnutrition is
a. Weight for age
b. Weight for height
c. Height for age
d. Mid upper arm circumference

759. Which of the following parameter is the best indicator for nutritional status of child?
a. Head circumference
b. Mid-arm circumference
c. Chest circumference
d. Rate of increase of height and weight

760. Small for gestational age newborns are at risk for difficulty maintaining body temperature because
a. They have less fat storage than other infants
b. They are relatively small in size which reduces the body surface area
c. They are more active
d. Their skin is more susceptible to cold

761. Medical termination of pregnancy can be done by a registered medical practitioner if the gestation period is less than
a. 8 weeks b. 12 weeks
c. 20 weeks d. 24 weeks

762. What are the amounts of calories and proteins received by a pregnant woman from the anganwadi worker?
a. 300 cals, 15 gm protein
b. 500 cals, 15 gm protein
c. 300 cals, 25 gm protein
d. 500 cals, 25 gm protein

763. Eligible couples are those couples whose wife is in the age group of
a. 18-35 years b. 18-40 years
c. 15-45 years d. 20-45 years

764. Natural method of contraception is .....
a. Coitus interruptus
b. Breastfeeding
c. Both a and b
d. Condom

765. The emergency contraceptive for woman is
a. Mala-D
b. Mala-N
c. Levonorgestrel
d. Progesterone

766. Which of the following is natural contraceptive method?
a. Breastfeeding b. Condom
c. Copper-T d. IUD

767. Chemical components of Mala–D includes
a. D- norgestrel and Ethinyl estradiol
b. D –norgestrel and progestogen
c. Levonorgestrel
d. Norethisterone Acetate and Levonorgestrel

768. Conventional Contraceptives are
a. IUD b. Condom
c. Coitus interruptus d. OCP

769. Which of the following is the terminal method of contraceptive in male?
a. IUD
b. Barrier method
c. Vasectomy
d. Condom

770. Spermicide used in Contraceptive TODAY is:
a. Norethisterone
b. 9-Nanoxynol
c. Prostaglandin F2
d. MPA

771. Barrier methods are all Except:
a. Diaphragm b. Foam tablets
c. Vaginal-sponge d. Lippes loop

772. Non medicated Intra Uterine Devices (IUDs) are called as
a. 3rd generation IUDs
b. 2nd generation IUDs
c. 1st generation IUDs
d. Multi – load devices

773. Cu T 380A IUD should be replaced once in
a. 4 years b. 6 years
c. 8 years d. 10 years

774. IUCD of choice in a woman with menorrhagia is –
a. Lippes loop
b. Cu T 200
c. Cu T 380A
d. Progesterone containing IUCD

775. Multiload device refers to?
a. 1st generation IUCD
b. 2st generation IUCD
c. Oc.
d. Barrier contraceptive

776. Most effective Cu T is?
a. Cu T 380
b. Cu T 220
c. Cu T 200
d. ML-Cu-250

777. In Cu T 200, the number denotes
a. Weight in microgram b. Weight in milligram
c. Surface area d. Volume of device

778. The following statements are true about IUD except:
a. Multiload Cu-375 is a 3rd generation IUD
b. The pregnancy rate of Lippes loop and Cu-T 200 are similar
c. IUD can be used for Emergency Contraception within 5 days
d. Levonorgestrel releasing IUD has an effective life of 5 years.

Ans.

Scanned with CamScanner

779. Which IUCD acts for 10 years?
a. Cu-T 200 b. Nova T
c. Cu-T380 d. Multi load 250

780. Characteristics of an ideal candidate for copper -T insertion include all of the following except –
a. Has borne at least one child
b. Is willing to check IUD tail
c. Has a history of ectopic pregnancy
d. Has normal menstrual periods

781. IUD associated most commonly with expulsion is
a. Lippes loop b. Cu-T 200
c. Cu –T 380 d. LNG IUD

782. Radiopaque material in copper T is:
a. Silicon b. $BaSO_4$
c. Carbon d. None

783. CuT is preferably inserted postnatal after:
a. 2 weeks b. 4 weeks
c. 5 weeks d. 8 weeks

784. Best contraceptive for a newly married healthy couple:
a. Barrier method
b. IUCD
c. Oral contraceptive pills
d. Natural methods

785. Packet of oral contraceptive pills consists of ---------- number of pills
a. 21 contraceptive and 7 iron pills
b. 28 contraceptive pills and 5 iron pills
c. 23 contraceptive pills and 5 iron pills
d. 14 contraceptive and 14 iron pills

786. Which of the following is not an absolute contraindication for OCP?
a. Nursing mother
b. Breast cancer
c. Cardiac abnormality
d. H/O Thromboembolism

787. Serious complication of oral contraceptive is:
a. Leg vein thrombosis
b. Headache
c. Break through bleeding
d. Breast tenderness

788. The dose of ethinyl estradiol in Mala-N is:
a. 20 ugm b. 30 ugm
c. 50 ugmq d. 100 ugm

789. Mala- N oral contraceptive pill differs from Mala D, in terms of
a. Norgestrel dosage
b. Estradiol dosage
c. Sold under social marketing scheme
d. Supplied free of cost

790. Hormonal contraceptive of choice in lactating woman is
a. Combined pill b. Multiphasic pill
c. Mini pill d. Centchroman

791. Minipill is contraceptive of choices for
a. Elderly females b. Lactating females
c. Obese women d. Menstruating women

792. Schedule of administration of mini pill containing 75 microgram of desogestrel for contraception is
a. Once a day pill for 3 month + 7 day pill free interval
b. Once a day pill for 2 month + 7 day pill free interval
c. Taken for 21 days with 7 day pill free interval
d. Taken for 28 days with no pill free interval

793. Minipills contain:
a. Only progesterone in small quantity
b. Progesterone and estrogen in small quantity
c. Estrogen in small quantity and progesterone in large
d. None of these

794. DMPA is an injectable contraceptive given every:
a. 2 week b. 2 month
c. 2 year d. 3 month

795. Safe period is calculated by –
a. Length of menstrual period
b. Duration and date of ovulation
c. Length of ovulation
d. Length of luteal phase

796. Which of the following Natural method of contraception is least effective:
a. Symptothermic method b. Creighton Model
c. Calendar method d. BBT method

Explanation: Among natural method of contraception, Calender method has 5% failure rate when it is perfectly used. Whereas symptothermal method and BBT has 0.4% of failure rate. Symptothermal method is combination of BBT and cervical mucuous method. Failure rate in Creighton method is 1% when it is perfectly used.

797. "Persona" is a method of –
a. Natural contraceptive
b. Hormonal contraceptive
c. Barrier contraceptive
d. IUCD

798. Most common method of sterilization practiced in India
a. Female sterilization b. Male sterilization
c. Both equally common d. None

799. In which year, a nationwide family planning programme was launched in India
a. 1948 b. 1950
c. 1952 d. 1955

800. Most cost effective family planning method is
a. Vasectomy b. Tubectomy
c. Copper T d. Oral pills

801. Which of the following method is most suitable for the couple who is already having two children?
a. Condom and Contraceptive pills
b. Tubectomy
c. Contraceptive pills and IUDs
d. Condom and Diaphragm

802. Following vasectomy for family planning. A patient should be advised to use some other method of contraception, till:
a. Removal of all sutures b. Pain completely subsides
c. Two weeks d. Eight weeks

803. In emergency contraception which progesterone is used-
a. Norethisterone b. Medroxyprogesterone
c. Desogestrel d. Levonorgestrel

804. The MTP Act does not allow termination of pregnancy after.....
a. 20 weeks b. 24 weeks
c. 28 weeks d. 30 weeks

805. MTP Act of 1971 provides the following indications except
a. Where continuation of pregnancy endangers mother's life
b. Where pregnancy is a result of rape
c. When acceptors requires incentives
d. Failure of contraceptive device

806. Leading Cause of maternal deaths in India is-
a. Anemia
b. Hemorrhage
c. Sepsis/Abortion
d. Obstructed labor

807. Among causes of maternal mortality, which one of the following is the correct descending order due to which the maternal death occur in India.
a. Hemorrhage, obstructed labor, abortion, sepsis
b. Obstructed labor, hemorrhage, abortion, sepsis
c. Hemorrhage, sepsis, abortion, obstructed labor
d. Sepsis, obstructed labor, abortion, hemorrhage

808. Most common cause of maternal death in India:
a. Unsafe abortion
b. Obstructed labor
c. Puerperal sepsis
d. Obstetric hemorrhage

809. Which one of the following is categorized as a high risk pregnancy?
a. Birth order 3
b. Maternal height 150 cm
c. Twins pregnancy
d. Blood group AB+ve

810. All are criteria for identifying 'at risk' infants, except:
a. Artificial feeding
b. Birth order 4 and more
c. Grade II malnutrition
d. Working mother

811. Which among the following is the most important immediate care of new born?
a. Resuscitation
b. Rooming-in
c. Breastfeeding
d. Health assessment

812. Which is the indicator of immediate estimate of the physical condition of the baby?
a. GCS Score
b. APGAR Score
c. Complete physical examination
d. Neurological assessment

813. Major cause of perinatal mortality is
a. Malnutrition
b. Congenital anomalies
c. Birth asphyxia
d. Both a and b

814. Leading cause of neonatal mortality in India is:
a. Infections
b. Birth asphyxia/trauma
c. Diarrhea
d. Prematurity and congenital malformation

815. The highest rate of infant mortality in India is reported from:
a. Madhya Pradesh
b. Bihar
c. Uttar Pradesh
d. Orissa

816. Breastfeeding week is celebrated in:
a. 1st week of March
b. 1st week of July
c. 1st week of August
d. 1st December

817. At which age weaning should start?
a. 5 to 6 months
b. 7 to 8 months
c. 8 to 12 months
d. Above one year

818. All are included in Kangaroo Mother Care except:
a. Skin to skin contact
b. Early discharge and follow-up
c. Free nutritional supplements
d. Exclusive breastfeeding

819. Kangaroo Mother Care is the management of which of the following condition?
a. Hypothermia
b. Hyperthermia
c. Respiratory Distress
d. Jaundice

820. The extra calorie requirement for a lactating mother is
a. 250 kcal/day
b. 400 kcal/day
c. 550 kcal/day
d. 650 kcal/day

821. Which of the following is not included in '5 cleans' in conduct of delivery?
a. Clean hands
b. Clean perineum
c. Clean cutting and care of cord
d. Clean surface for delivery

822. All are direct cause of maternal mortality in India except-
a. Cardiac disease
b. Eclampsia
c. Hemorrhage
d. Abortion

823. Mainly included in child survival index:
a. MMR
b. IMR
c. Mortality between 1 and 4 years age
d. Under 5 mortality

824. Preterm babies:
a. Born before 37 weeks
b. Born before 40 weeks
c. Born before 42 weeks
d. Born before 47 weeks

825. The term used for babies born as a result of retarded intrauterine fetal growth is:
a. Pre-term babies
b. Low birth weight babies
c. Small for date babies
d. Retarded babies

826. By international agreement, low birth weight has been defined as a birth weight when measured within the first hour of life is
a. Less than 2000 grams
b. Less than 2500 grams
c. Less than 2800 grams
d. Less than 3000 grams

827. Most common cause of low birth weight baby is:
a. Prematurity
b. Infection
c. Anemia
d. Diabetes

828. As per WHO low birth weight is defined as:
a. Birth weight less than 2.5 kg
b. Birth weight <10th percentile
c. Gestational age <34 weeks
d. Gestational age <28 weeks

829. Perinatal death includes:
a. After 28 weeks of pregnancy
b. Within seven days after birth
c. Both a and b
d. None

830. Most common cause of perinatal mortality is:
a. Prematurity
b. Birth injury
c. Metabolic
d. Congenital

Ans.

806.	b
807.	c
808.	d

830.	a

Scanned with CamScanner

831. Commonest cause of neonatal mortality in India is:
a. Diarrheal diseases
b. Birth injuries
c. Low birth weight
d. Congenital anomalies

832. Most common cause of death in children <5 years age:
a. Respiratory infection
b. Diarrhea
c. Prematurity
d. Accidents

833. Disposal of placenta at PHC is done by:
a. Dry burning
b. Deep burial
c. Boiling
d. Treat with bleaching powder and burial

NUTRITION AND DEFICIENCY DISORDER

834. Which of the following foods is accepted as a reference protein?
a. Cow's milk
b. Hen's egg
c. Human milk
d. Soybean

Explanation: Hen's egg is considered as reference protein.

835. Which vitamin is lost during polishing of rice?
a. B12
b. Thiamine
c. Vitamin A
d. Vitamin K

Explanation: Polishing of rice can lead to loss of vitamin called thiamine.

836. In Simmering, the food is prepared.....
a. At Boiling point
b. Above Boiling point
c. Below Boiling point
d. In normal water

Explanation: Food cooked below the boiling point is known as simmering.

837. Mixing of brick powder with Chili powder is called as:
a. Food intoxication
b. Food Additives
c. Food Fortification
d. Food Adulteration

Explanation: Adding of non-nutritive substance to nutritive substance is called food adulteration.

838. One gram of protein contains
a. 4 kcal
b. 5 kcal
c. 8 kcal
d. 9 kcal

839. One gram of fat contains
a. 4 kcal
b. 5 kcal
c. 8 kcal
d. 9 kcal

840. 100 mL of human milk provides
a. 40 kcal
b. 60 kcal
c. 70 kcal
d. 400 kcal

841. One gram of carbohydrate contains:
a. 4 kcal
b. 5 kcal
c. 8 kcal
d. 9 kcal

842. Polishing of rice results in loss of which of the following nutrient?
a. Niacin
b. Thiamine
c. Vitamin A
d. Riboflavin

843. Which of the following is an example of biologically incomplete protein?
a. Egg
b. Meat
c. Milk
d. Nuts

844. An example of unsaturated fatty acid is:
a. Oleic acid
b. Capric acid
c. Myristic acid
d. Stearic acid

845. An example of saturated fatty acid is:
a. Oleic acid
b. Linoleic acid
c. Palmitoleic acid
d. Lauric acid

846. Which of the following is NOT an essential amino acids:
a. Histidine
b. Leucine
c. Lysine
d. Arginine

847. Which of the following is NOT a sulfur containing amino acids? *(AIIMS Jodhpur Lecturer-Nursing screening exam)*
a. Methionine
b. Histidine
c. Cysteine
d. Homocysteine

848. Which of the following constituents of food is also called Body Building Food?
a. Minerals
b. Carbohydrates
c. Proteins
d. Fats

849. In Simmering, the food is prepared...
a. At boiling point
b. Above boiling point
c. Below boiling point
d. In normal water

850. Mixing of papaya seeds with pepper corns is a case of:
a. Food intoxication
b. Food Adulteration
c. Food Additives
d. Food Fortification

851. Vitamin C deficiency causes
a. Megaloblastic anemia
b. Glossitis
c. Scurvy
d. Bitot's spots

852. Which of the following vitamins is not present in Egg?
a. Folic acid
b. Vitamin C
c. Vitamin
b. Vitamin E

853. Which of the following vegetable is the rich source of Vitamin C is
a. Amla
b. Potatoes
c. Brinjal
d. Black gram

854. Angular stomatitis is usually caused by the deficiency of
a. Riboflavin
b. Thiamine
c. Folic acid
d. Pantothenic acid

855. Age independent anthropometric measure of malnutrition is
a. Weight for age
b. Mid arm circumference
c. Head circumference
d. Chest circumference

856. Compared with unprocessed cow's milk, human breast milk contains more of:
a. Lipids
b. Proteins
c. Minerals
d. Carbohydrates

857. Which of the following diet promotes wound healing?
a. Low carbohydrate, high protein and high Vitamin C diet
b. High carbohydrate, high protein and high vitamin C diet
c. High protein, high vitamin A and high vitamin C diet
d. Adequate calorie, Protein, Vitamin D and vitamin E diet

858. Tryptophan is present in all EXCEPT
a. Maize
b. Cheese
c. Chicken
d. Fish

Ans.

831.	c
832.	a
833.	d
834.	b
835.	b

847.	b
848.	c
849.	c
850.	b
851.	c
852.	b
853.	a
854.	a
855.	b
856.	d
857.	b
858.	a

Scanned with CamScanner

Explanation: Tryptophan is an amino acid needed for normal growth in infants and for nitrogen balance in adults. It is an essential amino acid, which means your body cannot produce it. Except in maize all other given food items contain Tryptophan

859. Calorie intake of 1 year child per kg is .....: *(AIIMS 1991)*

a. 100 b. 200
c. 300 d. 400

Explanation: Calculated energy requirement for 1 year child is 100 kcal/Kg. so total calorie intake will be approximately 1000 kcal/day

860. Maximum amount of Vitamin D is present in ..... among the following:

a. Liver b. Egg yolk
c. Cheese d. Cod liver oil

Explanation: The flesh of fatty fish (such as salmon, tuna, and mackerel) and fish liver oils are among the best sources. Small amounts of vitamin D are found in beef liver, cheese, and egg yolks. Dietary sources of vitamin D is habitual liver oil: 500-10000 μg/100 gm

861. Phosphatase test is used .....

a. To test the presence of nitric acid
b. To determine the type of methemoglobinemia, a blood disorder.
c. Test for efficacy of pasteurization of milk
d. None of the above

Explanation: Alkaline Phosphatase is an enzyme which is naturally present in milk, but is destroyed at a temperature just near to the pasteurization temperature. Alkaline Phosphatase test is used to indicate whether milk has been adequately pasteurized or whether it has been contaminated with raw milk after pasteurization

862. 3D's (diarrhea, dementia, dermatitis) are the characteristic of ..... deficiency disorder

a. Niacin b. Thiamine
c. Riboflavin d. Biotin

Explanation: Niacin deficiency results in pellagra. It is characterized by 3D's Diarrhea, Dermatitis, and Dementia.

863. Amino acid deficient in wheat is: *(DSSSB)*

a. Leucine
b. Methionine
c. Lysine
d. Cystine

Explanation: Wheat is deficient in lysine. Lysine is an amino acid found in the protein of foods such as beans, cheese, yogurt, meat, milk, brewer's yeast, wheat germ, and other animal proteins. Proteins derived from grains such as wheat and corn tend to be low in lysine content. The bioavailability of lysine is reduced with food preparation methods, such as heating

864. Orthotolidine test is used for detecting .....

a. Chlorine b. Silver
c. Oxygen d. Ammonia

Explanation: In this test, 10 mL of chlorinated sample of water is taken after the required contact period, in a glass tube. To this 0.1 mL of orthotolidine solution is added. The color formed is observed after 5 minutes. The formation of yellow color normally indicates the presence of chlorine (either combined or free) in the water. The more yellow the color, the greater, is the chlorine residual.

865. Guthrie Test is useful for screening .....: *(AIPGME 1999)*

a. Pomp's disease b. Phenylketonuria
c. Thalassemia d. Hemophilia

Explanation: Guthrie test: A simple screening blood test for phenylketonuria (PKU). The Guthrie test was the original impetus to newborn metabolic screening. A small drop of blood is taken from the heel of a newborn and applied to a card. In the original form of the test, a punch-out of the dried disc was incubated on a petri dish plated with bacteria (Bacillus subtilis) in the presence of a growth inhibitor, B-2-thienyl-alanine. High levels of Phe in the blood sample overcome the inhibition, and allow the bacteria to grow. If an elevated level of Phe is detected, the child is placed on a phenylalanine-restricted diet for the first several years

866. Most reliable indicator to identify the nutritional status in under 2 year's children in community setting is---------

a. Mid arm circumference
b. Weight for age
c. Weight for height
d. BMI

Explanation: MUAC is the circumference of the left upper arm, measured at the mid-point between the shoulder and the elbow (olecranon process and the acromion process). In children, MUAC is useful for the assessment of nutritional status.

867. Pasteurization of milk is considered better without boiling because:

a. Can be stored for longer period than that of boiled milk
b. Bacterial spores are destroyed
c. Vitamin C reduced only by 20%
d. Calcium forms complex when boiled

Explanation: When boiling the pasteurized milk the amount of Vitamin C present in the milk will reduce. So pasteurized milk is considered as best without boiling.

WATER PURIFICATION

868. True about slow sand filter is:

a. Occupies less space
b. More expensive
c. Requires longer duration
d. Sand size 0.4 - 0.7mm

869. Slow sand filter is differentiated from rapid sand filter by:

a. Bacteria are removed more effectively
b. Skilled person is needed
c. Cost construction is cheaper.
d. Sand particle are of smaller size

870. Purest water in nature is:

a. River water
b. Rain water
c. Deep well
d. Impounding reservoirs

871. Residual Chlorine after chlorination of water should be: *(Safdarjung NO 2018)*

a. 1 mg/L after 1 hour
b. 1 mg/L after ½ hour
c. 0.5 mg/L after 1 hour
d. 0.5 mg/L after ½ hour

Ans.

859.	a
860.	d
861.	c
862.	a
863.	c
864.	a
865.	b
866.	a
867.	c
868.	c
869.	a
870.	b
871.	c

Scanned with CamScanner

Explanation: Chlorination is the last step of the purification of water mainly kills bacteria and safe for drinking. The small excess of chlorine is called free residual chlorine. 0.5 mg chlorine per litre at the end of 1 hour having main purpose of continuous control of bacterial contamination.

872. The minimum recommended level of residual chlorine in the drinking water is for one hour
a. 0.25 mg/L
b. 0.5 mg/L
c. 1.0 mg/L
d. 2.0 mg/L

873. Hardness of water is expressed as: *(JIPMER 2012)*
a. OZ/L
b. mg/L
c. mg%
d. mEq/L

874. How much gram of chlorine tablet is required to disinfect 20 liters of water?
a. 0.2 g
b. 0.3 g
c. 0.5 g
d. 1.0 g

875. Hardness of water can be removed by
a. Adding sodium carbonate into water
b. Base exchange process
c. Chlorination
d. All of the above

876. Contact time for chlorination is:
a. 4 hour
b. 1 hour
c. 1 ½ hour
d. 2 hour

877. Disinfecting action of chlorine on water is mainly due to:
a. Hydrogen Chlorine
b. Hypochlorous acid
c. Hypochlorite ions
d. Hydrogen ions

878. True statement regarding chlorination is
a. Orthotolidine test measures free chlorine separately
b. Chlorine acts best when pH is around 7
c. It kills bacteria, viruses and spores
d. Hypochlorite ions are mainly responsible for disinfecting activity

879. Orthotolidine test is used to detect
a. Free residual chlorine
b. Bound chlorine
c. Free and combined chlorine
d. Chlorine demand

880. Fresh Bleaching powder contains:
a. 33% chlorine
b. 3.3% chlorine
c. 0.33% chlorine
d. 0.033% chlorine

881. Temporary hardness of water is primarily due to the presence of:
a. Calcium and magnesium sulfates
b. Calcium and magnesium chlorides
c. Calcium and magnesium bicarbonates
d. Calcium and magnesium nitrates

882. Not a feature of hard water is:
a. Increased fuel consumption
b. Erosion of lead pipe
c. Scaling of boiler
d. Decreased soap consumption

883. Coliform test is for
a. Air pollution
b. Water contamination
c. Sound pollution
d. None

884. The best bacterial indicator of water contamination is
a. Streptococci Fecalis
b. E. coli
c. Clostridium perfringens
d. Klebsiella

885. Fecal contamination of drinking water is indicated by the presence of
a. Klebsiella
b. E. coli
c. Proteus
d. Coagulase negative staphylococci

886. Which of the following is used as an indicator for recent fecal contamination of water:
a. E coli
b. Corynebacterium diphtheriae
c. Pseudomonas
d. Streptococci

887. Not seen in Fecal pollution is
a. E. coli
b. Staphylococcus
c. Streptococcus
d. Clostridium perfringens

888. Which of the following is not true about water quality estimation?
a. Clostridium spores indicates recent contamination
b. Not more than 5% samples should have any coliforms
c. Sodium thiosulfate is added to neutralize chlorine
d. Coliforms must not be detectable in any 100 mL sample

889. Maximum permissible chloride level is:
a. 200 mg/L
b. 300 mg/L
c. 500 mg/L
d. 600 mg/L

890. Which among the following is regarded as the most widely and commonly distributed air pollutant?
a. Carbon monoxide
b. Carbon dioxide
c. Hydrocarbons
d. Ozone

891. All of the following wastewater contains human excreta Except:
a. Sewage
b. Sullage
c. Feces
d. None

892. Vital layer in slow sand filter is seen:
a. Top of water
b. On the sand bed
c. Near filter valves
d. None

893. Temporary hardness of water is due to presence of:
a. Bicarbonates of calcium and magnesium
b. Chlorides of calcium and magnesium
c. Nitrates of calcium and magnesium
d. Oxides of calcium and magnesium

894. Venturi meter is used for measuring:
a. The bed strength in slow sand filter
b. Amount required for chlorination
c. Airflow direction
d. Airflow velocity

BIOMEDICAL WASTE MANAGEMENT AND WASTE DISPOSAL

895. Best method for disposal of refuse where land is available is:
a. Burial
b. Dumping
c. Manure pit
d. Controlled tipping

Ans.

872.	b
873.	b
874.	c
875.	d
876.	b
877.	b
878.	b
879.	c
880.	a
881.	c
882.	d
883.	b
884.	b
885.	b
886.	d
887.	b
888.	a
889.	d
890.	a
891.	b
892.	b
893.	a
894.	a
895.	d

Scanned with CamScanner

896. Waste water without human excreta is called
a. Sewage b. Humus
c. Sullage d. Effluent

897. What is the first step in sewage treatment?
a. Aeration b. Chlorination
c. Precipitation d. Sedimentation

898. Most hazardous pesticide color coding is:
a. Red b. Green
c. Yellow d. Black

899. Sputum can be disinfected by all of the following EXCEPT
a. Autoclaving
b. Boiling
c. Chlorhexidine
d. Cresol

900. Best disinfectant of cholera stool is
a. Bleaching powder
b. Lime
c. Cresol
d. Phenol

901. Best indication of air pollution is:
a. SO_2 b. CO_2
c. Smoke index d. Suspended particle

902. Which of the following methods is safe for disposal of mercury? *(PGIMER Chandigarh)*
a. Bury under earth
b. Collect carefully and reuse
c. Autoclaving and discard
d. Treat with chemical

Explanation: Mercury is highly poisonous and mercury containing products are properly and safely recycled or disposed of is one step that can be taken to protect environment and human health. Mercury is a virulent poison. Short-term or long-term exposures to mercury can lead to serious health problems, including death. Human exposure to mercury occurs primarily from breathing contaminated air. Mercury is also readily absorbed though the gastrointestinal tract and through the skin.

903. Universal precautions are applied to:
a. Blood b. Semen
c. Amniotic fluid d. All of the above

Explanation: Universal precaution applies to blood, semen, vaginal secretion, amniotic, cerebrospinal, pericardial, peritoneal, pleural and synovial fluid and to other body fluid contaminated blood. This is given by Center for disease control and prevention (CDC)

904. Color coded bag not to be incinerated as it contains Cadmium is:
a. Black bag b. Yellow bag
c. Blue bag d. Red bag

905. Waste sharps are disposed in:
a. Black container b. Yellow container
c. White container d. Red container

906. Most satisfactory method of Refuse disposal is:
a. Dumping
b. Controlled tipping
c. Incineration
d. Manure pits

907. If land is available the ideal method of disposal is:
a. Composting b. Incineration
c. Controlled tipping d. None

908. Discarded and expired medicines are to be thrown into:
a. Blue bag b. Black bag
c. Yellow bag d. Red bag

909. Not true about screw feed technique is:
a. 80% volume reduction
b. Pathological waste are removed
c. Weight is decreased by 20–30%
d. Based on non burn thermal treatment

910. Good for soil building is:
a. Incineration b. Controlled tipping
c. Composting d. Dumping

911. Which of the following waste is disposed through incineration?
a. Anatomical waste b. Sharp waste
c. Cytotoxic waste d. Radioactive waste

912. True about incinerator is/are:
a. Red bag can be incinerated
b. No pretreatment required
c. Yellow bag must be incinerated
d. Sharps must not be incinerated

913. Animal waste is disposed off by
a. Autoclaving b. Incineration
c. Chemical treatment d. Microwave

914. Incineration is done for:
a. Waste sharps
b. Human anatomical waste
c. Radiographic waste
d. Used batteries

915. What is the best method to dispose hospital waste? *(Banaras HU 2015)*
a. Composting b. Dumping
c. Chemical treatment d. Incineration

916. Incineration is not done for
a. Cytotoxic drugs b. Waste Sharp
c. Human Anatomical Waste
d. Both a and b

917. Incineration is:
a. High temperature reduction process
b. High temperature oxidation process
c. Low temperature reduction process
d. Low temperature oxidation process

918. Sharp waste should be disposed in
a. Black
b. Blue/ White translucent
c. Yellow
d. Red

919. "3-D" means in hospital waste management is:
a. Disinfection, Disposal, Drainage
b. Discard, Disinfection, Drainage
c. Destruction, Deep burial, Drainage
d. Destruction, Deep burial, Disposal

920. Which of the following can be incinerated?
a. Human waste
b. Radiographic waste
c. PVC
d. Pressurized gas container

921. Safe disposal of mercury is by:
a. Collect carefully and recycle
b. Controlled combustion
c. Chemical treatment
d. Deep burial

Ans.

896.	c
897.	d
898.	a
899.	c
900.	d
901.	a
902.	b

916.	d
917.	b
918.	b
919.	a
920.	a
921.	a

Scanned with CamScanner

922. Outdated cytotoxic drug are disposed off by:
a. Disposal in municipal waste
b. Destruction and dumping in secured landfill
c. Store for months and then burial
d. Autoclave

923. Method for waste disposal in small camps is
a. Burial
b. Land filling
c. Incineration
d. Dumping

MISCELLANEOUS

924. Social stratification implies: *(AIIMS Nagpur NO 2018)*
a. Social injustice
b. Social equality
c. Social inequality
d. Social justice

Explanation: Social stratification refers to a system by which a society ranks categories of people in a hierarchy. It is perfectly clear that some groups have greater status, power, and wealth than other groups. These differences are what led to **social inequality** in society

925. In Duvall's eight developmental stages of a family life cycle. Couples come under: *(AIIMS-BBS SNO 2019)*
a. Stage 1
b. Stage 7
c. Stage 8
d. Stage 5

Explanation: In Duvall's eight developmental stages of a family life cycle.

- Stage 1. Married couples without children
- Stage 2. Childbearing families with the oldest child between birth and 30 months
- Stage 3. Families with preschool children
- Stage 4. Families with school age children
- Stage 5. Families with adolescent children
- Stage 6. Launching families (First to last child is leaving home)
- Stage 7. Middle age families (Empty nest to retirement)
- Stage 8. Aging families (Retirement to death of both spouses)

926. Social stigma is felt or assumed in case of disability by community brings: *(Safdarjung NO 2018)*
a. Isolation
b. Serious problems
c. Bitterness
d. All of the above

Explanation: The individual perceive his/her disability as a limitation which is associated with social stigma and it brings isolation from the surrounding community. It is a serious social problem, as it decreases the ability of the otherwise healthy individual.

927. Magnitude of unemployment is aggravated by: *(Safdarjung NO 2018)*
a. Population control
b. Quality healthcare services
c. Population explosion
d. None of the above

Explanation: Unemployment is aggravated by population explosion. A sudden increase in the size of population is called as population explosion.

Ans.

922. b
923. a
924. c
925. a
926. a
927. c

"Keep your vitality. A life without health is like a river without water."
— Maxime Lagacé

5 PSYCHIATRIC NURSING

SYNOPSIS

INTRODUCTION

- **Mental health nursing** is a specialized area of nursing practice that deals with promotion of mental health, prevention of mental illness, care and rehabilitation of mentally ill individuals both in hospital and community.
- In1943, mental health nursing course was first started for male nurses.
- In 1965, **Indian Nursing Council** included psychiatric nursing as a compulsory course in the BSc Nursing program.
- In 1967 **TNAI**, formed a separate committee for mental health nursing to improve the perception of mental health nursing as well as to set guidelines for nursing teachers to conduct theory classes and clinical training in psychiatric nursing.
- **In 1976, Masters in Psychiatric Nursing was first started at RAK College of Nursing, New Delhi.**

MENTAL HEALTH

- Mental health is an adjustment of human beings to the world and to each other with maximum effectiveness and happiness.
- Mental health is an equilibrium of body, mind and spirit with the environment.

MENTAL ILLNESS

- Mental illness is maladjustment in living. It produces a disharmony in the person's ability to meet human needs comfortably or effectively and to function within a culture.
- Mental illness is health condition involving changes in emotion, thinking and behavior (or a combination of these).

Mental Healthcare Act 2017

- The Indian **Mental Healthcare Act 2017** replaced the Mental Health Act 1987.
- Mental Healthcare Act 2017 (MHA 2017) received presidential consent on April 7th, **2017** and **replaced** the **1987 Act.**

Salient Features of MHA 2017

- **Decriminalization of suicide attempt:** This act has overturned **309 Indian Penal Code.** The MHA 2017 decriminalizes suicide attempt by mentally ill person.
- **Rights of persons with mental illness**
  - Every person will have the right to access mental healthcare services
  - Protect person with mentally ill from inhuman treatment
  - Mentally ill patients to have access to free legal services and right to complain about shortcoming of provision of treatment
  - **Advance directive:** Empowers a mentally ill person to have the right to make an advance directive toward the way he/she wants to be treated.
- The government has to set up Central Mental Health Authority at national level and State Mental Health Authority at state level.
- The Act outlines the process of admission, treatment and discharge of patients
- **No ECT** therapy without use of muscle relaxants
- **No ECT** therapy for minors
- **Financial Punishment:** Up to 6 months of imprisonment or ₹10,000 or both for violating of provisions of MHA 2017. Repeat offenders may face up to 2 years imprisonment or fine of ₹50,000 – 5,00,000 or both.
- **Reception order:** Refers to an order for admission and detention of a mentally ill person in a psychiatric hospital

DEVELOPMENT OF PERSONALITY

Factors Influencing Personality Development

Biological Factors

- **Heredity:** Genetic characteristics such as height, color of the skin and appearance influence personality of a person.
- **Endocrine glands:** Secretions of endocrine glands heavily influences one's behavior, e.g. Male hormone, testosterone is associated with aggression.
- **Physique:** An individual's physical characters such as height, weight and general appearances determine the behavior towards others.
- **Nervous system:** Nervous systems works in close coordination with endocrine system. The behavior of an individual is managed and controlled by the nervous system.

Environmental/Social Factors

- **Family:** Most important factor in molding personality among environmental factors is family.
- **School:** Schools play a significant role in building personality of a growing child.
- **Teacher:** Desirable personalities of a teacher are often inculcated in student's behavior. Undesirable and prejudicial treatment by teachers often negatively affects student's personality.
- **Peer group:** Peer group plays a vital role in shaping the personalities of the children.
- **Sibling relationship:** The number of siblings, their gender and the age gap influences the children's personality traits like sharing, cooperativeness, jealousness and aggressiveness.

Scanned with CamScanner

- **Mass media:** Now a days, mass media has a major impact on children's behavior as the access and time to these media has increased recently. Use of smart phones and technologies impact the personality of the children as face to face interaction has became less significant at very young age.
- **Culture:** Every culture has its own value system, moral system, beliefs, and norms which shapes the behavior of the children. What is considered to be an acceptable behavior in one culture may not be same in an another culture of the country.

THEORIES OF PERSONALITY DEVELOPMENT

Freud's Stages of Psychosexual Development

Table 1

Stages of development	Main characteristics	Examples of unsuccessful task completion
Oral (Birth to 18 months)	Focus of libido is on Mouth, Tongue and Lips. Pleasure centers on mouth – sucking, biting, chewing	Smoking, over eating, obesity, alcoholism, nail biting, drug addiction, difficulty in trusting others
Anal (18 months to 3 years)	Pleasure focuses on bowel and bladder. Elimination and toilet training are central focus.	Perfectionism or messiness, obsessive compulsive disorder.
Phallic (3–6 years)	Awareness of genital area as source of pleasure. Child learns sexual identity. Conflicts end as child represses urge and identifies with same sex parent. The development of Electra complex *(female)* and Oedipus complex *(male)* occurs during this stage of development. Freud described this as the child's unconscious desire to eliminate the parent of the same sex and to possess the parent of the opposite sex.	Sexual dysfunction (transexuality, homosexuality, sexual identity problem) difficulty accepting authority
Latency (6–12 Years)	Quite stage in sexual development. Child learns to socialize.	Inability to conceptualize; lack of motivation in school or job.
Genital (12 years to adulthood)	The genitals are again the focus of stimulation. Sexual maturity and satisfactory relationships with opposite sex is the central focus	Unsatisfactory relationship, impotence, premature ejaculation.

Erikson's Stages of Personality Development

Table 2

Stage and approximate ages	Important events	Virtue	Tasks	Consequences of unsuccessful task completion
Infants Trust Vs mistrust Birth to 18 months	Feeding	Hope	Viewing the world as safe and reliable, relationships as nurturing, stable and dependable	Suspiciousness, trouble with personal relationship
Toddler Autonomy Vs shame and doubt 1.5–3 years	Toilet training	Will	Achieving a sense of control and free will	Low self-esteem, dependency
Pre-school Initiative Vs guilt 3–6 years	Explorative	Purpose	Beginning development of conscious learning to manage conflict and anxiety	Passive personality, strong feeling of guilt.
School age Industry Vs inferiority 6–12 years	Schooling	Competence	Emerging confidence in child's own ability, taking pleasure in accomplishments	Unmotivated, unreliable
Adolescence Identity Vs role confusion 12–19 years	Social relationship	Fidelity	Formulate a sense of self and belongingness	Substance abuse, difficulty in keeping personal relationship

Conto

Scanned with CamScanner

Stage and approximate ages	Important events	Virtue	Tasks	Consequences of unsuccessful task completion
Young adult Intimacy Vs isolation 20–40 years	Relationship	Love	Formulating adult, loving relationship and meaningful attachment to others	Emotional immaturity, may deny need for personal relationship
Middle adult Generativity Vs stagnation 41–65 years	Risk and parenthood	Care	Being creative and productive, focus is on establishment of family and guiding to the next generation	Inability to show concern for anyone but self
Maturity Ego integrity Vs despair 65 years to death	Reflection of life	Wisdom	Accepting the responsibility for one's self and life	Has difficulty dealing with issues of aging and death, may have feeling of hopelessness

Sigmund Freud Theory

- **Sigmund Freud (1856-1939)** an Austrian neurologist is considered as the **Father of Psychoanalytical Theory**. He emphasized the unconscious processes or psychodynamic factors as the basis for motivation and behavior. He categorized his personality theory according to structure, dynamics and development.
- He organized the structure of the personality into three major components: **id, ego** and **superego.**
- The *id* contains all our biologically based drives (hunger, sex), etc. It operates according to the "pleasure principle". Id driven behaviors are impulsive and may be irrational.
- The *ego* functions on the basis of "reality principle". It maintains harmony between the external world, the id and the super ego.
- The *superego* is referred to as the "perfection principle". It is important in the socialization of the individual as it assists the ego in the control of id impulses. **It works on '*ideal principle*' and is also called *conscience*.**
- A strong and mature ego will help to shape an ideal personality of an individual.

Maslow's Hierarchy of Needs

- **Abraham Maslow (1921–1970)** was an American psychologist who studied the needs or motivation of an individual.
- Maslow's hierarchy of needs model explains individual's differences in terms of a one's motivation, which are not necessarily stable throughout the life.
- ***Before moving to next stage, it is necessary to fulfill the needs at lower levels.***
- This theory helps nurses understand patient's behavioral change during life crisis.

Figure 1 ■ Pyramid of Maslow's hierarchy of needs

Table 3 Levels of consciousness

Clouding of consciousness →	Drowsiness →	Stupor →	Coma →
Earliest stage of impaired consciousness Decreased awareness and alertness	Next level of Impaired consciousness Decreased awareness and Alertness If not stimulated constantly, can go into sleep	Non-responsiveness Patient can be aroused by repeated stimulation	Unconscious patient Eyes closed and no mental responses

Scanned with CamScanner

DEFENSE MECHANISM

Defense mechanism is method of attempting to promote self-esteem and in coping with basic drives or emotionally painful thoughts, feelings or events.

Table 4 Defense mechanism and their descriptions

Defense mechanisms	Examples
Repression It is an unconscious mechanism that keeps the painful ideas and disturbing thoughts away from consciousness. Unconsciously deny impulse.	A child who is abused by a parent, later has no recollection of events, but has trouble in forming relationships.
Suppression A deliberate or conscious attempt to push away unwanted or disturbing thoughts. Consciously suppress impulse.	A voluntary decision not to think about his argument with his girlfriend while going for an interview.
Denial It is the refusal to accept the reality or fact that causes anxiety to a person.	Smokers may refuse to accept that smoking is injurious to health. A patient who is newly diagnosed with lung cancer may not admit even though there is a confirmatory laboratory findings.
Displacement Unwanted feelings and frustrations are discharged on a less threatening object or person.	A husband comes home after a bad day at work and shouts at her wife or children.
Reaction formation Anxiety producing or unacceptable feelings are replaced with their exact opposite feelings and emotions.	A jealous boy who hates his elder brother may show exaggerated respect and affection towards him.
Rationalization Justification of one's unacceptable behavior or failure in a logical manner by giving socially approved reasons.	A student who comes late to the class may complain that the hostel mess served the food late.
Sublimation It is a practice of acting out socially unacceptable impulses and urges into socially acceptable activities.	Aggressiveness might be transformed into competitiveness in studies and sports.
Compensation People try to over achieve in one area to compensate shortcomings or failure in another area. It is an act of covering up for a weakness by making up a desirable trait.	A student who fails in his studies may compensate by becoming the college champion in sports.
Projection The individual, either consciously or unconsciously, blames another person for his own failure or difficulties.	A surgeon, whose patient does not recover as he anticipated, may tend to blame the scrub nurse who helped at the time of surgery.
Intellectualization Reasoning (thinking) is used to block confrontation with an unconscious conflict and its associated emotional stress. Intellectualization may accompany rationalization but is different from rationalization.	Person shows no emotional expression when discussing serious car accident, he just goes through.
Undoing A person tries to 'undo' an unhealthy, destructive or threatening thought or action by engaging in contrary behavior.	Giving a treat to a child who is being punished for wrong doing.
Regression Unconscious return to an earlier and more comfortable developmental stage. It is an attempt to bring back a time when the person feels safe and taken care of.	An adult throws a temper tantrum when he does not get his own way.
Dissociation The unconscious detachment from immediate surroundings or physical and emotional experiences that cause anxiety.	Amnesia that prevents recall of previous day's car accident.
Conversion Psychological or interpersonal conflicts manifest themselves in physical symptoms	A student awakens with the migraine headache in the morning of a final examination and feels too ill to take the test.

Contd...

Scanned with CamScanner

Defense mechanisms	Examples
Retroflexion Retroflexion is the turning back of something onto the self. This could be any emotion such as anger, blame, guilt, etc.	Blaming oneself for the death of a friend.
Substitution The replacement of highly valued unacceptable object with an object that is more acceptable to the ego.	A person who could not get admission to MBBS chose BDS (Dentist).

THERAPEUTIC COMMUNICATION

It is an interpersonal interaction between the nurse and the patient that focuses on the patient's specific needs for promoting an effective exchange of information.

- **Process:** Sender, Message, Channel, Receiver, Feedback.
- **Techniques:** Listening, broad opening, restating, clarification, reflection, humor, informing, focusing, sharing perception, theme identification, silence, suggesting, validating, paraphrasing, pinpointing, linking, questioning and summarizing.

Types

Verbal and Nonverbal

Phases of therapeutic communication techniques include

- Preorientation phase (pre-interaction phase)
- Orientation phase (Interaction phase)
- Working phase
- Termination phase

Pre-interaction phase: This phase comes before the actual interaction with the client. This phase begins after assigning a client to the nurse. A nurse deals with her own anxiety of dealing a psychiatric patient

Orientation phase (interaction phase): This is the phase in which client and nurse will come face to face for interaction. In this phase itself termination of the therapeutic relationship will also begin. Goals of the therapeutic relationship will also be discussed during this phase.

Working phase: In this phase, the client and the nurse will work together to meet the goals established in the orientation phase. **Transference** (Patient develops emotional dependency on nurse) and **counter transference** (Nurse develops emotional dependency on patient) occur in this phase.

Termination phase: In this phase, actual termination of the therapeutic relationship will take place.

Techniques used in Therapeutic Communication

Table 5

Technique	Explanation
Using open ended question (broad opening)	Using open ended questions will allow the client to express himself/herself.
Using general leads	It will help the client to continue with the conversation.
Restating	It is stating back the sentence said by the client. It will also encourage the client to continue with the communication.
Reflection	Turn back the meaning or the feeling of what has been said by the client. It is to let the client make sense of the conversation.
Using silence	It helps the nurse to observe the non-verbal clues of the client as well as encourage the client to express his/her emotions.
Giving information	During the communication process providing appropriate information to the client will also help the client to make appropriate decision.
Clarifying	If the nurse is not clear about what was said by the client ask the client to clarify what the client said.
Exploring	It means ask the client to explain more about the specific part of the conversation in order to identify further ideas or experiences.
Non-judgmental	Refraining from judgment based on personal ethical standards. A core attitude that psychiatric nurses need to develop to be effective in their work is being non-judgmental.

Contd...

NEUROTRANSMITTERS

Table 6

Neuro-transmitter	Imbalance
Acetylcholine	Decreased level — Alzheimer's disease Increased level — depression
Norepinephrine	Decreased level — depression Increased level – Mania, Anxiety states, Schizophrenia
Dopamine	Decreased level — Parkinson's disease and depression Increased level — Mania and schizophrenia
Serotonin	Decreased level — Depression Increased level — Anxiety state
Histamine	Decreased level — Depression
Gamma amino butyric acid (GABA)	Decreased level — Anxiety disorders, schizophrenia and various forms of epilepsy
Somatostatin	Decreased level — Alzheimer's disease Increased level — Causes Huntington's disease

PSYCHOSOCIAL THERAPIES

Various therapies are used to relieve patient's symptoms and help him/her to understand and modify conduct and to lead a well-adjusted life.

Scanned with CamScanner

Psychoanalytical Therapy

In this, focus is on the cause of the problem, which is buried somewhere in the unconscious. The therapist tries to take the patient into the past in an effort to determine where the problem began. Techniques used are free association, dream analysis, hypnosis, catharsis and abreaction therapy.

Individual Psychotherapy

It is a method of bringing about change in a person by exploring his or her feelings, attitudes, thinking and behavior. It is one to one relationship of therapist with patient.

Indications

- Stress related disorder
- Alcohol and drug dependence
- Sexual disorders
- Marital disharmony

Behavioral Therapies

Behavioral therapy assumes that the maladaptive behavior can be corrected through provision of learning experiences.

Goal

6-8 wk

- To modify maladaptive behavior by reinforcing adaptive behaviors

Principles

- **Theory of Classical conditioning**: Learning by association. (remember Dog-saliva experiment) - Ivan Pavlov Response to stimulus
- Skinner) **Theory of Operant conditioning**: Learning by reinforcement (rewards) and punishment. [Remember Rat – lever – food experiment] Stimulus to Response
- Social learning theory
- Cognitive Behavioral Therapy

Indications

- Social phobia
- Obsessive Compulsive Disorder (OCD)
- Post-Traumatic Stress Disorder (PTSD)
- Eating disorder
- Substance use
- Depression, BPAD, Schizophrenia, Autism

Behavior Therapy Techniques

Systemic Desensitization

- Developed by **Joseph Wolpe**
- **Steps**
  - Relaxation Training → Hierarchy Construction of anxiety provoking situation→ Desensitization of Stimulus
- **Appropriate technique for**
  - Phobic anxiety disorder
  - Anxiety disorder
  - Obsessive compulsive disorder (OCD)
  - Certain sexual disorder

Flooding or Implosion

- A person is exposed directly to the stimulus (fearing object) in the most immediate and unavoidable way.
- No grading or relaxation
- Suitable to treat phobia
- Not suitable for client with heart disease

Shaping

- Based on operant conditioning principle
- Client's behavior leading to the desired behavior is rewarded
- Suitable for speech therapy in Autisitic Child

Extinction

- Reinforcement that is provided for problem behavior is discontinued in order to eliminate occurrences of these types of problem behaviors.
  E.g.: Extinction in temper tantrum

Token Economy

- It is an operant conditioning technique
- 'Token' is distributed to appreciate desired (target) behavior
- The token can be later exchanged for privileges such as food etc.

Restitution/Over Correction

- Used to treat disruptive behavior
- A person engaged in disruptive behavior is asked to restore the situation much better than before.
  E.g.: A patient who urinated in the ward will be asked to clean the dirty area and also asked to mop the entire ward.

Time Out

- It is an aversive stimulus/punishment in which the client is isolated from the environment where he/she exhibited unacceptable behavior.
- This is to prevent reinforcement from attention of others.

Exposure and Response Prevention (ERP)

- Most important type of Cognitive Behavior Therapy (CBT) for OCD
- **Exposure:** Encourage client to expose himself/herself to the images, thoughts, objects or situations that make obsessions.
- **Response prevention:** Encourage client not to do compulsive act after the obsession and anxiety triggered by the exposure.

Aversion Therapy

- Punishment (noxious stimuli) is presented immediately after exhibiting undesired behavior
- Noxious stimuli can be Electric shock, substance that induce vomiting, social disapproval, corporeal punishment.
- Useful for Alcoholism, impulsive behavior, and paraphilias

Social Skill Training

- Teach the client with verbal and nonverbal behaviors to improve social interactions

Assertiveness Training

- Assertive responses promote positive sense of respect for self and others
- Assertive training helps empowering the client in terms of human interactions

Scanned with CamScanner

Cognitive Therapy

- It focuses on how patients think about themselves and their world, make change in current ways of thinking and behavior. It helps to modify the thinking pattern and develop right thinking.

Indications

- Anxiety, eating disorders
- Personality disorders
- Suicidal thoughts or attempts
- Sexual disorders

Family Therapy

- It is used when individual's psychiatric symptoms are inseparably related with the family in which he lives. Thus the focus of the treatment is not the treatment alone but also the family.

Indications

- Family problems or marital maladjustment

Behavior Therapy

- A trained professional helps a patient to correct the existing maladaptive behavior pattern by application of principles of learning.

Indications

- Specific phobias
- Alcohol abuse
- Paraphilias
- Homosexuality
- Transvestism
- Obsessions
- Compulsions

Milieu Therapy

- **Bettleheim'** coined the term Milieu therapy
- The word "milieu" is French word means "middle". English translation of the word is surroundings or environment
- Therapy involving the milieu or the environment may be called milieu therapy, therapeutic community or therapeutic environment.
- The goal of milieu therapy is **to manipulate the environment** so that all aspects of the client's hospital experience are considered therapeutic.
- Within this milieu, the client is expected to learn adaptive coping, interaction and relationship skills
- Key concepts of milieu therapy
  - **Containment:** Process of providing safety and security
  - **Validation:** Process that affirms patient individuality.
  - **Structured interaction:** Staff members approach the client in a consistent manner.
  - **Open communication:** Staff and patient willingly share information.
- **Programs within milieu**
  - Client government
  - Work related activities
- Some of the scales for evaluation of therapeutic environment includes Behavioral mapping by **Ittleson, Rivlin,** and **Proshansky,** Ward atmosphere scale by Moos.
- **Advantages**
  - The patient learns to adopt an acceptable behavior, decision making and leadership skills.
  - Client becomes socio centric
- **Disadvantages**
  - Role blurring between staff and patient
  - Patient may find transition to community difficult
  - Conflict resolution is needed as part of the staff's skills

ICD 10 CLASSIFICATION OF PSYCHIATRIC DISORDERS

Introduction

- ICD-10 is the 10th revision of the International Statistical Classification of Diseases and Related Health Problems (ICD), a medical classification list by the World Health Organization (WHO).
- Chapter V of the ICD 10 Classifies of Mental and Behavioral Disorders

List of Categories

- **F00-F09:** Organic, including symptomatic, mental disorders
- **F10-F19:** Mental and behavioral disorders due to psychoactive substance use
- **F20-F29:** Schizophrenia, schizotypal and delusional disorders
- **F30-F39:** Mood [affective] disorders
- **F40-F48:** Neurotic, stress-related and somatoform disorders
- **F50-F59:** Behavioral syndromes associated with physiological disturbances and physical factors
- **F60-F69:** Disorders of adult personality and behavior
- **F70-F79:** Mental retardation
- **F80-F89:** Disorders of psychological development
- **F90-F98:** Behavioral and emotional disorders with onset usually occurring in childhood and adolescence
- **F99-F99:** Unspecified mental disorder

Important Psychiatric Disorders and its Classification Codes

- **F10:** Mental and behavioral disorders due to use of **alcohol**
- **F11:** Mental and behavioral disorders due to use of **opioid**
- **F20:** Schizophrenia
- **F30:** Manic episode
- **F31:** Bipolar Affective Disorder (BPAD)
- **F32:** Depressive Episode
- **F40:** Phobic Anxiety Disorder
- **F42:** Obsessive Compulsive Disorder
- **F44:** Dissociative Disorder
- **F50:** Eating disorders
- **F52:** Sexual dysfunction
- **F60:** Specific Personality disorders
- **F70:** Mild Mental retardation
- **F71:** Moderate Mental retardation
- **F72:** Severe Mental retardation
- **F73:** Profound Mental retardation
- **F80:** Specific developmental disorders of speech and language
- **F90:** Hyperkinetic disorder
- **F95:** Tic disorders

Scanned with CamScanner

Target High - Fifth Premium Edition

Key Points

The traditional division between neurosis and psychosis that was evident in ICD-9 (although deliberately left without any attempt to define these concepts) has not been used in ICD-10.

GENERAL PSYCHOPATHOLOGY

Disorders of Consciousness

- **Consciousness** is awareness of the self and the environment
- **Quantitative changes of consciousness** mean reduced vigility (alertness):
  - **Somnolence**: State of strong desire for sleep, or sleeping for unusually long periods
  - **Stupor**: A state of near-unconsciousness or insensibility
  - **Coma**: A deep state of prolonged unconsciousness in which a person cannot be awakened
- **Qualitative changes of consciousness** mean disturbed perception, thinking, affectivity, memory and consequent motor disorders:
  - **Delirium (confusional state)**: Characterized by disorientation, distorted perception, enhanced suggestibility, misinterpretations and mood disorders
  - **Obnubilation** (twilight state): Starts and ends abruptly, amnesia is complete; the patient is disordered, his acting is aimless, sometimes aggressive, hard to understand. The person may be Stuporous or Delirious
- **Hypnosis:** Artificially incited change of consciousness
- **Syncope:** Short-term unconsciousness

Disorders of Perception

- **Illusions**: Refers to an instance of a wrong or misinterpreted perception of a sensory experience (sensory stimuli).
- **Pseudoillusions**: Distorted perception of objects which may occur when the general level of sensory stimulation is reduced
- **Hallucination:** Perception without any obvious stimulus

Table 7 Types of hallucination with their key features

Types of hallucination	Key points
Auditory hallucination (acousma)	Person hears non-existent sounds. Most common type of hallucination. Common in schizophrenic patient.
Visual hallucination	Person sees something that does not exist Common in acute organic brain stem conditions
Olfactory hallucination (Phantosmia)	Person smells odors that do not exist. Odors are usually unpleasant. Can occur in schizophrenia and organic states. It can also be caused by Epilepsy
Gustatory hallucination	Person tastes something that is not present Seen in depression
Tactile hallucination (or deep somatic)	Person senses that they are being touched when they are not. Commonly associated with substance use such as cocaine or amphetamine
Kinetic hallucination	Sensation of flying or moving the body or a part of body. Also known as motor hallucination.
Delusional zoopathy	Delusional belief + feeling of animals/ insects crawling in the body
Pseudohallucinations	Patient can distinguish them from reality

Contd...

Key Points

- Auditory hallucination is the most common form of hallucinations in schizophrenics.
- Olfactory hallucination occurs due to neurological damage to olfactory system. **It can also be caused by Epilepsy.**
- Visual hallucination is common in acute organic brain stem conditions.
- Tactile hallucinations is commonly associated with substance use such as cocaine or amphetamine.

Disorders of Thinking/Thought

Quantitative (Formal) Disorders of Thinking

- **Pressure of thought:** Ideas arise very rapidly and in great variety, passing through the mind quickly. It may be experienced in mania or schizophrenia.
- **Poverty of thought:** The mental state of being devoid of **thought** and having a feeling of emptiness.
- **Thought blocking:** A person stops speaking suddenly and without explanation in the middle of a sentence. Common in Schizophrenia.
- **Flight of ideas:** Rapid speech with frequent shifts in topic with no association between topics.
- **Perseveration:** Repetition of a particular response (such as a word, phrase, or gesture) regardless of the absence or cessation of a stimulus
- **Verbigeration:** Obsessive repetition of random words. It is similar to perseveration, in which a person repeats words in response to a stimulus.
- **Loosening of associations:** Series of ideas are presented with loosely apparent or completely in apparent logical connections.
- **Word salad:** Confused or unintelligible mixture of seemingly random words and phrases
- **Neologisms:** A newly created word whose meaning is unknown to others

Qualitative Disorders of Thought (Content Thought Disorders)

Delusion is defined as fixed, false belief that does not change even when a person is presented with conflicting evidence.

Table 8 Types of delusion

Types of delusion	Explanation
Delusion of persecution	Patient thinks that people are planning to kill or harm him/her
Delusion of grandiosity	Patient feels more superior and powerful than he really is

Contd...

Scanned with CamScanner

Types of delusion	Explanation
Delusion of infidelity	Patient thinks that his/her spouse is unfaithful on him/her. Feeling of being cheated by spouse.
Delusion of Nihilism	Patient feels that things do not exist (everything including self) and a sense that everything is unreal.

Concerning the Possession of Thoughts

- Thought insertion
- Thought withdrawal
- Thought broadcasting

Obsessions (Obsessive Thought)

Obsessions (obsessive thought) are recurrent persistent thoughts, impulses or images entering the mind despite the person's efforts to exclude them. Obsessive phenomena in acting (usual as senseless rituals – cleaning, counting, dressing) are called **compulsions**.

Disorders of Memory

Types of Memory

- **Short-term memory (working memory):** For verbal and visual information, retained for 15–20 sec., low capacity, e.g. retaining phone number while dialing.
- **Long-term memory:** Wide capacity and more permanent storage, e.g. childhood memories, language vocabulary

Various disorders of memory are:

- **Amnesia:** Severe memory loss.
  - **Retrograde amnesia:** Cannot recall events that occurred prior to the brain trauma.
  - **Anterograde amnesia:** Cannot recall events that occurs after the brain trauma. Occurs due to failure to make permanent traces.

Figure 2 ■ Types of amnesia

- **déja vu:** It comprises the feeling of having experienced a current event in the past, although it has no basis in fact.
- **Jamais vu:** It is opposite to déja vu. The phenomenon of experiencing a situation that one recognizes in some fashion, but that nonetheless seems very unfamiliar.
- **Confabulation:** Gaps in memory are unconsciously filled with fabricated, misinterpreted, or distorted information
- **Amnesic disorientation:** Characterized by disorientation particularly in time, impairment of immediate recall, loss of recent memory, retroactive loss of remote memory of varying extent and a tendency to confabulation
- **Hypomnesia:** Abnormally poor memory of the past.
- **Hypermnesia:** Unusual power or enhancement of memory, typically under abnormal conditions such as trauma, hypnosis, or narcosis.
- **Korsakoff's syndrome:** Occurs due to vitamin B1 (thiamin) deficiency. Memory problems are often preceded by ataxia.
- **Transient global amnesia:** It is characterized by a patient's inability to learn new material. Perception and personal identity are normal.

Motor Disorders

Motor disorders occur frequently in all kinds of mental disorders, especially in catatonic schizophrenia.

Quantitative

- **Hypoagility:** An overall lowering or deprivation of activities
- **Hyperagility:** Excessive activity.
- Agitated behavior

Qualitative

- **Mannerisms:** A habitual gesture or way of speaking or behaving
- **Stereotypies:** A motor disorder with onset in childhood involving repetitive, nonfunctional motor behavior (e.g., hand waving or head banging)
- **Posturing:** An abnormal involuntary flexion or extension of the arms, legs and or body parts.
- **Waxy flexibility:** The person is nearly or completely unresponsive to stimuli and remains immobile for long periods of time
- **Echopraxia:** Meaningless repetition or imitation of the movements of others
- **Negativism:** Seen in patients with catatonia. opposition or no response to instructions or external stimuli
- **Automatism:** Automatism is more or less coordinated, involuntary motor activity occurring during a state of impaired consciousness either in the course of or after an epileptic seizure and usually followed by amnesia.
- **Agitation:** A state of anxiety or nervous excitement
- **Tics:** Condition that involves brief, uncontrollable, spasm-like movements
- **Compulsions:** Compulsive acts can be defined as repetitious, purposeful physical or mental actions that the individual feels compelled to engage in a stereotyped manner.

ORGANIC MENTAL DISORDERS

These are behavioral or psychological disorders associated with transient or permanent brain dysfunction.

Dementia

It is an acquired global impairment of intellect, memory and personality without impairment at consciousness level. Sundown phenomena is also common in dementia.

Sundown phenomena is characterized by drowsiness, confusion and ataxia. Accidental falls may also occur at night when external stimuli such as light and interpersonal orienting cues are diminished.

Scanned with CamScanner

Causes of Dementia

- Alzheimer's disease
- Vascular dementia
- Frontotemporal dementia (Pick's disease)
- Head trauma
- Parkinson's disease
- Huntington's disease

Symptoms According to Stages

Stage I: Early Stage (2 to 4 Years)

- Forgetfulness
- Declining interest in the environment
- Hesitancy in initiating actions
- Poor performance at work.

Stage II: Middle Stage (2 to 12 Years)

- Progressive memory loss
- Hesitates in response to questions
- Has difficulty in following simple instructions
- Irritable, anxious
- Wandering
- Neglects personal hygiene
- Social isolation.

Stage III: Final Stage (Several Weeks to Several Years)

- Marked loss of weight because of inadequate intake of food
- Unable to communicate
- Does not recognize family
- Incontinence of urine and feces
- Losses the ability to stand and walk
- Death is unusually caused by aspiration pneumonia.

Treatment

- *Psychosocial therapy*
- *Symptomatic treatment*
- *Pharmacological treatment*
  - *Memantine is the drug of choice now a days.*
  - Tacrine hydrochloride (Cognex); rarely used due to potential side effect of hepatotoxicity
  - Donepezil hydrochloride (Aricept)
  - Antipsychotics such as risperidone and haloperidol
  - Benzodiazepines for insomnia and anxiety
  - Antidepressants for depression
  - Anticonvulsants to control seizures.

Key Points

- Mini mental status examination is used to assess cognitive impairment
- Minimize the sensory stimulation. The rooms should be free from distractions, quiet and away from the noise of any activity.
- Speak directly to the client in a low frequency range and enunciate clearly.
- Confusion and disorientation may increase at night.
- If the client is verbally upset, listen briefly give support, then change the topic.
- Provide simple group activities. Encourage the client for group activities that are familiar and simple to perform.

Contd...

- Assist the client as needed to maintain the daily functions and adequate personal hygiene.
- A complex task will be easier for the client if it is broken down into series.
- **Sundowning:** Nocturnal episodes of confusion with agitation, restlessness.

Delirium

It is an acute organic mental disorder characterized by impairment of consciousness (hallmark sign), disorientation and disturbances in perception and restlessness. Dementia can be differentiated from delirium by acute onset and lack of orientation.

Signs and Symptoms

- Impairment of consciousness
- Impairment of attention
- Perceptual disturbances (illusion, hallucination)
- Disturbance of cognition
- Psychomotor disturbances (Asterixis, tremer, unsteady gait)
- Disturbance of sleep wake cycle
- Insomnia at night and Drowsiness during day.
- Emotional disturbances—depression, anxiety, fear, irritability, euphoria and apathy

Treatment

- Identification of cause and its immediate correction
- Symptomatic measures—benzodiazepines or antipsychotics may be given.

Alzheimer's Disease

- Alzheimer's disease is the **most common cause of dementia**, a group of disorders that impairs mental functioning.
- More commonly seen in women than in men.
- Alzheimer's is progressive and irreversible disease.
- Memory loss is one of the earliest symptoms, along with a gradual decline of other intellectual and thinking abilities.

Symptoms of Alzheimer's Disease

- Difficulty in performing otherwise familiar tasks
- Memory loss that affects job skills
- Problems using language
- Disorientation to time and place
- Loss of good judgment
- Problems with abstract thinking
- Misplacing things
- Rapid mood swings
- Personality changes
- Loss of initiative, sleeping longer than usual, and loss of interest in the usual activities

Stages of Alzheimer's Disease

- **Stage 1:** Normal; Mentally healthy person
- **Stage 2:** Normal and aged forgetfulness
- **Stage 3:** Mild cognitive impairment
- **Stage 4:** Mild Alzheimer's disease
- **Stage 5:** Moderate Alzheimer's disease
- **Stage 6:** Moderately severe Alzheimer's disease
- **Stage 7:** Severe Alzheimer's disease

Scanned with CamScanner

Treatment

- Memantine, galantamine, rivastigmine, donepezil, tacrine

SUBSTANCE USE DISORDERS

Disorders due to psychoactive substance use and refers to conditions arising from the abuse of alcohol, psychoactive drugs and other chemicals such as volatile solvents.

Types of Substance use are:

- Alcohol
- Opioids
- Cannabis
- Cocaine
- Amphetamines and other sympathomimetic
- Hallucinogens, for example, LSD, phencyclidine
- Sedatives and hypnotics for example barbiturates
- Inhalants, for example, volatile solvents
- Nicotine
- Other stimulants, for example, caffeine

Alcohol-Dependence Syndrome (ADS)

It refers to the use of alcoholic beverages to the point of causing damage to the individual, society or both.

Symptoms

- **Minor complaints:** Malaise, dyspepsia, mood swings or depression, increased incidence of infection.
- Secretive behavior (may attempt to hide disorder or alcohol supply)
- Tendency to blame others and rationalize problems
- Poor personal hygiene, untreated injuries
- Denial of problem
- Usually high tolerance for sedatives and opioids
- Consumption of alcohol containing products
- Nutritional deficiency (vitamin B1)

Phases of Alcoholism

- Pre-alcoholic symptomatic phase
- Prodromal phase
- Crucial phase
- Chronic phase.

Withdrawal Symptoms of Alcoholism

In persons who have been drinking over a prolonged period of time, any rapid decrease in the amount of alcohol in the body is likely to produce withdrawal symptoms. These are:

- Simple withdrawal syndrome
- Delirium tremens

Wernicke's Korsakoff's syndrome occurs due to **thiamine (vitamin B1)** deficiency that is caused by chronic alcohol abuse.

Wernicke's syndrome: This is characterized by prominent cerebellar ataxia, **palsy of the 6th cranial nerve,** peripheral neuropathy, and mental confusion.

Korsakoff's syndrome: Gross memory disturbance (Irreversible in nature)

- Disorientation
- Confusion
- Confabulation (memory problem)
- Poor attention span and distractibility
- Impairment of insight

Management of Withdrawal Symptoms

- **Detoxification:** It is the treatment for alcohol withdrawal symptoms. The drugs of choice are benzodiazepines, for example, Chlordiazepoxide (80–200 mg/day in divided dose), Diazepam (40-80 mg/day)
- **Others:** For **vitamin B1 deficiency a preparation of vitamin B1** containing 100 mg of thiamine should be administered parenterally, twice daily for 3 to 5 days. This should be followed by oral administration of vitamin B1 for at least 6 months.
  - Administration of anticonvulsants is necessary, maintaining fluid and electrolyte balance, strict monitoring of vitals, level of consciousness and orientation.

Treatment

- Behavior therapy
- Group therapy (e.g. Alcoholic Anonymous)

Deterrent Agent (Disulfiram)

It is used to ensure abstinence in the treatment of alcohol dependence. It works on classical conditioning theory given by **Ivan Pavlov** (1936) and Operant conditioning theory of **BF Skinner** (1953).

- **Dose:** Initial dose is 500 mg/day orally for the first two weeks, followed by a maintenance dosage of 250 mg/day. It should not exceed 500 mg/day.
- **Indications:** It is used as an aversive conditioning treatment for alcohol dependence.

It is used mainly in patients who are highly motivated in quitting alcohol.

Informed consent is necessary before initiation of disulfiram therapy.

Disulfiram Ethanol Reaction (DER)

Disulfiram ethanol reaction is caused due to accumulation of acetaldehyde, as Disulfiram is an aldehyde dehydrogenase inhibitor that interferes with the metabolism of alcohol and produces acetaldehyde in blood. DER is characterized by nausea, throbbing headache, vomiting, hypotension, flushing, sweating, thirst, dyspnea, tachycardia, chest pain, vertigo, blurred vision and a sense of impending doom associated with severe anxiety.

Role of Nurse

- An informed consent should be taken before starting treatment.
- Ensure that at least 12 hours have elapsed since the last ingestion of alcohol before administering the drug.
- Patient must be instructed that ingestion of even the smallest amount of alcohol brings on a Disulfiram-Ethanol Reaction with all its unpleasant effects.
- Patient should also be warned against ingestion of any alcohol containing preparations such as cough syrups, drops of any kind, and alcohol containing foods and sauces.
- Caution patient against taking CNS depressants or any OTC drugs.
- Instruct patient to avoid driving or other activities requiring alertness until response to drug is known.
- Emphasize the importance of follow-up visits to the physician to monitor the progress in long-term therapy.

Scanned with CamScanner

Target High - Fifth Premium Edition

Opioid Dependence

Commonly used opioids are heroin (brown sugar and smack) and synthetic preparations like pethidine, fortwin and tidigesic.

Symptoms of Acute Intoxication

- Apathy
- Bradycardia
- Hypotension
- Respiratory depression
- Subnormal temperature
- Pinpoint pupils

Withdrawal Symptoms

- **Constricted pupil** (acute intoxication) and **dilated pupil** (in chronic use)
  - Watery eyes
  - Running nose
  - Yawning
  - Anorexia
  - Irritability
  - Tremors
  - Sweating
  - Muscle cramps
  - Nausea
  - Diarrhea
  - Insomnia
  - Raised body temperature
  - Piloerection
  - Anorexia
  - Constipation

Treatment

- **Overdose:** Narcotic antagonist for example naloxone, naltrexone.
- **Detoxification:** Methadone, clonidine, naltrexone
- **Maintenance therapy:** Methadone, opioid antagonists (naltrexone and naloxone), psychotherapies.

SCHIZOPHRENIA

It is psychotic condition characterized by a disturbance in thinking, emotions, volitions and faculties in the presence of clear consciousness, which usually leads to social withdrawal.

Types

Table 9 Types of schizophrenia with their key features

Types of schizophrenia	Key points
Paranoid schizophrenia	Most common type of schizophrenia Presence of delusion, hallucination and false belief of grandeur Good prognosis No noticeable change in affect
Hebephrenic schizophrenia (Disorganized Schizophrenia)	Worst diagnosis Disorganized thinking, flat affect, inappropriate emotions or behavior
Catatonic schizophrenia	Best prognosis Marked disturbance in motor behavior Rigid posture and waxy flexibility ECT and IV Lorazepam is the treatment of choice
Simple Schizophrenia	Worst prognosis after hebephrenic schizophrenia Predominantly negative symptoms Symptoms are mild and does not exhibit psychotic trait
Undifferentiated schizophrenia	When the patient cannot be categorized into other types
Residual Schizophrenia	It is characterized by past history of at least one episode of schizophrenia but person currently having no positive symptoms
Pfropf schizophrenia	Schizophrenia associated with mental retardation. Also known as grafted schizophrenia

Ref: Gajandra H. and Singh P. My PGMEE Notes. CBS Publishers and Distributors Pvt ltd.

Thought and Speech Disorders

- Autistic thinking
- Thought blocking
- Poverty of speech
- Echolalia
- Verbigeration
- Loosening of association
- Neologism
- Poverty of ideation
- Perseveration
- Delusions of various kinds

Disorders of Perception

- Auditory hallucination
- Visual hallucination

Disorder of Affect

- Apathy
- Emotional blunting
- Emotional shallowness
- Anhedonia
- In appropriate emotional response

Symptoms

- **Bleuler's four A's**
  - Affective disturbance
  - Autistic thinking
  - Ambivalence
  - Associative looseness

Table 10 Positive and negative signs of schizophrenia

Positive signs	Negative signs (5 A's)
Delusions	Affective flattening or blunting
Hallucinations	Avolition—apathy
Excitement or agitation	Attentional impairment
Hostility or aggressive behavior	Anhedonia
Suspiciousness, ideas of reference	Alogia
Possible suicidal tendencies	

Contd...

Scanned with CamScanner

Treatment

- **Pharmacotherapy** includes antipsychotics such as clozapine, risperidone, olanzapine, quetiapine; other drugs are antidepressants, mood stabilizers, and benzodiazepines.
- ECT
- **Psychosocial therapies:** Group therapy, behavior therapy, social skills training, cognitive therapy, family therapy.

PERSONALITY DISORDERS

Personality disorders result when personality traits become abnormal, i.e. become inflexible and maladaptive, and cause significant social or occupational impairment or significant subjective distress.

Types

Table 11 Types of personality disorders with characteristics features

Cluster	Personality disorder	Characteristics
Cluster A	Paranoid personality	Long-standing suspicious, hypersensitive, secretive, hostile and irritable
	Schizoid personality	Passive, seclusive, indifferent, cold and aloof
	Schizotypal personality	Odd thinking, peculiar language, bizarre thinking, idea of reference
Cluster B	Histrionic personality	Attention seeking, provocative, flamboyant, dramatic
	Narcissistic personality	Excessive self-admiration, self-importance, sense of grandiose, egocentric
	Borderline personality	Impulsive, manipulative, self-mutilative
	Antisocial personality	Aggressive, rule breaker, abusive, lying, theft
Cluster C	Avoidant personality	Overly serious, fears criticism, withdrawn, sensitive to rejection, inflexibility
	Dependent personality	Indecisive, submissive, clingy
	Obsessive compulsive personality	Perfectionist, rigid, passive-aggressive

Psychological Test for Assessment of Personality

Table 12 Objective and projective tests

Objective personality tests *(To determine the personality traits of a person)*	Projective personality tests *(Test reveals hidden emotions and internal conflicts projected by the person into the test)*
• Minnesota Multiphasic Personality Inventory [MMPI] • 16 Personality factor • Millon clinical multiaxial inventory [MCMI] • Eysenck personality questionnaire	• Draw a Person Test [DAPT] • Thematic Apperception Test [TAT] • Rorschach Inkblot Test • Sentence Completion Test [SCT]

Ref: Pg. No. 807 Table from My PGMEE NOTES (Hemant Gajendra)

Treatment for Personality Disorders

- Group therapy, occupational therapy, recreation therapy, interaction and guidance by therapist.

MOOD DISORDERS

- Mood disorder is a group of conditions where a disturbance in the person's mood is the main underlying feature.
- Common mood disorders are:
  - Depression
  - Hypomania and Mania
  - Bipolar Affective Disorder (BPAD)

Depression

An alteration in mood that is expressed by feelings of sadness, despair and pessimism. There is a loss of interest in usual activities and somatic symptoms may be evident. Change in appetite and sleep patterns are common.

Clinical Features

- Depressed mood
- Depressive cognitions
- Suicidal thoughts
- Psychomotor activity
- Psychotic features—Delusion and hallucinations
- Somatic symptoms—Decrease in appetite or weight, early morning awakening, diurnal variation, psychomotor agitation

Depression Classical Triad Includes

- Hoplessness
- Helplessness
- Worthlessness

Scanned with CamScanner

Target High - Fifth Premium Edition

Table 13 Common and other symptoms of depression

Common symptoms	Other symptoms
Apathy	Fatigue
Sadness	Thoughts of death
Sleep disturbances	Decreased libido
Hopelessness	Dependency
Helplessness	Spontaneous crying
Worthlessness	Passiveness

Treatment

- It includes use of antidepressants and various therapies such as Cognitive behavioral therapy, interpersonal therapy and problem-solving therapy.
  ECT is the choice of treatment in severe depression or when patient does not respond to any other treatment.
- Antidepressant drugs of choice include selective serotonin reuptake inhibitors (SSRIs), Serotonin and norepinephrine reuptake inhibitors (SNRIs), Tricyclic antidepressants (TCAs), Tetracyclic antidepressants (TeCAs), Monoamine Oxidase inhibitors (MAOIs).

Mania and Hypomania

Mania refers to a syndrome in which the central features are over-activity, mood change and self-important ideas. ***It is characterized by pressure of speech, increased psychomotor activity and elevated mood.***

Hypomania is a lesser degree of mania. There is a persistent mild elevation of mood and increased sense of psychological well-being and happiness not in keeping with ongoing events.

Clinical Features

Elevated, Expansive or Irritable Mood

- **Euphoria (Stage I):** Mild elevation of mood; feeling of elevated mood and optimism; Usually present in hypomania.
- **Elation (stage II):** Moderate elevation of mood- feeling of confidence and enjoyment– seen in manic illness
- **Exaltation (stage III):** Intense (severe) elevation of mood with delusions of grandiosity; usually seen in severe mania.
- **Ecstasy (Stage IV):** Very severe elevation of mood; a sense of extreme well-being. Usually seen in delirious and stuporous mania.

Psychomotor Activity

- Increased psychomotor activity ranging from activeness and restlessness to manic excitement.

Speech and Thought

- Flight of ideas
- Pressure of speech
- Delusion of grandeur
- Delusions of persecution
- Distractibility
- Poverty of thought

Other Features

- Increased sociability
- Impulsive behavior
- Disinhibition
- Hypersexual and promiscuous behavior
- Poor judgment
- High risk activities
- Decreased need for sleep
- Decreased food intake
- Absence of insight (psychosis)
- The **characteristic triad** of symptoms include:
  - Elevated mood
  - Increased psychomotor activity
  - Flight of ideas.

Treatment

- Pharmacotherapy includes lithium carbonate 900–2100 mg/day), carbamazepine (600–1800 mg/day), sodium valproate (15–60 mg/kg/day).
- ECT
- Psychotherapies—Family and marital therapy.

Bipolar Affective Disorder (BPAD)

This is characterized by recurrent episodes of mania and depression in the same patient at different times. Typically, the patient experiences extreme highs (mania or hypomania) alternating with extreme lows (depression): Interspersed between the highs and lows are periods of normal mood.

Treatment

- Lithium carbonate
- Carbamazepine
- Antipsychotics
- Valproic acid
- Antidepressants

SOMATOFORM DISORDERS

It is characterized by repeated presentation with physical symptoms which do not have any physical basis and persistent request for investigation and treatment.

- **Somatization disorder:** Chronic multiple somatic complaints, unexplained by medical findings.
- **Hypochondriasis:** A persistent preoccupation with a fear or belief of having a serious disease.
- **Somatoform autonomic dysfunction:** In this disorder the symptoms are predominantly under autonomic control, as they were due to a physical disorder.
- **Persistent somatoform pain disorder:** The main feature of this disorder is persistent and severe pain without any physical basis. It may be of sufficient severity so as to cause social or occupational impairment.

STRESS AND ADAPTATION

Stress

- Stress is an adaptive response to a real or perceived threat to physical or psychological integrity of an individual.
- The term "stress" was first used by the endocrinologist ***Hans Selye (1930s)***
- Process which shows on body responds to stress.

General Adaptation Syndrome (GAS)

- Hans Seyle (1936) termed the body's response to stressors as GAS –general adaptation syndrome.
- There are three stages of GAS:
  - Alarm stage
  - Resistance stage
  - Exhaustion stage

Scanned with CamScanner

Alarm Stage

- It is the emergency response of the body in response to the stressor
- There is a **Flight- or fight response**
- Mainly mediated by **sympathetic nervous system**

Resistance Stage

- If continuous stressor is present body tries to resist the effects
- Hormonal responses of the body comes to play (adreno-corticotropic-ACTH- axis) - Cortisol
- High level of Cortisol causes immune suppression, high BP

Exhaustion Stage

- Inability to defend against stressors
- Person may become ill or can even die (due to the high Cortisol) end of relationships

Acute Stress Disorder (ASD)

- Acute stress disorder develops within one month after an individual experiences or sees an event involving a threat or actual death, serious injury, or physical violation to the individual or others, and responds to this event with strong feelings of fear, helplessness or horror.
- Pharmacological treatment includes Anxiolytics, selective serotonin reuptake inhibitors (SSRI) and antidepressants.
- Cognitive behavior therapy may speed up recovery and may prevent ASD from turning into PTSD.

Post-Traumatic Stress Disorder (PTSD)

- Hyperarousal, re-experiencing image of the stressful events and avoidance of reminders.
- It is a reaction to extreme stressor such as floods, earthquakes, war, and rape.
- The symptoms develop after the latency period, within 6 months after the stress or may be delayed.
- Anxiolytics, SSRIs and antidepressants to relieve secondary symptoms.
- Psychotherapy includes cognitive therapy, exposure therapy and Eye Movement Desensitization and Reprocessing (EMDR).

PHOBIA

Phobia refers to a marked, intense and irrational fear or aversion toward something.

Classification of Phobic Disorder

Figure 3 ■ Types of phobic disorders

Agoraphobia

- Fear of the marketplace
- Person experiences fear of being alone in places or situations from where escape may be difficult or immediate help may not be available.

Social Phobia (Social Anxiety Disorder)

- A person with social phobia has persistent, intense fear or anxiety about specific social situations because he/she believe that he/she may be judged, embarrassed or humiliated

Specific phobia: Irrational fear about a specific objects or situation

Classification of Specific Phobias

Table 14 List of specific phobias and their definition

Types of phobia	Definitions
Achluophobia	Fear of darkness
Acrophobia	Fear of heights
Agliophobia	Fear of pain
Aichmophobia	Fear of needles or pointed objects
Androphobia	Fear of men
Anginophobia	Fear of angina or choking
Anthophobia	Fear of flowers
Anthrophobia	Fear of people or society
Aphenphosmphobia	Fear of being touched
Arachnophobia	Fear of spiders
Arithmophobia	Fear of numbers
Astraphobia	Fear of thunder and lightening
Atychiphobia	Fear of failure
Monophobia	Fear of being alone
Bacteriophobia	Fear of bacteria
Belonephobia	Fear of needles
Bibliophobia	Fear of books
Botanophobia	Fear of plants
Cacophobia	Fear of ugliness
Chromophobia	Fear of colors
Claustrophobia	Fear of confined spaces
Cyberphobia	Fear of computers
Cynophobia	Fear of dogs
Domatophobia	Fear of houses
Ecophobia	Fear of the one's home
Ailurophobia	Fear of cats
Entomophobia	Fear of insects
Gamophobia	Fear of marriage
Glossophobia	Fear of speaking in public
Gynophobia	Fear of women
Heliophobia	Fear of the sun
Hemophobia	Fear of blood

Scanned with CamScanner

Types of phobia	Definitions
Herpetophobia	Fear of reptiles
Homophobia	Fear of homosexuality
Hydrophobia	Fear of water
Iatrophobia	Fear of doctors
Insectophobia	Fear of insects
Lockiophobia	Fear of childbirth
Mageirocophobia	Fear of cooking
Mysophobia	Fear of dirt and germs
Necrophobia	Fear of death or dead things
Noctiphobia	Fear of the night
Nosocomephobia	Fear of hospitals
Obesophobia	Fear of gaining weight
Ophidiophobia	Fear of snakes
Ornithophobia	Fear of birds
Pathophobia	Fear of disease
Pedophobia	Fear of children
Philophobia	Fear of love
Pyrophobia	Fear of fire
Somniphobia	Fear of sleep
Taphophobia	Fear of being buried alive
Thanatophobia	Fear of Death
Trichophobia	Fear of Hair
Venustraphobia	Fear of beautiful women
Verminophobia	Fear of germs
Wiccaphobia	Fear of witches and witchcraft
Xenophobia	Fear of strangers or foreigners
Zoophobia	Fear of animals.

Management

Pharmacological Management

- Anxiolytics. e.g. Benzodiazepines such as Alprazolam and Clonazepam
- **Antidepressants:** SSRI is the first-line treatment choice
- Antihypertensive agents (for symptom control). E.g. Propranolol and atenolol

Psychosocial Interventions

- Systematic desensitization (introduced by Joseph Wolpe in 1958): Patient is gradually exposed to anxiety causing situation.
- **Flooding (implosion therapy):** Floods the client with triggering situation/stimuli.

OBSESSIVE COMPULSIVE DISORDER (OCD)

- OCD is repetitive, irresistative with unwanted thoughts and ritualistic action
- It is characterized by intrusive thoughts that produce uneasiness, apprehension, fear or worry (obsessions), repetitive behaviors aimed at reducing the associated anxiety (compulsions), or a combination of such obsessions and compulsions.
- Various types of obsession includes obsessional thoughts, obsessional images, obsessional rumination, obsessional doubts, obsessional impulses, obsessional rituals, obsessional slowness. Various types of compulsive acts such as washing, checking, knocking are common
- Pharmacological treatment includes antidepressants including SSRIs. (Clomipramine, Fluvoxamine, Fluoxetine, Sertraline).
- ***Exposure and Response Prevention (ERP) and thought stopping is the most effective treatment.***

Key Points

- Neurotransmitter serotonin plays a role in the psychopathology of OCD
- **Obsessive thoughts:** Most common obsessive thought is fear of being contaminated by germs or dirt.
- **Compulsive behaviors:** E.g. spending a lot of time on washing and cleaning. Excessive double-checking of things, such as locks and appliances. Ordering or arranging things.
- Medication with a serotonin reuptake inhibitor is helpful for many OCD patients

ADJUSTMENT DISORDER

- **Adjustment disorder** is a short-term condition that occurs when a person has great difficulty coping with, or adjusting to, a particular source of stress. This conduct disorder usually occurs within one month of significant life change.
- Duration of the disorder is usually less than one month
- It is characterized by predominant disturbance of emotions.
- **Treatment:** Anxiolytics and antidepressants.

EATING DISORDERS

Eating disorders are psychological disorders characterized by abnormal or disturbed eating habits and severe distress or concern about body weight and shape. Eating disorders includes:

- Anorexia nervosa
- Bulimia nervosa
- Binge eating disorder.

Anorexia Nervosa

- Inadequate food intake leading to visible weight loss
- Intense fear of weight gain, obsession with weight and persistent behavior to prevent weight gain.

Signs and Symptoms

- Amenorrhea, excessive weight loss, lanugo (fine body hair), abdominal distention, dry hair, and electrolyte disturbances. Nail biting is common.
- Poor self-esteem related to body image.
- Inability to appreciate the severity of the situation.

Treatment

- Neuroleptics, appetite stimulants, antidepressants.
- Individual psychotherapy, behavioral therapy, cognitive behavioral therapy, family therapy.

Scanned with CamScanner

Bulimia Nervosa

- Frequent episodes of consuming very large amount of food followed by behaviors to prevent weight gain, such as self-induced vomiting.
- A feeling of being out of control during the binge-eating episodes.
- Self-esteem overly related to body image.

Treatment

Psychotherapy, SSRI and Self-help group.

Binge Eating Disorder

- Frequent episodes of consuming very large amounts of food but without behaviors to prevent weight gain, such as self- induced vomiting.
- A feeling of being out of control during the binge eating episodes.
- Feelings of strong shame or guilt regarding the binge eating.

Treatment

Cognitive therapy, interpersonal therapy, anti-depressants, and self-help group.

Nursing Intervention

- Maintains intake output chart and electrolyte balance
- Encourages patient to verbalize his feelings
- Avoid discussions that focuses on food
- Engages patient in therapeutic alliance to obtain commitment to treatment
- Sets a time limit for food
- Explains the complication
- Provides assertiveness training
- Assesses the suicide potential.

SLEEP DISORDERS

Physiology of Sleep

Sleep is a state of unconsciousness in which the brain is relatively more responsive to internal than external stimuli.

Stages of Sleep

- Stages of sleep are defined based on the patterns of EEG (Electroencephalogram)

Stage 1

- Non Rapid Movement (NREM) Sleep (Orthodox sleep or Synchronized or 'S' sleep)
  - Further divided into Stage 1, Stage 2, Stage 3, and Stage 4 sleep
  - EEG
    - **Stage 1:** Theta waves (Hypnogogic state)
    - **Stage 2:** Theta waves (Sleep Spindles)
    - **Stage 3:** Delta waves
    - **Stage 4:** Delta waves (**Bed wetting, Night terrors, sleep walk/talk**)

Stage 2

- **Rapid Eye Movement (REM) sleep** (Paradoxical sleep or Desynchronized or 'D' sleep)
  - After 90 minutes of sleep onset → 1st REM episode
  - **EEG: Mimic beta waves**
  - **Associated with dreaming**
  - Difficult to arose
  - Increased/Irregular HR, RR and BP
  - Penile erection or clitoris engorgement
  - Muscle twitches

Circadian Rhythm

- Sleep/wake cycle of body that goes through 24-hour cycle
- It is a natural cycle of physical, mental and behavioral changes in a body.
- **Polysomnography**, also called a sleep study, is a test used to diagnose sleep disorders

Sleep Disorders

Figure 4 ■ Types of sleep disorders

Dysomnia

Insomnia

- Difficulty in initiating or maintaining sleep.
- Insomnia is the **most common sleep disorders.**
- **Management:** Melatonin, L-Tryptophan, Short acting benzo-diazepines, Zolpidem etc.

Hypersomnia

- Excessive amount of sleep, excessive day time sleepiness or both.
- **Management:** Non-Sedating SSRI, Stimulant drugs

Narcolepsy

- It is a chronic sleep disorder characterized by excessive daytime drowsiness and sudden attacks of sleep.
- Uncontrollable sleepiness leading to 10-20 mins of sleep at inappropriate times.
- **Management:** Dexamphetamine, Modafinil, Methylphenidate

Obstructive Sleep Apnea Syndrome

- Insomnia caused by sleep-related breathing disturbances such as apnea, hypopnea etc.
- **Management:** encourage weight loss, **CPAP**, treat the cause of respiratory obstruction

Scanned with CamScanner

Circadian Rhythm Sleep Disorder

- **Jet lag type:** Difficulty in initiating or maintain sleep. Resolves in 2-7 days without treatment
- **Delayed sleep phase:** Late onset of sleep. (2 am)
- **Shift work type:** excessive sleepiness, symptoms of insomnia
- **Management:** Chronotherapy – Adopt regular waking time. Melatonin and short acting Benzodiazepines.

Restless Leg Syndrome (Ekbom's Syndome)

- Painful condition lead to severe insomnia and periodic limb movement during sleep
- **Causes**: Vit B12 deficiency, Anemia.
- Aggravated by caffeine, stress or fatigue
- **Management**: Clonazepam, L-Dopa, Carbidopa, Bromocriptine, Vit B12 supplement.

Kleine-Levin Syndrome

- Characterized by Megaphagia, Hypersomnolence, and sexual disinhibition

Parasominias

- Abnormal behavior associated with sleep/wake cycle or stages
- Includes night mares, sleep walk/talk, or night terror
- **Causes**: PTSD, fever, psychotropic drugs, alcohol intoxication
- **Management**: Sleep hygiene measures, Benzodiazepines or antidepressants

SEASONAL AFFECTIVE DISORDER

Seasonal affective disorder (SAD), also known as **winter depression,** winter blues, summer depression, summer blues, or seasonal depression, are mood disorders in which people who have normal mental health throughout the year experience depressive symptoms in the winter or summer. Seasonal depression is because of stop breakdown of melatonin. Sunlight therapy is helpful to treat seasonal depression.

SEXUAL DISORDERS

Disorder of Preference

- **Transvestism**: Sexual arousal occurs by wearing clothes of the opposite sex.
- **Sexual sadism**: The person is sexually aroused by physical and psychological humiliation, suffering, or injury of the sexual partner.
- **Sexual masochism**: Here the person is sexually aroused by physical or psychological humiliation or injury inflicted to self by other.
- **Exhibitionism**: In this the person is sexually aroused by the exposure of one's genitalia to an unsuspecting stranger.
- **Voyeurism**: This is a persistent or recurrent tendency to observe unsuspecting person naked (usually of the other sex) and engaged in sexual activity.
- **Pedophilia:** It is characterized by persistent or recurrent involvement of an adult in sexual activity with prepubertal children.
- **Zoophilia**: Involving in sexual activity with animals.

Sexual Dysfunction

- **Frigidity**: Absence of desire for sexual activity.
- **Impotence**: This disorder is characterized by an inability to have or sustain penile erection till the completion of satisfactory sexual activity.
- **Premature ejaculation:** Ejaculation before the completion of satisfactory sexual activity of both partners.
- **Nonorganic vaginismus:** An involuntary spasm of lower 1/3rd of vagina, interfering with coitus.
- **Nonorganic dyspareunia:** Pain in the genital area of either male or female during coitus which is not having any ruled out organic cause.

ELECTROCONVULSIVE THERAPY (ECT)

Electroconvulsive therapy was first introduced by **Bini and Cerletti** in April 1938. From 1980 onwards ECT is being considered as a unique psychiatric treatment. ECT also known as electroshock therapy or shock therapy. It is a form of somatic treatment/physical therapy.

Voltage: 70–120 volts
Duration: 0.7–1.5 seconds
Frequency: 3 times per week or as indicated
Total number: 6–10 up to 25 may be preferred as indicated
Indications: Major depression, severe catatonia, severe psychosis, organic mental disorder
Contraindication: Raised ICP (absolute contraindication), congestive heart failure, cerebral hemorrhage, retinal detachment, pneumonia, acute myocardial infarction, brain tumor, cerebral aneurysm.

- **Drugs used**
  - Inj. Succinyl choline 0.5 mg/kg (Muscle relaxant)
  - Inj. Thiopentone sodium 3 mg/kg (Anesthetic).
  - Inj. Atropine 0.4 - 1.0 mg IV or 0.3 mg - 0.6 mg IM (To reduce respiratory secretions and prevent aspiration).

Nursing responsibilities: Informed consent, empty stomach before for 4–6 hours prior to ECT, hold the medication that can increase the threshold of seizure, head shampoo, environment preparation oxygen, suction, medication, monitors. Side lying position after ECT is advised to prevent aspiration.

- **Side effects**
  - Headache and short-term memory loss

CHILDHOOD PSYCHIATRIC DISORDERS

Table 15 The childhood psychiatric disorders

Autistic disorder	Rett's disorder	Childhood disintegrative disorder	Asperger's disorder
• Also called as **EARLY INFANTILE AUTISM/ KANNER'SAUTISM** • Biological causation onset prior to 3 years of age	• Mutation of Mecp2 gene is involved in maximum cases • It is a genetic brain disorder/ neurodevelopmental disorder	• Also called as **Heller's Syndrome/Disintegrative Psychosis** • Shows at least 2 years of normal development	• There is qualitative impairment in social interactions with stereotyped and repetitive behavior

Contd...

Scanned with CamScanner

Autistic disorder	Rett's disorder	Childhood disintegrative disorder	Asperger's disorder
• Mental retardation seen in 2/3 of patients • Absent social smile • Psychological intervention is the mainstay of treatment	• It most commonly affects girls after 6 - 18 months of age • Normal prenatal and perinatal development with normal motor development in first 5 months after birth • Normal head circumference at birth and more common in females • There is deceleration of head growth • Development of stereotyped hand movements and poorly coordinated gait and drunk moments • Treatment is physiotherapy for muscular dysfunction anticonvulsants for seizures and behavior therapy+ medications to control self-injurious behavior	• Significant loss of previously acquired skills • Associated with tuberous sclerosis and epilepsy	• As per DSM-V, it is a part of Austism Spectrum Disorder (ASD) • Also known as "High Functioning" type of ASD

Ref: My PGMEE Notes (Hemant Gajendra) page no. 810

ATTENTION DEFICIT HYPERACTIVE DISORDER (ADHD)

Also known as **hyperkinetic disorder** is persistent pattern of in attention and or hyperactivity. Characterized by neurological disorder, developmentally inappropriate inattention, impulsiveness and in some cases, hyperactivity.

Treatment

- **Drugs**
  - Stimulants. E.g. Methylphenidate (Ritalin), Amphetamine. Ritalin is the drug of choice in ADHD
- Behavioral modification technique.
- Cognitive behavior therapy.
- Social skills training.
- Family education.

MENTAL RETARDATION (INTELLECTUAL DISABILITY)

Intellectual disability (ID), also known as general learning disability and mental retardation (MR), is a generalized neurodevelopmental disorder characterized by significantly impaired intellectual and adaptive functioning.

Etiology

- **Down's Syndrome:** Caused due to trisomy 21 (extra chromosome 21)
- **Phenylketonuria (P.K.U)**
- **Maple syrup urine disease**
- **Cat cry syndrome:** Absence of 5 chromosomes
- **Lead poisoning**
- **Maternal age:** >35 yrs has more chances of abnormalities
- **Problems during pregnancy**
- Birth trauma, hypoxia, cord around neck, very low birth weight, brain infections, head injury, cerebral palsy

Levels of Mental Retardation

Normal IQ = 90 to 110

Table 16 Levels of mental retardation with their characteristics Borderline - 71 to 90

Types	IQ level	Characteristics
Mild MR Educable 6th std	50–70	• Includes 85% of MR population • Many adults with mild MR can live independently with appropriate support
Moderate MR Trainable Educable 2nd std	35–50	• Includes 10% MR population • They are challenged academically • Often are unable to achieve above second to third grade level in academics • Can lead relatively normal lives with supervision
Severe MR Dependable Can't self care	20–35	• Includes about 3–4% of MR population • Often learns to count as well as recognize words that are critical to functioning • Often master the most basic skills of living, e.g. cleaning and dressing themselves • They live in groups
Profound MR Idiot's (custodian)	Less than 20	• Includes 1-2% of MR population. • Most individuals may be taught some self-care skills and learn to communicate their needs given the appropriate training.

Scanned with CamScanner

Assessment of IQ

- A normal individual have IQ between 90 and 110.

Calculating IQ

$$= \frac{\text{Mental Age}}{\text{Chronological Age}} \times 100 = \text{IQ}$$

For example, a 10 year old that tested at a 12 year old mental age would have an IQ of 120

$$= \frac{12}{10} \times 100 = 120$$

- An intelligence quotient (IQ) is a total score derived from several standardized tests designed to assess human intelligence.
- Standard IQ Tests
  - Stanford Binet test
  - Wechsler Adult Intelligence Scale (WAIS)
  - Raven color progressive matrices
  - Vineland social maturity scale (for blind deaf and dumb)
  - Seguin form board test (for illiterate patients)

Signs and Symptoms

- Delays in oral language development and memory skills
- Difficulty in learning social rules and problem solving skills
- Lack of social interests
- Delays in the development of adaptive behavior such as self-help or self care skills
- Behavioral problems associated with MR are Restlessness, Poor concentration, Impulsiveness, Temper-tantrum, Irritability, Crying and Self injurious behavior (head banging).

Prevention

- *Antenatal counselling and screening*

MANAGEMENT

- *Training on self-care and life skills*
- *Training in vocation*
- *Family support and parental teaching.*

LEARNING DISABILITIES AND DISORDERS (SPECIFIC LEARNING DISORDER)

- As per DSM-5, Children with learning disability have difficulties in at least one of the following:
  - Difficulty in reading, spelling, understanding the meaning, written expression, number concepts, mathematical reasoning.
- Specific learning disorder (learning disorder or learning disability) is a neurodevelopmental disorder that begins during school-age.
- Approximately 5 to 15 percent of school-age children struggle with a learning disability
- One third of people with learning disabilities also have ADHD

Types of Learning Disorders

- **Dyslexia**: refers to the difficulty with reading. Reading becomes slow and effortful.
- **Dysgraphia**: Difficulties in writing one's thought on paper. It interferes with spelling, word spacing, grammar and punctuations.
- **Dyscalculia**: Difficulties in arithmetic (maths) calculations.

Management

- Strengthening the skills
- Developing a learning strategy tailored to take advantage of a child's strengths.

PSYCHOPHARMACOLOGY

Antipsychotics

These are used to treat psychotic symptoms. Also known as **neuroleptic drugs** as they produce neurological side effect, major tranquilizer, D_2 receptor blockers and anti-schizophrenia drugs. Chlorpromazine is the first and oldest antipsychotics.

Typical Antipsychotic (First Generation)

• **Phenothiazines**	
▪ Chlorpromazine	40–800 mg
▪ Perphenazine	12–64 mg
▪ Fluphenazine	1–40 mg
▪ Thioridazine	150–800 mg
• **Thioxanthenes**	
▪ Thiothixene:	6–30 mg
• **Butyrophenones**	
▪ Haloperidol	1–100mg
• **Dibenzothiazepine**	

Atypical Antipsychotics (Second Generation)

• Clozapine	300–900 mg
• Risperidone	4–16 mg
• Olanzapine	5–20 mg
• Quetiapine	150–750 mg

Newer drugs: Aripiprazole and blonanserine

Side Effects

- **Anticholinergic effects**
  - Dry mouth, blurred vision, constipation, urinary retention
- Nausea, skin rash, sedation
- Orthostatic hypotension
- Photosensitivity
- **Hormonal effects**
  - Decreased libido, retrograde ejaculation, gynecomastia, amenorrhea, weight gain.
- **ECG changes:** Prolongation of the QT interval are possible with most of the antipsychotics.
- Reduction of seizure threshold.
- **Agranulocytosis and hypersalivation**
  - **Clozapine:** Weekly/biweekly blood investigation but more effective in treating treatment-resistant schizophrenia
- **Extrapyramidal symptoms (EPS)**
  - Pseudoparkinsonism (neuroleptic induced parkinsonism)
    - Tremor, shuffling gait, drooling, rigidity
    - 1–5 days after initiation of antipsychotics

Scanned with CamScanner

- Akinesia
- Akathisia: Restlessness characterized by inability to sit still (50–60 days after initiation of therapy)
- Dystonia: Men; greater than 25 years of age (muscle spasm)
  - **Acute Dystonia:** Sustained muscle contraction frequently causing twisting, repetitive movement or abnormal posture
- Oculogyric crisis
  - Treated as emergency
  - Physician should be contacted immediately
  - **Management:** IV benztropine mesylate
- **Tardive dyskinesia:** Continuous movement of mouth, tongue and jaw.

- **Neuroleptic malignant syndrome (NMS)**
  - Severe Parkinsonian muscle rigidity
  - Body temperature up to107° F, tachycardia, tachypnea
  - Fluctuations in blood pressure, diaphoresis, and rapid deterioration of mental status to stupor and coma
  - This is rare but potentially fatal complication of treatment with neuroleptic drugs
  - It may precipitate within hours – years after drug initiation
    - Discontinue neuroleptic immediately.
    - **Management:** Bromocriptine or dantrolene.

Key Points

- First generation antipsychotics known as Typical Antipsychotic was discovered in 1950
- Chlorpromazine (typical antipsychotic) was discovered in 1950 and was the first antipsychotic drug
- Second generation antipsychotics known as Atypical Antipsychotic in which Clozapine was discovered in 1950 and introduced clinically in 1970.
- Anticholinergics (e.g. Benztropine) are used to treat Extrapyramidal symptoms (EPS)
- The major side effect of Clozapine is agranulocytosis. So periodical Complete Blood Count is suggested.
- EPS is most common with Fluphenazine and Haloperidol
- Orthostatic hypotension is most common with Chlorpromazine, Thioridazine, and Clozapine.

Antiparkinsonian Drugs for Drug Induced Extrapyramidal Symptoms (EPS)

- **Anticholinergics**
  - **Benztropine:** 0.5–9 mg
  - **Biperiden:** 2–8 mg
  - **Procyclidine:** 5–20 mg
  - **Trihexyphenidyl:** 1–15 mg
- **Antihistamines**
  - **Diphenhydramine:** 10–400 mg
- **Dopaminergic agents**
  - **Amantadine:** 200–400 mg
  - **Bromocriptine:** 10–40 mg

Antidepressants

These are the drugs, which are used for the treatment of the depressive illness. Also known as **mood elevators** or thymoleptics.

Monoamine Oxidase Inhibitors (MAOI)

E.g. Phenelzine, Tranylcypromine, Selegiline

Side Effects

Nausea, Headache, stiff neck and dry mouth.

Caution

Avoid tyramine containing food items (i.e. red meat, wine, liver, dried fish, chicken, chocolate, beer and coffee) in a patient who is getting MAOI to prevent hypertensive crisis.

Tricyclic Antidepressants (TCAs)

- NA + 5-HT reuptake inhibitors
  - Imipramine, Amitriptyline, Trimeprazine,
- Doxepin, Dothiepin, Clomipramine
  - Predominantly NA reuptake inhibitors
    - Desipramine, Nortriptyline, Amoxapine

Side Effects

- Dry mouth, bad taste, constipation, epigastric distress, urinary retention, blurred vision, palpitation, sedation, mental confusion, and weight gain.
- Some patients may switch to hypomania or mania
- Sweating and fine tremors are relatively common
- Seizure threshold is lowered fits may be precipitated
- Postural hypotension, especially in older patients

Note

Dangerous hypertensive crisis with excitement and hallucinations occur when **TCAs are given with SSRI.**

Selective Serotonin Reuptake Inhibitors (SSRI)

- Fluoxetine, Fluvoxamine, Paroxetine, Sertraline, Citalopram.

Side Effects

- Dry mouth, insomnia, restlessness, agitation, difficulty reaching orgasm, erectile dysfunction.

Atypical Antidepressants

Trazodone, Mianserin, Mirtazapine, Venlafaxine, Tianeptine, Amineptine, Bupropion.

Side Effect

- Dry mouth, nervousness and seizure at high dose.

Anxiolytics

- Anxiolytics are mostly mild CNS depressants which are aimed to control the symptoms of anxiety
- The anxiolytic-sedative drugs are more closely resemble sedative-hypnotics
- They do not produce extrapyramidal side effects

Classification

Benzodiazepines

- Diazepam (5–30 mg/day; Valium, calmpose)
- Chlordiazepoxide (20–100 mg/day; Librium, equilibrium)

Scanned with CamScanner

- Oxazepam (30–60 mg/day in 2–3 divided portions; Serepax)
- Lorazepam (1–6 mg/day; Larpose, ativan, Calmese)
- Alprazolam (0.25–1.0mg tds up to 6 mg/day in panic disorder; Alprax, alzolam)

Mechanism of Action

- Benzodiazepines act preferentially on midbrain ascending reticular formation and on limbic system

Indications

- Generalized anxiety disorders
- Panic anxiety disorders
- Anxiety disorders with or without depressive symptoms

Side Effects

- Drowsiness
- Sedation
- Confusion
- Dependence and withdrawal symptoms
- Sexual dysfunction

Azapirones

- **Buspirone (5–15 mg OD-TDS; Anxipar, Buspin), Gepirone**
- Ispapirone

Sedative Antihistaminic

- Hydroxyzine (100-200 mg/day; Atarax 10, 25 mg tab)

Beta Blocker

- Propranolol

Note

Antidepressants, especially the SSRIs are effective in OCD, phobias, panic and many types of severe generalized anxiety disorders

Mood Stabilizers

Mood stabilizers are used for the treatment of bipolar affective disorders, more commonly used mood stabilizers are: lithium carbonate, carbamazepine and sodium valproate.

Lithium Carbonate

- **Dose:** In acute mania—900–2100 mg/day in 2-3 divided dose
- Serum Therapeutic level: 0.8–1.2 mEq/L
- Prophylactic level: 0.6–1.2 mEq/L
- Toxic lithium level: >2.0 mEq/L

Side Effect

- **Adverse reactions:** below 1.5 mEq/L.
- **Mild to moderate adverse reactions:** 1.5–2.5 mEq/L
- **Severe reactions:** 2.5 mEq/L and above.
- Fine hand tremor, polyuria, and mild thirst
- **EEG Changes:** Diffuse slowing, widening of the frequency spectrum
- **ECG Changes:** Reversible flattening, isoelectricity or inversion of T-waves.

Lithium Toxicity

Symptoms of lithium toxicity begin to appear at blood levels greater than 1.5 mEq/L and are dosage determinate.

Table 17

Serum level of lithium	Toxicity symptoms
1.5 to 2.0 mEq/L	• Blurred vision, ataxia, tinnitus, persistent nausea and vomiting, severe diarrhea.
2.0 to 3.5 mEq./L	• Excessive output of dilute urine, increasing tremors, muscular irritability, psychomotor retardation, mental confusion, giddiness.
Above 3.5 mEq/L	• Impaired consciousness, nystagmus, seizures, coma, oligurea/ anuria, arrythmias, myocardial infarction, cardio vascular collapse.

Client/Family Education

- **Not drive or operate dangerous machinery** until lithium levels are stabilized
- The client should drink **6 to 8 large glasses of water** each day and avoid excessive use of beverages containing caffeine
- Notify the physician if vomiting or diarrhea occur. These symptoms can result in sodium loss and an increased risk of toxicity.
- Include **adequate sodium** in the diet (in case or heavy sweating in labor work, add more sodium in the diet or else maintain normal intake)
- **Avoid pregnancy** while receiving lithium therapy. Lithium is teratogenic agent which is likely to cause Ebstein's Anomaly.

Nurses Responsibilities

- Lithium should be taken along with food
- In a patient who is stabilized on lithium therapy, blood lithium levels should be checked
  - 8–12 hours after the first dose
  - 2 or 3 times weekly during the first month
  - Weekly to monthly during maintenance therapy.
- Discontinue medication in case of sign of lithium toxicity (excessive vomiting, extreme hand tremors, sedation, muscles weakness and vertigo) and report physician immediately.
- Increase water intake with salt to prevent lithium toxicity
- A patient who is taking lithium for bipolar affective disorder must maintain a balanced diet with adequate salt intake.
- Low calorie diet to prevent weight gain.
- Explain the patient about dehydration and lithium toxicity.

NATIONAL MENTAL HEALTH PROGRAMME (NMHP)

- The National Mental Health Program (NMHP, 1982) was **launched in 1982,** by the government of India
- The NMHP was re-strategized in 2003 to include two schemes, viz.
  - Modernization of State Mental Hospitals and
  - Up-gradation of Psychiatric Wings of Medical Colleges/General Hospitals.
- The Manpower Development Scheme (Scheme-A and B) became part of the Program in 2009.

Scanned with CamScanner

Components of NMHP

Three main components of NMHP are as follows:

1. Treatment of Mentally ill
2. Rehabilitation
3. Prevention and promotion of positive mental health.

Objectives of NMHP

- To ensure the availability and accessibility of minimum mental healthcare for all in the foreseeable future
- To encourage the application of mental health knowledge in general healthcare and in social development
- To promote community participation in the mental health service development
- To enhance human resources in mental health sub-specialties

Strategies

- Integration of mental health with primary healthcare through the NMHP
- Provision of tertiary care institutions for treatment of mental disorders
- Eradicating stigmatization of mentally ill patients and protecting their rights

OBJECTIVES OF DISTRICT MENTAL HEALTH PROGRAM (DMHP)

- To provide sustainable basic mental health services to the community and to integrate these services with other health services
- Early detection and treatment in community itself
- To reduce stigma of mental illness through public awareness
- To treat and rehabilitate mental patients within the community.

Components of DMHP

- Training of medical, paramedical personnel and community leaders
- Community Mental Health care through existing infrastructure of the health services
- Information, Education and Communication (IEC) activities

DEADDICTION DRUGS/ANTABUSE DRUGS

The drugs mentioned in Table 18 are used for the treatment of substance use disorders.

Criteria for Treatment on Out Patient Department (OPD) Basis

- Mild to moderate dependence, Medically stable, Good social support, High motivation,
- Willing to give body fluids for exam.

Criteria for Inpatient Treatment

- Having severe withdrawals (current or past history), With medical complications, Co-morbid psychiatric/mental illness, Poor social support, Patient in crisis

Phases of Treatment

- Withdrawal phase (detoxification)
- Maintenance phase

Table 18 Drugs used in withdrawal and maintenance phase of deaddiction treatment

Substance	Treatment	
	Withdrawal phase	Maintenance phase
Opioid	• Opioid detoxification requires 2 weeks • Buprenorphine, dextropropoxyphene, and clonidine are used • Starting dose of depends on amount of opioids consumed. • Divided doses of 1.2-4 mg of buprenorphine/ 6-12 capsules of dextropropoxyphene is preferred	• **Opioid agonist:** Methadone, Buprenorphine, Morphine • **Antagonist:** Naltrexone
Alcohol	• Long acting benzodiazepines (chlordiazepoxide/ diazepam) are used • Usually daily divided doses of 20-40 mg of diazepam/ 40-80 mg of chlordiazepoxide • Taper off the dose of benzodiazepines gradually over next 7–10 days. • Oral administration of thiamine to treat wernicke-korsakoff syndrome • **Loading dose:** 20 mg diazepam every 2 hourly till sedated on the first day of withdrawal.	• Deterrent agents: Disulfiram (**dose:** 250 mg tab.; 1-2 tab per day), calcium carbimide • **Anticraving agents:** Acamprosate (333 mg, 2-3tabs TDS, commonly used), naltrexone (50mg, 1tab OD), fluxetine (20/40mg).
Benzodiazepine	• Shift to long acting benzodiazepines, e.g. Diazepam	Taper off Long acting benzodiazines.
Nicotine	• Nicotine gum, Nicotine transdermal patch	• Nicotine chewette • 2/4 mg, every 2-3 hrly. • Gradual tapering over few weeks. • Nicotine transdermal patch • Bupropion – 300-600 mg/day. Onset of action takes 2 week time.

Scanned with CamScanner

CRISIS AND CRISIS INTERVENTION

- Crisis is an acute time limiting state of physiological disequilibrium resulting from situational, developmental or societal source of stress
- Crisis is acute, will be solved by one or another mean within a brief period

Stages of Crisis

- Exposure to Hazardous event (stressor) → The vulnerable state → The precipitating factor → Active crisis state → Reintegration/ restoration of equilibrium

Types of Crisis

- **Developmental Crisis/Maturational crisis:** It is the result of a normal life event, e.g. Pregnancy, graduation
- **Situational Crisis:** Most common type of crisis. An event that is so overwhelming and sudden that it overwhelms normal coping, e.g. sexual assault, Road traffic accident or sudden loss or grief.
- **Existential Crisis:** These are related to situations of regret or belief that one will not reach goals they had set for themselves at a certain age. Existential crises are particularly common at life transition points like 30, 40, and 50 when people "take stock" of their life.

Crisis Intervention

- **Goals:** Relieving the client's symptoms and restoration of client's previous level of functioning

Stages of Crisis Intervention

- **Assessment**
  - Identify the precipitating factor
  - Determine client's subjective reaction to the precipitating event
  - Define the context of the crisis situation
  - Assess previously used coping mechanisms
- **Planning and implementation**
  - Obtain relevant background information
  - Set immediate goals based on available resources and support system
  - Identify tasks that allow the client to achieve those goals
- **Termination**
  - The client and therapist review the client's progress in terms of the goals of the intervention
  - Make a decision on termination
  - Discuss the client's plan for future
- **Crisis intervention technique**
  - **Sustainment:** During initial stages of crisis intervention
  - **Direct influence:** Involves contact with other agencies to mobilize support system
  - **Person-situation reflection:** Help the client to understand the crisis situation
  - **Dynamic and developmental understating:** Used to explore deeply the client's role in the crisis situation.

GLOSSARY OF COMMON TERMINOLOGIES

- **Akathisia:** Motor restlessness, inability to sit still.
- **Anhedonia:** Inability to experience pleasure in any activity.
- **Amnesia:** Partial or total inability to recall fast experience may be organic or emotional.
- **Apathy:** Lack of emotional feeling.
- **Anorexia nervosa:** Characterized by extreme concern with body weight, an intense fear of becoming fat, and maintenance of body weight below expected level.
- **Blunt affect:** A reduction in emotional experience.
- **Circumstantiality:** A pattern of communication that is includes many irreverent and unnecessary trivial detailed in his speech before he is able to come to the point.
- **Idea of reference:** It is an incorrect belief that the statements or actions of others are related to oneself.
- **Déjà vu:** A subjective feeling that an event which is occurring for the first time has been experienced before.
- **Delusion:** A false, fixed and unshakeable belief which is not amenable to reasoning and is not in keeping with the patient's sociocultural and educational background.
- **Dystonia:** Muscle rigidity that affects posture, gait, and eye movement.
- **Echolalia:** Pathological repetition by imitation of the speech of another.
- **Echopraxia:** Pathological repetition by imitation of the behavior or act of another.
- **Encopresis:** Involuntary passage of feces in inappropriate place after age of voluntary control has been established.
- **Euphoria:** Excessive feeling of happiness.
- **Grandiose:** Unrealistic or exaggerated sense of self worth importance wealth or ability
- **Hallucination:** A false sensory perception in the absence of an actual external stimulus.
- **Illusion:** The misinterpretation of real external sensory experience. It is mental misperception of actual sensory stimuli.
- **Insight:** Awareness of one's own mental illness.
- **Jamais vu:** Failure to recognize events that have been encountered before.
- **Palilalia:** Compulsive repetition of one word (usually last one) phrase
- **Stupor:** A state in which the individual does not reach to his surroundings and appears to be unaware of them.
- **Tangentiality:** A form of thinking /speech in which the client tends to wander away from the intended point, and never returning to the original idea.
- **Thought block:** A sudden interruption in the thought process before the thought is completed. After a pause, the subject cannot recall what he had meant to say.
- **Tic:** Sudden, repetitive, stereotyped motor movement or verbal speech.
- **Waxy flexibility:** A condition by which the individual with schizophrenia passively yields all movable parts of the body to any efforts made at placing them in certain position.

Golden points to remember

- Linda Richards is considered as First Psychiatric Nurse.
- Sigmund Freud is the father of Modern Psychiatry.
- Freud's model of development which comprised 'id, ego and superego' is called Structural Model.
- Psychoanalytic therapy was developed by Sigmund Freud.
- The term 'Psychiatry' was coined by Christian Reil.
- The Nobel Prize for experiments on split brain was given to Roger Sperry.
- Pavlov's experiment is an example of Classical Conditioning.
- The theory of operant conditioning was experimented by B F Skinner.
- Cognitive model suggests that psychological disorders result from acquiring dysfunctional ways of Thinking and Acting.
- The Indian Lunacy Act was passed in the year 1912.
- The Indian Mental Health Act was passed in the year 1987.
- Mental Healthcare Act 2017 (MHA 2017) received presidential assent on April 7th, 2017 and replaced the 1987 Act.
- Mental Health Act 2017 decriminalizes suicide attempt by mentally ill person.
- As per MHA 2017, No ECT therapy without use of muscle relaxants and No ECT therapy for Minors.
- Mental Health Act (MHA 2017) empowers a mentally ill person to have the right to make an advance directive toward the way he/she wants to be treated.
- Reception order refers to an order for admission and detention of a mentally ill person in a psychiatric hospital.
- Temporary discharge of the patient from the psychiatric hospital is referred to as Parole.
- Diagnostic and Statistical Manual (DSM) classification of mental disorders is published by American Psychiatric Association.
- ICD stands for International Classification of Diseases.
- International Classification of Diseases is published by World Health Organization (WHO).
- The National Mental Health Program (NMHP, 1982) was launched in 1982 by the Government of India.
- National Mental Health Programme (NMHP) was re-strategized in 2003 to include two schemes, viz. Modernization of State Mental Hospitals and Up-gradation of Psychiatric Wings of Medical Colleges/General Hospitals.
- The Manpower development scheme (Scheme-A & B) became part of NMHP in 2009.
- Three main components of NMHP include treatment of mentally ill, rehabilitation and prevention and promotion of positive mental health.
- Trust is the most important factor in a therapeutic relationship.
- Termination of interpersonal relationship starts in orientation phase.
- Transference is a phenomenon in which the person in treatment redirects feelings for others onto the therapist.
- Countertransference occurs when a therapist transfers emotion to a person in therapy.
- Process recording is the recording of conversation between the nurse and patient in a psychiatric set up.
- The best approach in helping a severely withdrawn patient is to provide a trusting relationship.
- Giving advice to the patient is one of the barriers of therapeutic nurse-patient communication.
- Open-ended questions are used during psychiatric history collection.
- Presenile dementia occurs in younger person (<65 years). Causes: Alzheimer's disease, Pick's disease, Parkinson's disease.
- Senile dementia occurs after 65 years of age. Cause: degenerative brain changes.
- In dementia, symptoms seem to worsen in the late afternoon and evening—a phenomenon termed sundowning.
- For a client with dementia, a complex task will be easier if it is broken down into series.
- Biochemical etiology of Alzheimer's disease relates to Acetylcholine.
- Parkinson's disease is primarily caused by low and falling dopamine levels. Parkinson's disease is caused by a loss of nerve cells in the part of the brain called the substantia nigra.
- Part of the brain that is responsible for emotional aspects of behaviour is limbic system.
- The part of the brain that regulates cognitive function is cerebrum.
- Mini mental status examination is used to assess cognitive impairment.
- Total score of Mini Mental Status Examination (MMSE) is 30. A score of 24 or more indicates a normal cognition.
- Mini Mental Status Examination (MMSE) score of 19 to 23 indicates mild cognitive impairment; scores of 10 to 18 indicate moderate cognitive impairment. Scores below 10 indicate severe cognitive impairment.
- The most significant characteristics experienced by a patient with depression is depressed mood and loss of pleasure or interest.
- 'Omega sign' is seen in depressed patient.
- Depressed mood and loss of pleasure or interest are the most significant characteristics experienced by a patient with depression.
- Deficiency of Serotonin or 5 HT (5-hydroxytryptamine) is found to cause depression.
- Common risk factor in patient with severe depression is suicidal tendency.

Contd...

Scanned with CamScanner

- Incidence of suicide in India is 10-11/1,00,000 population.
- Hanging is the most common method of suicide in India according to National Crime Records Bureau 2014.
- The behavioural clues for impending suicide include giving away valuable possessions, becoming energetic after a period of server depression, withdrawals from social activities, farewell quotes and letters, and avoiding serious decision making.
- For a patient with severe depression, the setting where there are simple daily routines will be least stressful.
- Aphonia is the inability to produce voiced sound.
- Apathy is a state of indifference, or the suppression of emotions such as concern, excitement, motivation, and passion.
- Kleptomania means irresistible desire to steal things.
- World's "No Tobacco Day" is observed on 31st May.
- World Mental Health Day is observed on 10th October.
- For determining the serum lithium, the blood specimen to be obtained before breakfast.
- Tardive dyskinesia is the adverse effect resulting from the chronic use of antipsychotics.
- The term schizophrenia is coined by Eugene Bleuler.
- Meaning of term 'Schizophrenia' is split mind.
- Negative symptoms of Schizophrenia include Affective flattening, Alogia, Avolition, and Apathy.
- First rank symptoms of schizophrenia (FRSS) was described by Schneider.
- Four As of Schizophrenia (According to Eugen Bleuler) are: Associative looseness, ambivalence, autistic thinking, and affective changes.
- In schizophrenia, gradual subtle behavioural changes occur in the prodromal phase.
- Inability to maintain adequate boundaries is the feature of schizophrenic patients.
- Increased dopamine level will cause Schizophrenia.
- Impaired insight is a common feature in Schizophrenia.
- The affect that is most commonly seen in patients with schizophrenia is apathy and flatness.
- Waxy flexibility, mutism, bizarre posture and stupor are characteristics of catatonic schizophrenia.
- Persecutory delusion and/or suspiciousness is common in paranoid schizophrenia.
- Late adolescence to early adulthood is the most common period of onset of schizophrenia.
- Flight of ideas is typical feature of mania.
- Type of diet is recommended for a patient with manic episode is finger foods.
- Most appropriate intervention to manage manipulative behaviour of a manic patient is to set limits on patient behaviour.
- Calling hospital security should be the first step by the nurse following a violent episode on a psychiatric unit.
- False sensory perceptions with no basis in reality (no external stimuli) is known as hallucination.
- Illusion is a distortion of senses characterized by misinterpretation of stimuli.
- Formed visual hallucinations are usually from lesion of temporal region.
- Unformed hallucinations are common with disorders of the occipital lobe.
- Auditory hallucination is the most common type of hallucination experienced by patients with mental illness.
- Mood congruent hallucination refers to hallucination whose content represents or reflects the mood state of the individual.
- Fixed false belief of a person which cannot be changed by logical reasoning is known as delusion.
- The belief that oneself, a part of one's body, or the real world does not exist is known as nihilistic delusion.
- Schizophrenia is treated by antipsychotics.
- Risperidone is the treatment of choice for patients with schizophrenia, who refuses to take treatment.
- Gradual onset is one of the poor prognostic factors in schizophrenia.
- Presenting the patient with a 'hypothetical situation' helps in the assessment of judgement.
- Catharsis is the process of releasing strong emotions through a particular activity or experience.
- Confabulation is a symptom of various memory disorders in which made up stories fill in any gaps in memory.
- Unfamiliarity of familiar things is seen in Jamais vu.
- Déjà vu is a feeling of having already experienced the present situation.
- Catatonia is a state of psychomotor immobility and behavioural abnormality manifested by stupor
- Cataplexy is a sudden and transient episode of muscle weakness accompanied by full conscious awareness which is precipitated or triggered by emotions as laughing, crying etc.
- A state of diminished consciousness in which the patient remains mute and still with the eyes open is called as stupor.
- Systematized delusions occur in the dementia only. It does not occur in delirium.
- Delirium is an acute confusional state but dementia develops over time with slow progression of cognitive decline.
- The most common cause of dementia is Alzheimer's disease.
- Hypothyroidism is one of the most important causes of potentially reversible dementia.
- Recent memory loss is a feature of Alzheimer's disease.
- Best test for diagnosis of organic mental disorder is Bender gestalt test.
- Rorschach Test (RT) and Thematic Apperception Test (TAT) are projective tests to assess personality structure, pattern of thoughts, emotional problems and mental disorders.
- Rorschach's projective test is designed to measure unconscious intentions.
- The extreme feeling of happiness is known as Euphoria.
- Circumstantiality is a disorder of thought in which thinking proceeds slowly with many unnecessary trivial details, but finally the point is reached.

Contd...

Scanned with CamScanner

- When a patient is not aware of his/her mental disorder, it is called lack of insight.
- A person who is aloof, isolated and does not socialize, is considered to be withdrawn.
- Verbal utterance that are often obscene is known as Coprolalia.
- Echolalia is the repetition of the words spoken by others.
- Echopraxia is the repetition of movements performed by others.
- Neologism is the coining of new words without any meaning.
- Persistent and inappropriate repetition of the same thoughts is known as Perseveration.
- An unwanted thought that a person finds intrusive and distressing is called as obsession.
- A behavior that a person feels compelled to perform is defined as compulsion.
- Polysomnography, also called a sleep study, is a test used to diagnose sleep disorders.
- Most vivid dreams occur during REM sleep.
- Penile erection or clitoris engorgement occurs during REM sleep.
- Non-Rapid Eye Movement (NREM) sleep is also known as Orthodox sleep or Synchronized or 'S' sleep.
- Restless leg syndrome (Ekbom's Syndome) - Painful condition lead to severe insomnia and periodic limb movement during sleep.
  - Sleep walking is otherwise called somnambulism.
  - Systemic desensitization is developed by Joseph Wolpe. This therapy is useful for phobic anxiety disorder, OCD and certain sexual disorder.
  - Flooding or implosion is useful therapy for phobia.
  - Shaping is suitable for speech therapy in autistic child.
- Extinction is a behavioural therapy technique that is useful in temper tantrum.
- Repetitive, uncontrollable thoughts and acts are termed as Obsessive-compulsive disorders (OCDs).
- Exposure and response prevention (ERP) is the most important type of Cognitive Behaviour Therapy (CBT) for OCD.
- Brief Cognitive Behavioral Therapy (CBT) focuses on solving current problems. It focuses on 'here and now' approach.
- Gradual disappearance of conditioned response to stimuli is referred to as Extinction.
  - Aversion therapy is useful alcoholism, impulsive behaviour, and paraphilias.
  - Chlorpromazine (typical antipsychotic) was discovered in 1950 and was the first antipsychotic.
  - Extra pyramidal symptoms are most common with Fluphenazine and Haloperidol.
- Orthostatic hypotension is most common with Chlorpromazine, Thioridazine, Clozapine.
- Agranulocytosis is more common with typical than atypical antipsychotics (except Clozapine).
- The major side effect of Clozapine is agranulocytosis. So periodical complete blood count is suggested.
- Bromocryptine or dantrolene is the treatment of choice for Neuroleptic Malignant syndrome (NMS).
- Anticholinergics (e.g. Benztropine) are used to treat extrapyramidal symptoms (EPS).
- The drug of choice for treatment and management of bipolar mania is lithium carbonate.
- Daily adult dosage of lithium for acute mania is 1800-2400 mg. For maintenance - 900-1200 mg.
- Therapeutic Plasma Range for acute mania - 1.0 – 1.5 mEq/L; For maintenance - 0.6 – 1.2 mEq/L.
- Patient who is on lithium therapy should drink 6 to 8 large glasses of water each day and avoid excessive use of beverages containing caffeine (coffee, tea, colas), which promote increased urine output. The client must consume a diet adequate in sodium.
- The goal of milieu therapy is to manipulate the environment so that all aspects of the client's hospital experience are considered therapeutic.
- Concepts of milieu therapy include containment, validation, structured interaction, and open communication.
- Neurotransmitter serotonin plays a role in the psychopathology of OCD.
- Medication with a serotonin reuptake inhibitor is helpful for many OCD patients.
- The type of loss in which the client is aware that a loss will occur is known as anticipatory loss.
- Willis Ekbom Syndrome is also known as Restless legs syndrome.
- Excessive sleep is termed as Hypersomnia.
- Dhat syndrome: It is considered as a culture-bound syndrome (CBS) specific to the Indian subcontinent.
- Kleine–Levin syndrome is a rare sleep disorder mainly affecting teenage boys in which the main features are intermittent hypersomnolence.
- Ganser syndrome is a type of factitious disorder, in which a person deliberately and consciously acts as if he or she has a physical or mental illness when he or she is not really sick.
- The immediate nursing intervention for the patient who has just awakened from an electroconvulsive therapy (ECT) treatment is to orient the patient.
- The most common indication of ECT is Major depression.
- type of schizophrenia best responds to ECT is Catatonic Schizophrenia.
- The voltage needed to produce seizures while giving ECT is 70 to 130 volts.
- Succinylcholine (smooth muscle relaxant) is administered during ECT to prevent injuries to patient during seizure.
- Atropine is given to patient before Electroconvulsive Therapy (ECT) is to minimize secretions and to prevent transient postictal brady arrhythmia due to excessive vagal tone.
- Most common side effect of ECT is temporary memory loss.

Scanned with CamScanner

- Agoraphobia is fear of open spaces. It is the most common type of phobia seen in clinical practice.
- Irrational fear related to closed spaces is referred to as claustrophobia.
- Fear of high places is called acrophobia.
- Preoccupation with a fear of having a serious physical illness, not based on real or organic pathology is hypochondriasis.
- The part of mind that distinguishes right from wrong and acts as censor of behavior is known as superego.
- An attempt to integrate values learned from parents and society is referred to as superego.
- Another term for superego is conscience.
- As per psychoanalytic theory the ability to tolerate frustration is seen in Ego.
- As per Freud, the development of Oedipus Complex (male) and Electra Complex (female) occurs during the phallic (3-6 years) stage of development.
- A male child's unconscious sexual desire for the parent of the opposite sex is termed as Oedipus Complex.
- A female child's unconscious sexual desire for the parent of the opposite sex is termed as Electra complex.
- Topographical model of mind by Freud is Conscious - Preconscious – Unconscious.
- Father of Intelligence Test is Alfred Binet (Early 1900s).
- Milieu theory insists on community participation by abiding unit rules.
- In psychoanalytic terms, obsessive compulsive disorder is fixed at Anal Stage.
- Separation of a thought or memory from its associated feeling or emotion is known as Isolation.
- Ego defense mechanism is a mechanism designed to reduce stress and conflict caused by specific experiences.
- Rechanneling of socially unacceptable drives into activities that are more tolerable and constructive is known as Sublimation.
- A young man who is dealing with aggression by playing football is an example of Sublimation (Defense Mechanism).
- Attributing unacceptable feeling to others is the mechanism known as Projection.
- Rationalization is an **adaptive mechanism of giving excuses when a person cannot solve a problem.**
- Repression involves placing uncomfortable thoughts in relatively inaccessible areas of the subconscious mind.
- Intellectualization is an attempt to avoid expressing actual emotions associated with a stressful situation by using the intellectual process of logic, reasoning and analysis.
- Most commonly using defensive mechanism by a physically abusive individual is Displacement.
- Situational crisis is term given to a person whose coping mechanisms are affected due to their circumstances, e.g. job loss, financial crisis, etc.
- In conversion disorder, anxiety is expressed through physical symptoms.
- The ability of a person to readily recover from stressful situations is called Resilience.
- Integrative approach is a combined approach to psychotherapy that brings different elements of specific therapies.
- Eradication of unwanted habits by associating unpleasant condition with it is called Aversive Conditioning.
- Systematic desensitization therapy is useful in the treatment of Phobias.
- Flooding is a behavioral therapy in which the patient is suddenly exposed to a direct and maximum fear producing stimulus.
- Supportive confrontation can be used in a patient with narcissistic personality disorder to point out discrepancies between what the client states and what actually exists.
- The ideal size for group therapy is 8 to 10 members.
- Most common symptom of alcohol withdrawal is tremor.
- The health education to a group of alcoholic people should be able to change their behavior.
- Korsakoff's Psychosis is a long-term effect of 'Medical Complication of Alcoholism'. It occurs due to deficiency of the Vitamin Thiamine.
- Chronic alcoholic patients are treated initially by IM injection of thiamine 100 mg.
- Heroin (like opium and morphine) is made from the resin of poppy plants.
- Total abstinence is the only effective treatment for alcoholism, particularly in short-term alcoholic addicts.
- Regular coffee is contraindicated in a patient who is on alcohol withdrawal phase.
- Alcohol anonymous group is a self-help group, who meets together to maintain sobriety.
- Most severe alcohol withdrawal syndrome is Delirium tremens.
- Chlordiazepoxide is used to treat withdrawal symptoms of alcoholism.
- Acamprosate is an anti-craving agent used in maintenance phase of treatment of alcohol dependence.
- Disulfiram is the deterrent agent used in the maintenance phase of treatment of alcohol dependence syndrome.
- Combination of alcohol and Disulfiram results in nausea and hypertension as a result of accumulation of Acetaldehyde.
- Flumazenil is an antidote of benzodiazepines.
- Naloxone is an antidote of opioids.
- Naltrexone is an opioid antagonist.
- Suspiciousness and mistrust of others (paranoia) is a characteristic feature of schizotypal personality disorder.
- Patient with schizotypal personality has great difficulty in establishing and maintaining close relationships with others.
- Characteristic of schizoid personality disorder is introverted and emotionally withdrawn.
- Dependent personality disorder is characterized by intense lack of self-confidence, low self-esteem, and inability to make decisions.
- Clients with borderline personality disorder are likely to develop dysfunctional coping and act out in self-destructive ways such as binge eating.

Contd.

Scanned with CamScanner

- Dissociative fugue or psychogenic fugue is a dissociative disorder characterized by reversible amnesia for personal identity.
- A nurse who is caring for a client with antisocial behavior should stress on setting clear rules and expectations about the client's behavior.
- Sheldon's classification of personality includes Ectomorphs, Endomorphs, and Mesomorphs.
- Characteristic of histrionic personality is dramatic, theatrical and attention seeking.
- People with anti-social behavior lack ego and super-ego that controls behavior. They have little or no concern for others.
- A naive, inappropriate lack of emotion or concern for the perceptions by others of one's disability is known as La belle indifference.
- Derealization and Depersonalisation are seen in Dissociative disorder.
- A person who is kind, quiet, submissive, sympathetic and gloomy has Melancholic personality.
- Loss of personal identity and wandering away from psychiatric hospital is referred to as Dissociative Fugue.
- Uncertainty and excessive sense of responsibility is seen in Generalized anxiety disorder.
- Diagnostic interview with sodium amytal or hypnosis is a special feature of Post-traumatic neurosis.
- Release of feelings that takes place by talking about an emotionally charged areas is known as abreaction.
- Treatment of choice is for Cognitive Behaviour Therapy.
- Grief is a reaction of an individual to a significant loss. The loss may be real or anticipated one.
- The basis of ritualistic behavior seen in Obsessive Compulsive disorder (OCD) is aimed at controlling guilt and inadequacy by maintaining an absolute set pattern of behavior.
- The most common psychotherapy used to help a person with Obsessive Compulsive Disorder is behavior modification.
- In a client with OCD, the rituals performed by the client will help to control the anxiety.
- Drug most useful in treatment of obsessive compulsive disorder is Fluoxetine (SSRI).
- Lateral hypothalamus (to start) and Ventromedial Nuclei (to stop) of hypothalamus controls hunger and eating
- Establishing a consistent eating plan and monitoring the client's weight are important in developing care plan for a client with anorexia nervosa.
- Bulimic behavior is generally a maladaptive coping response to stress and underlying issues.
- The most appropriate goal for a client with bulimia nervosa is that the patient must identify anxiety-causing events or situations that stimulate the bulimic behavior.
- Trichotellomania is a disorder that involves recurrent irresistible urge to pull out hair.
- Juvenile delinquency is a legal classification of children's behavior that violates the law.
- Methylphenidate is the first line drug of choice for the treatment of ADHD.
- Autistic child turns inward to his/her own self stimulating acts and responds less to environmental stimuli.
- Language development of an autistic child resembles Echolalia.
- Dyslexia is a learning disorder that involves difficulty reading.
- Dyscalculia refers to severe difficulty in making arithmetical calculations.
- Tic is an abnormal involuntary movement which occurs suddenly, repetitively and purposelessly.
- Tourette syndrome is a disorder of Tic.
- Magical thinking is commonly seen in Toddlers and Preschoolers.
- Haloperidol is the drug of choice to treat Tourette's disorder.
- Patients who are taking monoamine oxidase inhibitor should avoid taking food rich in tyramine.
- Examples of tyramine rich foods are aged cheeses, alcohol beverages, cured meats, etc.
- Antipsychotic drugs are also known as neuroleptic drugs or tranquilizers.
- Tardive dyskinesia is a side effect of long-term use of certain antipsychotics.
- Neuroleptic malignant syndrome (NMS) is a life-threatening, neurological disorder most often caused by an adverse reaction to antipsychotic drugs.
- Neuroleptic malignant syndrome (NMS), an adverse effect of antipsychotics, can occur within hours after drug initiation.
- For determining the serum lithium, the blood specimen is to be obtained before breakfast. It is advisable to take the blood sample after 12 hours of last dose.
- Chlorpromazine depresses hypothalamic thermoregulatory mechanism, exposure to extreme temperature may cause hyperthermia.
- Patients who are on haloperidol are advised not to drive or operating machines due to the side effect of dizziness and drowsiness.
- Abrupt withdrawal of barbiturate could cause withdrawal symptoms such as seizure, restlessness, insomnia, sweating and anxiety.
- Drug of choice to reverse a dystonic reaction is Diphenhydramine (Benadryl), 25 to 50 mg IM or IV.
- Disulfiram therapy is an overt sensitization, a type of aversion therapy which produces unpleasant consequence for undesirable behavior.
- Antidote for methanol is Ethanol.
- Therapeutic serum level of lithium is 0. 8-1. 2 mEq/L.
- Atypical antipsychotics has a lower incidence of extra pyramidal effects than the typical antipsychotics.
- Agranulocytosis is the side effect of Clozapine (atypical antipsychotics). So periodical Blood screening for CBC is required.
- Psychology is a Natural science.
- Psychology as a 'Science of Mind', is defined by Psychoanalysts.
- E.B. Titchener (1867-1927) defined 'Psychology' as the science of mind.
- Abnormal Psychology is mainly the study of Abnormality of mind.

Image-Based Questions

1. **Identify the Behavioral syndrome as shown in Photograph** *[Recent Question 2013]*

a. Anorexia nervosa
b. Bulimia nervosa
c. Obesity
d. Binge-eating disorder

2. **Fear of Situation shown in the Photograph is known as**

a. Xenophobia
b. Sitophobia
c. Algophobia
d. Ichthyophobia

3. **Disorder in which a person develops sexual arousal with object shown in Photograph**

a. Sexual masochism
b. Voyeurism
c. Frotteurism
d. Fetischism

4. **Identify Paraphilia shown in Photograph**

a. Sadism
b. Exhibitionism
c. Sexual masochism
d. Frotteurism

5. **Method of Substance use shown in Figure is mainly used for**

a. Ganja
b. Bhang
c. Charas
d. Cocaine

6. **Punishment for attempt to commit Act shown in Photograph is under Section**

a. 302 IPC
b. 306 IPC
c. 309 IPC
d. 319 IPC

7. **Plant shown in Photograph is NOT a source of**

a. Bhang
b. Charas
c. Cocaine
d. Ganja

8. **Plant shown in the photograph can lead to ..... poisoning** *[Recent Question 2017]*

a. Cocaine
b. Opioid
c. Cannabis
d. None of the above

Ans.

1. b
2. b
3. d
4. d
5. d
6. c
7. c
8. b

9. Maximum score of test shown in photograph is:

a. 13
b. 30
c. 47
d. 55

10. Psychiatric test shown in photograph is a type of .....

a. Objective test
b. Projective test
c. Neuropsychological test
d. Rating scale

11. Fear of situation shown in the photograph is known as:

a. Xenophobia
b. Algophobia
c. Anthophobia
d. Claustrophobia

12. Identify the child psychiatric disorder as shown in photograph:

a. Dyscalculia
b. Dysphasia
c. Dyspraxia
d. Echolalia

13. Identify fear shown in photograph:

a. Agoraphobia
b. Acrophobia
c. Claustrophobia
d. Xenophobia

14. Impulse disorder associated with photograph is:

a. Kleptomania
b. Trichotitillomania
c. Onychophagia
d. Pyromania

Ans.

9. b

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

HISTORY OF PSYCHIATRIC NURSING AND GENERAL PSYCHOPATHOLOGY

1. Which of the following is NOT a medicopsychiatric condition? *(AIIMS BPL NO 2018)*

a. Insulinoma
b. Agitated depression
c. Hyperthyroidism
d. Angina

Explanation:

- Agitated depression is a psychiatric condition without organic involvement (medical condition). Agitated depression is also known as "melancholia agitation." It is known as "mixed mania" or "mixed features." Other conditions are medico-psychiatric condition.
- **Strategy:** Use the rule of elimination to solve this question. Find out three medical condition which are associated with psychiatric condition (medicopsychiatric condition) and eliminate them. Among given options, the medical conditions that are associated with psychiatric conditions are Insulinoma, Hyperthyroidism and Angina.

Ans.

1. b
2. c
3. d
4. b
5. a
6. d
7. a

2. The state of complete dis-organization and confusion which leads to loss of identity and direction. It is known as: *(Safdarjung NO 2018)*

a. Equilibrium
b. Bargaining
c. Chaos or disruption
d. Resistance

Explanation:

- The state of complete dis-organization and confusion which leads to loss of identity and direction is chaos and disruption. When a person is not able to cope up with the existing problems and become disorganized externally or internally is called as Chaos and disruption. It hugely affects the harmony and performance of the person.
- Equilibrium is a state of balance. Bargaining is a process of negotiation. Resistance is an action or inaction towards the change.

3. Assuming the all members of a group are alike is called: *(AIIMS BBS NO 2018)*

a. Cultural imposition
b. Cultural competency
c. Clustering
d. Stereotyping

Explanation: A stereotype is a belief that all members of a certain group act and think in the same fashion.

4. Formed visual hallucinations are seen in the lesion of: *(AIIMS BBS NO 2018)*

a. Occipital
b. Temporal
c. Parietal
d. Frontal

Explanation:

- Formed visual hallucinations are usually from lesion of temporal region. The content are vivid objects, flowers, animals and persons
- Unformed hallucinations are common with disorders of the occipital lobe. Patients may describe white or colored flashes of light, kaleidoscopic colors, moving discs, flickering, or a hexagonal array (honeycomb pattern).

5. Services aimed at reducing the prevalence of psychiatric illness by shortening the course of the illness is called as: *(AIIMS Bhopal Grade-I 2018)*

a. Secondary prevention
b. Primary prevention
c. Tertiary prevention
d. Primordial prevention

Explanation: Disease prevention includes measures not only to prevent the occurrence of disease (primary level prevention-reduce risk, immunization) but also to arrest its progress (secondary level prevention- early diagnosis and prompt treatment) and reduce its consequences once established (tertiary level prevention-rehabilitations).

6. Presenting the patient with a 'hypothetical situation' helps in the assessment of: *(AIIMS Bhopal Grade-I 2018)*

a. Abstractability
b. Insight
c. Comprehension
d. Judgment

Explanation: Judgment involves ability to understand the facts and draw conclusions. Judgment can be evaluated by exploring the patient's involvement in hypothetical situations, relationships and vocational choices by the use of situational judgment test

7. Temporary loss of muscle tone and weakness precipitated by a variety of emotional states is called: *(AIIMS Raipur Grade II 2017)*

a. Cataplexy
b. Catharsis
c. Compulsion
d. Confabulation

Explanation: Cataplexy is a sudden and transient episode of muscle weakness accompanied by full conscious awareness which is precipitated or triggered by emotions as laughing, crying etc. Catharsis is the process of releasing strong emotions through a particular activity or experience. Compulsive behavior is a psychological condition in which a person does behavior compulsively having an overwhelming feeling that they must do so. Confabulation is a symptom of various memory disorders in which made up stories fill in any gaps in memory.

Scanned with CamScanner

8. A state of diminished consciousness in which the patient remains mute and still with the eyes open is called as: *(AIIMS Raipur Grade II 2017)*

a. Catatonia
b. Stupor
c. Panic
d. Hysteria

Explanation: Catatonia is a state of psychomotor immobility and behavioral abnormality manifested by stupor. Panic is a sudden, strong feeling of anxiety or fear that prevents reasonable thought and actions and may spread to influence many people. Hysteria is exaggerated or uncontrollable emotion or excitement.

9. When a patient is not aware of his/her mental illness, it is called? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Disorientation
b. Lack of insight
c. Unconsciousness
d. Lack of concentration

Explanation:

- **Disorientation:** Cognitive disability in which person is not aware about time place and person
- **Lack of insight:** Also known as anosognosia in which person is not aware about his or her own mental illness.

10. Who is the first psychiatric nurse? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Hildegard Peplau
b. Linda Richards
c. Sigmund Freud
d. Jean Watson

Explanation: Linda Richards considered as first psychiatric nurse

11. What is total score in Mini Mental Status Examination (MMSE)? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. 25
b. 30
c. 32
d. 35

Explanation: Total score of mini mental status examination is 30 and is divide among the following categories such as orientation, registration, attention and calculation, recall and language

12. Which of the following is NOT a type of conflict? *(AIIMS Bhopal Nursing Officer, 2018)*

a. Intrapersonal
b. Manifest
c. Interpersonal
d. Intragroup

Explanation: Interpersonal, intrapersonal, intergroup and intra-group are the different type of conflicts

13. Among the following identify the overall priority goal of in-patient psychiatric treatment?

a. Prevention of violence
b. Monitor and minimize self-harm behavior
c. Stabilization and return to the community.
d. Encourage to come for regular follow up

Explanation: The goals of in-patient psychiatric treatment are to reduce stress on the patient and prepare the patient to lead a normal life in the community setting. It also focus upon to prevent the relapses and also enhance the patient adaptation and coping skill with new life situation in the community.

14. Which among the following activity need to be restricted in a client with Parkinson's disease?

a. Taking cold water bath
b. Walking on the yard on a cold winter day
c. Taking food item which is high in water content
d. Sitting on the beach in the sun on a summer day

Explanation: The patient with Parkinson's should be advised to avoid exposure to sun during summer. The patient may be oversensitive to heat and increases the risk of hyperthermia.

15. Abnormal drowsiness in the day time is known as .....

a. Narcolepsy
b. Somnolence
c. Somnambulism
d. Sleep ataxia

Explanation: One of the most prominent symptoms of narcolepsy is excessive daytime sleepiness. People with narcolepsy feel moderately or severely tired during the day.

16. The person is able to speak only in whisper

a. Aphonia
b. Mutism
c. Aphasia
d. Stuperness

Explanation: Aphonia is the inability to produce voiced sound.

17. Parkinson stuporous disease is caused by: *(DSSSB 2013)*

a. Death of brain cells due to old age
b. Hereditary factors
c. Impairment of dopamine producing cells in the brain
d. Demyelination of the nerve cells

Explanation: Parkinson's disease is primarily caused by low and falling dopamine levels. Parkinson's disease is caused by a loss of nerve cells in the part of the brain called the substantia nigra.

18. The parrot like repetition of words spoken by others is known as ..... *(RPSC Nursing Tutor 2009)*

a. Enmeshment
b. Echopraxia
c. Echolalia
d. Neologism

Explanation: Echolalia is a meaningless repetition of another person's spoken words i.e. patient keeps repeating the last few words of what he/she hears. Echopraxia is imitating the movement of others. Enmeshment is a psychological state that describes blurring of boundaries between individuals, especially family members. This occurs when a parent tries to get his/her needs met through the child. Neologism refers to the coining or use of new words which has no meaning.

19. In psychosomatic disorders, which of the following factors causes physical symptoms? *(Nursing Grade- II 2007)*

a. Genetic factors
b. Emotional factors
c. Social factors
d. Physical factors

Explanation: A psychosomatic disorder is a disease which involves both mind and body. Some physical symptoms are thought to be particularly prone to be made worse by emotional factors such as stress and anxiety.

20. The junction at which impulses are being transmitted from one neuron to another is *(Nursing Grade- II 2007)*

a. Schwan cell
b. Axon
c. Synapse
d. Dendron

Ans.

8.	b
9.	b
10.	b
11.	b
12.	b
13.	c
14.	d
15.	a
16.	a
17.	c
18.	c
19.	b
20.	c

Scanned with CamScanner

Explanation: Synapse is a junction between two nerve cells, consisting of a minute gap across which impulses pass by diffusion of a neurotransmitter.

21. Blocking of acetylcholine receptor by a psychotropic drug resulting in .....

a. Diarrhea
b. Dry mouth
c. Dementia
d. Vomiting

Explanation: Blocking of acetylcholine receptor will result in dry mouth, blurred vision, constipation, and urinary incontinence.

22. Emotion can be best expressed through

(Nursing Grade- II 2007)

a. Gesture
b. Language
c. Posture
d. All of the above

Explanation: Emotional expressions are observable through verbal and nonverbal behaviors. Language is verbal communication and gesture and posture are the non-verbal communication.

23. Creating imaginary events to fill up the memory gap is known as.....

a. Circumstantiality
b. Neologism
c. Confabulation
d. Compulsion

Explanation: Confabulation is the falsification of memory in which gaps in recall are filled by fabrications that the generating individual accepts as fact.

24. A psychiatric illness may be manifested by all of the following, EXCEPT:

a. Impairment in pre-existing functioning
b. Impoverishment of feelings
c. Disturbance in behavior
d. Unpopular beliefs

Explanation: Unpopular beliefs or opinion by an individual is not considered as psychiatric illness. Fixed false belief that is not changed by rational explanation is known as delusion.

25. While talking to a psychiatric client, nurse came to know that the client moves from one idea to other which are not related. This phenomenon is called as

a. Echopraxia
b. Echolalia
c. Circumstantiality
d. Loosening of association

Explanation: Loosening of association is a thought disorder characterized by discourse consisting of a sequence of unrelated or only remotely related ideas. The frame of reference often changes from one sentence to the next.

26. Rorschach's projective test designed to measure?

(VIHMANS 1996)

a. Unconscious intentions
b. Dreams
c. Conscious desires
d. Brain size

Explanation: Rorschach's Inkblot Test: The inkblot test (also called the "Rorschach's test") is a method of psychological evaluation. Psychologists use this test in an attempt to examine the personality characteristics and emotional functioning of their patients. This test is often employed in diagnosing underlying thought disorders and differentiating psychotic from nonpsychotic thinking in cases where the patient is reluctant to openly admit to psychotic thinking.

27. In a group therapy members express both positive and negative feeling in a non-threatening atmosphere is called as.....

a. Catharsis
b. Echopraxia
c. Cognition
d. Apraxia

Explanation: The given statement indicates catharsis, which is identified by Yalom.

28. Full form of MMSE is

a. Multi memory state status examination
b. Multiple mental strata evaluation
c. Mini mental status examination
d. Meta mental structural evaluation

Explanation: MMSE stands for Mini Mental Status Examination. It is otherwise called Folstein test. The maximum score is 30.

29. The patient may not talk at all. This term is known as

a. Mutism
b. Aphonia
c. Stupor
d. Thought block

Explanation: This condition is mutism, Aphonia is inability to talk.

30. Intense elation of mood with delusions of grandeur is known as

a. Euphoria
b. Elation
c. Exaltation
d. Euthymia

Explanation: Exaltation is a severe elevation of mod. There is intense elation with delusions of grandeur; seen in severe mood mania.

31. A term used to explain a disorder of thought in which thinking proceeds slowly with many unnecessary trivial details, but finally the point is reached is:

a. Flight of ideas
b. Prolixity
c. Tangentiality
d. Circumstantiality

Explanation: In circumstantiality client will talk too much details and finally come to the original topic.

32. Who coined the term schizophrenia?

a. Eugene Bleuler
b. William Tuke
c. Karl Menninger
d. John Weber

Explanation: The term schizophrenia is coined by Eugene Bleuler

33. Who is the father of modern psychiatry?

a. Benjamin Rush
b. Philippe Pinel
c. Emil Kraepelin
d. William Tuke

Explanation: Philippe Pinel is considered as the father of modern psychiatry and Benjamin Rush is considered as the father of American psychiatry

34. Verbal utterance that are often obscene is known as

a. Palilalia
b. Coprolalia
c. Echokinesis
d. Agoraphobia

Explanation: Use of involuntary vocalizations that are often obscene is termed as coprolalia.

- Palilalia is repeating one's own sound or words.
- Echokinesis means imitating someone else movement.
- Agoraphobia means fear of being alone in public place.

Ans.

21.	b
22.	d
23.	c
24.	d
25.	d
26.	a
27.	a
28.	c
29.	a
30.	c
31.	d
32.	a
33.	b
34.	b

Scanned with CamScanner

35. Touching one's body without consent is known as .....
a. Battery
b. Fraud
c. Breach of confidentiality
d. Harassment

Explanation: A battery is an intentional and wrongful physical contact with another person without that person's consent that includes some injury or offensive touching.

36. Behavior of pretending to be ill is:
a. Psychotic
b. Malingering
c. Out of contact with reality
d. Using conversion defenses

Explanation: Pretending to be ill without any physical cause is called as Malingering.

37. Clang association means.....
a. Impaired verbal communication
b. Risk for violence
c. Ineffective health maintenance
d. Disturbed sensory perception

Explanation: In psychiatry, clanging refers to a mode of speech characterized by association of words based upon sound rather than concepts. It usually includes compulsive rhyming. As speech is verbal form, it is under impaired verbal communication.

38. All of the following are the characteristic of perception EXCEPT: *(IGNOU PBBSC 2016)*
a. Perception is an active process.
b. Perception is highly selective.
c. Perception is unaffected by motivation.
d. Perception is automatic that we are not aware of it.

Explanation:
- Perception is influenced by motivation or drive of the individual. So the statement that perception is unaffected by motivation is incorrect statement. So the answer C is correct.
- All other statements are characteristics of perception.

39. Temporary discharge of the patient from the psychiatric hospital is referred as: *(DSSSB PHN, 2015)*
a. Parole
b. Abscond
c. Termination
d. Escape

40. Who is the first psychiatric nurse?
a. Hildegard Peplau
b. Linda Richards
c. Sigmund Freud
d. Jean Watson

41. Which of the following is one of the general principles of mental health nursing?
a. Judgment of patient symptoms
b. Use self understanding as a therapeutic tool
c. Repeated talking
d. Focus on symptoms of patients

42. With regard to diagnosis of mental disorders, the term DSM stands for
a. Disease System Manual
b. Diagnostic System Manual
c. Diagnostic and Statistical Manual
d. Diagnostic System for Mental disorders

43. DSM classification of mental disorders is published by
a. World Health Organization
b. American Psychiatric Association
c. International Psychiatric Association
d. American Psychological Association

44. Which of the following statement about mental illness is true?
a. Marriage can cure mental illness
b. Metal illness is connected to committing sin in the past
c. Mental illness is curable
d. Mentally ill patients are dangerous for the society

45. With regard to diagnosis of Mental disorders, the term ICD stands for
a. International Classification of Diseases
b. Indian Classification of Diseases
c. International Criteria for Diagnoses
d. Indian Criteria for Diagnoses

46. The ICD classification of diseases is published by
a. American Psychiatric Association (APA)
b. Indian Society of Psychiatric Nurses (ISPN)
c. International Psychiatric Association
d. World Health Organization

47. Part of the brain that is responsible for emotional aspects of behavior is:
a. Cerebellum
b. Limbic system
c. Gyri and Sulcus
d. Cerebrum

48. The part of the brain that regulates cognitive function is.
a. Cerebrum
b. Cerebellum
c. Limbic system
d. Pons

49. Which of the following is a characteristics of an adolescent with bulimia nervosa?
a. A positive body image
b. A positive self-concept
c. Excessive stained teeth
d. Previous history of gastritis

50. Number of sleep stages are _____
a. 2
b. 4
c. 5
d. 6

51. In community mental health nursing, primary prevention refers to
a. Identification and specific protection of vulnerable population
b. Early diagnosis and prompt treatment
c. Reduce the severity associated with mental disorders
d. Rehabilitation of mentally ill patients

52. Relative of Mrs. X brought her to psychiatry hospital with an application made out to the magistrate and got her admitted in the hospital. The nurse knows that this type of admission is:
a. Admission on voluntary basis
b. Admission on involuntary basis
c. Admission under special circumstances
d. Admission under reception order

53. All of the following are features of Parkinsonism EXCEPT *(JIPMER 2011)*
a. Rest-tremors
b. Mask like face
c. Rigidity
d. Preserved postural reflexes

54. Confabulation is a disorder of
a. Perception
b. Thought
c. Memory
d. Mood

55. **Unfamiliarity of familiar things is seen in**
    a. Déjà Vu b. Jamais Vu
    c. Deja Entend d. Deja pence
56. **Narcolepsy is due to abnormality in**
    a. Hypothalamus
    b. Neocortex
    c. Cerebellum
    d. Medulla oblongata
57. **Preservation is:**
    a. Persistent and inappropriate repetition of the same thoughts
    b. When a patient feels very distressed about it
    c. Characteristic of schizophrenia
    d. Characteristic of obsessive compulsive disorder (OSD)
58. **Emotion is controlled by:**
    a. Limbic system
    b. Hypothalamus
    c. Cerebrum
    d. Reticuloendothelial system
59. **Term 'Psychiatry' was coined by:**
    a. Skinner b. Sigmund Freud
    c. Christian Reil d. Eugene Blueur
60. **Nobel Prize for experiments on Split brain was given to**
    a. M. Morgia b. Penfield
    c. M. Gazzaniga d. Roger Sperry
61. **Co-occurrence of how many psychiatric disorders in a single patient can be termed comorbidity?**
    a. 2 b. ≥2
    c. ≥3 d. 3
62. **When a clients's behavior is considered abnormal the nurse first need to**
    a. Ignore the client's behavior
    b. Point out the client's disturbed behavior
    c. Focus on the emotions
    d. Focus on the positive behavior
63. **If the activities done by the people are repeated by a patient, it is called as:** *(Kerala PSC, Nov 2014)*
    a. Echolalia b. Hyperactivity
    c. Compulsion d. Echopraxia
64. **A false memory that the patient believes to be true is:** *(Staff Nurse G II 2014)*
    a. Confabulation b. Fugue
    c. Cataplexy d. Anergia
65. **A condition in which person maintaining the body posture into which it is placed is:** *(Staff Nurse G II 2014)*
    a. Anergia b. Echopraxia
    c. Cataplexy d. Catalepsy

Explanation: Catatonia is a motor inactivity manifested by waxy flexibility or catalepsy, mutism, and increased muscle tone. Catalepsy is a condition characterized by a trance or sudden loss of sensation and consciousness along with rigidity of the body. Cataplexy is sudden loss of muscle tone leading to fall precipitated by laughter or excessive emotions.

66. **Abnormal involuntary movement which occurs suddenly, repetitively and purposeless is:** *(Staff Nurse G II 2014)*
    a. Mannerism
    b. Compulsion
    c. Cataplexy
    d. Tic
67. **Making up stories to fill in the gaps of memory is:** *(JIPMER 2012)*
    a. Reaction formation b. Sublimation
    c. Confabulation d. Lying
68. **Type of speech in which one repeats what others have just said is:** *(JIPMER 2012)*
    a. Neologism b. Echopraxia
    c. Echolalia d. Association
69. **Excessive sleep is termed as:** *(LNJP H D 2012)*
    a. Insomnia b. Asomnia
    c. Somnambulism d. Hypersomnia
70. **Persistent mechanical repetition of speech or movement is known as**
    a. Echolalia b. Stereotype
    c. Tangentiality d. Circumstantiality

Explanation:

- Stereotype of stereotyped behavior is characterized by repetition of speech or movement.
- **Echolalia is meaningless repetition of another person's words. Echopraxia refers to involuntary repetition or imitation of another person's actions.**

71. **Pathological repetition by imitation of the words of another person is referred as**
    a. Circumstantiality
    b. Echopraxia
    c. Echolalia
    d. Clang Association
72. **Which is not a therapeutic communication technique?**
    a. Informing
    b. Reflection
    c. Humour
    d. **Automatic response**
73. **A state of indifference, or the suppression of emotions such as concern, excitement, motivation, and passion is known as**
    a. Apathy b. Ambivalence
    c. Catatonia d. Mutism
74. **Having the strong sensation that an event or experience currently being experienced has already been experienced in the past is known as**
    a. Déjà Vu b. Jamais vu
    c. Selective amnesia d. Dissociative amnesia
75. **Feeling or experience that a person knows or recognizes a situation, but that it still seems very unfamiliar or unknown is referred as**
    a. Déjà vu b. Jamais Vu
    c. Selective amnesia d. Dissociative amnesia
76. **The condition in which the person is able to speak only in whisper is known as**
    a. Aphonia b. Mutism
    c. Aphasia d. Stuporness
77. **An inability to speak, due to a physical defect, conscious refusal, or psychogenic inhibition is known as**
    a. Aphonia b. Mutism
    c. Aphasia d. Stuper
78. **The process of rapidly releasing negative emotions is known as:**
    a. Reminiscence therapy b. Hypnosis
    c. Biofeedback d. Catharsis

79. Fixed false belief of a person which cannot be changed by logical reasoning is known as:
a. Illusion b. Hallucination
c. Delusion d. Thought fixation

80. Name the author who founded psychoanalysis:
a. Sigmund Freud
b. Carl Jung
c. Jean Piaget
d. Wilhelm Wundt

81. A person who is aloof, isolated and does not socialized, is considered to be
a. Withdrawn b. Ambiguous
c. Apathy d. Negativism

82. Sleep walking is otherwise called
a. Somnambulism b. Somnokinesis
c. Insomnia d. Enuresis

83. Flattening of emotions is otherwise known as:
a. Loose association b. Ambiguity
c. Blunted affect d. Suppression

84. A person who laughs one minute and cries the next without any clear stimulus is said to have:
a. Incongruent affect b. Euphoria
c. Labile affect d. Split personality

85. Loosening of association is an example of:
a. Formal thought disorder b. Schneider's first symptoms
c. Preservation d. Concrete thinking

86. Kleptomania means *(JIPMER 1999)*
a. Irresistible desire to set fire
b. Irresistible desire to steal things
c. Compulsive hair pulling
d. Pathological gambling

87. Which of the following assessment method is used to assess cognitive impairment?
a. Mini mental status examination
b. Ishihara polychromatic plates
c. Ink blot test
d. Projective technique

88. Which of the following tools does a nurse use to assess the cognitive function of a client?
a. Ishihara polychromatic plates
b. Rorschach Ink blot test
c. Mini-mental Status Examination
d. Goldberg Depression Scale

89. Which of the following component is NOT a part of mental status examination (MSE)
a. Insight b. Judgment
c. Mood and affect d. Language

90. Total score in Mini Mental Status Examination (MMSE) is *(JIPMER 2012)*
a. 25 b. 30
c. 32 d. 35

91. Mini mental status is *(JIPMER 2002, 2007)*
a. Method to investigate common psychiatric problem
b. 30-point programme to evaluate cognitive function
c. To evaluate schizophrenia
d. Instrument to measure delirium

92. What cut-off score of Mini-Mental State Examination (MMSE) is used to detect dementia?
a. Less than 20
b. Less than 24
c. Less than 27
d. Less than 29

93. X-linked disease leading to mental retardation is
a. Myotonic dystrophy b. Fragile-X syndrome
c. Tuberous sclerosis d. Phenylketonuria

94. Abnormal sensitivity to light is known as: *(JIPMER 2012)*
a. Aphasia b. Photophobia
c. Hydrophobia d. Diplopia

95. All are true about Ganser syndrome except: *(JIPMER 1999, 2000, 2000)*
a. Approximate answer
b. Apparent clouding of consciousness
c. Only found in prisoners
d. Hallucinations

96. Parkinson's disease is characterized by all of the following clinical features except
a. Hyperactivity b. Tremor
c. Bradykinesia d. Rigidity

97. All among the following are the role of community psychiatric nurse EXCEPT
a. Counsellor b. Client Advocate
c. Prescribe drugs d. Crisis worker

THEORIES AND LEGAL ASPECTS

98. In Erickson's theory, adolescent develops a sense of_____ *(ESIC 2019)*
a. Initiative b. Intellect
c. Identity d. Industry

Explanation: In Erickson's theory, adolescent develop a sense of identity, preschooler child develops sense of initiative, and school age child develops sense of industry. Intellect is a distractor that is not associated with Erickson's stages of development. [*Refer to Erickson's stage of personality development in Synopsis (Page no. 562)*]

99. Freud's model of development which comprised 'id, ego and superego' is called
a. Genetic model b. Unconscious model
c. Constructive model d. Structural model

Explanation: Structural model: Freud developed the psychoanalytic theory of personality development, which argued that personality is formed through conflicts among three fundamental structures of the human mind: the id, ego, and superego.

100. According to Kubler-Ross theory of grief, which among the following behavior is observed in stage II? *(AIIMS Bhopal Grade-I 2018)*
a. Depression b. Anger
c. Bargaining d. Denial

Explanation: The 5 stages of grief according to Kubler-Ross are as follows
1. **Denial: E.g.** "This can't be happening to me"
2. **Anger: E.g.** "Why is this happening to me?" "Who is to blame for this?"
3. **Bargaining:** Stage of false hope. E.g. "Make the loss less significant"
4. **Depression:** E.g. "I am too sad to do anything"
5. **Acceptance:** E.g. "I am able to exist and adjust what happened to me"

Scanned with CamScanner

Explanation: Transference is psychological phenomenon in which an individual redirects emotions and feelings, often unconsciously, from one person to another. Free association refers to process of discovering thoughts, memories and feelings by freely sharing all the seemingly random thoughts that pass through the mind. Exploration refers to action of exploring an unfamiliar area though examination of a subject.

102. Which of the following behavior by a 35-year-old male client indicates cognitive development?

a. Acquire object permanence
b. Generates new levels of awareness
c. Intelligence is demonstrated through logical and systematic manipulation
d. Egocentric thought diminishes

Explanation: An adult of age 31 to 45 years generates new level of awareness. As per Piaget's theory of cognitive development object permanence developed during infancy. Intelligence is demonstrated through logical and systematic manipulation and egocentric thought diminishes are seen among elementary and early adolescence period.

103. How many quadrants are there in the Johari window?

a. 2 b. 6
c. 4 d. 8

Explanation: The Johari Window model is a simple and useful tool for illustrating and improving self-awareness, and mutual understanding between individuals within a group. The Johari Window model can also be used to assess and improve a group's relationship with other groups.

104. The part of mind that distinguishes right from wrong and acts as censor of behavior is known as *(RPSC Nursing Tutor 2009)*

a. Id b. Ego
c. Superego d. Libido

Explanation: The id, ego, and superego are names for the three parts of the human personality which are part of Sigmund Freud's psychoanalytic personality theory. The superego is the ethical component of the personality and provides the moral standards by which the ego operates. The superego develops last, and is based on morals and judgments about right and wrong.

105. Identity v/s role confusion is the task of which stage of development according to Erik Erikson?

a. Toddler b. Preschool
c. Adolescent d. Adult

Explanation:

Age	Psychosocial Crisis
Infancy (0 - 2 years)	Trust Vs Mistrust
Early childhood (2 - 4 years)	Autonomy Vs Shame doubt
Preschool (4 - 5 years)	Initiative Vs Guilt
School age (5 - 12 years)	Industry Vs Inferiority
Adolescence (13 -19 years)	Identity Vs role confusion
Early adulthood (20 - 39 years)	Intimacy Vs Isolation
Adulthood (40 - 64 years)	Generativity Vs Stagnation
Maturity (65 - Death)	Ego integrity Vs despair

106. As per Freudian theory, a Male child's unconscious sexual desire for the parent of the opposite sex and wish to exclude the parent of the same sex is known as

a. Oedipus complex
b. Electra complex
c. Phallic complex
d. Latency complex

Explanation: As per Freud, the development of Oedipus complex (male) and Electra complex (female) and occurs during the phallic (3-6 years) stage of development. Freud described this as the child's unconscious desire to eliminate the parent of the same sex and to possess the parent of the opposite sex.

107. As per psychoanalytic theory the ability to tolerate frustration is seen in

a. Id b. Ego
c. Superego d. Unconscious

Explanation: Mediating frustration within the real world is an ego function.

108. You need to abide by the unit rules and attend the community meeting. This statement by the nurse is indicative of ---------- theory

a. Crisis theory
b. Milieu theory
c. Family system theory
d. Biological theory

Explanation: Milieu theory insists community participation by abiding unit rules. Crisis communication theory is designed to protect and defend an individual facing a challenge to his reputation/ existence.

109. Topographical model of mind by Freud is .....

a. Id - ego - superego
b. Conscious - preconscious - unconscious
c. Regression - repression - suppression
d. Denial - rationalization - projection

Explanation: Freud topographical model represents his configuration of the mind. According to Freud, there are three levels of consciousness:

- **Conscious (small):** This is the part of the mind that holds what the person is aware of.
- **Preconscious (small-medium):** This is ordinary memory. So although things stored here are not in the conscious, they can be readily brought into conscious.
- **Unconscious (enormous):** Freud felt that this part of the mind was not directly accessible to awareness. In part, he saw it as a dump box for urges, feelings and ideas that are tied to anxiety, conflict and pain.

110. National mental health programme was launched in the year of

a. 1982 b. 1981
c. 1980 d. 1979

Explanation: The Government of India launched the National Mental Health Programme (NMHP) in 1982, keeping in view the heavy burden of mental illness in the community, and the absolute inadequacy of mental health care infrastructure in the country to deal with it.

111. Father of Intelligence test is: *(DSSSB PHN, 2015)*
a. Alfred Binet
b. Erick Erickson
c. Alfred Adler
d. Carl Jung

Explanation:

- **Alfred Binet (early 1900s)** is known as the man who created the first ‹intelligence test› in the form as we know them today. He is commonly known as the father of IQ testing.

Theorists	Theory
Alfred Binet	Father of intelligence test
Erikson's	Psychosocial development
Alfred Adler	School of individual psychology.
Carl Jung	Theory of the Collective Unconscious, Meyers-Briggs personality tests

112. Psychoanalytic therapy was developed by: *(RRB SSNE 2015)*
a. Sigmund Freud b. Jacobson
c. Franklin d. Aristotle

113. Another term for superego is: *(JIPMER 2012)*
a. Self b. Ideal self
c. Conscience d. Sub conscious

114. An attempt to integrate values learned from parents and society is referred as
a. The id b. Superego
c. Sublimation d. Projection

115. Mental Healthcare Act 2017 bill received president assent on
a. April 7, 2017 b. April 15, 2017
c. July 7, 2017 d. July 15, 2017

116. According to Erikson's stages of psychosocial development, Which of the following developmental task is associated with Infancy?
a. Trust vs Mistrust
b. Autonomy vs Shame
c. Initiative vs Guilt
d. Intimacy vs Isolation

117. According to Erikson's stages of psychosocial development, Which of the following developmental task is associated with adolescence?
a. Trust vs Mistrust
b. Identity vs Role confusion
c. Industry vs Inferiority
d. Intimacy vs Isolation

118. Interpersonal theory of nursing was proposed by
a. Betty Neuman b. Dorothy Orem
c. Hildegard Peplau d. Jean Watson

119. The Indian Lunacy Act was passed in the year
a. 1898 b. 1912
c. 1982 d. 1987

120. The Indian Mental Health Act was passed in the year
a. 1912 b. 1947
c. 1982 d. 1987

121. A 5-year-old girl is struggling with whether to take chocolates cookies out of the jar without her mother's permission. Which of Freud's personality structures is activated in this scenario?
a. Suppression b. Id
c. Ego d. Superego

122. According to Mental Health Act 1987, leave of absence refers to
a. Mentally ill patient is forcefully removed from the hospital
b. Mentally ill patient is denied entry into the hospital
c. Mentally ill patient is given time limited leave
d. Mentally ill patient is leaving the hospital without permission

123. Which of the following is not a feature of Mental Healthcare Act 2017
a. Every person except minor has right to take advance directive in writing
b. It does not allow the patient to appoint a representative to take decision on behalf of patient
c. This act abolished the ECT for children and made provisions for Modified ECT
d. Decriminalization of suicide

124. According to Mental Health Act 1987, admission under special circumstances refers to
a. Application for admission is made by the patient voluntarily
b. Application for admission is made by relatives or friends of the patient
c. Application for admission is made by a relative or friends of the patient through a magistrate
d. Application for admission is made by Police through a Magistrate

125. The contributions of Sigmund Freud are all except *(JIPMER 1996)*
a. Effects of cocaine
b. Interpretation of dream
c. Psychosexual stages of development
d. Superiority inferiority complex

126. The term 'id' was coined by
a. Freud b. Skinner
c. Wayker d. Bleuler

127. Cognitive model of depression was given by:
a. Beck b. Skinner
c. Cerletti d. Freud

128. Pavlov's experiment is an example of:
a. Operant conditioning
b. Classical conditioning
c. Learned helplessness
d. Modeling

129. Which of the following model suggests that psychological disorders result from acquiring dysfunctional ways of thinking and acting?
a. Social model b. Somatic model
c. Behavioral mode d. Cognitive model

a. ID b. Ego
c. Super ego d. Ego-ideal

135. Fixation of Hysteria is:
a. Genital b. Anal
c. Oral d. Phallic

136. Oedipus complex (given by Sigmund Freud) is seen in *(JIPMER 1998, 2004)*
a. Boys of 1-3 years of age
b. Girls of 1-3 years of age
c. Boys of 3-5 years of age
d. Girls of 3-5 years of age

137. In psychoanalytic terms, obsessive compulsive disorder is fixed at:
a. Oedipal stage b. Genital stage
c. Oral stage d. Anal stage

138. Which of the following is an example of classical conditioning?
a. Dog learns to salivate on hearing bell
b. Rat presses lever to get food delivered
c. Crow pecks at key for food delivery
d. All of the above

139. Which of the following is an example of operant conditioning?
a. Dog learns to salivate on hearing bell.
b. Rat presses lever to get food delivered.
c. Crow pecks at key for food delivery.
d. All of the above

140. The theory of operant conditioning was experimented by:
a. William James b. Ivan Pavlov
c. Harry Stock Sullivan d. B F Skinner

141. Which of the following therapy is based on learning theory
a. Cognitive therapy b. Psychoanalysis
c. Behavior therapy d. Milieu therapy

142. Person included in disability act 1999
a. Mental retardation
b. Phobia disorder
c. Alcohol dependence
d. Personality disorder

143. Rorschach inkblot test is: *(Rohtak PGMEE 2003)*
a. Projective b. Subjective
c. Both d. None

144. 'Reinforcement' is used in:
a. Psychoanalysis
b. Hypno-analysis
c. Abreaction
d. Conditioned learning

145. According to Freud, Child adopts parental standards, traits and habits through
a. Regression b. Imitation
c. Introjection d. Identification

CRISIS AND DEFENSE MECHANISM

Explanation: Isolation is a defense against harmful thoughts. Isolation prevents the self from allowing these cognitions of harmful thoughts or memory to become recurrent and possibly damaging to the self-concept.

147. Which of the following is an example of sublimation? *(AIIMS BPL NO 2018)*
a. Blaming the teacher for failing in exams
b. A woman has no memory of being sexually assaulted as a child
c. Child starts bedwetting after the birth of sibling
d. A young man who is dealing with aggression by playing football

Explanation: Rechanneling of drives or impulses (**aggression**) that are personally or socially unacceptable into activities that are constructive (**playing football**) is known as sublimation.

148. The ability of a person to readily recover from stressful situations is called: *(AIIMS BPL NO 2018)*
a. Mental freedom
b. Androgyny
c. Hardiness
d. Resilience

Explanation: Psychological resilience is the ability to successfully cope with a crisis and to return to pre-crisis status quickly. Resilience exists when the person uses "mental processes and behaviors in promoting personal assets and protecting self from the potential negative effects of stressors".

149. Adaptive mechanism of giving excuses when a person cannot solve a problem: *(AIIMS Nagpur NO 2018)*
a. Projection
b. Substitution
c. Rationalization
d. Compensation

Explanation: Rationalization is a process in which an individual justifies his failure and socially unacceptable behavior by giving socially approved reasons. **Example:** A student who fails in the examination may complain that the hostel atmosphere is not favorable and resulted in his failure.

150. The crisis that is precipitated by an unanticipated stressful event that creates disequilibrium by threatening one's sense of biological, social or psychological integrity is called *(AIIMS Bhopal Grade-I 2018)*
a. Situational crisis b. Adventitious crisis
c. Maturational crisis d. Social crisis

Explanation: Situational crisis is term given to a person whose coping mechanisms are affected due to their circumstances (situations). Circumstances include loss of a job, financial situation, death of loved one, divorces, abortion or physical illness. It differs from adventitious crisis (unplanned or accidental) which includes rape, flood, fire, earthquake, terrorist attack, murder, child abuse etc. Maturational crisis includes puberty, marriage etc.

151. In which defense mechanism anxiety is expressed through physical symptoms? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Projection b. Regression
c. Conversion d. Hypochondriasis

Scanned with CamScanner

Explanation:

- Conversion as a defense mechanism occurs where cognitive tensions manifest themselves in physical symptoms. The symptom may well be symbolic and dramatic and it often acts as a communication about the situation. Extreme symptoms may include paralysis, blindness, deafness, becoming mute or having a seizure.
- Regression is an ego defense mechanism in which person goes back to the earlier stage of development. Hypochondriasis means person believe that he/she may having serious but undiagnosed medical condition. Projection is blaming someone else for one's own difficulty.

152. Which of the following describes "ego defense mechanism"? *(DSSSB)*

a. A mechanism designed to reduce stress and conflict caused by specific experiences.
b. A mechanism designed to remove psychological barriers
c. Any form of martial arts
d. A method for negotiating a stage of development. .

Explanation: Defense mechanisms operate at an unconscious level and help ward off unpleasant feelings (i.e. anxiety) or make good things feel better for the individual.

153. Rechanneling of socially unacceptable drives into activities that are more tolerable and constructive is known as .....

a. Displacement
b. Sublimation
c. Intellectualization
d. Projection

Explanation: It is the definition of sublimation. Displacement means transfer of feeling from one target to another. Intellectualization means avoidances of expression of actual emotion associated with stressful situation. Projection is attributing feelings or impulses unacceptable to one's self to another person.

154. Which of the following client behavior indicate displacement?

a. Ignoring unpleasant aspects of reality
b. Resisting any demand made by others
c. Using imaginary activity to escape reality
d. Directing pent-up emotions to other than the primary source.

Explanation: Acting out angry or express feeling on a weaker or safer object or a indicates displacement.

155. A client stated that "people get angry and take it out on me". This sentence indicates which of the following defense mechanism

a. Denial
b. Projection
c. Displacement
d. Intellectualization

Explanation: Attributing unacceptable feeling to others is the mechanism known as projection.

156. Imposing one's own weaknesses to others is a defense mechanism, known as-

a. Projection
b. Intellectualization
c. Suppression
d. Displacement

Explanation: Projection is a defense mechanism that involves taking our own unacceptable qualities or feelings and imposing them to other people.

157. Finding a logical reason for the things that one wants to do 'sour grapes' mechanism is:

a. Projection
b. Rationalization
c. Identification
d. Sublimation

Explanation: In psychology, rationalization (also known as making excuses) is a defense mechanism in which controversial behaviors or feelings are justified and explained in a seemingly rational or logical manner to avoid the true explanation, and are made consciously tolerable – or even admirable and superior – by plausible means. It is also an informal fallacy of reasoning.

158. The act of purging or purification or elimination of complex emotions by bringing it to consciousness and affording to expression is:

a. Abreaction therapy
b. Hypnosis
c. Catharsis
d. Biofeedback

Explanation: Catharsis (from the Greek katharsis meaning "purification" or "cleansing") is the purification and purgation of emotions—especially pity and fear—through art or any extreme change in emotion that results in renewal and restoration.

159. The involuntary blocking of unpleasant feeling and experiences from one's awareness is known as ..... *(RPSC Nursing Tutor 2009)*

a. Displacement
b. Repression
c. Regression
d. Suppression

Explanation: Repression involves placing uncomfortable thoughts in relatively inaccessible areas of the subconscious mind.

160. An attempt to avoid expressing actual emotions associated with a stressful situation by using the intellectual process of logic, reasoning and analysis is ..... *(AIIMS)*

a. Suppression
b. Regression
c. Intellectualization
d. Displacement

Explanation: Intellectualization is a defense mechanism where reasoning is used to block confrontation with an unconscious conflict and is associated with emotional stress where thinking is used to avoid feeling. The given situation refers to an intellectualization.

161. Most commonly using defensive mechanism by a physically abusive individual is

a. Transference
b. Manipulation
c. Displacement
d. Reaction formation

Explanation: In displacement one's pent up feelings are discharged from threatening person to less threatening individuals.

162. Following the death of spouse the person is experiencing Crisis. This type of crisis is known as.....

a. Dispositional crisis
b. Crisis resulting from traumatic life experiences
c. Developmental crisis
d. Crisis reflecting psychopathology

Explanation: Crisis precipitated by unexpected external stress over which the individual has little or no control and as a result of which he/she feels emotionally overwhelmed and defeated.

Ans.

152. a
153. b
154. d
155. b
156. a
157. b
158. c
159. b
160. c
161. c
162. b

Scanned with CamScanner

163. Identify the characteristic of crisis among the following
a. Crisis occur in all individual and is not equated with psychopathology
b. Crisis is precipitated by specific identifiable event
c. Crisis is personal in nature and can vary from one person to another
d. All of the above

Explanation: A crisis is any event that is going to lead to an unstable and dangerous situation affecting an individual.

The following are the characteristics of crisis
- The event is unexpected
- It creates uncertainty
- Crisis is seen as a threat to important goals
- Crisis is precipitated by specific events
- Crisis is personal in nature and can vary from person to person
- Crisis occur in all individual and is not equated with psychopathology.

164. "Doctor shopping" is the characteristic of hypochondriac disease, which defense mechanism is the root of this behavior?
a. Denial
b. Compensation
c. Displacement
d. Identification

Explanation: Patient with hypochondriasis believe that their physical symptoms are having some underlying pathology, but whenever the doctor says everything is normal and there is no underlying pathology, and the cause may be psychological they deny the words of doctor and go to another doctor.

165. The crisis experienced by middle aged adult during midlife is most commonly due to
a. Many role changes experienced by the person
b. Individual's perception about his or her own life
c. Anticipation of negative changes associated with old age
d. Lack of support from family

Explanation: Most significant factor in avoiding or precipitating crisis is how individual perceive them.

166. The main goal in planning care for a client in crisis is
a. Schedule follow up counselling for the client
b. Restore the client's psychological equilibrium
c. Have the client gain insight into the problems
d. Refer the client for occupational and physiotherapy

Explanation: Crisis intervention always focused on restoring the psychologic equilibrium.

167. During crisis intervention nurse should adopt
a. Passive and reflective approach
b. Active and goal directed
c. Future oriented and passive
d. Interpretive and analytical

Explanation: Nurse should be active and goal directed in crisis intervention. Other approaches are not appropriate for crisis management.

168. The defense mechanism which return to the earlier developmental stage is
a. Regression
b. Repression
c. Projection
d. Rationalization

Explanation: Going back to the earlier stages of development is the characteristic of regression. Involuntary blocking of unpleasant feelings is repression. Projection means attributing to another person feeling or impulses.

169. A defense mechanism that allows to convert our unacceptable behavior into acceptable form is: *(JIPMER 2015)*
a. Introjection
b. Sublimation
c. Projection
d. Displacement

170. An unconscious exclusion (forgetting) of distressing memories, thoughts, or feelings from the conscious mind is known as
a. Repression b. Fantasy
c. Displacement d. Identification

171. A conscious exclusion (forgetting) of distressing memories, thoughts, or feelings is known as
a. Repression b. Suppression
c. Displacement d. Identification

172. A surgeon, whose patient did not respond as he anticipated, blamed the theatre nurse who helped him at the time of surgery. Which of the following defense mechanism was used by the surgeon?
a. Intellectualization b. Rationalization
c. Suppression d. Projection

173. Mr Prakash says, "I don't cry because my wife can't bear it". This is an example of
a. Suppression b. Undoing
c. Rationalization d. Reaction formation

174. Defense against feelings of inferiority and inadequacy is known as
a. Repression b. Sublimation
c. Regression d. Compensation

175. The defense mechanism in which the controversial behaviors or feelings are justified and explained in a seemingly rational or logical manner is known as
a. Intellectualization b. Rationalization
c. Identification d. Regression

176. Individuals attributing their own thoughts, feeling and motives to another person is known as:
a. Rationalization b. Projection
c. Reaction formation d. Displacement

177. Patient who is newly diagnosed with cancer frequently use the defense mechanism of
a. Displacement b. Reaction formation
c. Denial d. Projection

178. A mechanism designed to reduce stress and conflict caused by specific experiences is known as:
a. Immune mechanism
b. Defense mechanism
c. Catharsis mechanism
d. Coping mechanism

Ans.

Scanned with CamScanner

179. Repression refers to:
a. Conscious exclusion of bad memories that cause anxiety from mind
b. Unconscious exclusion of bad memories that cause anxiety from mind
c. Diversion of energy into positive and socially acceptable activities
d. Stopping bad thoughts from memory

180. Which of the following information is the most important assessment data for the nurse to collect from a patient in crisis?
a. Socio-economical background
b. Strength and weaknesses
c. Food habits
d. Occupational history

181. A client with substance use disorder joins a self-help group and preaches against substance abuse. He is likely demonstrating the use of:
a. Displacement
b. Suppression
c. Reaction formation
d. Projection

182. An example of maturational crisis is:
a. Retirement b. Earthquake
c. Road traffic accident d. Financial loss

183. Rape is an example of:
a. Adventitious crisis b. Social crisis
c. Maturational crisis d. Cultural crisis

184. The primary goal of crisis intervention is to:
a. Help the patient return to pre-crisis level of functioning
b. Identify predisposing factors
c. Help the patient to ventilate his/her feelings
d. Support the family members to cope with the crisis

185. Most common psychiatric emergency: *(JIPMER 2005)*
a. Rape b. Violence
c. Panic attack d. Suicide

186. Psychiatric emergencies include all except: *(JIPMER 2014)*
a. Suicide b. Panic disorder
c. Drug use disorder d. Insomnia

187. A dishonest person thinks other persons are also dishonest. Defense mechanism used by him is:
a. Projection b. Introjection
c. Suppression d. Rationalisation

188. Which of the following defense mechanism is often used by drug dependents to forget shame and pain?
a. Sublimation b. Compensation
c. Repression d. Displacement

THERAPEUTIC COMMUNICATION

189. Responses to avoid in therapeutic communications are as follows, EXCEPT: *(ESIC 2019)*
a. Advice giving
b. Closed-ended questions.
c. Reflecting and clarifying
d. Arguing and judgmental responses

Explanation: Reflecting and clarifying are therapeutic communication techniques. Advise giving, closed-ended questions and arguing and judgmental responses are antitherapeutic communication techniques, so it should be avoided.
NOTE: There are double negatives in the stem. "Avoid" and "EXCEPT". So carefully read the question twice before answering.

190. An example of non-therapeutic communication techniques:
a. Validating b. Reflecting
c. Belittling d. Listening

Explanation: Belittling means putting down or making another person feel as less important than you.

191. The most important factor in a therapeutic relationship is-
a. Trust b. Knowledge
c. Professionalism d. Motivation

Explanation: Without trust in a relationship, there is no relationship. Trust is one of the most important aspects of a relationship.

192. Most difficult part of a nurse-client relationship in therapeutic relationship for the nurse is
a. Remain as therapeutic and professional
b. Being able to understand and accept client's behavior
c. Developing an awareness of self and professional role relationship
d. Accepting responsibility in identifying and evaluating the real need of the client

Explanation: Psychiatric nurse identify their own feeling and understand how they affect the situation.

193. Termination of interpersonal relationship starts in .....phase
a. Preinteraction b. Orientation
c. Working d. Termination

Explanation: Terminating phase starts during the orientation phase when the therapeutic nurse-patient relationship is established. The length of this therapeutic relationship in terms of termination should be discussed when the nurse and patient initially agree to work together.

194. In a mental health unit nurse is showing undue concern and kindness towards a patient, this can be identified as .....
a. Transference
b. Counter transference
c. Emotional attachment
d. Sympathy

Explanation: Countertransference, which occurs when a therapist transfers emotion to a person in therapy, is often a reaction to transference, a phenomenon in which the person in treatment redirects feelings for others onto the therapist.

195. While communicating to a client nurse ask, what time it is, place where they admitted and person with them, these questions help the nurse to assess .....
a. Memory
b. Orientation
c. Thought process
d. For good rapport

Explanation: Questions related to time, place and person will give information regarding the orientation of the patient.

196. The patient states "Give me five minutes to recall the name of the college lecturer who failed most of us in pediatric nursing exam". The patient is operating his:
a. Conscious self
b. Subconscious
c. Unconscious
d. Superego

Scanned with CamScanner

197. The recording of conversation between the nurse and patient in a psychiatric set up is termed as: *(JIPMER 2015)*
a. Therapeutic communication
b. Interview technique
c. Process recording
d. Case study

198. The best approach in helping a severely withdrawn patient is
a. Engage in group activities
b. Establish a specific routine
c. To provide a trusting relationship
d. Engage in ward activities

199. The process of encouraging or establishing a belief or pattern of behavior is known as:
a. Exploration
b. Reinforcement
c. Sensitization
d. Enforcement

200. Which of the following is NOT a therapeutic communication technique?
a. Belittling b. Restating
c. Reflecting d. Validating

201. Communication technique of confrontation is used during which phase of nurse-patient relationship?
a. Pre-orientation b. Orientation
c. Working d. Termination

202. Cultural barrier of communication is
a. Intelligence b. Sound
c. Fear d. Language

203. Which of the following is one of the barriers of therapeutic nurse-patient communication?
a. Reflection b. Restating
c. Giving advice d. Silence

204. One of the barrier in nurse-patient therapeutic relationship is
a. Reflection b. Transference
c. Listening d. Nodding

205. A prerequisite for a nurse to develop an effective communication with patient is
a. A good understanding the pathophysiology of mental disorders
b. To use transference and counter transference
c. To use self-awareness as a tool to understand the patient
d. To have good knowledge of various treatment modalities

206. Which of the following is an example of non-therapeutic communication techniques?
a. Non-judgmental attitude b. Silence
c. Reflection d. Informing

207. A nurse, during the course of treatment, develops positive or negative feelings toward the patient. This is termed as
a. Empathy b. Counter-transference
c. Sympathy d. Transference

208. The attitude of nurse who is taking care of a patient with mania should be
a. Active friendliness
b. Jovial
c. Passive friendliness and firm
d. Threatening

209. Repeating the main thoughts expressed by the patient is called as:
a. Restating b. Clarification
c. Reflection d. Validation

210. Which of the following type of questions are used during psychiatric history collection?
a. Forced choice questions
b. Objective type questions
c. Open ended questions
d. Closed ended questions

211. First step in counseling process is
a. Relationship building b. Goal setting
c. Problem assessment d. Interventions

212. A written documentation of verbal interaction between a client and nurse is known as?
a. Mental status examination
b. Process recording
c. Mini mental status examination
d. Anecdotal record

213. A client is very affectionate towards one of the staff in the ward. The client is manifesting
a. Empathy b. Resistance
c. **Transference** d. Counter transference

214. All of the following are the elements of therapeutic community, EXCEPT
a. Validation
b. Restricted communication
c. Structured interaction
d. Active participation

215. A form of psychotherapy that involves the use of therapeutic communities is known as
a. Group therapy
b. Cognitive behavior therapy
c. **Milieu therapy**
d. Interpersonal psychotherapy

216. A mental health nurse performs a process recording with a 30-year-old male patient with BPAD. Which of the following is NOT a component of a process recording?
a. Verbal narrative account
b. Nonverbal narrative account
c. Audio-visual recording
d. Audio and interpretation

ECT AND PSYCHOSOCIAL THERAPIES

217. Which of the following is NOT true regarding Brief Cognitive Therapy? *(AIIMS-BBS SNO 2019)*
a. It puts greater emphasis on the cause of the problem
b. It uses here-and now approach
c. It uses goal-oriented approach
d. It uses time-limited approach

Explanation: Brief Cognitive Therapy has gained widespread application in treatment of substance abuse. The aim is to help the client address specific, identifiable problems in such a way that the client is able to apply basic techniques and skills learned, without assistance of therapist. It focuses on **'here and now' approach** Instead of focusing on cause.

218. _____is a family therapy approach that focuses on both the biological and the psychosocial components of a problem. *(AIIMS-BBS SNO 2019)*
a. Integrative approach
b. Bowen approach
c. Psychoanalytic approach
d. Structural approach

218.	a

Scanned with CamScanner

Explanation: Integrative approach is a combined approach to psychotherapy that brings different elements of specific therapies. It also refers to the infusion of a person's personality and needs-integrating the affective, behavioral, cognitive, and physiological systems within one person, as well as addressing social and spiritual aspects.

219. Eradication of unwanted habits by associating unpleasant condition with it is called: *(AIIMS BPL NO 2018)*

a. Biofeedback
b. Desensitization
c. Aversive conditioning
d. Classical conditioning

Explanation: Aversion therapy is a form of behavior therapy in which an aversive (causing a strong feeling of dislike or disgust) stimulus is paired with an undesirable behavior in order to reduce or eliminate that behavior. The aim of aversion therapy is to decrease or eliminate unwanted behaviors.

220. A neuromuscular blocking agent is administered to a client before ECT therapy. The Nurse should carefully observe the client for: *(Safdarjung NO 2018)*

a. Respiratory difficulties
b. Nausea and vomiting
c. Dizziness
d. Seizures

Explanation: Neuromuscular blocking agents (NMBA) reduce muscular convulsions and decrease the risk of serious injury during ECT procedure. Succinylcholine (0.5 mg kg–1) is most commonly used NMBA in ECT. NMBA induces reversible muscle paralysis that leads to respiratory difficulties. So, the nurse should carefully observe the client for respiratory difficulties.

221. Which of the following therapy is based on learning theory?

a. Logo therapy
b. Psychoanalysis
c. Behavior therapy
d. Interpersonal therapy

Explanation: Behavior therapy is a broad term referring to psychotherapy, behavior analytical, or a combination of the two therapies. In its broadest sense, the methods focus on either just behaviors or in combination with thoughts and feelings that might be causing them.

222. Administration of a neuromuscular blocking agents before ECT can cause.....

a. Dry mouth
b. Respiratory difficulties
c. Increased body secretions
d. Seizures

Explanation: Neuromuscular blockers (for e. g. Succinyl-choline) produces respiratory depression. So the respiratory function of the client to be carefully observed.

223. The purpose of self-help group is to provide:

a. Support
b. Confrontation
c. Psychotherapy
d. Self-awareness

Explanation: Self-help group members share similar experiences and can provide support to each other

224. Following ECT a client is receiving oxygen via positive pressure ventilation method. The nurse should understand that positive pressure ventilation is necessary because:

a. Seizure activity can depresses respirations
b. Decreased oxygen to the brain leads to confusion and disorientation
c. Anesthesia is administered during the procedure
d. Succinylcholine administered during procedure can cause respiratory depression.

Explanation: Succinylcholine (smooth muscle relaxant) is administered during ECT to prevent injuries to patient during seizure. The effect of this drug can cause respiratory depression.

225. Identify the correct statement regarding Milieu therapy (therapeutic community)

a. Manipulate the environment to bring about positive changes in behavior
b. The client own his or her own environment
c. Each client own his or her own behavior
d. All of the above

Explanation: Milieu therapy manipulates the environment so that all aspects of the client's hospital experience become therapeutic. All the above-mentioned statements are correct in relation to Milieu therapy.

226. Prior to ECT therapy client is given with atropine to

a. Induce sleep
b. Minimize the secretions
c. To decrease pain
d. Relax smooth muscles

Explanation: Atropine is given to patient before Electroconvulsive Therapy (ECT) is for two reasons.

- To prevent transient postictal brady arrhythmia due to excessive vagal tone
- To minimize secretions within the respiratory tract. No option related to postictalbrady arrhythmia was given which leads you to select the option (B).

227. The most common side effect of ECT is:

a. Permanent memory loss
b. Temporary memory loss
c. Fracture of cranial bone
d. MI and cardiac arrest

Explanation: Most common side effect of ECT is temporary memory loss

228. Among the following what is the important nursing intervention to maintain safety of a client who is receiving ECT?

a. Tyramine free meals
b. Avoidance of exposure to sun
c. Maintenance of a safety sodium intake
d. Elimination of benzodiazepine for night time sedation

Explanation: The use of these drugs can raise the seizure threshold, which is counterproductive.

Ans.

219. c
220. a
221. c
222. b
223. a
224. d
225. d
226. b
227. b
228. d

Scanned with CamScanner

229. The sequence of administration of medications in anesthesia for ECT is:
a. Atropine--- thiopentone/methohexitol --- succinylcholine
b. Succinylcholine--- atropine --- thiopentone/methohexitol
c. Atracurium --- succinylcholine --- atropine
d. Atropine---succinylcholine --- thiopentone/methohexitol

Explanation: Atropine is to decrease secretions, thiopentone is for anesthesia effect and succinylcholine is for muscle relaxation.

230. The drug need to be administer to a client immediately before ECT include.....
a. Thiopental sodium b. Succinylcholine
c. Methohexital sodium d. All of the above

Explanation: All the above-mentioned drugs need to administer immediately before the procedure, anti-cholinergic drug such as atropine will administer 30 min prior to the procedure. Option A and C are short acting anesthetic drugs, while option B is a muscle relaxant.

231. When explaining the procedure about ECT, nurse should emphasize that:
a. Answer to all questions will be provided
b. Periods of amnesia will be there following treatment
c. Treatment will make the client feel better
d. Client will not be alone during the treatment

Explanation: Staff present in the unit will provide continues support to the client.

232. Nurse attending to a patient receiving electroconvulsive therapy (ECT) in a psychiatry department should ensure the compliance of all of the following except: *(Banaras HU 2015)*
a. Emptying of bladder and bowel is not necessary
b. Patient's hair should be kept clean and dry
c. Hairpins, bracelets, body piercing should be removed
d. Take the informed consent from a patient/legal heir

233. Desensitization is a type of
a. Psychotherapy
b. Psychoanalysis
c. Behavioral therapy
d. None

234. ECT is not the first-line treatment for
a. Mania
b. Severe psychotic depression
c. Depressive stupor
d. Catatonia

235. Most common complication of ECT is: *(JIPMER 1991,1996; 1992)*
a. Antegrade Amnesia
b. Retrograde Amnesia
c. Psychosis
d. Depression

236. In Direct ECT, the intraocular tension is *(JIPMER 1991)*
a. Increased b. Decreased
c. No change d. Variable

237. Behavior therapy is useful in all of the following conditions, EXCEPT:
a. OCD
b. Phobia
c. Mania
d. Hysterical conversion reaction

238. A specialized type of group therapy is
a. Psychodrama
b. Psychotherapy
c. Cognitive behavioral therapy
d. Reminiscence therapy

239. Group therapy can most useful for those who are
a. Dependent on others
b. Distressed
c. Emotionally ill
d. Isolated

240. The voltage needed to produce seizures while giving ECT is: *(JIPMER 2015; 2012)*
a. 180 to 220 volts b. 40 to 70 volts
c. 150 to 180 volts d. 70 to 130 volts

241. The most effective psychotherapy for a 9-year-old child diagnosed with attention deficit hyperactivity disorder (ADHD) is: *(Banaras HU 2015)*
a. Play therapy b. Milieu therapy
c. Behavior therapy d. Family therapy

242. Nursing care in electroconvulsive therapy include: *(ESIC Chennai May 2012)*
a. Preparing and monitoring the patient during the actual procedure
b. Providing educational and emotional support
c. Pretreatment planning and assessment
d. All the above

243. As per The Mental Healthcare Act 2017, which of the following statement is NOT TRUE regarding ECT therapy?
a. ECT should not be used without muscle relaxant
b. ECT should not be used without anesthesia
c. ECT therapy will not be performed for minors
d. Direct ECT can be given with the consent of the patient

244. The nurse is planning to formulate a psychotherapy group; several clients are interested in attending the session. The nurse plans the group, knowing that the maximum number of group members to include in this group is: *(LNJP H D 2012)*
a. 20 b. 16
c. 12 d. 6

245. Psychoanalysis is an attempt to explain:
a. Normal psychological functioning
b. Abnormal psychological functioning
c. Normal and abnormal psychological functioning
d. Cognitive thinking

246. Which of the following action can minimize agitation in a disturbed client?
a. Increasing environmental stimuli
b. Limiting unnecessary interaction with patient
c. Discussing the reasons for suspicious belief
d. All of the above

247. Characteristics of milieu therapy includes
a. Distribution of power
b. Structured interactions
c. Work-related activities
d. All of the above

248. All of the following behavioral techniques are used to treat OCD, EXCEPT
a. Exposure and response prevention
b. Aversive conditioning
c. Flooding
d. Thought stoppage

Scanned with CamScanner

249. Steps of systematic desensitization includes following steps, EXCEPT
a. Hierarchy construction
b. Testing anxiety level
c. Learning of relaxation techniques
d. Desensitization of stimulus

250. Which of the following is a type of relaxation therapy?
a. Reiki therapy
b. Acupuncture
c. Catharsis
d. Deep breathing exercise

251. A treatment for phobias in which the patient is exposed to progressively more anxiety-provoking stimuli and taught relaxation techniques is known as
a. Aversive therapy
b. Flooding
c. Deterrent therapy
d. Systematic desensitization

252. Which of the following behavior modification technique is useful in the treatment of phobias?
a. Positive reinforcement
b. Modeling
c. Desensitization therapy
d. Token economy

253. The immediate nursing intervention for the patient who has just awakened from an electroconvulsive therapy treatment is to
a. Orient the patient
b. Assess for suicidal behavior
c. Serve the food
d. Assess for auditory hallucination

254. The technique used in hypnosis is
a. Exploration
b. Questioning
c. Suggestion
d. Sensitization

255. Which of the following is an absolute contraindication for ECT treatment?
a. Recent stroke
b. Recent myocardial ischemia
c. Aortic aneurysms
d. Pheochromocytoma

256. ECT procedure was first used for the treatment of psychosis in the year
a. 1930 b. 1938
c. 1940 d. 1942

257. The normal range of duration of electricity delivery during ECT is
a. 0.1 to 0.2 seconds b. 0.7 to 1.5 seconds
c. 0.5 to 2.5 seconds d. 1.0 to 2.5 seconds

258. The most common indication of ECT is:
a. Schizophrenia
b. Phobia
c. Mania
d. Major depression

259. Which of the following type of schizophrenia best responds to ECT
a. Catatonic schizophrenia
b. Simple schizophrenia
c. Paranoid schizophrenia
d. Hebephrenic schizophrenia

260. The induction of a state of altered consciousness in which a person apparently loses the power of voluntary action and is highly responsive to suggestion is known as
a. Psychotherapy
b. Rehabilitation
c. Hypnosis
d. Cognitive therapy

261. The most effective form of somatic therapy for patient with schizophrenia is
a. Minor tranquilizers
b. Electroconvulsive Therapy
c. Major tranquilizers
d. Biofeedback

262. The commonest side effect of ECT is
a. Dislocation of mandible
b. Fracture of a long bone
c. Nausea and vomiting
d. Body pain particularly in lower extremities

263. Electroconvulsive therapy (ECT) is primarily used to treat patients with
a. Conversion disorder
b. Organic brain Syndrome
c. Depression
d. OCD

264. Useful intervention for a patient with adjustment disorder is
a. Extended follow-up
b. Individual Psychotherapy
c. Group therapy
d. CBT

265. The ideal size for group therapy is
a. 8-12 members b. 10-55 members
c. 15-20 members d. 15-25 members

266. Pre-sleep rituals that helps to initiate relaxation each night before sleep includes all of the following EXCEPT
a. Warm bath before bedtime
b. Eating heavy meals near bedtime
c. Eating light Snacks
d. Reading or listing to music

267. Behavioral therapy is helpful in
a. Schizophrenia
b. Agoraphobia
c. Personality disorder
d. Neuroetic depression

ORGANIC MENTAL DISORDERS

268. Biochemical etiology of Alzheimer's disease relates to: *(AIIMS BBS NO 2018)*
a. Epinephrine b. Acetylcholine
c. Serotonin d. Dopamine

Explanation: The decrease in production of acetylcholine reduces the amount of the neurotransmitter that is released to cells in the cortex and hippocampus, resulting in a disruption of the cognitive processes.

269. Which of the following features is present only in dementia when compared with Delirium? *(AIIMS BPL NO 2018)*
a. Misperception
b. Vivid illusions
c. Hallucination
d. Systematized delusions occur early

Ans.

264.	b
265.	a
266.	b
267.	b
268.	b
269.	d

Scanned with CamScanner

Explanation:

- Systematized delusions occur in the dementia only. It does not occur in delirium.
- Misperception, vivid illusions and Misperception are the symptoms of delirium.

270. Best test for diagnosis of organic mental disorder is:
(AIIMS BBS NO 2018)

a. Bender gestalt test
b. Sentence completion test
c. Rorschach test
d. Thematic appreciation test

Explanation:

- The Bender-Gestalt test is a psychological test used by mental health professionals that assesses visual-motor functioning, developmental disorders, and neurological impairments in children ages 3 and older and adults.
- Sentence completion test – diagnosis of personality.
- Rorschach test and Thematic Apperception Test (TAT) - projective test to assess personality structure, pattern of thoughts, emotional problems and mental disorders.

271. A 73-year-old client is admitted to the hospital with the diagnosis of dementia of the Alzheimer's type and depression. The symptom that is unrelated to depression would be:
(Safdarjung NO 2018)

a. Apathetic response to the environment
b. "I don't know" answer to questions
c. Shallow of labile effect
d. Neglect of personal hygiene

Explanation:

- Apathetic response to the environment, neglect of personal hygiene, and "I Don't Know" answer to questions are signs of depression.
- Labile affect is also known as pseudobulbar affect, emotional incontinence, or involuntary emotional expression disorder (IEED). Shallow effect refers to little or no emotions of a person. It is referred as marked fluctuation of mood; can be a symptom of a disorder such as schizophrenia.

272. Reversible dementia is seen in

a. Wilson
b. **Myxedema**
c. Alzheimer's
d. Huntington disease

Explanation: Hypothyroidism is one of the most important causes of potentially reversible dementia. Myxedema is caused by hypothyroidism.

273. Which of the following features is present only in Dementia when compared with Delirium?
(AIIMS Bhopal Nursing officer, 2018)

a. Misperception
b. Vivid illusions
c. Hallucination
d. Systematized delusions occur early

Explanation:

- When a delusion is elaborated, it is said to be systematized when there is one basic delusion upon which the remainder of the system is logically built. Systematized delusions are more likely seen in schizophrenia and dementia.
- Delirium is an acute confusional state but dementia develop over time with slow progression of cognitive decline.

274. Which of the following is considered under acute neuro-psychiatric complications of AIDS?
(AIIMS Bhopal Nursing officer, 2018)

a. Organic hallucinosis
b. Organic personality disorder
c. Delirium
d. AIDS dementia

Explanation: Delirium is considered under acute neuropsychiatric complications of AIDS

275. Psychogenic amnesia is characterized by

a. Antegrade Amnesia
b. **Retrograde Amnesia**
c. Both with confabulation
d. Patchy impairment of Personal memories

276. All are true about Dementia except

a. Loss of short term memory
b. Loss of long term memory
c. Deterioration of personality
d. Impaired learning

277. All of the following are true about nursing care for a patient with delirium, Except *(Banaras HU 2015)*

a. Allow the client to wear his/her own clothes
b. A void room changes, especially at night
c. Refrain family members to stay with the patient
d. Avoid physical restraint whenever possible

278. A 65-year-old man with Alzheimer's disease exhibits frequent episodes of emotional liability. Which of the following intervention is most appropriate for this patient

a. Logically explains the reality
b. Reduce environmental stimuli to redirect attention
c. Try humour to alter the patient's mood
d. Explore the cause of altered mood

279. Which of the following is a short-term goal for a patient with Alzheimer's disease?

a. Optimum functioning in the least restrictive environment
b. Improved self-esteem
c. Improved self-confidence
d. Regain of sensory and cognitive function

280. Clouding of consciousness is a feature of

a. Selective amnesia
b. Dementia
c. Delirium
d. Alzheimer's disease

281. Disturbances of orientation, memory and Intelligence is seen in

a. Functional Psychosis
b. Organic Psychosis
c. Delusion
d. Anxiety disorder

282. Paroxysmal cerebral dysfunction is otherwise called as

a. Depression
b. Epilepsy
c. Coma
d. Brain death

283. A mental disturbance characterized by confusion, disordered speech, clouding of consciousness and hallucinations is known as

a. Dementia
b. Delirium
c. Hallucination
d. Psychosis

284. The most common cause of dementia is

a. Stroke
b. Alzheimer's disease
c. Thyroid abnormalities
d. Trauma

285. All of the following are an example of organic brain disorders, EXCEPT
a. Alzheimer's disease b. Delirium
c. Dementia d. PTSD

286. An acquired global impairment of intellect, memory and personality without impairment of consciousness is referred as
a. Amnesia b. Dementia
c. Delirium d. Parkinsonism

287. In dementia patients, mood changes can be eased by
a. Use of mood stabilizers such as lithium
b. Keeping the client busy with activities
c. Keeping a calm environment with fixed daily routine
d. Engaging the client in group activities

288. Which of the following is feature of Alzheimer's disease? *(JIPMER 2007)*
a. Early memory loss
b. Recent memory loss
c. **Recent and past memory loss**
d. Global memory loss

289. Delirium is seen mainly in disorders associated with *(JIPMER 2012)*
a. Alcohol b. Barbiturate
c. Opium d. Cocaine

290. Alzheimer's disease is associated with *(JIPMER 2008)*
a. Delusion b. Dementia
c. Delirium d. Depression

291. The major cause of neurotic disorders is
a. Physical factor b. Genetic disorder
c. Stress factor d. Biological factor

292. Which of the following is NOT a neurotic disorder?
a. Panic anxiety b. Conversion reaction
c. Delirious mania d. Dissociative fugue

293. Which of the following is NOT a characteristic feature of neurotic disorders?
a. Intact insight b. Subjective distress
c. Anxiety d. Delusions

294. 60-year-old man had undergone cardiac bypass surgery 2 days back. Now he started forgetting things and was not able to recall names and phone numbers of his relatives. What is the probable diagnosis? *(JIPMER 2010)*
a. Depression
b. Post traumatic psychosis
c. Cognitive dysfunction
d. Alzheimer's disease

295. Cognitive behavior therapy deals with
a. Unconscious motive
b. Maladaptive assumptions
c. Pseudo-dynamic conflict
d. Emotional consciousness of automatic thoughts

SUBSTANCE USE DISORDERS

296. A patient approached nurse asking for advice on how to deal with his alcohol addiction. Nurse should tell the client that the only effective treatment for alcoholism is: *(Safdarjung NO 2018)*
a. Psychotherapy
b. Alcoholics anonymous (AA)
c. Total abstinence
d. Aversion Therapy

Explanation: For alcoholism total abstinence is the only effective treatment. Psychotherapy, attendance at alcoholics anonymous (AA) meeting, and aversion therapy are all adjunctive therapies that can support the client in efforts to abstain.

297. Most common symptom of alcohol withdrawal is: *(AIIMS BBS NO 2018)*
a. Body ache b. Tremor
c. Rhinorrhea d. Diarrhea

Explanation:
- Within 4 – 12 hours of cessation of or reduction in heavy or prolonged alcohol use, the following symptoms may appear—coarse tremor of hands, tongue, or eyelids, nausea or vomiting, weakness, tachycardia, sweating, elevated BP, anxiety, depressed mood or irritability, and insomnia.
- Body ache, Rhinorrhea and diarrhea are more common in Opioid withdrawal.

298. The health education to a group of alcoholic people should be able to: *(RAK MSc 2018)*
a. Teach the bad effects of alcoholism
b. Change their behavior
c. Inform about constituents of alcohol
d. Create awareness among them about family crisis

Explanation: In alcohol and drug education, the goal is to alter several negative behaviors. Other options are the way of approach to achieve the goal of behavioral change. The goal of health education is to bring behavioral change in an alcoholic

299. Which of the following foods would the nurse eliminate from the diet of a client in alcohol withdrawal: *(Safdarjung NO 2018)*
a. Milk
b. Orange juice
c. Tea
d. Regular coffee

Explanation: Caffeine is present in regular coffee, which stimulates psychomotor activity and results in feelings of anxiety and agitation. Serving coffee to the client may add to tremors and wakefulness. Orange juice, milk and tea are part of balanced diet needed for the client who is on alcohol withdrawal.

300. Which of the following is a long-term effect of 'Medical complication of Alcoholism'? *(AIIMS Bhopal Nursing officer, 2018)*
a. Korsakoff's Psychosis
b. Depression
c. Delirium Tremens
d. Paranoia

Explanation: In alcohol misuse a chronic memory disorder can occur due to the deficiency of thiamine (vit B1). It is called as Korsakoff's Psychosis.

301. In a client with substance abuse, which is the best indicator to assess the client's progress in rehabilitation?
a. Perform all the activities of daily living independently
b. The number of drug-free days he has
c. Taking all the prescribed drugs on time
d. Willing to come for follow up

298.	b
299.	d
300.	a
301.	b

Scanned with CamScanner

Explanation: Number of drug-free days is the best indicator to determine the progress of rehabilitation of patient with substance use disorder. Maintenance of abstinence from the substance is the ultimate goal of the deaddiction treatment.

302. Chronic alcoholic patients are treated initially by:
a. Use of paraldehyde
b. Use of tranquilizers
c. Providing high protein diet
d. IM injection of thiamine

Explanation: Parenteral administration of thiamine is unanimously considered the route of choice to replenish thiamine stores as rapidly as possible.

303. Heroin is a form of
a. Tobacco b. Poppy
c. Datura d. Cannabis

Explanation: Heroin is a highly addictive, illegal drug. Heroin (like opium and morphine) is made from the resin of poppy plants. Milky, sap-like opium is first removed from the pod of the poppy flower.

304. The most effective treatment for alcoholism is
a. Group therapy b. Disulfiram therapy
c. Total abstinence d. Chlorpromazine

Explanation: Abstinence is the total avoidance of an activity. Total abstinence is the marker of success of deaddiction treatment. Abstinence is the only effective treatment for alcoholism, particularly in short-term alcoholic addicts.

305. Among the following food items which item is contra-indicated in alcohol withdrawal client?
a. Milk b. Regular Coffee
c. Fruit juice d. None of the above

Explanation: Coffee contains caffeine and it is a CNS stimulant. Consumption of caffeine leads to feelings of anxiety and agitation. It may cause insomnia and tremors in client who is on alcohol withdrawal phase.

306. An alcoholic client is showing confabulation, which complication of alcoholism did the nurse need to suspect?
a. Seizure
b. Wernicke's encephalopathy
c. Korsakoff's psychosis
d. Dementia

Explanation: It is a syndrome of confusion, loss of recent memory, and confabulation in alcoholic client caused by deficiency of thiamine (vitamin B1).

307. Among the following identify the late sign of heroine withdrawal:
a. Dysphoric mood b. lacrimation
c. Vomiting and Diarrhea d. Muscle cramps

Explanation: Vomiting, diarrhea, muscle spasm, fever, nausea, abdominal cramps and backache are the common late signs of heroin withdrawal.

308. Drug of choice to treat alcohol withdrawal symptoms such as tremors, and high BP include
a. Disulfiram b. Lorazepam
c. Cloxacillin d. Benztropine

Explanation: The drug of choice to treat the alcohol withdrawal symptoms include lorazepam, its onset of action is also fast.

309. Alcohol anonymous group is classified as:
a. Social group
b. Self-help group
c. Resocialization group
d. Psychotherapeutic group

Explanation: It is a self-help group, who meet together to maintain sobriety.

310. An alcoholic client experiencing burning and tingling sensations of the feet. It is suggestive of .....
a. Peripheral neuropathy
b. Wernicke's encephalopathy
c. Korsakoff psychosis
d. Seizure

Explanation: Peripheral neuropathy, characterized by peripheral nerve damage, results in pain, burning, tingling, or prickly sensations of the extremities.

311. Most severe alcohol withdrawal syndrome is: *(Staff Nurse G II 2014)*
a. Alcoholic hallucinosis b. Hangover
c. Alcoholic seizures d. Delirium tremens

312. Thiamine therapy in alcoholic patient is to prevent *(ISRO)*
a. Alcoholic Dementia
b. Wernicke-Korsakoff syndrome
c. Huntington's disease
d. All of the above

313. The most common deficiency seen in patient with chronic alcoholism is *(ISRO)*
a. Thiamine b. Cyanocobalamin
c. Niacin d. Vitamin C

314. Which of the following drug is used to treat withdrawal symptoms of alcoholism?
a. Naloxone b. Naltrexone
c. Chlordiazepoxide d. Bupropion

315. A 35-year-old male patient is discharged on Disulfiram as maintenance therapy for alcohol dependence syndrome. The nurse should educate patient to avoid which of the following product?
a. Carbonated beverages b. Cheese
c. Red meat d. After shave lotion

316. Substance abuse refers to
a. Developing tolerance for substance
b. Maladaptive pattern of substance use
c. Experiencing withdrawal symptoms on stopping the substance
d. Psychological dependence on drugs

317. ICD-10 diagnostic criteria for drug dependence syndrome includes all, EXCEPT
a. Development of tolerance
b. Episodic use of substances
c. Appearance of withdrawal symptoms on stopping the substance
d. A strong craving for the substance

318. Amount of alcohol an average healthy adult person can metabolise in 24 hours is
a. Two ounces (60 mL) b. Four ounces (120 mL)
c. Five ounces (150 mL) d. Six ounces (180 mL)

Scanned with CamScanner

319. A 35-year-old male client was admitted to emergency room with alcohol intoxication. Which of the following intervention by the nurse is most appropriate for this client?
a. Counsel the patient on harmful effects of alcoholism
b. Motivate the client to stop alcoholism
c. Decrease in environmental stimuli
d. Use harm minimization principles to counsel the patient

320. A nurse is observing a patient for alcohol withdrawal symptoms. Which of the following findings indicates a potential risk for delirium tremens?
a. Muscular rigidity and stupor
b. Hypertension, hallucinations and changes in LOC
c. Agitation and hypotension
d. Hypotension and ataxia

321. Disulfiram therapy is indicated in
a. Acute alcohol intoxication
b. Nicotine dependence
c. Acute opium intoxication
d. Alcohol dependence

322. Drug dependence refers to
a. Harmful pattern of substance use
b. Physiological and psychological dependence on substances
c. Habitual use of substances
d. Experiencing psychotic symptoms due to substance use

323. Treatment for withdrawal symptoms of substance abuse is otherwise known as
a. Detoxification phase b. Maintenance phase
c. Harm reduction d. Harm minimization

324. Wernicke-Korsakoff syndrome in chronic alcoholic patients is caused by a deficiency of
a. Riboflavin b. Thiamine
c. Pyridoxine c. Niacin

325. Signs and symptoms of delirium tremens includes all of the following, EXCEPT *(JIPMER 2011)*
a. Clouding of consciousness
b. Tremors
c. Hypothermia
d. Disorientation

326. Which of the following is an anticraving agent used during the maintenance phase of treatment of alcoholism?
a. Naltrexone b. Calcium carbonate
c. Disulfiram d. Acamprosate

327. Which of the following is the deterrent agent used in the maintenance phase of treatment of alcohol dependence syndrome?
a. Naloxone b. Disulfiram
c. Acamprosate d. Naltrexone

328. What is a relapse?
a. Worsening of symptoms after temporary improvement
b. It is a stage of diminution in symptom
c. Deterioration of symptoms
d. Recurrence of symptoms

329. The primary function of Alcoholic Anonymous (AA) is
a. To teach harmful effects of alcoholism to public
b. To help members to maintain sobriety
c. To provide financial assistance for treatment
d. To provide detoxification and maintenance treatment

330. Disulfiram like reaction is not seen with
a. Disulfiram b. Amoxycillin
c. Metronidazole d. Cefoperazone

331. A 40-year-old man presents with a 20 years history of alcohol intake with a 10 years history of a dependence pattern. He presents with a 2 day history of altered behavior, restlessness, tremors, sleep disturbance, irritability and difficulty in walking. On examination he has gaze palsy and is disoriented. What is the most likely diagnosis?
a. Delirium tremens
b. Wernicke's encephalopathy
c. Korsakoff s psychosis
d. Alcohol induced psychosis

332. Wernicke's encephalopathy features are all except *(JIPMER 2012)*
a. Confusion b. Ataxia
c. Aphasia d. Nystagmus

333. Combination of alcohol and Disulfiram results in nausea and hypertension as a result of accumulation of
a. NADH b. Methanol
c. Acetate d. Acetaldehyde

334. Heavy users of alcohol are from
a. Upper social class
b. Middle class
c. Lower class
d. None of social class predominance

335. Delirium and amnestic reaction are seen with
a. Alcohol b. Opiates
c. Cannabis d. Amphetamines

336. Direct evidence of alcohol addiction is *(JIPMER 1995)*
a. Memory disturbance
b. Confabulation
c. Cirrhosis
d. Withdrawal symptoms

337. Alcohol hallucinations occur within *(JIPMER 2005)*
a. 24 hours b. 36 hours
c. 72 hours d. 96 hours

338. Recommended treatment for extremely agitated behavior by a person who is grossly intoxicated with alcohol is
a. Diazepam
b. Phenobarbital
c. Chlorpromazine
d. Haloperidol

339. All of the following drugs may be used for the treatment of alcohol dependence, EXCEPT *(JIPMER 2012)*
a. Naltrexone
b. Disulfiram
c. Flumazenil
d. Acamprosate

340. LSD is also known as: *(JIPMER 1992)*
a. Brown sugar
b. Mind blocker
c. Mind expander
d. Glue

341. The drug which is used to create aversion of the Alcohol Dependence: *(JIPMER 2015)*
a. Apomorphine b. Propranolol
c. Diazepam d. Disulfiram

342. Chronic Alcoholic patients are treated initially with _____ to prevent Wernicke-Korsakoff Syndrome
a. Disulfiram
b. I/M injection of thiamine
c. I/V Diazepam
d. Acamprosate

SCHIZOPHRENIA RELATED DISORDERS

343. In schizophrenia, gradual subtle behavioral changes occur in: *(AIIMS-BBS SNO 2019)*

a. The premorbid phase
b. The prodromal phase
c. The onset phases
d. The progressive phase

Explanation: Features of prodromal phase include Functional impairment, nonspecific symptoms, and gradual subtle behavioral changes (disorientation in role functioning, social withdrawal, and positive symptoms appear).

344. The following are presenting symptoms of patient with catatonic schizophrenia EXCEPT *(ESIC 2019)*

a. Sudden onset of mutism
b. Have dangerous periods of agitation and explosive behavior
c. Disorganized behavior and speech.
d. Stereotyped position with waxy flexibility.

Explanation: Catatonic schizophrenia is a type of schizophrenia that is characterized by disruptions in a person's movement. The features may include

- Catatonic excitement (periods of agitation and explosive behavior) or
- Catatonic stupor (mutism or Stereotyped position with waxy flexibility)

Disorganized behavior and speech are not the presenting symptoms of patient with catatonic schizophrenia.

Ans.

345. Which of the following is not a part of Bleuler's 4 A's? *(AIIMS Bhopal Grade-I 2018)*

a. Ambivalence
b. Avolition
c. Associative loosening
d. Autistic thinking

Explanation: Eugen Bleuler's gave the famous 4 A's that he presumed lied at the core of the schizophrenia and were fundamental aspects of the disorder. These 4 A's are: Affect, Autism, Ambivalence and Associative loosening.

346. According to DSM IV, the positive symptoms of Schizophrenia includes: *(AIIMS Raipur Grade II 2017)*

A. Hallucinations
B. Delusions
C. Flat affect
D Bizarre behavior

a. A, B, C
b. B, C, D
c. A, C, D
d. A, B, D

Explanation: The positive symptoms of schizophrenia include delusions, thought disorder, disorganized behavior and movement disorder (agitated or repeated movements). The negative symptoms include lack of emotion or small emotional range, reduced ability to plan and follow through the activities, neglect of personal hygiene, social withdrawal and decrease in talkativeness and loss of motivations

347. Mr. Raju says that he is the first lead of the world and he is born with a special mission in life. These are the symptoms of: *(AIIMS Raipur Grade II 2017)*

a. Autochthonous delusion
b. Delusion of grandeur
c. Delusion of persecution
d. Delusion of reference

Explanation: A primary delusion is a delusion which arises "out of the blue" with no morbid antecedents is called autochthonous delusion. Persecutory delusions are a set of delusional conditions in which the affected persons believe they are being persecuted. A delusion of reference is a type of delusion wherein the individual perceives unrelated events or objects in his/her surroundings to be of significance for himself/herself. Delusion of grandeur refers to feeling superior

348. A form of speech in which the client tends to wander away from the intended point and never returning to the original idea is called: *(AIIMS Raipur Grade II 2017)*

a. Verbigeration
b. Thought insertion
c. Tangentiality
d. Thought block

Explanation: Verbigeration is the obsessive repetition of random words. Thought insertion is associated with schizophrenia. Thought insertion along with thought broadcasting, thought blocking and thought withdrawal are primary first rank symptoms of schizophrenia.

349. Mrs. Gowri, on assessment, shows the following behavior. *(AIIMS Raipur Grade II 2017)*

A. Maintaining rigid posture
B. Being mute
C. Hears "God's voice"
D. Repeating the phrases.

These are the characteristics of:

a. Paranoid Schizophrenia
b. Undifferentiated schizophrenia
c. Catatonic schizophrenia
d. Residual Schizophrenia

Explanation: Catatonia include extremes of behavior such as excessive and peculiar motor behaviors and decreased motor activity and engagement. Paranoid schizophrenia people may have false beliefs or delusions that an individual or group of people are conspiring to harm them or members of their family. When a person has a past history of at least one episode of schizophrenia but currently has no symptoms are called as residual schizophrenia. Undifferentiated schizophrenia is categorized when features of no other subtypes of schizophrenia are fully present of features of more than one type of subtype are exhibited.

350. Rema is admitted in psychiatric ward, refused to eat breakfast by stating that the food is poisoned. This kind of response is an example of:

a. Hallucination
b. Illusion
c. Delusion
d. Empathy

Explanation: An erroneous belief that is held without evidence and irrational is known as delusion.

351. Unshakable and persistent ideas are called as:

a. Delusion
b. Obsession
c. Compulsion
d. Illusion

Explanation: Delusion is a belief held with strong conviction despite superior evidence to the contrary.

352. A client with schizophrenia unlikely to demonstrate

a. Low self-esteem
b. Ambivalence
c. Effective self-boundaries
d. Weak ego

Scanned with CamScanner

Explanation: Inability to maintain adequate boundaries is the feature of schizophrenic patients.

353. The most frequent period of onset of schizophrenia is

a. Late adolescence to early adulthood
b. Childhood
c. Middle age
d. Old age

Explanation: Schizophrenia is a disease that typically begins in early adulthood; between the ages of 15 and 25. Men tend to develop schizophrenia slightly earlier than women; whereas most males become ill between 16 and 25 years old, most females develop symptoms several years later, and the incidence in women is noticeably higher in women after age 30. The average age of onset is 18 in men and 25 in women.

354. False sensory perceptions with no basis in reality is known as *(DSSSB 2013;* Safdarjung NO 2018*)*

a. Hallucinations
b. Delusions
c. Illusions
d. Thought insertion

Explanation: Hallucination is an experience involving the apparent perception of something not present. It is a perception without a presence of sensory stimuli. Types of hallucination includes Auditory (sound), visual (vision), olfactory (smell), tactile (touch) and gustatory (taste). Auditory hallucination is the most common type of hallucination experienced by patients with mental illness.

355. Persecutory delusion is common in: *(RPSC Nursing Tutor 2009)*

a. Schizophrenia
b. Paranoid Schizophrenia
c. BPAD
d. OCD

Explanation: Individual with persecutory delusion believes that they are being malevolently (vindictively) treated in some way. Persecutory delusion is common in Paranoid Schizophrenia.

356. Gustatory hallucination affects the *(RPSC Nursing Tutor 2009)*

a. Ears
b. Taste buds
c. Nose
d. Eyes

Explanation: A hallucination is a perception in the absence of a stimulus. A gustatory hallucination is a perception of taste without a stimulus. These hallucinations, which are typically strange or unpleasant, are relatively common among individuals who have certain types of focal epilepsy, especially temporal lobe epilepsy.

357. The priority nursing intervention for a client who is admitted with paranoid schizophrenia is

a. Establish a structured daily routine
b. Plan a programme of self-fulfillment.
c. Provide patient and others with safe environment
d. Do mini mental status examination

Explanation: Patient is suffering from paranoid schizophrenia, so the priority nursing intervention is to provide a safe environment for patient and others.

358. Client with schizophrenia experiencing voice which stated that "you are bad and should die". This is called as

a. A delusion
b. Illusion
c. Grandiosity
d. Hallucination

Explanation: A hallucination is a sensory perception without a real stimuli. Hearing voice without a stimuli is known as auditory stimuli.

359. Characteristic of Paranoid personality disorder includes .....

a. Constantly on guard and hypervigilant
b. Appear tense and irritable
c. Avoid interaction with other people
d. All of the above

Explanation: Characteristic of paranoid personality disorder include doubt the commitment, loyalty, or trustworthiness of others, believing others are using or deceiving them, reluctant to confide in others or reveal personal information due to a fear that the information will be used against them, unforgiving and hold grudges, hypersensitive and take criticism poorly, read hidden meanings in the innocent remarks or casual looks of others, perceive attacks on their character that are not apparent to others; they generally react with anger and are quick to retaliate, have recurrent suspicions, without reason, that their spouses or lovers are being unfaithful, generally cold and distant in their relationships with others, and might become controlling and jealous. They cannot see their role in problems or conflicts and believe they are always right. Have difficulty relaxing, hostile, stubborn, and argumentative.

360. Delusions of grandeur means..... *(IHBAS, Delhi)*

a. Someone usually in higher status is in love with them
b. Irrational ideas regarding their own worth, talent, knowledge or power
c. Sexual partner is unfaithful.
d. They are being malevolently treated in some way

Explanation: Option B is the correct answer. Option A is delusion of erotomanic type. Option C is jealous type delusion. Option D is persecutory type delusion.

361. Nihilistic delusions is

a. A false belief about the functioning of the body
b. False idea that others are talking about the person
c. Part of self, other or world is nonexistent
d. The inability to carry out somatic functioning

Explanation: Nihilistic delusions are false ideas about the self, others, or the world. A false belief about the functioning of the body is somatic delusion.

362. Most common type of hallucination seen in schizophrenia patient is

a. Auditory
b. Visual
c. Tactile
d. Olfactory

Explanation: The most commonly seen hallucination among schizophrenia patient is auditory hallucination.

363. Among the following all are positive symptoms of schizophrenia, Except:

a. Apathy
b. Agitation
c. Hallucination
d. Aggression

Explanation: Apathy is considered as one of the negative symptoms of schizophrenia.

364. Increased dopamine level will cause

a. Schizophrenia
b. Depression
c. OCD
d. BPAD

Explanation: Increased dopamine level can cause schizophrenia in the person.

364. a

Scanned with CamScanner

365. The prominent symptom that last at least for 1 month and helpful to diagnose paranoid schizophrenia is
a. Delusions and hallucination
b. Poverty of speech with apathy
c. Bizarre behavior associated with drug use
d. Disturbed relationship and poor grooming

Explanation: Diagnostic criteria for paranoid schizophrenia include persistence of two or more symptoms such as delusion or hallucination for more than 1 month.

366. Condition indicating abnormality in perception is ---------
a. Illusion
b. Obsession
c. Persecution
d. Compulsion

Explanation: Illusion is a distortion of senses characterized by misinterpretation of stimuli. For example, a rope could be misinterpreted as snake.

367. When the person feel both positive and negative towards same object it is known as .....
a. Ambivalent
b. Occasionally appropriate
c. Positive affect
d. Inappropriate

Explanation: Ambivalence is a state of having simultaneous conflicting reactions, beliefs, or feelings towards some object. Stated another way, ambivalence is the experience of having an attitude towards someone or something that contains both positively and negatively valanced components.

368. Perception of an object in the absence of a stimuli is called as:
a. Illusion
b. Hallucination
c. Delusion
d. Confabulation

369. Misinterpretation or misperception of real external stimuli is known as
a. Illusion
b. Hallucination
c. Delusion
d. Confabulation

370. Which of the following is the disorder of perception?
a. Delusion
b. Hallucination
c. Amnesia
d. Delirium

371. Impaired insight is evident in: *(JIPMER 1992, 2009)*
a. Psychosomatic disorder
b. Anxiety neurosis
c. Post-traumatic Stress Disorder
d. Schizophrenia

372. Which of the following is not true about hallucinations?
a. It is a disorder of perception
b. It is always pathological
c. It is different from imagery
d. It occurs on objective space

373. An 8-year-old child after a tonsillectomy sees a bear in her room. She screams in fright. A nurse who rushes in switches on the light, finds a rug wrapped on an arm chair. She pacifies the child. What the child experienced was
a. Delusion
b. Illusion
c. Hallucination
d. None of the above

374. Hallucinations are seen in All Except
a. Schizophrenia
b. Seizure due to intracerebral space occupying lesions
c. LSD
d. Anxiety

375. Insight is present in all except
a. Neurosis
b. Obsessive compulsive disorders
c. Phobias
d. Psychosis

376. Visual hallucinations is seen in
a. Alcoholism
b. Mania
c. Depression
d. Phobia

377. Auditory hallucinations not seen in
a. Schizophrenia
b. Mania
c. Hysteria
d. Amphetamine toxicity

378. The delusion that things do not exist, a sense that everything is unreal is known as
a. Delusion of grandiosity
b. Delusion of nihilism
c. Delusion of persecution
d. Delusion of haloness

379. Altered perception of real objects is
a. Illusion
b. Delusion
c. Hallucination
d. Delirium

380. Lack of insight is not a feature of *(JIPMER 2003)*
a. Panic disorder
b. Schizophrenia
c. Mania
d. Reactive Psychosis

381. Hallucination is caused by:
a. Gastrointestinal disorder
b. Mental illness
c. Disorder of reproductive organs
d. Infectious disease

382. A person seeing a design on the floor thought it was a fossil. It is an example of: *(Banaras HU 2015)*
a. Illusion
b. Delusion
c. Hallucination
d. Idea of reference

383. A false unshakable belief is: *(Staff Nurse G II 2014)*
a. Illusion
b. Hallucination
c. Delusion
d. Derealization

384. The most common type of hallucination seen in patients with mental illness is: *(JIPMER Nursing Tutor Entrance 2011)*
a. Gustatory hallucination
b. Auditory hallucination
c. Olfactory hallucination
d. Visual hallucination

385. Patient tells the nurse that the news announcer on TV is talking about me. The nurse documents this as:
a. Delusion of reference
b. Delusion of grandiosity
c. Delusion of persecution
d. Delusion of infidelity

386. Mrs. Anita refuses to eat her breakfast in the hospital, stating that the food is poisoned. This is an example of:
a. Delusion of nihilism
b. Delusion of grandiosity
c. Delusion of persecution
d. Delusion of grandiosity

387. **When patient's ideas are unshakable and persistent despite logical reasoning, they are called as**
   a. Delusion
   b. Illusion
   c. Confabulation
   d. Obsession

388. **A patient expresses the belief that the Army is out to shoot him. This is an example of:**
   a. Delusion of grandiosity
   b. Idea of reference
   c. Delusion of persecution
   d. Delusion of nihilism

389. **Commonest type of phobia seen in clinical practice:** *(JIPMER 1992, 2004)*
   a. Social phobia
   b. Simple phobia
   c. Agoraphobia
   d. Claustrophobia

390. **Delusion is a disorder of:**
   a. Thought
   b. Perception
   c. Insight
   d. Cognition

391. **Persistent belief in something which is not a fact is:**
   a. Illusion
   b. Hallucination
   c. Delusion
   d. Delirium

392. **A man hits his neighbour. Next day he feels that police is behind him and his brain is being controlled by radio waves by his neighbour. The probable diagnosis is:** *(JIPMER 1999)*
   a. Thought insertion
   b. Passivity feeling
   c. Delusion of persecution
   d. Obsessive Compulsive Disorder

393. **Catatonic behavior in schizophrenia is characterized by which of the following:** *(LNJP H D 2012)*
   a. Resisting attempts to be moved
   b. Maintaining rigid, immobile postures
   c. Decrease in reactivity to the environment
   d. All of the above

394. **The parents of a 20-year-old male patient with schizophrenia express feelings of guilt for their son's problems. Which of the following should be a part of family education?**
   a. Teach the parents that they must change
   b. Acknowledge the parent's responsibility and commitment
   c. Explain the biological process of schizophrenia
   d. Refer the family to a support group

395. **The major neurotransmitter involved in causation of schizophrenia is**
   a. GABA
   b. Acetylcholine
   c. Dopamine
   d. Epinephrine

396. **Typical antipsychotics act predominantly on _____ receptors**
   a. GABA
   b. D1
   c. D2
   d. D3

397. **Pattern of speech that is very indirect and delayed in reaching the central point (goal) is known as**
   a. Word salad
   b. Clang association
   c. Circumstantiality
   d. Tangentiality

398. **Flight of ideas is typical feature of**
   a. Schizophreni
   b. Mania
   c. Conduct disorder
   d. Tic

399. **The characteristic feature of catatonic schizophrenia is**
   a. Paranoid thoughts
   b. Motor disturbances
   c. Delusion of persecution
   d. Thought broadcasting

400. **The four A's of schizophrenia includes all the following EXCEPT**
   a. Auditory hallucinations
   b. Ambivalence
   c. Associative looseness
   d. Autistic thinking

401. **First rank symptoms of schizophrenia (FRSS) was described by**
   a. William Wundt
   b. Eugen Bleuler
   c. Schneider
   d. Evan Pavlov

402. **Persecutory delusion is a feature of _____**
   a. OCD
   b. Paranoid Schizophrenia
   c. Catatonic Schizophrenia
   d. BPAD

403. **Loss of insight and judgement is seen in patients with _____**
   a. Phobic disorder
   b. Psychosis
   c. Alcoholism
   d. Dissociative disorder

404. **Schizophrenia is a disorder of _____**
   a. Perception
   b. Thinking
   c. Speech
   d. Mood

405. **A patient in acute care psychiatric ward assessed to have hallucination and intense delusions. The nurse understands that this patient should be closely monitored for**
   a. Negligence of personal hygiene
   b. Grandiosity
   c. Suicidal behavior
   d. Injury to others

406. **Example of nonaffective psychosis is**
   a. Schizophrenia
   b. Mental Retardation
   c. Anxiety Neurosis
   d. Hysteria

407. **The affect that is most commonly seen in patients with schizophrenia is**
   a. Elation and Euphoria
   b. Sadness and depression
   c. Apathy and flatness
   d. Anger and Aggression

408. **A 32-year-old woman who is admitted in to acute care psychiatric ward with a diagnosis of paranoid schizophrenia refuses to take food saying that the food is poisoned. The appropriate nursing intervention for this client is to**
   a. Reassure the patient by tasting the food before patient
   b. Assure the patient that the food is safe to take
   c. Allow the patient to take packed/canned foods.
   d. Warn the patient of the consequences if she refuses to take food

409. **Waxy flexibility, mutism, bizarre posture and stupor are characteristics of**
   a. Undifferentiated schizophrenia
   b. Catatonic schizophrenia
   c. Paranoid schizophrenia
   d. BPAD with depressive episode

410. **Suspiciousness is a typical feature of**
   a. BPAD with Mania
   b. Paranoid schizophrenia
   c. Undifferentiated schizophrenia
   d. Hebephrenic schizophrenia

411. **A schizophrenic patient is suspecting his faithful partner of infidelity (extramarital affair). The nurse understands that the patient is experiencing**
   a. Delusion of nihilism
   b. Delusion of grandiosity
   c. Delusion of persecution
   d. Delusion of infidelity

c. Primary delusion d. Somatic passivity

422. Poor prognostic factor in schizophrenia is
a. Acute onset
b. Middle age
c. Family history of affective disorder
d. Gradual onset

423. Which of the following is the treatment of choice for patients with schizophrenia, who refuse to take treatment? *(JIPMER 2012)*
a. Clozapine b. Risperidone
c. Olanzapine d. Fluphenazine

424. Schizophrenia drugs mainly act on *(JIPMER 2014)*
a. D1 Dopamine receptors
b. D2 Dopamine receptors
c. D3 Dopamine receptors
d. Ach receptors

425. Meaning of term 'Schizophrenia' is *(JIPMER 2014)*
a. Free mind b. Euphoric mind
c. Split mind d. Confused mind

426. Cause of premature deaths in Schizophrenia is *(JIPMER 2011)*
a. Hospital acquired infections
b. Homicide
c. Suicide
d. Toxicity of anti-psychotic drugs

427. Schizophrenia is characterized by all except
a. Delusion
b. Auditory Hallucination
c. Elation
d. Catatonia

428. Characteristic clinical manifestation of Schizophrenia is *(JIPMER 1998)*
a. Confusion
b. Anxiety
c. Auditory hallucinations
d. Visual hallucinations

429. Most common hallucination in Schizophrenia is *(JIPMER 1995, 1999)*
a. Auditory b. Visual
c. Olfactory d. Tactile

430. Schizophrenia with late onset and good prognosis
a. Simple Schizophrenia
b. Hebephrenic
c. Catatonic Schizophrenia
d. Paranoid Schizophrenia

431. Most common types of schizophrenia
a. Simple b. Hebephrenic
c. Catatonic d. Paranoid

432. Waxy flexibility is characteristic of schizophrenia is *(JIPMER 2006)*
a. Excitatory catatonia
b. Stuporous catatonia
c. OCD
d. All

433. Which is not classical 4 A's of Schizophrenia?
a. Ambivalence b. Autism
c. Affective flattening d. Automatism

434. Ambivalence is most commonly associated with *(MP PGMEE 2002)*
a. Depression
b. Generalized anxiety disorder
c. Schizophrenia
d. OCD

435. Schizophrenia with early onset and poor prognosis is
a. Catatonic b. Hebephrenic
c. Paranoid d. Schizoaffective

436. Grimacing and Mannerism is *(JIPMER 1992)*
a. Simple Schizophrenia
b. Catatonic Schizophrenia
c. Hebephrenic Schizophrenia

438. Sudden involuntary movement which is purposeless in nature is termed as
a. Mannerisms
b. Tic disorder
c. Catatonia
d. Waxy flexibility

439. Olfactory and gustatory hallucinations are seen in:
a. Depression
b. Paranoia
c. Temporal lobe epilepsy
d. Alzheimer's disease

440. The commonest form of puerperal psychosis
a. Organic
b. Schizophreniform
c. Affective
d. Anxiety neurosis

441. Presence of which of the following feature is seen in patients with neurosis?
a. Hallucination
b. Insight
c. Delusion
d. Disorganized speech

442. Following are correctly matched except
a. Schizophrenia-Auditory hallucination
b. OCD-infidelity
c. Alcoholism-auditory hallucination
d. Depression-guilt feeling

443. Visual hallucinations without auditory hallucinations is seen in:
a. Organic brain damage
b. Obsessive compulsive neurosis
c. Agoraphobia
d. Schizophrenia

444. Deja vu is seen in: *(JIPMER 1994)*
a. Temporal lobe epilepsy
b. Normal person
c. Psychosis
d. All of the above

PERSONALITY DISORDERS

445. Which of the following approaches would be most appropriate to use with a client suffering from narcissistic personality disorder when discrepancies exist between what the client states and what actually exist: *(Safdarjung NO 2018)*
a. Rationalization
b. Supportive confrontation
c. Limit setting
d. Consistency

Explanation: Supportive confrontation can be used to point out discrepancies between what the client states and what actually exists. This will increase the client's responsibility for self. Limit setting may help the client control unacceptable behavior but do not point out discrepancies. Rationalization usually used by the client as defense mechanism, not the nurse. Consistency helps gain control but do not point out discrepancies.

446. A patient with antisocial personality disorder belches loudly. A staff member asks "Do you know why people find you repulsive?" this statement most likely would elicit which of the following client reaction: *(Safdarjung NO 2018)*
a. Defensiveness
b. Embarrassment
c. Shame
d. Remorseful

Explanation: Since the question from the nurse is demeaning (belittling) the client, the client may likely feel defensive because the question may attack the self-image of the client. It is the natural tendency of the client to counterattack the threat to self-image.

447. A male client is diagnosed with schizotypal personality disorder. Which signs would this client exhibit during social situation: *(Safdarjung NO 2018)*
a. **Paranoid thoughts**
b. Emotional affect
c. Independence need
d. Aggressive behavior

Ref: Mary C Townsend. Essentials of Mental Health Nursing. 6th edition. pp. 608-14.

Explanation:
- Suspiciousness and mistrust of others (paranoia) is a characteristic feature of schizotypal personality disorder.
- Emotional affect and independence need are not related to schizotypal personality disorder. Aggressive behavior is not seen in person with schizotypal personality.

448. A 20-year-old client was diagnosed with dependent personality disorder. Which behavior is most likely to be evidence of ineffective individual coping? *(Safdarjung NO 2018)*
a. Recurrent self-destructive behavior
b. Avoiding relationship
c. Showing interest in solitary activities
d. Inability to make choices and decision without advice

Explanation: Dependent personality disorder is characterized by intense lack of self-confidence, low self-esteem, and inability to make decisions.

449. A patient with borderline personality disorder who is to be discharged soon threatens to "do something" to herself if discharged. Which of the following actions by the nurse would be most important? *(Safdarjung NO 2018)*
a. Ask a family member to stay with the client at home temporarily
b. Discuss the meaning of the client's statement with her
c. Request an immediate extension for the client
d. Ignore the client's statement because it's a sign of manipulation

Explanation:
- The nurse should assess for suicidal risk. The nurse should attempt to assess any suicidal statement and determine its meaning in terms of suicide. It is common among clients with borderline personality disorder to make threatening comments before discharge.
- Asking family members to stay with a client will transfer the responsibility to the family instead of client. Granting extension will encourage dependency of client. Ignoring client's statement may lead to error in judgment.

450. A hospitalized client, diagnosed with a borderline personality disorder, consistently breaks the unit rules. This behavior should be confronted because it will help the client: *(RAK MSc 2018)*
a. Control anger
b. Become more self-aware
c. Reduce anxiety
d. Set realistic goals

Scanned with CamScanner

Explanation:

- Clients with borderline personality disorder are likely to develop dysfunctional coping and act out in self-destructive ways such as binge eating. Clients must first become aware of their behavior before they can change it. So, confrontation of their rules breaking behavior will help the client to become more self-aware.
- After the client is aware of the behavior and has a desire to change the behavior, then other options like setting the realistic goal reducing anxiety and controlling anger should be done.

451. A person has run away from home adopting a new identify with complete amnesia about his earlier life. This disorder is known as: *(AIIMS Bhopal Grade-I 2018)*

a. Dissociative fugue
b. Multiple personality disorder
c. Dissociative amnesia
d. Conversion disorder

Explanation: Dissociative fugue or psychogenic fugue is a dissociative disorder characterized by reversible amnesia for personal identity. The state can last for days, months or longer and is sometimes accompanied by the establishment of new identity.

452. A person who is aloof, isolated and does not socialized, falls into which of the following category? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Withdrawn
b. Anxious
c. Aggressive
d. Obsessive

Explanation: Above given description indicates withdrawn person. In anxious personality worry and fear become overwhelming and can interfere with activity of daily living. In aggressive personality persistent maladaptive aggression expressed in different ways. In obsessive personality preoccupation with orderliness and perfectionism can be seen

453. A nurse who is caring for a client with antisocial behavior should stress on

a. Close supervision of the client
b. Educate the family members that someone should be with the client all time
c. Setting clear rules and expectations about the client's behavior
d. Provide stimuli free environment to the client

Explanation: The nursing care plan for the antisocial client should stress on setting the clear rules and expectation about the client's behavior.

454. Which is the most appropriate nursing intervention for a schizotypal personality disorder client with a nursing diagnosis of impaired verbal communication?

a. Helping the client to participate in social interactions
b. Establishing a one-on-one relationship with the client
c. Establishing alternative forms of communication
d. Allowing the client to decide when he wants to participate in verbal communication with the nurse.

Explanation: Patient with schizotypal personality has great difficulty in establishing and maintaining close relationships with others. By establishing a one-to-one relationship, the nurse can help the client to learn how to interact with other people in different environment.

455. Disturbances of orientation memory and intelligence is present in which of the following condition?

a. Organic Psychosis
b. Functional Psychosis
c. Hallucination
d. Phobia

Explanation: Psychosis may be divided into two categories: organic and functional. Organic psychosis is characterized by abnormal brain function that is caused by a known physical abnormality, which in most cases is some organic disease of the brain.

456. The main treatment for Dissociative Identity Disorder is-

a. Hypnosis
b. Individual psychodynamic psychotherapy
c. Family therapy
d. Group psychotherapy focusing on family issues

Explanation: Individual psychotherapy is the most widely used modality as opposed to family, group or couples therapy. The main goal for treatment is the integration of the separate personality states into one cohesive, unified personality, unless the person with DID is not ready or motivated to work with trauma..

457. Which of the following sign would be exhibited by a client with schizotypal personality in a social situation?

a. Blunt emotional affect
b. Violent behavior
c. Paranoid thoughts
d. Anhedonia

Explanation: Patients with schizotypal personality disorder develops excessive social anxiety in a social situations. This may lead to paranoid thoughts.

458. Which among the following activity is best suited for a client with histrionic personality disorder who is responding to situations in an exaggerated manner?

a. Behavioral therapy
b. Role playing
c. Isolate the client
d. Therapeutic community

Explanation: Use of role-playing can be used to teach the client appropriate responses to others and in different situations.

459. Splitting is the trait of ..... Disorder

a. Borderline personality disorder
b. Passive aggressive personality
c. Dependent personality disorder
d. Narcissistic personality disorder

Explanation: It is the characteristic of borderline personality disorder. It arises from their lack of achievement of object constancy and is manifested by an inability to integrate and accept both positive and negative feeling.

460. Schizotypal personality disorder exhibit .....

a. Paranoid thoughts
b. Inappropriate/constricted affect
c. Odd thinking and speech
d. All of the above

Explanation: Schizotypal personality disorder (STPD) is a personality disorder characterized by all the above-mentioned signs and symptoms.

461. Disorientation is most evident in .....

a. Organic brain damage
b. Paranoid schizophrenia
c. BPAD
d. OCD

Ans.

459.	a
460.	d
461.	a

Scanned with CamScanner

Explanation: A person with dementia (organic brain syndrome) is usually disoriented in terms of time and space, and has incoherent thoughts and speech.

462. Sheldon's classification of personality includes
a. Ectomorphs
b. Endomorphs
c. Mesomorphs
d. All of the above

Explanation: All the above-mentioned components are the part of Sheldon's classification of personality.

463. Narcissistic personality disorder is characterized by
a. Callous unconcern for feelings of others
b. Self-dramatization, theatrically
c. Ideas of grandiosity and inflated sense of self-importance
d. Significant and persistent disturbances of identity of self

Explanation: Ideas of grandiosity and inflated sense of self-importance are the characteristic of narcissistic personality.

464. Characteristic of schizoid personality disorder is
a. Rigid and controlling
b. Submissive and immature
c. Arrogant and attention seeking
d. Introverted and emotionally withdrawn

Explanation: These clients show social inadequacy and lack of emotional contact with others.

465. Characteristic of histrionic personality is:
a. Dramatic and theatrical
b. Boastful and egocentric
c. Rigid and perfectionistic
d. Aggressive and manipulative

Explanation: Client with histrionic personality draw attention to themselves and demonstrate emotionally and attention-seeking behavior

466. People with anti-social personality have difficulty in relating to others because:
a. Will not count on others
b. Cannot empathize with others
c. Never learned to be dependent on others
d. Have difficulty in communicating socially with others

Explanation: People with anti-social behavior lack ego and super-ego that controls behavior. These people have little or no concern for others.

467. Which of the following intervention is appropriate for handling a patient with an antisocial personality?
a. Ignore the patient
b. Agree with the patient's demands
c. Set limits with patient
d. Be friendly with patient

468. Lack of self-esteem, strong dependency needs and impulsive behavior are characteristics of:
a. Schizoid personality disorder
b. Paranoid personality disorder
c. **Borderline personality disorder**
d. Narcissistic personality disorder

469. The primary treatment for dissociative identity disorder is:
a. Individual psychodynamic psychotherapy
b. Narcoanalysis
c. Cognitive therapy
d. Group psychotherapy

470. Which of the following is a type of dissociative disorder?
a. Panic anxiety disorder
b. Trans and possession disorder
c. Acute stress disorder
d. Obsessive compulsive disorder

471. A naive, inappropriate lack of emotion or concern for the perceptions by others of one's disability is known as:
a. Apathy
b. La belle indifference
c. Déjà vu
d. Jamme vu

472. In which of the following disorders the "La belle indifference" is a typical feature?
a. Post-traumatic stress disorder
b. Dissociative disorders
c. Phobic disorders
d. Mood disorders

473. Insensitive to others, no sense of remorse and abusive behaviors towards others are characteristics of:
a. **Antisocial personality**
b. Paranoid personality
c. Schizoid personality
d. Narcissistic personality

474. Derealization and Depersonalisation seen in which type of disorder? *(JIPMER 2012)*
a. Dissociative disorder
b. Personality disorder
c. Mania
d. None

475. Person who is kind, quiet, submissive, sympathetic and gloomy has: *(Kerala PSC, Nov 2014)*
a. Melancholic personality
b. Narcissistic personality
c. Cyclothymic personality
d. Histrionic personality

476. While providing care to a patient with antisocial personality, which of the following intervention is appropriate?
a. Focuses on group, not individual therapy
b. Provide an organized and structured environment
c. Withdraw basic privileges until showing positive response to treatment
d. Recognizes that the disorder is a form of social withdrawal

477. Which of the following assessment information is most important for a nurse to collect while assessing a patient with a personality disorder?
a. A family history of sexual abuse
b. Number of close friends
c. Ability to form close relationship
d. History of substance abuse

478. Narcissistic personality disorder is characterized by
a. Unconcern for feelings of others
b. Ideas of grandiosity and inflated sense of self-importance
c. Self- dramatization
d. Disassociation

479. The characteristics of schizoid personality disorder includes
a. Dramatic, emotional, and suspicious behavior
b. Shy, quiet, passive, daydreaming, and introverted
c. Self-centric and maladjustment
d. Suspicious ideas and mistrust

480. The most prominent characteristics of a person with borderline personality disorder is
a. Paranoid thinking
b. Instability in personal relationships
c. Mistrust
d. Antisocial activity

481. All of the following are Cluster-A personality disorders except *(JIPMER 2005)*
a. Paranoid
b. Schizoid
c. Schizotypal
d. Histrionic

482. Most effective treatment in borderline personality disorders is *(JIPMER 2012)*
a. Pharmacotherapy
b. Behavior therapy
c. Combination of both pharmacotherapy and behavioral therapy
d. None

483. In schizoid personality disorder all are seen except *(JIPMER 2013)*
a. Aloof and detached
b. Prone to fantasy
c. Suspicious
d. Introspective

484. Lifelong theatricality of behavior is seen in *(JIPMER 1992)*
a. Obsessive personality
b. Schizoid personality
c. Hysterical personalities
d. Avoidant personalities

485. Which of the following is a Cluster C personality disorder? *(JIPMER 2012, 2013)*
a. Avoidant personality disorder
b. Histrionic personality disorder
c. Paranoid personality disorder
d. Narcissistic personality disorder

486. Anti-social personality disorder is characterized by *(JIPMER 2014)*
a. Excessive sensitivity and suspiciousness
b. Emotional coldness, lack of pleasure
c. Unconcern for feeling of others, disregard for social norms
d. Self-dramatization, exaggerated expression of emotions

487. All are cluster B disorders of personality except *(JIPMER 1999)*
a. Antisocial
b. Narcissistic
c. Avoidant
d. Borderline

488. Characteristic feature of Schizoid personality is *(JIPMER 1999)*
a. Conversion reaction
b. Not concerned with disease
c. Checks details of all things
d. Emotional coldness

489. Antisocial personality is seen with *(JIPMER 1999)*
a. Drug abuse
b. Paranoid schizophrenia
c. OCN
d. None

MOOD DISORDERS

490. 'Omega sign' is seen in which of the following? *(AIIMS BPL NO 2018)*
a. Anxious patient
b. Depressed patient
c. Deluded patients
d. Negativistic patient

Explanation: Omega sign is a sign in melancholia (depression) in which the patients have a furrowed brow due to sustained contraction of the corrugator muscle, often accompanied by Veraguth's folds, a finding likened to the Greek letter omega

Figure: Omega sign seen in depressed patients

491. Behavioral clues of impending suicide are as follows EXCEPT *(ESIC 2019)*
a. Gives away valuable possessions
b. Becomes energetic after a period of severe depression
c. Withdraws from social activities and plans
d. Hypervigilance and exaggerated startle response

Explanation: The behavioral clues for impending suicide include:

- **Gives away valuable possessions.**
- **Becomes energetic after a period of severe depression**
- **Withdraws from social activities and plans**
- Farewell quotes and letters
- Avoid taking serious decisions

492. The most significant characteristics experienced by a patient with depression is: *(ESIC 2015)*
a. Aggressive, abusive or violent behavior
b. Hypervigilance and nightmares.
c. Lack of impulse control
d. Depressed mood and loss of pleasure or interest

Explanation:

- **Aggressive, abusive, violent behavior and lack of impulse control** are feature of mania. **Hypervigilance and nightmares** are the feature of anxiety disorders and/or paranoid schizophrenia. **Lack of impulse control:** is common among manic patients.
- **Strategy:** Use the key word 'depression' to find out the answer. Depression is the key term which is common in stem and in option 'D'.

493. Clients with the diagnosis of bipolar disorders, manic episode, most likely will exhibit signs of: *(RAK MSc 2015)*
a. Passivity
b. Dysphoria
c. Anhedonia
d. Grandiosity

Scanned with CamScanner

Explanation:

- As per ICD-10 diagnostic criteria, mania is the episode which should last for at least 1 week and should be severe enough to disrupt ordinary work and social activities more or less completely. The mood change is usually accompanied by increased energy, pressure of speech, decreased need for sleep, **grandiosity**, and excessive optimism (opposite to passivity).
- All other given symptoms are characteristics of patient with depression.

494. Which of the following is exhibited by a mother with postpartum depression? *(Daman and Diu NO 2018)*

a. Hallucinations
b. Delusions
c. Uncontrolled crying
d. Confusion

Explanation:

- Postpartum depression (PPD), also called postnatal depression, is a type of mood disorder associated with childbirth. Symptoms may include extreme sadness, low energy, anxiety, crying episodes, irritability, and changes in sleeping or eating patterns.
- Hallucinations, delusion and confusion are seen in postpartum psychosis

495. The hallucination in which the content is consistent with either a depressed or manic mood is called: *(AIIMS Raipur Grade II 2017)*

a. Somatic hallucination
b. Mood - congruent hallucination
c. Mood - incongruent hallucination
d. Haptic hallucination

Explanation: Mood congruent hallucination refers to hallucination whose content represents or reflects the mood state of the individual. Mood congruence is a psychotic symptom of bipolar disorder. Mood incongruence is a psychotic feature of the disease wherein the person's belief or action, whether by hallucination or delusion, does not match with his or her mood. Haptic hallucination is the sensation of touch mostly seen in alcoholic delirium tremens. Somatic hallucination is the perception of a physical experience occurring within the body.

496. A clinical feature of patient with major depression includes: *(AIIMS Raipur Grade II 2017)*

A. Psychomotor agitation
B. Insomnia
C. Feelings of worthlessness
D. Increased libido

a. A, B, C
b. B, C, D
c. A, B, D
d. A, C, D

Explanation: As per DSM IV criteria for major depressive disorder are 5 more of the following symptoms present during the same 2-week period and represent a change from previous functioning.

1. Depressed mood most of the day
2. Markedly diminished interest or pleasure in all activities
3. Significant weight loss when not dieting or weight gain
4. Insomnia or hypersomnia every day
5. Psychomotor agitation or retardation
6. Fatigue or loss of energy every day
7. Feelings of worthlessness or inappropriate guilt
8. Diminished ability to think and concentrate
9. Recurrent thoughts of death

497. The most significant causative factor of depression is:

a. Family environment
b. Chemical imbalance
c. Social environment
d. Hereditary

Explanation: Mental disorders, such as depression and anxiety, are caused by a chemical imbalance in the brain. The hypothesis is sometimes called the chemical imbalance hypothesis or chemical imbalance theory. Imbalances in serotonin, particularly relative to norepinephrine and dopamine, are common causes of certain types of depression.

498. Which of the following is NOT a characteristic of Endogenous Depression? *(AIIMS Bhopal Nursing officer, 2018)*

a. Feeling of more sadness during morning
b. Having suicidal tendency
c. A better feeling when in solitude
d. Feeling of more sadness during evening

Explanation: Feeling of more sadness during evening is not the characteristic of endogenous depression. Feeling sadness in the morning is the characteristic of endogenous depression.

499. Which of the following neurotransmitter is deficient in depression? *(AIIMS)*

a. Serotonin
b. 5 HT
c. Both A and B
d. GABA

Explanation: Serotonin or 5 HT (5-hydroxytryptamine) is a excitatory neurotransmitter. Deficiency of these neurotransmitter found to cause depression.

500. Which of the following is the most lethal method of suicide?

a. Wrist cutting
b. Taking poison
c. Use of gun
d. Drowning

Explanation: Lethality method of suicide is determined based on the amount of time that occurs between initiating the attempt and the lethal impact of the method. Out of the given options above, use of gun is most lethal.

501. All of the following are neurotic disorders, except:

a. Panic anxiety
b. Delirious mania
c. Conversion reaction
d. Depersonalization

Explanation: Delirious mania is a severe but under-recognized neuropsychiatric syndrome characterized by the rapid onset of delirium, mania, and psychosis, not associated with a prior toxicity, physical illness, or mental disorder.

502. Common risk factor in patient with severe depression is *(DSSSB 2013)*

a. Fatigability
b. Hallucinations
c. Agitation
d. Suicidal tendency

Explanation: Suicidal ideation is generally associated with mood disorders such as depression. Depression alone can cause suicidal thoughts and behavior. Suicidal risk assessment of patients diagnosed with depression is an important nursing intervention.

Ans.

494.	c
495.	b
496.	a
497.	b
498.	d
499.	c
500.	c
501.	b
502.	d

Scanned with CamScanner

503. Mania is a type of *(DSSSB 2013)*

a. Thought disorder
b. Dissociative disorder
c. Mood disorder
d. Neurotic disorder

Explanation: Mania is an abnormally elated mental state, typically characterized by feelings of euphoria, lack of inhibitions, racing thoughts, diminished need for sleep, talkativeness, risk taking, and irritability. In extreme cases, mania can induce hallucinations and other psychotic symptoms.

504. Which of the following comments, if made by a patient who has major depression would indicate an increased risk of suicide? *(RAK MSc Entrance 2010)*

a. I don't want to share my problem with any one
b. I won't be a problem much longer
c. my family members are not giving me the medication daily
d. I don't have any plan to kill my self

Explanation: Option B indicated the patient is having suicidal ideas and nurse need to intervene immediately.

505. The type of delusion commonly seen in depression is/are:

a. Delusion of Nihilism
b. Delusion of poverty
c. Delusion of persecution
d. All of the above

Explanation: All the above-mentioned delusions are apparent in depression.

506. Identify the correct statement regarding suicide

a. Suicidal people have definitive clues and warning about their plan
b. Suicidal people are ambivalent about their feelings
c. Suicidal thoughts are only for limited period of time
d. All of the above

Explanation: All of the above statements are true regarding suicidal thought in an individual.

507. How agitation in a disturbed client can be minimized? *(JIPMER)*

a. Communicate to the client regarding his problem
b. Limiting unnecessary interaction
c. Involve the client in psychotherapies
d. Encourage the family members to interact with the client

Explanation: Agitation can be minimized by reducing the environmental stimuli and with limited interaction to the client.

508. Most appropriate nursing intervention for a client who has a history of suicidal attempt and currently on suicidal tendency is

a. Give him privacy
b. Allow him to urinate
c. Open the window and allow him to get some fresh air
d. Observe him continuously

Explanation: Continuous nursing observation is regularly involved for patient at risk of suicide. Providing privacy will affect observation. Other interventions are not appropriate for suicidal client.

509. Which of the following actions should the nurse take first following a violent episode in a psychiatric unit? *(RAK MSc Entrance 2010)*

a. Restrain the client
b. Administer sedatives
c. Call physician
d. Call hospital security

Explanation: During a violent behavior in psychiatric unit, first nursing responsibility is to call the hospital security.

510. In major depression the neurotransmitter deficient is .....

a. Acetyl choline
b. GABA
c. Serotonin
d. Dopamine

Explanation: Serotonin is neurotransmitter which is deficient in major depression.

511. Go through the following statement and identify the most appropriate one for depression.

a. Causes may include chemical imbalance in the brain and stressful life events
b. Dysthymia is also a type of depressive disorder.
c. Includes symptoms such as loss of interest, sadness, weight loss and worthless feelings
d. All of the above

Explanation: As per WHO, depression is a common mental disorder, characterized by sadness, loss of interest or pleasure, feelings of guilt or low self-worth, disturbed sleep or appetite, feelings of tiredness and poor concentration. Dysthymia is known as persistent mild depression. Causes include imbalance in neurotransmitters (serotonin) and stressful life events.

512. A client with manic phase of BPAD exhibits

a. Passivity
b. Dysphonia
c. Anhedonia
d. Grandiosity

Explanation: Grandiosity is the most commonly seen behavior in the manic phase of BPAD.

513. Extremely depressed clients are anticipated to perform well in settings where they_____

a. Have support from someone
b. Do routine activities
c. Have somebody to assist
d. Have varied daily activities

Explanation:

- For a patient with severe depression, the setting where there are simple daily routines are followed will be least stressful and anxiety producing.
- **Elimination Tips:** Eliminate Option A and C because both are seeming to be very similar. None of the two similar options may be right answer.

514. Most common psychiatric illness seen in majority in India is

a. Mania
b. Depression
c. Schizophrenia
d. OCD's

Scanned with CamScanner

515. **Most common psychiatric disorder is:**
   a. Dementia
   b. Schizophrenia
   c. Depression
   d. Paranoia

516. **Which of the following would be the most appropriate cognitive intervention for a client with major depressive disorder?**
   a. Promote active socialization with other patients
   b. Role play to increase assertiveness skills
   c. Focus on identifying strengths and accomplishments
   d. Encourage journaling of underlying feelings

517. **Which of the following symptoms is NOT a sign of depression?**
   a. Disrupted sleep
   b. Lethargy
   c. Worthlessness
   d. Uninhibited socialization

518. **Pyromania is a type of** *(JIPMER 2005; 2003)*
   a. Phobia
   b. Impulse
   c. Delusion
   d. Obsession

519. **Elevated mood with increased psychomotor activity is a characteristic feature of:** *(JIPMER 2015)*
   a. Mania
   b. Euphoria
   c. Bipolar Disorder
   d. Dysthymia

520. **Which of the following is not a symptom of depression?** *(JIPMER 2015)*
   a. Loss of interest in daily activities
   b. Delusion of guilt
   c. Suicidal ideas
   d. Delusion of grandiosity

521. **Which of the following is the priority nursing diagnosis for the patient with BPAD who exhibits extreme excitement, delusion and command hallucinations?**
   a. Impaired social interaction
   b. Altered sensory perception
   c. Risk for other-directed violence
   d. Altered thought process

522. **The most common psychiatric disorder seen in Indian population?**
   a. Schizophrenia
   b. Personality Disorder
   c. Endogenous depression
   d. BPAD

523. **The neurotransmitter believed to be associated with Bipolar Disorder is**
   a. GABA
   b. Norepinephrine
   c. Serotonin.
   d. Acetylcholine

524. **Neurotransmitters elevated in manic episode are**
   a. Acetylcholine and serotonin
   b. Norepinephrine and dopamine
   c. GABA and dopamine
   d. Serotonin and GABA

525. **Structural and functional abnormalities in which of the following part of brain is associated with Major Depression?**
   a. Amygdala
   b. Brain stem
   c. Pituitary gland
   d. Cerebrum

526. **Which of the following type of diet is recommended for a patient with manic episode?**
   a. High-fiber diet
   b. Liquid diet
   c. Finger foods
   d. High Calorie diet

527. **Most appropriate intervention to manage manipulative behavior of a manic patient is to**
   a. Set limits on patient behavior
   b. Reduce environmental stimuli
   c. Punish the patient for inappropriate behaviors
   d. Engage patient in physical activities

528. **Grandiose delusions are associated with**
   a. Manic disorder
   b. Obsessive compulsive disorder
   c. Schizophrenia
   d. PTSD

529. **Helplessness, hopelessness and worthlessness are the characteristic features of**
   a. BPAD with mania
   b. Paranoid schizophrenia
   c. Depression
   d. Acute stress disorder

530. **Hyperactive behavior of an manic patient can be best channelized by**
   a. Engaging in a writing activities
   b. Engage patient in aerobic exercise
   c. Engaging in craft activities
   d. Engaging in activities which requires intellectuality

531. **Risk of suicide is high in patients with**
   a. Mania
   b. Major depression
   c. Paranoid schizophrenia
   d. Substance abuse

532. **Prevalence of suicide is high among patients with** *(JIPMER 2008)*
   a. Schizophrenic disorders
   b. Neurotic stress related disorders
   c. Personality disorders
   d. Mood disorders

533. **Which of the following disorder is classified under mood disorders?**
   a. Neurosis
   b. OCD
   c. Schizophrenia
   d. Mania

534. **All of the following symptoms are characteristics of mania EXCEPT**
   a. Grandiosity
   b. Suicidal ideas
   c. Hyperactivity
   d. Flight of ideas

535. **Which of the following activities can be suggested by a nurse for a patient with manic behavior?**
   a. Playing chess
   b. Playing carom
   c. Solitary activity (writing)
   d. Hammering on metal (Jewelry making)

536. **A mild form of bipolar disorder, in which a person has mood swings over a period of years that go from mild depression to mild elation is known as:**
   a. Dysthymic Disorder
   b. Cyclothymic Disorder
   c. Conversion disorder
   d. Multiple personality disorder

537. **A mood disorder that consists of the same cognitive and physical problems as in depression, with less severe but longer-lasting symptoms is known as**
   a. Melancholia
   b. Dysthymic Disorder
   c. Cyclothymic disorder
   d. Bipolar affective disorder with depression

538. In Bipolar II Disorder, hypomanic episodes alternate with periods of
a. Hyperventilation.
b. Major depressive disorders
c. Elation and euphoria
d. Obsession and compulsion

539. The significant neurotransmitter that is believed to be involved in major depression is:
a. Serotonin
b. Dopamine.
c. Acetylcholine
d. GABA

540. Stimulation of which of the nerve leads to elevated mood? *(JIPMER 2009)*
a. Optic
b. Olfactory
c. Trochlear
d. Vagus

541. Which of the following is not true about major depressive disorder? *(JIPMER 2003)*
a. Commonly seen in females
b. Recovery is complete after treatment
c. Associated with hypothyroidism
d. Family history of major depression

542. A 25-year-old woman complains of intense depressed mood for 6 months with inability to enjoy previously pleasurable activities. This symptom is known as *(JIPMER 2005)*
a. Anhedonia
b. Avolition
c. Apathy
d. Amotivation

543. An example of hybrid disorder is
a. Borderline personality disorder
b. Eating disorder
c. Paranoid personality disorder
d. Mixed-anxiety depressive disorder

544. Feeling of sadness and irritability is referred as:
a. Dysphoria
b. Anhedonia
c. Cyclothymia
d. Dysthymia

545. The best way to assess suicidal risk of a patient is by:
a. Indirectly asking for the clues
b. Directly question the patient on suicidal thoughts
c. Observe for cues
d. None of the above

546. Which of the following takes priority while planning care plan for a patient with suicidal risk?
a. Safety
b. Sleep
c. Self-esteem
d. Elimination

547. Recurrent suicidal tendencies are seen in: *(JIPMER 2009)*
a. Schizophrenia
b. Severe depression
c. Borderline personality disorders
d. All of the above

548. Suicidal tendencies are least common with *(JIPMER 2013)*
a. Alone
b. Depression
c. Male
d. Married person

549. Incidence of suicide in India is:
a. 10-11/1000 population
b. 10-11/10000 population
c. 10-11/100000 population
d. 10-11/1000000 population

550. Most common mental disorder as a cause of suicide: *(JIPMER 2002; 2003)*
a. Mania
b. Depression
c. Alcohol dependence
d. Schizophrenia

551. What is most common method of suicide in India according to National Crime Records Bureau 2014? *(JIPMER 2015)*
a. Hanging
b. Drowning
c. Poisoning
d. Fall from height

552. Which of the following intervention is appropriate for a patient with depression?
a. Limiting interpersonal interaction
b. Protecting the client against harm to others.
c. Providing motor outlets for feelings.
d. All of the above

553. The appropriate nursing intervention for a patient acting out aggression is
a. Maintain low level of stimuli in the environment
b. Verbal de-escalation
c. Remove all dangerous objects from the patient environment
d. All of the above

554. The Psychological disorder most commonly associated with myxoedema
a. Mania
b. Depression
c. Phobia
d. Paranoia

555. "Learned helplessness" is typically seen in:
a. Delirium
b. Dementia
c. Schizophrenia
d. Depression

556. Phototherapy is used in which Psychiatric illness?
a. Involutional melancholia
b. Seasonal mood disorder
c. Masked depression
d. Bipolar depression

NEUROTIC, STRESS-RELATED AND SOMATOFORM DISORDERS

557. A client is experiencing anxiety attack. The most appropriate nursing intervention should include: *(Safdarjung NO 2018)*
a. Turning on the television
b. Leaving the client alone
c. Staying with the client and speaking in short sentences
d. Ask the client to play with other clients

Explanation:
- Nursing interventions during anxiety include Using short sentence, Staying with the client, Decreasing stimuli, Remaining calm, and medication administration.
- Leaving client alone, turning on television and play with other may exaggerate the anxiety of the client.

558. All of the following conditions are included in somatoform disorder, EXCEPT
a. Conversion disorder
b. Body dysmorphic disorder
c. Pain disorder
d. Anorexia Nervosa

Explanation: Somatoform disorders are characterized by recurrent multiple somatic complaints which are not accounted for by any underlying physical illness. Somatoform disorders include conversion disorder, somatization disorder, hypochondriasis, body dysmorphic disorder and pain disorder. Anorexia nervosa is a type of eating disorder.

559. La Bella indifference is related to ..... *(RPSC Nursing tutor 2009)*

a. Body dysmorphic disorder
b. Pain disorder
c. Somatization disorder
d. Conversion disorder

Explanation: La Bella indifference is related to conversion disorder. It is a symptom of conversion disorder in which there is a relative lack of concern that is out of keeping with the severity of impairment

560. Mental illnesses that cause bodily symptoms, including pain and the symptoms can't be traced back to any physical cause is known as.....

a. PTSD
b. Obsessive- compulsive disorder
c. Somatoform disorder
d. Dissociative disorder

Explanation: Somatoform disorders are mental illnesses that cause bodily symptoms, including pain. The symptoms cannot be traced back to any physical cause and they are not the result of substance abuse or another mental illness. People with somatoform disorders are not faking their symptoms. The pain and other problems they experience are real. The symptoms can significantly affect daily functioning.

561. The level of anxiety that enhance the individual's power of perception is known as

a. Mild
b. Panic
c. Moderate
d. Severe

Explanation: Mild anxiety enhances the perception while higher level of anxiety interferes with one's functioning.

562. Identify common motor symptoms in conversion disorder

a. Paralysis
b. Impaired balance
c. Double vision
d. All of the above

Explanation: Conversion disorder involves symptoms or deficits affecting voluntary motor or sensory function. Common examples of conversion symptoms include blindness, diplopia, paralysis, dystonia, psychogenic nonepileptic seizures (PNES), anesthesia, aphonia, amnesia, dementia, unresponsiveness, swallowing difficulties, motor tics, hallucinations, pseudocyesis and difficulty in walking.

563. Which of the following is the most appropriate intervention when the patient is experiencing anxiety attack?

a. Leave the client alone for sometime
b. Stay with the patient and speak in short sentences
c. Encourage client to engage in group activities with other patients
d. Turn on the television and play music video of patient's choice

Explanation: Decreasing stimuli, remaining calm, medication administration, staying with the client and talk in short sentences are the appropriate nursing interventions for the patient having anxiety attack.

564. While assessing a client with generalized anxiety disorder, which among the following is the best indicator of client's present situation?

a. Memory
b. Behavior
c. Judgment
d. Responsiveness

Explanation: Client's current behavior is the best indicator of client's present situation.

565. Physical symptom which is present in panic attack is .....

a. Sweating and palpitation
b. Seizure
c. Vomiting
d. Restlessness

Explanation: Sweating and palpitations are the signs and symptoms associated with panic attack.

566. The stage which keeps an individual physically alert to face the danger arising out of stress is termed: *(DSSSB PHN, 2015)*

a. Adjustment reaction
b. Stage of resistance
c. Exhaustion stage
d. Alarm reaction

Explanation: There are three stages in General Adaptation Syndrome.

- **Alarm reaction stage:** The alarm stage is also known as the fight or flight stage. The person is physically alert and the sympathetic nervous system is stimulated. There is increased heart rate and blood supply to arms and legs.
- **Resistance stage:** After initial shock of stressful event, the body begins to resist. The parasympathetic system attempts to bring physiological functions to normal level
- **Exhaustion stage:** If the stressor continue beyond the body's capacity, the resources get exhausted and the body is susceptible for disease and eventual death.

567. Loss of personal identity and wandering away from psychiatric hospital is referred as: *(JIPMER 2015)*

a. Fugue
b. Split personality
c. Possession state
d. Trance state

568. Anxiety expressed through physical symptoms is: *(JIPMER 2012)*

a. Depersonalization
b. Sublimation
c. Regression
d. Hypochondriasis

569. Stress is always ..... of the client

a. Adaptation
b. Life style
c. Perception
d. Tolerance

570. State of apprehension arising out of anticipation of danger is referred as

a. Phobia
b. Amnesia
c. Anxiety
d. Obsession

571. The neurotransmitter associated with anxiety is

a. GABA
b. Acetylcholine
c. Dopamine
d. Serotonin

572. A condition wherein the individuals have overwhelming fear that they are suffering from a physical illness despite no medical evidence of illness, is known as:

a. Generalized anxiety disorder
b. Conduct disorder
c. Hypochondriasis
d. Dissociative disorder

573. The symptoms of conversion disorder includes all of the following EXCEPT

a. Neurological symptoms
b. Altered motor and sensory function
c. Stress exacerbated symptoms
d. Lack of insight

574. A sudden unexpected travel away from home/work place with inability to recall one's past is called
a. Possession disorder
b. Dissociative fugue
c. Selective amnesia
d. Multiple personality disorder

575. Which of the following is a characteristic feature of hysterical fits?
a. Tongue bite is absent
b. It usually occurs in unsafe places
c. It usually occurs in the absence of people
d. Incontinence of urine occurs

576. When psychological distress causes physical symptoms, the condition is known as:
a. Hypochondiasis b. Hysteria
c. Somatization disorder d. Dissociative disorder

577. Which of the following is not an anxiety reduction technique? *(JIPMER 2010)*
a. Using anxiolytics
b. Biofeedback techniques
c. Implosion of flooding techniques
d. Jacobson progressive muscle relaxation

578. Features of anxiety neurosis are following except: *(JIPMER 1998, 2007)*
a. Excessive sweating
b. Palpitations
c. Loss of consciousness
d. Tremors

579. Most common form of dissociation hysteria is: *(JIPMER 1998)*
a. Fugue b. Amnesia
c. Multiple personality d. Somnambulism

580. Thyrotoxicosis is most commonly associated with: *(JIPMER 1993)*
a. Anxiety b. Paranoid states
c. Mania d. Delirium

581. Anxiety is *(JIPMER 2012)*
a. Neurosis b. Psychosis
c. Personality disorder d. None

582. Differentiation of hysterical fits from epileptic fit: *(JIPMER 1995, 1999, 2001, 2004, 2006)*
a. Occurs in sleep
b. Injuries to person
c. Incontinence
d. Occurs when people are watching

583. Dissociative fugue is characterized by: *(JIPMER 2012)*
a. Wandering away from home
b. Irreversible amnesia
c. Gradual recovery
d. Normal recall

584. Hypochondriasis is *(JIPMER 1994)*
a. Fear of fatal disease
b. To much concern of own health and misinterpretation of normal body function
c. Marked mental and Physical fatigue
d. Repeated hospitalization

585. A 45-year-old male presents with history of headache, and vague body pains, off and on diarrhea and constipation, Impotence and tingling and paresthesia in glove stocking pattern. The probable diagnosis is *(JIPMER 2000; 2002)*
a. Hypochondriasis b. Somatization disorder
c. Conversion disorder d. Factitious disorder

586. Uncertainty and excessive sense of responsibility is seen in *(JIPMER 2015)*
a. OCD
b. Depression
c. Personality disorder
d. Generalized anxiety disorder

587. Diagnostic interview with sodium amytal or hypnosis is a special feature of: *(AIIMS BPL SNO, NO 2018)*
a. Post-traumatic neurosis
b. Mania
c. Hyperventilation syndrome
d. Phobia

Explanation: Therapeutic indications of amytal interviews include the abreaction of traumatic neurosis, recovery of memory in amnesic and fugue states, and recovery of function in conversion disorders. Amytal interviews have a valid role in the assessment and initial management of catatonia, hysterical stupor, and unexplained muteness as well as in distinguishing between depressive, schizophrenic, and organic stuporous states.

588. Which among the following information is required by the nurse to make the client return to pre-crisis level of functioning?
a. Full knowledge regarding the event
b. Family support system
c. Social support system
d. Personal strength of the client

Explanation: Information regarding the personal strength and weakness is necessary to make the client return to pre-crisis phase of functioning.

589. Cognitive manifestation of stress includes.....
a. Inability to concentrate
b. Higher level of anxiety
c. Obsessive thoughts
d. All of the above

Explanation: Cognitive manifestation of stress include:
- Constant worrying
- Racing thoughts
- Forgetfulness and disorganization
- Inability to focus/concentrate
- Poor judgment
- Being pessimistic or seeing only the negative side
- Obsessive thoughts and
- Higher level of anxiety

590. The symptom that differentiate PTSD from other anxiety disorder is
a. Avoidance similar situation that cause stress
b. Depression and a blunted affect when discussing the traumatic situation
c. Lack of interest in family and others
d. Bring back memories of the trauma accompanied by intense emotional and physical reactions.

Explanation: Post-traumatic stress disorder (PTSD) is a mental health condition that's triggered by a terrifying event — either experiencing it or witnessing it. Symptoms may include flashbacks, nightmares and severe anxiety, as well as uncontrollable thoughts about the event.

591. **Screening family members for PTSD after a major disaster comes in ..... level of prevention**
   a. Primordial
   b. Primary
   c. Secondary
   d. Tertiary

Explanation: Early identification and treatment comes under secondary prevention. So, screening after PTSD will be secondary prevention.

592. **Which of the following is the correct sequence of stages of General Adaptation Syndrome?**
   a. Alarm – Exhaustion - Resistance
   b. Alarm – Resistance – Exhaustion
   c. Resistance - Alarm – exhaustion
   d. Exhaustion – alarm – resistance

593. **The emotional state an individual experience to the loss of loved object is:**
   a. Grief
   b. Mourning
   c. Bereavement
   d. Agony

594. **Release of feelings that takes place by talking about an emotionally charged areas is:**
   a. Clarification
   b. Abreaction
   c. Suggestion
   d. Exploration

595. **Panic attack is characterized by all except:** *(JIPMER 2001)*
   a. Fear of dying
   b. Visual hallucinations
   c. Choking sensation
   d. Fear of losing control

596. **True for PTSD are all except:**
   a. Past h/o psychiatric illness
   b. Women are more predisposed
   c. Occur in intellectuals
   d. Numbness

597. **Drug of choice for Panic Disorder is:** *(JIPMER 1994)*
   a. Fluoxetine
   b. Lithium
   c. Diazepam
   d. Chlorpromazine

598. **Post-traumatic stress disorder, treatment of choice is** *(JIPMER 2014)*
   a. Cognitive behavior therapy
   b. Hypnosis
   c. Rational emotive therapy
   d. Eye movement desensitization and reprocessing

599. **Which of the following is the priority nursing action for a patient who experiencing acute panic attack?**
   a. Remain with the client and encourage physical activity
   b. Encourage low, deep breathing
   c. Reduce external stimuli
   d. Teach coping measures

600. **Reaction of an individual to a significant loss is known as:**
   a. Coping
   b. Grief
   c. Distress
   d. Disequilibrium

601. **In patient with Post-traumatic Stress Disorder (PTSD), the most common factor associated with disturbed sleep pattern is**
   a. Drinking alcohol at bed time
   b. Persistent dreams of the traumatic event
   c. Apprehension of being harmed while asleep
   d. None of the above

602. **Four months after a traumatic incident, Mr X is re-experiencing flashbacks of incident, insomnia and depression. He is most likely to be suffering with:**
   a. Conversion disorder
   b. Acute stress disorder
   c. Post-traumatic stress disorder
   d. Hysteria

603. **Sudden attacks of anxiety accompanied by a fear of serious consequence such as a heart attack is a characteristic feature of:**
   a. Acute stress disorder
   b. Phobic disorder
   c. Panic disorder
   d. PTSD

604. **Post-Traumatic stress syndrome is due to:** *(JIPMER 1998)*
   a. Head Injury
   b. CVD
   c. Minor Stress
   d. Major Life threatening events

605. **A 20-year-old female complains of sudden onset palpitation and apprehension. She is sweating for last 10 minutes and fears of impending death. Diagnosis is** *(JIPMER 2001)*
   a. Hysteria
   b. Generalized Anxiety Disorder
   c. Cystic fibrosis
   d. Panic attack

606. **Which of the following is NOT true about sleep?** *(AIIMS-BBS SNO 2019, Daman and Diu NO 2018)*
   a. It consists of REM and non-REM sleep.
   b. Sleep cycles are controlled by the suprachiasmatic nucleus.
   c. Most growth hormones are produced during stage 3 and 4 of sleep
   d. Dreams occur during non-REM sleep

Explanation: REM means Rapid eye movements and non-REM means non rapid eye movements. REM sleep first occurs about 90 minutes after falling asleep. Most of the dreams occur during REM sleep.

607. **All are true regarding REM sleep EXCEPT:**
   a. Frequent and rapid movement of the eyes.
   b. Difficult to arose.
   c. It is also known as Synchronized or 'S' sleep.
   d. It is associated with dream.

Explanation:

Stages of sleep
- Stages of sleep are defined based on the patterns of EEG (Electroencephalogram)
- Non Rapid Eye Movement (NREM) sleep (Orthodox sleep or Synchronized or 'S' sleep)
- Rapid Eye Movement (REM) sleep (paradoxical sleep or Desynchronized or 'D' sleep)

Non Rapid Movement (NREM) Sleep
- Further divided into Stage 1, Stage 2, Stage 3, and Stage 4 sleep

EEG
- Stage 1: Theta waves (hypnogogic state)
- Stage 2: Theta waves (Sleep Spindles)
- Stage 3: Delta waves
- Stage 4: Delta waves **(bed wetting, Night terrors, sleep walk/talk)**

Rapid Eye Movement (REM) sleep
- After 90 minutes after sleep onset → 1st REM episode

EEG: Mimic beta waves

Associated with dreaming
- Difficult to arose
- Increased/Irregular HR, RR and BP
- Penile erection or clitoris engorgement
- Muscle twitches

608. The sleep stage at which majority of the dreams appears is *(ISRO)*
a. Stage 1 NREM sleep
b. Stage 2 NREM sleep
c. Stage 4 NREM sleep
d. REM sleep

609. During a health teaching session regarding sleep hygiene among insomnia client nurse need to focus upon .....
a. Encourage day time nap
b. Exercise before going to bed
c. Use hypnotics
d. Avoiding caffeine-containing beverages

610. Disruptive sleep disorders that can occur during arousals from REM sleep or partial arousals from non-REM sleep is known as
a. Somnabulism
b. Parasomnia
c. Narcolepsy
d. Somnambulism

611. Gamophobia means.....
a. Fear of sound
b. Fear of marriage
c. Fear of social isolation
d. Fear of speed

Explanation: Fear of marriage is known as gamophobia

612. The acquisition of phobia can best be explained by which of the following model
a. Behavioral model
b. Tetrad model
c. Interpersonal model
d. Environmental model

Explanation: Phobias can be acquired by classical conditioning (behavioral model) by simply pairing the neutral stimulus with the potent stimulus.

613. Which of the following modality has highest success rate in client with phobia?
a. Systematic desensitization with relaxation technique
b. Insight therapy to determine the origin of anxiety and fear
c. Psychotherapy aimed at rearranging psychotic thought process
d. Psychoanalytic exploration of repressed conflict of an earlier developmental phase

Explanation: Highest success rate is present in systematic desensitization with relaxation therapy.

614. Which of the following condition is not a psychotic illness:
a. BPAD
b. Phobia
c. Depression
d. Schizophrenia

615. Agoraphobia is fear of *(JIPMER 2007; 2003; ESI IMO 2014)*
a. Agar
b. Strangers
c. Open spaces
d. Closed spaces

616. Patient of contamination phobia was asked by therapist to follow behind and touch everything he touches in patient's house. Therapist kept talking quietly and calmly all the time and the patient was asked to repeat the procedure twice daily. The procedure is:
a. Flooding
b. Modeling
c. Positive reinforcement
d. Aversion therapy

617. Definitive treatment of all types of phobia is: *(JIPMER 2008)*
a. Behavior therapy
b. Social therapy
c. Avoidance
d. Drug therapy

618. Irrational fear related to closed spaces is referred as: *(JIPMER 2015)*
a. Acrophobia
b. Agoraphobia
c. Claustrophobia
d. Nosophobia

619. A behavioral therapy of sudden, direct and maximum exposure to the fear producing stimulus: *(JIPMER 2015)*
a. Biofeedback
b. Flooding
c. Desensitization
d. Response prevention

620. Fear of high places is called: *(JIPMER 2014; Staff Nurse G II 2014)*
a. Agoraphobia
b. Algophobia
c. Acrophobia
d. Claustrophobia

621. Preoccupation with a fear of having a serious physical illness, not based on real or organic pathology is: *(JIPMER 2012)*
a. Hypochondriasis
b. Hypoesthesia
c. Psychosomatic disorder
d. Hypertonicity

622. Claustrophobia refers to fear of
a. Grapes
b. Closed spaces
c. Animals
d. Insects

623. Irrational fear of being in places away from home setting is referred as:
a. Agoraphobia
b. Claustrophobia
c. Acrophobia
d. Homophobia

624. Predominant evolutionary theory of phobias is:
a. Hypersensitivity
b. Biological preparedness
c. Learned responses
d. Fight or flight response

625. Social phobia can be treated with
a. Serotonin reuptake inhibitors
b. Mood stabilizers
c. Antipsychotic drugs
d. NSAIDs

626. Excessive daytime sleep is also known as
a. Narcolepsy
b. Enuresis
c. Insomnia
d. Somnambulism

627. All of the following psychiatric disorders are more prevalent in women than in men, EXCEPT
a. Social Phobia
b. Anorexia Nervosa
c. Depression
d. Transvestism

628. A person has poor performance in front of his seniors in public place, has tachycardia when he has to deliver a lecture, avoids going to parties. The diagnosis is *(JIPMER 1999)*
a. Panic disorder
b. Schizophrenia
c. Social Phobia
d. Avoidant Personality

629. True about NREM sleep is
a. Teeth grinding
b. Narcolepsy
c. Nightmares
d. Sleep paralysis

OBSESSIVE COMPULSIVE DISORDER (OCD)

630. Repetitive, uncontrollable thoughts and acts (E.g. Rituals, rigidity, inflexibility) is termed as: *(ESIC 2019)*
a. Ritualistic behavior
b. Phobias
c. Obsessive Compulsive Disorder
d. Apprehension

Ans.

Scanned with CamScanner

Explanation:

- Repetitive, uncontrollable thoughts and acts (E.g. Rituals, rigidity, inflexibility) is termed as Obsessive-compulsive disorder (OCD). Obsessive-compulsive disorder is characterized by unreasonable thoughts and fears (obsessions) that lead to compulsive behaviors (acts).
- Ritualistic behavior involves the performance of daily activities in the same manner each time.

631. Which is the best nursing intervention to meet the needs of individuals who demonstrate obsessive compulsive behavior? *(RAK MSc 2018)*

a. Restricting their movements
b. Calling attention to their behavior
c. Keeping them busy to distract them
d. Supporting but limiting their behavior

Explanation:

- Accepting these clients and their symptomatic behavior sets the foundation for the nurse-patient relationship. Setting limit provide external control and helps lower anxiety.
- Calling attention and restricting their movement will increase the anxiety. Distraction is unrealistic.

632. A 39-year-old mother with obsessive-compulsive disorder has become immobilized by her elaborate hand washing and walking rituals. Nurse recognizes that the basis of Obsessive-compulsive disorder is often: *(Safdarjung NO 2018)*

a. Problems with being too conscientious
b. Problems with anger and remorse
c. Feelings of guilt and inadequacy
d. Feeling of unworthiness and hopelessness

Explanation:

- The basis of ritualistic behavior seen in Obsessive Compulsive disorder (OCD) is aimed at controlling guilt and inadequacy by maintaining an absolute set pattern of behavior.
- Being too conscientious is a healthy perfectionism (adaptive perfectionism).

633. The major neurotransmitter involved in the occurrence of Obsessive compulsive disorder is: *(AIIMS Bhopal Grade-I 2018)*

a. Dopamine
b. Acetylcholine
c. Epinephrine
d. Serotonin

Explanation: Serotonin neurotransmitter involved in core physical processes such as regulation of sleep, aggression, anxiety, mood, fear etc. Low level of serotonin are linked to the repetitive thoughts or obsessions and initiating the disorder. So, serotonin is the primary neurotransmitter associated with the symptoms of OCD.

634. OCD is best managed with which of the following psychotherapy?

a. Psychodynamic psychotherapy
b. Interpersonal psychotherapy
c. Cognitive behavior therapy
d. Supportive psychotherapy

Explanation: Cognitive behavioral therapy (CBT) can help you manage your problems by changing the way you think and behave. It is most commonly used to treat anxiety and depression, but can be useful for other mental and physical health problems.

635. The most common psychotherapy used to help a person with Obsessive Compulsive Disorder is:

a. Behavior modification
b. Transaction Therapy
c. Abreaction
d. Flooding

Explanation: Behavior modification is a treatment approach, based on the principles of operant conditioning that replaces undesirable behaviors with more desirable ones through positive or negative reinforcement.

636. In a client with OCD, the rituals performed by the client will help to .....

a. Maintain hygiene
b. Control the anxiety
c. Provide safe environment
d. Attain primarily for secondary gains

Explanation: Obsessive-compulsive disorder is characterized by unreasonable thoughts and fears (obsessions) that leads to compulsive behaviors. OCD often centers on themes such as a fear of germs or the need to arrange objects in a specific manner. Symptoms usually begin gradually and vary throughout life. It is an anxiety disorder characterized by unwanted thoughts and repetitive, ritualized behaviors.

637. A condition in which thoughts enter into the mind of the person though he does not want to think about them, is known as-

a. Obsession
b. Delusion
c. Regression
d. Suppression

Explanation: Compulsive pre-occupation with a fixed idea or an unwanted feeling or emotion, often accompanied by symptoms of anxiety, is known as obsession.

638. The compulsive act seen in OCD is:

a. Has a purpose but useless
b. Is performed after long urging
c. Appear to be performed willingly
d. Seems absurd but necessary to that person

Explanation: Carrying out of this kind of compulsive activity is a way for the client to relive anxiety. These activities are important for the client.

639. An idea or thought that continually preoccupies or intrudes on a person's mind is known as

a. Suppression
b. Obsession
c. Delusion
d. Repression

640. Drug most useful in treatment of obsessive compulsive disorder is: *(JIPMER 1997, 2000, 2001, 2003, 2005, 2006, 2007)*

a. Amoxapine
b. Fluoxetine
c. Doxepin
d. Dothiepin

642. All drugs are used for treatment of OCD except: *(JIPMER 1999; 2002)*
a. Carbamazepine b. Lithium
c. Fluoxetine d. Diazepam

643. The ego defense mechanism commonly used by patients with OCD is
a. Displacement b. Reaction formation
c. Undoing d. Projection

644. The most effective therapy for a patient with obsessive compulsive disorder (OCD) is
a. Transaction therapy b. Token economy
c. Behavior modification d. Abreaction

645. Characteristics of obsessional thoughts includes all of the following, EXCEPT:
a. Unwanted thoughts
b. Subjective distress
c. Feeling of subjective compulsions
d. Feeling of worthlessness

646. An appropriate nursing intervention for a client with OCD is:
a. Recognize that the compulsive act is a part of OCD
b. Provide positive reinforcement for non-ritualistic behavior
c. Ignore patient behavior completely
d. Restrict the clients compulsive acts

647. Which of the following is the most appropriate nursing diagnosis for a patient exhibit obsessive compulsive behavior?
a. Altered nutritional status
b. Ineffective individual coping
c. Impaired socialization
d. Risk for injury to self and others

648. Which of the following statement about OCD is incorrect?
a. Anxiety is the key reason for OCD
b. Compulsions relives anxiety
c. Obsessive thoughts are not associated with level of neurochemicals
d. Antidepressant medications increase serotonin levels

649. Signs and symptoms of Obsessive Compulsive Disorder (OCD) include all, EXCEPT
a. Thought broadcasting
b. Feeling of guilt
c. Obsessive thoughts
d. Ritualistic behavior

650. Obsessional personality is also known as
a. Schizoid personality b. Histrionic personality
c. Anankastic personality d. Borderline personality

651. A psychotherapy technique that is most effective in obsessive ruminations is
a. Thought stopping b. Desensitization
c. Flooding d. Sensitization

EATING DISORDERS

652. Nurse is caring for a client diagnosed with bulimia nervosa. The most appropriate initial goal for a client diagnosed with bulimia nervosa is: *(Safdarjung NO 2018)*
a. Encourage to avoid foods
b. Identify anxiety causing situations
c. Eat only three meals a day
d. Avoid shopping plenty of groceries

Ans.

642.	d

650.	c
651.	a
652.	b
653.	a
654.	b
655.	a
656.	b

Explanation: Bulimic behavior is generally a maladaptive coping response to stress and underlying issues. The most appropriate goal for the client is that the patient must identify anxiety-causing events or situations that stimulate the bulimic behavior. This is followed by learning new ways or methods to cope with the anxiety.

653. Intractable anorexia nervosa is associated with *(Safdarjung NO 2018)*
a. Cardiac dysrhythmia resulting to cardiac arrest
b. Glucose intolerance resulting in protracted hypoglycemia
c. Endocrine imbalance causing cold amenorrhea
d. Decreased metabolism causing cold intolerance

Explanation: Patients with intractable anorexia nervosa often have severe electrolyte imbalance such as decreased levels of sodium and potassium because of their starvation diet and energy expenditure, these electrolytes are very essential for cardiac functioning. Anemia, constipation, dehydration, electrolyte imbalances and orthostatic hypotension are the potential medical complications of anorexia nervosa. So cardiac dysrhythmias due to electrolyte imbalance is one of the major complications among the given options.

654. Nurse is developing a plan of care for a female client with anorexia nervosa. Which action should the nurse include in the plan: *(Safdarjung NO 2018)*
a. Provide privacy during meals
b. Set-up a strict eating plan for the client
c. Encourage client to exercise to reduce anxiety
d. Restrict visits with the family

Explanation:
- Establishing a consistent eating plan and monitoring the client's weight are important in developing care plan for a client with anorexia nervosa.
- Inclusion of family members in plan of care is important. Client should be monitored during meals, so client privacy is not necessary. Only limited and supervised exercise is recommended.

655. The morbid fear of becoming obese with a persistent lack of appetite and severe weight loss is
a. Anorexia nervosa
b. Bulimia nervosa
c. Binge eating disorder
d. Pica

Explanation: Option A is the correct answer. Bulimia nervosa is excessive insatiable appetite.

656. Among the following groups of sign and symptoms identify the most specific signs and symptoms that would be used for diagnosis of anorexia nervosa?
a. Binge eating behavior is present
b. Excessive weight loss, amenorrhea and abdominal distension
c. Eating only homemade food and avoiding fast food
d. Lazy and not doing any activity

Explanation: Anorexia nervosa is a serious eating disorder primarily of young women in their teens and early twenties that is characterized especially by a pathological fear of weight gain leading to faulty eating patterns, malnutrition, and usually excessive weight loss. Common signs and symptoms include excessive weight loss, amenorrhea and abdominal distension.

Scanned with CamScanner

657. While communicating to a client who is admitted in psychiatry ward because of the disordered thinking process about food being poisoned, which of the following technique need to be adopted by the nurse to encourage the client to have dinner?
a. Have dinner with client
b. Using open ended question and silence
c. Explain the client that food is not poisoned
d. Allow the client to express his thoughts

Explanation: Open ended questions are exploratory in nature. Open ended questions along with silence encourages the patient to discuss his/her problem in a friendly manner.

658. Which of the following part controls eating behavior *(Nursing Grade- II 2007)*
a. Hypothalamus
b. Pituitary gland
c. pineal gland
d. Pancreas

Explanation: There are two places in the hypothalamus (part of the brain) that controls hunger and eating. The Ventromedial Nuclei gives a signal when to stop eating, and the Lateral hypothalamus gives a signal to start eating

659. Which is the characteristic of anorexia nervosa?
a. Obsessed with weight loss
b. Body image disturbance
c. Healthy family relation ship
d. Both A and B

Explanation: Anorexia is characterized by a distorted body image, with an unwarranted fear of being overweight. Symptoms include trying to maintain a below-normal weight through starvation or too much exercises.

660. An adolescent with a diagnosis of bulimia nervosa is likely to exhibit:
a. Affective instability
b. Anhedonia
c. Repetitive motor mechanism such as tics
d. Unkempt appearance

Explanation: Affective instability, impulsivity, and anger are associated with Bulimia Nervosa and Anorexia Nervosa. These symptoms are observed more in bulimia nervosa than in anorexia nervosa. Identity disturbance is strongly associated with anorexia nervosa than bulimia nervosa.

661. A patient with anorexia nervosa shows signs of malnutrition. During initial re-feeding, the nurse carefully assess the patient for
a. Hyperkalemia
b. Hypoglycemia
c. Hypercalcemia
d. Hypophosphatemia

662. Anorexia nervosa is characterized by all except:
a. Amenorrhoea
b. Weight loss
c. Hypothermia
d. Alopecia

663. A young lady is present with H/O repeated episode of over eating (binge) followed by purging using laxatives she probably suffering from *(JIPMER 2010; 2007; 2004; 2001)*
a. Bulimia nervosa
b. Schizophrenia
c. Anorexia nervosa
d. Benign eating disorders

664. All of the following are signs of anorexia nervosa, Except: *(Banaras HU 2015)*
a. Frequent eating habits
b. Dry hair and skin
c. Fatigue
d. Anxious and hopeless look

665. The most appropriate initial goal for an adolescent patient with bulimia is to
a. Control eating bouts
b. Identify anxiety-causing situations
c. Control shopping for large amounts of food
d. Eat only limited meals

666. Which of the following is the highest priority for a 18-year-old female patient diagnosed with anorexia nervousa?
a. The patient will develop insight about body size
b. The patient will understand the physical consequences of fasting
c. The patient will establish adequate nutritional intake
d. The patient will sets a target weight in consultation with nurse

667. An 18-year-old female patient diagnosed with anorexia nervosa tells the nurse, "I have what I see at mirror. I look so ugly and fat." Which of the following strategy by a nurse is appropriate to deal with distorted perceptions of the patient?
a. Focus discussions on food and weight
b. Provide objective data feedback about patient's weight
c. Avoid discussing the patient's perceptions about weight
d. All of the above

668. Which of the following is a type of eating disorder?
a. Anorexia nervosa
b. Phobic anxiety disorder
c. Conversion disorder
d. Fetishism

669. Characteristics of a client with anorexia nervosa includes all of the following, EXCEPT
a. Fear of gaining weight
b. Distorted body image
c. Fasting and dieting
d. Binge eating followed by purging

670. Bulimia nervosa is a type of
a. Anxiety disorder
b. Eating disorder
c. Stress disorder
d. Organic disorder

671. Characteristics of a client with bulimia nervosa includes all of the following, EXCEPT:
a. Binge eating
b. Feeling of thinness
c. Use of laxatives
d. Induce vomiting

672. Craving and eating of non-edible substances such as chalk and mud is known as
a. Bulimia
b. Pica
c. Paraphagia
d. Verbigeration

673. Anorexia nervosa is an eating disorder characterized by all except *(JIPMER 2012)*
a. Menorrhagia
b. Salivary gland enlargement
c. Acrocyanosis
d. Bradycardia

SEXUAL DISORDERS

674. Voyeurism means
a. Person receives sexual gratification from seeing the genitalia of others or witnessing others' sexual behavior.
b. Sexual urges or fantasies involving unusual sources of gratification problems
c. An individual is dissatisfied with their own biological sex and have a strong desire to be a member of the opposite sex
d. Use opposite sex under garments to satisfy sexual drive

Explanation: Option A is the correct definition of voyeurism

Ans.

657.	b

Scanned with CamScanner

675. Excessive sexual desire in males is known as: *(JIPMER 2008)*
a. Nymphomania b. Satyriasis
c. Tribadism d. Sadism

676. Squeeze Technique is used for: *(JIPMER 2000)*
a. Impotence
b. Premature ejaculation
c. Infertility
d. Priapism

677. The force by which the sexual instinct is represented in the mind is known as:
a. Propositions b. Fetishism
c. Condensation d. Libido

678. A paraphilic interest in which the person gets sexual gratification by rubbing against a unsuspecting, non-consenting person. This is termed as
a. Frotteurism b. Sadism
c. Voyeurism d. Exhibitionism

679. Practice of dressing and acting in a style or manner traditionally associated with the opposite sex is known as
a. Voyeurism b. Exhibitionism
c. Fetishism d. Transvestism

680. The practice of obtaining sexual gratification by looking at sexual objects or acts, especially secretively, is known as.
a. Fetishism b. Voyeurism
c. Sexual sadism d. Frotteurism

681. A feeling of sexual excitement resulting from administering pain, suffering, or humiliation to the partner is known as
a. Fetishism b. Masochism
c. Voyeurism d. Sadism

682. Bestiality is also known as
a. Social phobia b. Zoophilia
c. Pedophilia d. Zoophobia

CHILDHOOD PSYCHIATRIC DISORDER

683. Thinking containing erroneous conclusions and internal contradiction is called: *(AIIMS Raipur Grade II 2017)*
a. Autistic thinking
b. Critical thinking
c. Illogical thinking
d. Logical thinking

Explanation: Autistic thinking comprises of inner thoughts and individual reality. Day dreaming and fantasies are elements of autistic thinking. Critical thinking means making reasoned judgements that are logical and well thought out. Logical thinking is the process in which one uses reasoning consistently to come to a conclusion.

684. What is the condition in which children is pulling out hair? *(AIIMS Raipur Staff Nurse Grade I-2018); (AIIMS Bhopal Nursing officer, 2018)*
a. Trichotillomania
b. Acrophobia
c. Imipramine
d. Olanzapine

Explanation: Trichotillomania: a disorder that involve recurrent irresistible urge to pull out hair
- **Acrophobia:** Irrational fear of height
- **Imipramine:** It is a tricyclic antidepressant drug
- **Olanzapine:** It is an antipsychotic drug

685. A legal classification of children's behavior that violate the law:
a. Juvenile delinquency b. Enuresis
c. Pica d. ADHD

Explanation: Juvenile delinquency, also known as "juvenile offending", is participation in illegal behavior by minors (juveniles, i.e. individuals younger than the statutory age of majority).

686. Treatment of ADHD involves the following drugs except: *(Kerala PSC 2004)*
a. Amphetamine b. Antidepressants
c. Benzodiazepine d. Methylphenidate

Explanation: Drugs of choice for the management of ADHD includes amphetamines, methylphenidate, dexmethylphenidate, antidepressants and lithium carbonate. Benzodiazepine is not the drug of choice.

687. Autistic child gives best response to:
a. Large group activity
b. Loud cheerful music
c. Small group activities
d. Their own self stimulating acts

Explanation: Autistic child turns inward and respond less to environmental stimuli.

688. Major behavioral characteristic of child with ADHD is:
a. Overreaction to stimuli
b. Continued use of rituals
c. Delayed speech development
d. Inability to use abstract thought

Explanation: ADHD children are highly reactive to external stimuli

689. ADHD is usually treated with
a. Lorazepam b. Haloperidol
c. Methylphenidate d. Methocarbamol

Explanation: Methylphenidate acts by stimulating the release of norepinephrine.

690. Autistic child's language resembles
a. Stuttering b. Confabulation
c. Neologism d. Echolalia

Explanation: Language development of an autistic child resembles Echolalia i.e. the uncontrollable and immediate repetition of words spoken by another person.

691. IQ level of 45 is called *(JIPMER 2005)*
a. Mild mental retardation
b. Moderate mental retardation
c. Severe mental retardation
d. Profound mental retardation

692. Patient with IQ of 65 has
a. Mild Mental Retardation
b. Moderate M.R.
c. Severe M.R.
d. Profound M.R.

693. Which of the following are risk factors for childhood psychiatric disorders? *(LNJP H D 2012)*
a. Parental psychopathology
b. Repeated early separation from parents
c. Harsh parents
d. All of the above

Ans.

694. Autism is: *(LNJP H D 2012)*
a. Metabolic disease
b. Neurodevelopmental disorders
c. Social and language communication problems
d. Mainly due to hypothalamic damage

695. Most effective nursing action to change child's behavior in a child with Attention Deficit Hyperactivity Disorder (ADHD) is:
a. Sedate child for hyperactivity
b. Reward appropriate behavior
c. Use of seclusions and restraints
d. Aggressive punishments

696. Person with I.Q below _____ is considered to be mentally retarded
a. 60 b. 70
c. 80 d. 100

697. Which of the following should be a primary focus of a nurse in terms of primary prevention of psychiatric disorder in children?
a. Lack of friends
b. Culture of the family
c. Family history of mental illness
d. Single parent

698. A child with an IQ score 30 has
a. Mild Mental Retardation b. Moderate M.R
c. Severe M.R d. Profound M.R

699. The disorder in which the child suffers from incontinence of urine during sleep
a. Incontinence b. Somnambulism
c. Enuresis d. Uropsychogenesis

700. The major cause of enuresis in children is
a. Overprotection by parents
b. Emotional insecurity in a child
c. Drinking too much fluid at bedtime
d. Dehydration

701. Example of a specific learning disability is
a. Mental Retardation b. Dyslexia
c. Hyperkinetic disorder d. Childhood autism

702. Which of the following is an example of intellectual disability?
a. Dyscalculia b. Mental Retardation
c. Hyperkinetic disorder d. Childhood autism

703. Profound Mental Retardation is :
a. IQ below 20 b. IQ 20-35
c. IQ 50-70 d. IQ 35-50

704. Which of the following intervention is most appropriate to develop language skills among autistic children?
a. Provide child with his/her favourite toys
b. Restrict number of care givers to autistic child
c. Teach the names of the objects by linking them with the actual object
d. Encourage child to interact

705. Characteristics of children with ADHD is
a. More attentive, hyperactive, and impulsive
b. Less attentive, hyperactive, and impulsive
c. More attentive, impulsive and focused
d. Less attentive, focused and calm

706. Children with hyperkinetic disorder are likely to have deficits in which of the following brain areas?
a. Motor functioning
b. Executive functioning
c. Limbic system
d. Perception

707. A Characteristic feature of autism is:
a. Over activity
b. Inattention
c. Poor communication
d. Poor intelligence

708. A child with moderate mental retardation is capable of:
a. Performing an intellectual job
b. Performing ADL independently
c. Performing certain self-care activities
d. Performing complex task which requires intellectuality

709. Adverse effect due to Sodium valproate seen only in children is: *(JIPMER 2007)*
a. Tremor b. Hepatitis
c. Anorexia d. Loss of hair

710. The treatment of choice in Attention deficit hyperactivity disorder is: *(JIPMER 2012, 2013, 2003)*
a. Haloperidol
b. Imipramine
c. Methylphenidate
d. Alprazolam

711. Stimulant drug is given to child for *(JIPMER 2012)*
a. Conduct disorder
b. Speech developmental disorder
c. Pervasive disorder
d. ADHD

712. Tourette is a disorder of: *(JIPMER 2015)*
a. Attention deficit b. Tics
c. Autism d. Mental retardation

PSYCHOPHARMACOLOGY

713. What will be the side effect if a client on monoamine oxidase fail to follow the diet restriction? *(RAK MSc 2018)*
a. Occipital headache
b. Generalized urticaria
c. Severe muscle spasm
d. Sudden drop in blood pressure

Explanation: Patients who are taking monoamine oxidase inhibitor should avoid taking food rich in tyramine. Tyramine is an amino acid found in fermented, aged or overripe food. This may cause sudden rise in blood pressure due to release of norepinephrine directly into the blood stream, causing occipital headache.

714. A monoamine oxidase inhibitor (MAOI) is prescribed. What should the nurse teach the client to avoid? *(RAK MSc 2018; AIIMS Bhopal Grade-I 2018)*
a. Prolonged exposure to the sun
b. Ingesting wines and aged cheese
c. Engaging inactive physical exercise
d. Over the counter NSAID medications

Explanation: Nurse suggest the patient to avoid ingesting wines and aged cheese as it contains tyramine which will otherwise cause sudden rise in blood pressure by releasing norepinephrine directly into the blood stream. Sudden rise in blood pressure causes hypertension crises which require immediate treatment. Tyramine rich foods (aged cheeses, alcohol beverages, cured meats etc.) must be avoided or used cautiously.

715. The nurse understands that neuroleptics are the drugs of choice to relieve symptoms of *(RAK MSc 2018)*
a. Psychosis b. Depression
c. Excessive activity d. Narcotic withdrawal

Ans.

714.	b
715.	a

Scanned with CamScanner

Explanation: Antipsychotic drugs are also known as neuroleptic drugs or tranquilizers which are used to treat or manage psychosis basically in bipolar disorder or schizophrenia.

716. Important nursing intervention for a client who is on lithium therapy is *(RAK MSc 2018)*

a. Restrict daily sodium intake
b. Test client's urine specific gravity
c. Monitor drug level in blood
d. Withhold all other medication

Explanation: It is very important to monitor blood levels of drug when patient is on lithium carbonate therapy since the plasma concentrations (>2 mmol/L) can be fatal, and causes lithium toxicity producing symptoms like vomiting, severe diarrhea, albuminuria, hypotension and cardiac arrhythmias.

717. Which one of the following is the adverse effects resulting from the chronic use of antipsychotics? *(AIIMS Raipur NO 2019)*

a. Parkinson's tremor
b. Akathisia
c. Neurologic malignant syndrome
d. Tardive dyskinesia

Explanation:

- All the given symptoms are extrapyramidal symptoms of antipsychotics.
- **Tardive dyskinesia:** Bizarre facial and tongue movements, stiff neck, difficulty swallowing. It can be a side effect of **long-term use of certain antipsychotics.**
- **Parkinson's tremors:** The symptoms may appear within 1–5 days after the initiation of antipsychotic medications.
- **Akathisia** may occur 50–60 days after initiation of therapy.
- **Neuroleptic malignant syndrome (NMS)** - onset occurs within hours after drug initiation.

718. For determining the serum lithium, the blood specimen to be obtained: *(AIIMS Raipur NO 2019)*

a. Afternoon
b. Before lunch
c. Before breakfast
d. Before bedtime

Explanation: It is advisable to take the blood sample after 12 hours of last dose. If the last dose is administered at bedtime, it is convenient for the patient to provide a blood sample before next morning dose. So, the sample should be drawn before breakfast.

719. A client with schizophrenia is receiving chlorpromazine (Thorazine) 400 mg twice a day. An adverse side effect of the medication is -- *(AIIMS Raipur NO 2019)*

a. Photosensitivity
b. Elevated temperature
c. Weight gain
d. Elevated blood pressure

Explanation: Chlorpromazine depresses hypothalamic thermoregulatory mechanism, exposure to extreme temperature may cause hyperthermia. Other adverse effects are EPS, sedation and hypotension (IM use), etc.

720. What is the most important information the nurse should teach to prevent relapse in a client with a psychiatric illness? *(RAK MSc 2018)*

a. Develop a close support system
b. Create stress-free environment
c. Refrain from activities that cause anxiety
d. Follow the prescribed medication regimen

Explanation: Compliance with the medications is important because side effects and denial of illness may cause clients to stop taking their medications; Research studies highlighted that chance of relapse is very high when medication are discontinued.

721. A client is to be discharged from a psychiatric unit with suggested haloperidol therapy. As a part of the teaching plan concerning this medication, the nurse should teach the client to avoid: *(RAK MSc 2018)*

a. Driving at night
b. Staying in the sun
c. Ingesting aged cheese
d. Taking medications containing aspirin

Explanation:

- Patients who are on haloperidol are advised not to drive or operating machines due to the side effect of dizziness and drowsiness.
- Photosensitivity is an uncommon (0.1% to 1%) side effect of haloperidol. Ingesting aged cheese should be avoided in case of MAO inhibitors. Aspirin is not contraindicated with haloperidol therapy.

722. The side effects of antidepressant include: *(AIIMS Raipur Grade II 2017)*

A. Dry mouth, difficult in micturition and constipation
B. Epileptic seizures, tremors and muscle twitching
C. Skin rashes and jaundice
D. Somnolence and orthostatic hypotension

a. A, B, C
b. B, C, D
c. A, B, D
d. A, B, C, D

Explanation: The side effects of antidepressants include nausea, increased appetite and weight gain, loss of sexual desire and sexual problems such as erectile dysfunction and decreased orgasm, fatigue and drowsiness, insomnia, dry mouth, blurred vision and constipation.

723. Which among the following is the most appropriate nursing action if the client is experiencing muscle rigidity following haloperidol administration?

a. Administer one more dose of haloperidol per orally as the dose is less for the client.
b. Administer a dose of benztropine IM as ordered.
c. Withhold the next dose of haloperidol as it occur because of toxicity
d. Inform the physician immediately

Explanation: Haloperidol can trigger oculogyric crisis (OGC) which is characterized by muscle rigidity. Immediate treatment of drug induced OGC can be achieved with benztropine.

Ans.

716. c
717. d
718. c
719. b
720. d
721. a
722. a
723. b

Scanned with CamScanner

724. What is the advantage of liquid chlorpromazine over its tablet forms?

a. Has a more predictable onset of action.
b. Easy to swallow and early absorption in GI tract
c. It is more palatable than the tablet form
d. Has few drug interaction

Explanation: The onset of liquid chlorpromazine is rapid and predictable compare to tablet because the liquid form produces therapeutic effects within 2 to 4 hours time.

725. Among the following condition which one is treated with hypnotic drugs?

a. Psychosis
b. Sleep disorders
c. Delusion
d. Hallucination

Explanation: Hypnotic drugs are used to treat sleep disorders.

726. After initiating lithium therapy, the therapeutic effective serum lithium concentration level is monitored: *(RPSC Nursing tutor 2009)*

a. <12 hours
b. 12-24 hours
c. 1-2 days
d. After 1 week

Explanation: The therapeutic effective serum lithium concentration level is monitored within 12-24 hours of Lithium administration.

727. When administering an oral medication to a patient with psychiatric disorder, it is important to-

a. Give the medication to the patient's attendant
b. Keep the medication on the bedside table
c. Give to the patient and observe that it is swallowed
d. Tell the patient to take the medication

Explanation: There are chances that they may not take the medicines or even throw them away. So it is important to give the medicine to patient and observe that is swallowed.

728. Abrupt withdrawal of barbiturate cause *(RPSC 2010)*

a. Sleepiness
b. Itching
c. Erythema
d. Seizures

Explanation: Abrupt withdrawal of barbiturate could cause withdrawal symptoms. These includes seizure, restlessness, insomnia, weakness, dizziness, nausea, sweating and anxiety.

729. Drug of choice to reverse a dystonic reaction is ..... *(Karnataka PSC)*

a. Prochlorperazine (Compazine)
b. Diphenhydramine (Benadryl)
c. Chlorpromazine (Thorazine)
d. Fentanyl

Explanation: Diphenhydramine (Benadryl), 25 to 50 mg IM or IV, is an antihistamine. Diphenhydramine blocks the effects of the naturally occurring chemical histamine in the body. Benadryl is used to treat sneezing; runny nose; itching, watery eyes; hives; rashes; itching; and other symptoms of allergies and the common cold.

730. Which among the following indicate that client is experiencing pseudo-parkinsonism induced by chlorpromazine? *(CMC Vellore)*

a. Restlessness and showing tics
b. Continuous muscle twitching
c. Tremors, shuffling gait, and mask like face
d. Extremity spasm and difficulty to walk

Explanation: Drug induced parkinsonism (pseudoparkinsonism) may develop 1 to 5 days after starting an antipsychotic medication. Symptoms mimic Parkinson disease such as tremor, shuffling gait, drooling, mask like face and rigidity.

731. Important teaching for women in their childbearing years who are receiving antipsychotic medications includes *(DSSSB)*

a. Instruction that amenorrhea is irreversible
b. Increased incidence of dysmenorrhea while taking the drug
c. Continuing previous use of contraception during periods of amenorrhea
d. Occurrence of increased libido due to medication adverse effects

Explanation: Antipsychotics may cause amenorrhea, which is reversible. The client must be instructed to continue her previous use of contraception despite amenorrhea present.

732. Disulfiram therapy is ..... type of behavioral therapy

a. Systematic desensitization
b. Overt sensitization
c. Token economy
d. Flooding

Explanation: Disulfiram therapy is an overt sensitization, a type of aversion therapy which produces unpleasant consequence for undesirable behavior.

733. Higher dose of thioridazine (Mellaril) results in:

a. Widened or narrowed pupils
b. Stuffed nose
c. Retinal pigmentation
d. All of the above

Explanation: All the above-mentioned signs and symptoms are the side effect of overdose with thioridazine (Mellaril)

734. Psychiatrist orders "restraints PRN", the nurse should understand that

a. Use restraints if client begin to act out
b. Ask to the doctor regarding the type of restraints
c. Ensure that all staffs are aware about restraints
d. Identify that PRN orders are not valid for restraints

Explanation: Order for restraints should be prescribed each time when it is required. PRN orders are not acceptable for restraints

735. A client on antipsychotic therapy developed muscle rigidity, higher fever, tachycardia, fluctuations in BP, diaphoresis, and rapid deterioration of mental status to stupor and coma. These signs and symptoms indicative of .....

a. Extra pyramidal symptoms
b. Oculogyric crisis
c. Tardive dyskinesia
d. Neuroleptic malignant syndrome

Explanation: Neuroleptic malignant syndrome (NMS) is a life-threatening, neurological disorder most often caused by an adverse reaction to antipsychotic drugs. Symptoms include high fever, sweating, unstable blood pressure, stupor, muscular rigidity, and autonomic dysfunction.

736. All are anti-depressant drug EXCEPT
a. Tricyclic antidepressants
b. Monoamine oxidase inhibitors (MAOIs)
c. Selective serotonin reuptake inhibitors (SSRIs)
d. Thiazides

Explanation: Thiazide is a diuretic. All other drugs given above are antidepressants

737. Drug of choice for Tourette's disorder?
a. Chloramphenicol
b. Methylphenidate
c. Haloperidol
d. Faith in his wife

Explanation: Haloperidol is the drug of choice to treat Tourette's disorder.

738. Which group of drug is the choice for ADHD?
a. Benzodiazepine
b. CNS stimulant
c. Anti-psychotics
d. Anticonvulsant

Explanation: CNS stimulant is the drug of choice to treat ADHD. Methylphenidate, a CNS stimulant, is the drug of choice for the treatment of ADHD.

739. Antenatal use of lithium by mother can leads to ..... malformation in fetus
a. Neural tube defects
b. Cardiac malformations
c. Esophageal atresia
d. Cleft lip

Explanation: Lithium use during pregnancy (antenatal period) can cause Ebstein's anomaly in the fetus. Ebstein's anomaly is a congenital heart defect in which the septal and posterior leaflets of the tricuspid valve are displaced towards the apex of the right ventricle of the heart.

740. Best prophylactic drug for febrile seizure is:
a. Acetaminophen
b. Phenytoin
c. Diazepam
d. Phenobarbitone

Explanation: Phenobarbitone is effective in preventing the recurrence of simple febrile seizures

741. Neuroleptic drugs are the drugs of choice to relieve
a. Psychosis
b. Depression
c. Excessive activity
d. Narcotic withdrawal

Explanation: Neuroleptic drugs modify the behavior of psychotic client.

742. Common manageable side effect of neuroleptic drug is
a. Jaundice
b. Melanocytosis
c. Drooping eyelids
d. Unintentional tremors

Explanation: Unintentional tremors are the common and manageable side effect of neuroleptic drugs.

743. Antidote of benzodiazepine:
a. Lithium
b. Methadone
c. Flumazenil
d. Chlorpromazine

Explanation: Flumazenil competitively inhibit activity at benzodiazepine recognition site on GABA/benzodiazepine receptor complexes.

744. A patient with schizophrenia is not taking medication as advised, for this client a medication that is to be administered I/M by the nurse every 2-3 weeks is:
a. Haloperidol
b. Valium
c. Lithium carbonate
d. Prolixin decanoate

Explanation: Prolixin decanoate (Fluphenazine decanoate injection) is a long-acting parenteral antipsychotic drug. It is administered 2-3 times weekly to the client to control the sign and symptoms.

745. What is the important nursing action while administering imipramine?
a. Avoid administration of barbiturates or steroids with this drug
b. Warn the client not to eat cheese, fermenting products and chicken liver
c. Observe client for increased tolerance so that dosage is maintained
d. Have the client checked the intraocular pressure and provide instruction to be alert for symptoms of glaucoma.

Explanation: Development of glaucoma is the side effect of imipramine. It belongs to tricyclic group of antidepressants. Option B is applicable to MAOI group of antidepressants.

746. Identify the classic manifestations of Parkinson's disease:
a. Bradykinesia, ataxia and dysarthria
b. Tremor, ataxia and drowsiness
c. Dysarthria, rigidity and bradykinesia
d. Tremor, rigidity and bradykinesia

747. A diabetic client taking insulin is psychotic and started with olanzapine, this combination can cause
a. Depress respiration
b. Decreased control of diabetes
c. Intensify the action of both drugs
d. Increase chances for extra pyramidal symptoms

Explanation: Olanzapoine alter the effect of exogenous insulin and the combination must be used with caution.

748. Photosensitivity is a side effect of
a. Sertraline
b. Lithium carbonate
c. Methylphenidate hydrochloride
d. Chlorpromazine hydrochloride

Explanation: Acute phototoxic dermatitis on sun exposure is a well-known side-effect of chlorpromazine.

749. Disulfiram therapy is indicated in
a. Acute alcohol intoxication
b. Acute opium intoxication
c. Alcohol dependence
d. Cannabis dependence

Explanation: Disulfiram therapy is used for the management of alcohol dependence. Disulfiram is deterrent agent in the treatment of alcohol dependence.

Ans.

Scanned with CamScanner

750. Antidote for methanol is .....
a. Ethanol
b. Fomepizole
c. Both a & b
d. Flumazenil

Explanation: The mainstay of treatment for both Methanol and Ethylene glycol ingestion is the administration of an antidote which blocks the function of Alcohol Dehydrogenase (ADH). Currently there are two antidotes used to block ADH metabolism: ethanol, a competitive ADH substrate, and fomepizole, an ADH inhibitor.

751. Which of the following food item is contra indicated to a client who is on MAOI therapy?
a. Banana
b. Red wine
c. Milk
d. Legumes

Explanation: A hypertensive crisis can result from ingestion of tyramine-rich foods in conjunction with monoamine oxidase inhibitors (MAOIs). So, the tyramine-rich foods should be strictly avoided for the clients on MAOI therapy. For tyramine rich food aged cheeses, red wine, yeast extract, pickles and canned sardines and liver.

752. Therapeutic serum level of lithium is .....
a. 0.5-1.2 mEq/l
b. 0.8-1.2 mEq/l
c. 0.9-1.2 mEq/l
d. 1-1.2 mEq/l

Explanation: Normal therapeutic serum level of lithium is 0.8 to 1.2 mEq/L. Lithium is an antimanic drug with very low therapeutic index (low safety margin). So therapeutic serum level of the drug should be strictly monitored to prevent adverse effect of the drug.

753. Drug of choice to treat extra pyramidal symptom include
a. Noradrenaline
b. Benztropine
c. Carbamazepine
d. Haloperidol

Explanation: Benztropine is an anticholinergic drug which is used to treat the extrapyramidal symptoms associated with anti-psychotic drugs.

754. A client who was started on antipsychotics a week back developed parkinsonism. Which of the following drugs is used for the treatment of parkinsonism in this patient
a. Anticholinergics
b. Anti-depressants
c. Atypical antisychotics
d. Mood stabilizer

Explanation: Anticholinergics (i.e. Benztropine) are used in the treatment of antipsychotic drug-induced Parkinsonism (peudoparkinsonism).

755. Extrapyramidal symptoms are the side effect of
a. Antipsychotic
b. Antianxiety drugs
c. Antidepressants
d. Antimalarial drugs

Explanation: Complication of using antipsychotic drug includes extrapyramidal symptoms (EPS)

756. Advantage of risperidone is:
a. Cholinergic effects are more
b. A lower incidence of extrapyramidal effects
c. It causes sedation and sleep in the patient
d. No incidence of neuroleptic malignant syndrome

Explanation: Risperidone is an atypical antipsychotic which has a lower incidence of extra pyramidal effects than the typical antipsychotic.

757. Health education regarding imipramine should include .....
a. It causes dry mouth
b. It causes urinary retention
c. Should not stop abruptly
d. All of the above

Explanation: All the above-mentioned statements are correct regarding imipramine, which is an anti-depressant drug. It can cause photosensitivity and nausea among the individual.

758. A common anti obsessional medication usually prescribed by practitioner are
a. Fluvoxamine
b. Benztropine
c. Amantadine
d. Diphenhydramine

Explanation: Fluvoxamine block the uptake of serotonin and decreases the obsessive-compulsive behavior.

759. Anticholinergic side effect of TCA therapy includes .....
a. Urine retention and blurred vision
b. Kussmaul breathing
c. Sleeplessness
d. Tremors and cardiac arrhythmia

Explanation: Anticholinergic effects of tricyclic antidepressants (TCA) include dry mouth, blurred vision, constipation, urinary retention, drowsiness, orthostatic hypotension, and perspiration.

760. Which of the following lab test will be prescribed for a client who is getting sodium Valproate for BPAD?
a. Platelet count and bleeding time
b. Liver function test
c. Both A and B
d. Blood sugar

Explanation: It is an anticonvulsant and used as a mood stabilizer. It will cause blood dyscrasias, so platelet count and bleeding time need to monitor, it has liver toxicity as side effect, so monitor aminotransferase level.

761. Drug which causes hallucinations is *(JIPMER March 2008)*
a. Ketamine
b. Gallamine
c. D-tubocurare
d. Pancuronium

762. The function of gland which is affected in lithium toxicity is: *(JIPMER 2015)*
a. Parathyroid
b. Pituitary
c. Adrenal
d. Thyroid

763. A patient who is taking Monoamine Oxidase Inhibitor (MAOI) must avoid taking
a. Green leafy vegetables
b. Milk and fruit juices
c. Aged cheese and red wine
d. Tomato products

764. Following drugs cause CNS depression, except *(JIPMER 1998)*
a. Amphetamine
b. Alcohol
c. Barbiturates
d. Diazepam

765. All of the following are used in treatment of Bipolar disorders except *(JIPMER 2012)*
a. Lithium
b. Antipsychotics
c. Phenytoin
d. Sodium valproate

766. Lithium toxicity affects all of the following organs except *(JIPMER 2006)*
a. Liver
b. Brain
c. Heart
d. Kidney

767. Treatment of choice of bipolar mood disorder *(JIPMER 2012)*
a. Fluoxetine
b. Imipramine
c. Lithium
d. Chlorpromazine

768. Absolute contraindication to Lithium therapy *(JIPMER 2004)*
a. Renal failure
b. Angina
c. Glaucoma
d. Epilepsy

769. Drugs used for recurrent depressive episode is *(JIPMER 2009)*
a. Imipramine b. Carbamazepine
c. Fluoxetine d. Sodium valproate

770. Drug of choice for prophylaxis of Mania is *(JIPMER 1994)*
a. Diazepam b. Lithium
c. Haloperidol d. Fluoxetine

771. Non sedating Antidepressant is *(JIPMER 1993)*
a. Fluoxetine b. Mianserin
c. Amoxaprine d. Imipramine

772. A 30-year-old manic patient was prescribed Haloperidol one week back. For the last two days he has become restless and kept pacing in the room for a day. On examination he was found to have tremors of hand. He is most likely suffering from *(JIPMER 2003)*
a. Anhedonia b. Dystonia
c. Restless leg syndrome d. Akathisia

773. Serum Lithium level should be checked earliest after how many days of constant dosing? *(JIPMER 2015)*
a. 3 b. 5
c. 14 d. 20

774. Which of the following class of drugs used to treat enuresis in children?
a. Benzodiazepines b. MAOI
c. Tricyclic antidepressants d. Sedative and hypnotics

775. Fluoxetine is used in which of the following childhood condition *(JIPMER 2002)*
a. Depression b. Autism
c. Enuresis d. None of these

776. Consumption of tyramine rich food by a patient who is on MAOI therapy may leads to
a. Hypertensive crisis
b. Extrapyramidal symptoms
c. Neuroleptic Malignant syndrome
d. Severe vomiting

777. All are side-effects of prolonged Phenytoin therapy except *(JIPMER 2008)*
a. Osteomalacia b. Gum hyperplasia
c. Gynaecomastia d. Megaloblastic anaemia

778. Which of the following anti-epileptic drugs act by affecting levels of GABA? *(JIPMER 2008)*
a. Phenytoin sodium b. Ethosuximide
c. Sodium valproate d. Carbamazepine

779. Serene is an example of: *(JIPMER 2015)*
a. Antipsychotic b. Antidepressant
c. Mood stabilizer d. Anxiolytic

780. Benzodiazepines reduce anxiety by acting on which neurotransmitter? *(Banaras HU 2015)*
a. GABA b. Serotonin
c. Noradrenaline d. Dopamine

781. Drug of choice for treatment and prevention of further episodes of bipolar mood disorder is: *(Staff Nurse G II 2014)*
a. Amitriptyline
b. Lithium
c. Fluoxetine
d. Chlordiazepoxide

782. Use of Carbamazepine in psychiatry is as a: *(JIPMER 2012)*
a. Mood stabilizer b. Antidote
c. Anticonvulsant d. Neuroleptic

783. The most common serious adverse effect of using flumazenil to reverse benzodiazepine overdose is
a. Shivering b. Chest pain
c. Anorexia d. Seizures

784. Which of the following part of the brain is the target of Selective serotonin reuptake inhibitors (SSRI)?
a. Limbic system b. Basal ganglia
c. Frontal cortex d. Hippocampus

785. Risperidone is an example of
a. Anti-psychotics b. Anxiolytics
c. Anti-convulsants d. Antidepressants

786. All of the following drugs belongs to antipsychotics EXCEPT
a. Haloperidol b. Clozapine
c. Chlorpromazine d. Imipramine

787. Which of the following drug is an antidepressant
a. Clozapine b. Fluoxetine
c. Haloperidol d. Risperidone

788. Haloperidol is an example of
a. Anxiolytic b. Antipsychotic
c. Antidepressant d. Sedative

789. Atypical antipsychotics include
a. Haloperidol and Olanzapine
b. Chlorpromazine and Trifluoperazine
c. Olanzapine and Quetiapine
d. Chlorpromazine and Haloperidol

790. All of the following are antidepressants EXCEPT
a. Sertraline b. Imipramine
c. Valproate d. Trazodone

791. Which of the following drug is NOT an example of SSRI
a. Phenelzine b. Citalopram
c. Fluoxetine d. Sertraline

792. The drug of choice for the treatment of recurrent Manic-depressive psychosis is
a. Carbamazepine b. Lithium Carbonate
c. Chlorpromazine d. Valproate

793. Normal dose of lithium in the treatment of mania is
a. 900-3000 mg b. 600-900 mg
c. 500-750 mg d. 900-2100 mg

794. Which of the following antidepressant drug is not an MAOI
a. Selegiline b. Phenelzine
c. Trazodone d. Isocarboxazid

795. Which of the following drug needs a blood screening for CBC periodically?
a. Clozapine b. Lithium
c. Alprazolam d. Haloperidol

796. Chlorpromazine belongs to :
a. Anti-psychotic group b. Anti-anxiety group
c. Anti-convulsive group d. Anti-biotic group

797. One of the potential adverse effect of Mellaril (thioridazine) is
a. Weight loss b. Photosensitivity
c. Diarrhea d. Color blindness

798. Patients on MAOI's should not consume foods rich in
a. Thiamine b. Tyramine
c. Vitamin C d. Iron

799. One of the major pharmacological therapies for BPAD is
a. Clozapine b. Benzodiazepine
c. Lithium carbonate d. Trazodone

800. Which of the following drug is an anxiolytic?
a. Risperidone b. Chlorpromazine
c. Alprazolam d. Haloperidol

801. Drug induced extra pyramidal symptoms (EPS) such as tardive dyskinesia is treated with
a. Anxiolytics b. Anticholinergic drugs
c. Tranquilizers d. Sedatives and hypnotics

802. Which of the following receptors is blocked by tricyclic antidepressants (TCA)?
a. Acetylcholine receptor
b. Norepinephrine transporter
c. GABA receptor
d. D2 receptor

803. One of the side effects of an antipsychotic drug that is characterized by involuntary movements of the face and jaw is known as
a. Tardive dyskinesia
b. Facial palsy
c. Akathisia
d. Neuroleptic malignant syndrome

804. Contraindications of lithium includes
a. Renal diseases
b. Cardiovascular disease
c. Sodium depletion
d. All of the above

805. Time lag for maximum therapeutic response after initiation of fluoxetine hydrochloride is
a. One week
b. Two weeks
c. Three weeks
d. Four weeks

806. Which of the following electrolyte should be consumed in adequate amount by a patient who is on lithium therapy?
a. Sodium
b. Calcium
c. Potassium
d. Zinc

807. Antipsychotic drugs mainly work by their action on receptors of
a. Dopamine
b. Acetylcholine
c. Epinephrine
d. GABA

808. Atypical antipsychotics are all, except
a. Olanzapine
b. Clozapine
c. Risperidone
d. Thioridazine

809. Korsakoff psychosis is due to deficiency of:
a. Vitamin B1
b. Vitamin B2
c. Vitamin B3
d. Vitamin B12

810. Least Extrapyramidal side-effects are seen in:
a. Haloperidol
b. Thioridazine
c. Clozapine
d. Chlorpromazine

811. Adverse effect of clozapine is:
a. Hypertension
b. Sialorrhea
c. Extrapyramidal side effects
d. Neuroleptic malignant syndrome

812. Tardive dyskinesia is produced by following except:
a. Fluphenazine
b. Haloperidol
c. Chlorpromazine
d. Clozapine

813. Side effects of Fluoxetine are all except *(AP PGMEE 1994)*
a. Weigh gain
b. Sweating
c. Urinary retention
d. Diarrhea

814. Mode of action of fluoxetine
a. GABA agonist
b. GABA antagonist
c. Inhibit uptake of 5-HT
d. Increase uptake of 5-HT

815. Gender specific side effect of Valproate?
a. Alopecia
b. Weight loss
c. Tremor
d. PCOD

PSYCHOLOGY

816. Magical thinking is chiefly seen in *(AIIMS BBS 2016)*
a. Adolescents
b. Toddlers
c. Preschoolers
d. Infants

Explanation: Magical thinking is a stage that occurs between the 2 and 7 years of age. Age group 1-3 years are known as toddlers and 3-5 years are known as preschoolers. The prime time for fantasy (magical thinking) is during preschool age (around 5 years) than toddler age. At this developmental stage, children believe in fantastic characters so much that they truly believe they accompany them every day. For example, they believe that the mountains can move and due to this they can enjoy authentic adventure when they are in a moving car.

817. The first task in psychology is to carefully observe and objectively describe: *(IGNOU PB BSc 2016)*
a. Behavior
b. Personality
c. Social institution
d. Motivation

Explanation: The first task in psychology is to make accurate observations about behavior. This means that psychologists must first describe behavior. Rest of the options are irrelevant to the statement given above.

818. Aptitudes are defined as *(IGNOU PB BSc 2016)*
a. Preferences to perform certain activities.
b. High level of achievement in an area.
c. Skills one brings to a given task.
d. Abilities of individual to learn in specific endeavor

Explanation: An Aptitude is a component of a competence to do a certain kind of work at a certain level. Outstanding aptitude can be considered "talent". An aptitude may be physical or mental. Aptitude is outcome of both inborn and hereditary potential to do certain kinds of work whether developed or undeveloped.

819. Gradual disappearance of conditioned response to stimuli is referred as: *(JIPMER 2015)*
a. Negative conditioning
b. Extinction
c. Delayed conditioning
d. Elimination

Explanation:

Extinction	Extinction is the gradual weakening and disappearance of a conditioned response
Negative conditioning	Negative conditioning is the removal of a stimulus after a response.
Delayed conditioning	A form of classical conditioning in which the conditioned stimulus precedes the unconditioned stimulus by a significant time period and the organism learns to withhold its conditioned response
Elimination	Elimination is an aversive stimulus or punishment during which the client is removed from the environment when the desired behavior is being is exhibited.

820. Ego works based on the: *(DSSSB PHN, 2015)*
a. Reality
b. Pleasure
c. Perfection
d. Conscience

Explanation: The Id, Ego, Superego are names for the three parts of the structure of human personality given by psychoanalytical theory. Ego is the realistic part that mediates between the desires of the id and the super-ego. The id is the primitive instinctual part of mind

which operates on pleasure principle. The superego (perfection) is the aspect of personality that holds all of our internalized moral standards and ideals that we acquire from both parents and society

Structure of personality	Principle
Id	Pleasure
Ego	Reality
Superego	Perfection

821. Psychology is a: *(Safdarjung NO 2018)*

a. Natural science
b. Physical science
c. Biological science
d. Social science

Explanation: Psychology is a natural science. "Natural science" means a branch of science that is concerned with the description, prediction and understanding of natural phenomena (based on observation and empirical evidence) -- and it can be seen in psychology.

822. Psychology as a 'Science of Mind', is defined by: *(Safdarjung NO 2018)*

a. Psychoanalysts
b. Behaviorists
c. Functionalists
d. Ancient Greek Philosophers

Explanation:

School/System of Psychology	Definition
Psychoanalysts	Psychoanalysis is the School of psychology that focuses on treating mental disorders by recognizing the relationships between the conscious mind and the unconscious mind. Proponent of this school of psychology is William James.
Functionalists	Functionalists focused on the purpose of consciousness and behavior.
Behaviorist	A school of psychology that confines itself to the study of observable and quantifiable aspects of behavior and excludes subjective phenomena, such as emotions or motives
Ancient Greek philosopher	Study of mind as a function of bodily processes. They are due to brain pathology.

823. E.B. Titchener (1867-1927) defined 'Psychology' as the science of: *(Safdarjung NO 2018)*

a. Conscious Experience
b. Science of Mind
c. Science of Experience
d. Science of Soul

Explanation: E.B. Titchener coined the term structural psychology and functional psychology. **Titchener** concluded that there are three essential elements that made up all **conscious experiences**: feelings, sensations, and images.

Table: Other definitions along with their authors

Definition of Psychology	Given by
Science of Mind	William James
Science of Soul	Rudolf Geöckle
Science of Experience	Carl rogers Abraham Maslow's

824. 'Psychology' as the scientific study of activities of organism in relation to its Environment is defined by: *(Safdarjung NO 2018)*

a. J.B Watson
b. Sigmund Freud
c. Woodworth
d. William James

Explanation:

Table: Definition of psychology given by various theorists

Theorists	Definition of Psychology
Woodworth	Psychology' as the scientific study of activities of organism in relation to its Environment.
William James	Psychology as Study of Mind
Sigmund Freud	This school of thought emphasized the influence of the unconscious mind on behavior.
J.B Watson	Scientific study of behavior and mental processes.

825. Abnormal Psychology is mainly the study of: *(Safdarjung NO 2018)*

a. Normality of mind
b. Unconscious level of mind
c. Subconscious level of mind
d. Abnormality of mind

Explanation: Abnormal psychology is the branch of psychology that studies unusual patterns of behavior, emotion and thought, which may or may not be understood as precipitating into a mental disorder.

826. All of the following are types of conflict except *(Safdarjung NO 2018)*

a. Intrapersonal
b. Manifest
c. Interpersonal
d. Intragroup

Explanation: Conflict is a process, where perception (real or otherwise) leads to disruption of desirable state of harmony.

Types of conflicts:

- Conflicts may be intrapersonal (conflict with self), interpersonal (between two persons) and organizational.
- Organizational conflict is again classified into interorganizational and intraorganizational (intragroup) conflicts. Intragroup conflict (or infighting) refers to conflict between two or more members of the same group or team.

Manifest is not a type of conflict. In fact, it is one of the five stages of conflict.

1. **Latest stage:** People may be in conflict without being aware that they are in conflict
2. **Perceived stage:** People involved in a conflict become fully aware that there is a conflict
3. **Felt stage:** Stress and anxiety are felt by one or more of the participants due to the conflict
4. **Manifest stage:** The conflict can be observed in this stage
5. **Aftermath stage:** Takes place when there is some outcome of the conflict

6 OBSTETRIC AND GYNECOLOGICAL NURSING

SYNOPSIS

OVERVIEW OF ANATOMY OF FEMALE REPRODUCTIVE SYSTEM

Organs engaged in copulation, fertilization, growth and development of the fetus and its delivery are reproductive organs in female. These organs are broadly divided into:

- External genitalia
- Internal genitalia
- Accessory reproductive organs

External Genitalia (Vulva, Pudendum)

It includes:

- **Mons Pubis:** It is a pad of subcutaneous adipose tissue anterio superior to pubic symphysis. It is covered by hair in adults.
- **Labia Majora:** Subcutaneous tissue covering the vulva at the sides (homologous to scrotum in males).
- **Labia Minora:** Thin fold of skin without fat located inside the labia majora. Made up of erectile connective tissue. (homologous to penile urethra and part of skin of penis in males).
- **Clitoris :** Small erectile body located anteriorly to vulva consisting of glans, body and two cura. (homologous to penis in males).
- **Vestibule:** It is triangular space consisting of four openings:-
  - Urethral opening
  - Vaginal orifice and hymen
  - Opening of Bartholin's ducts
  - Skene's gland
- **Perineum:** Muscle and tissue located between the vaginal opening and anal canal.

Figure 1 ■ Anatomy of female reproductive system

Internal Genitalia

It includes:

Vagina

- Vagina connects the cervix to external genital.
- It is located between rectum and bladder.
- 2.5 cm in diameter, it is widest in upper part and narrowest at introitus.
- From puberty, vaginal pH is acidic (4-5 pH) because of lactic acid produced by Doderlein's bacilli.

Cervix

It connects the uterus to the vagina.

Fallopian Tubes (Uterine Tube, Oviduct)

These are paired structures measuring 10 cm. It has four parts: intramural or interstitial, isthmus, ampulla, infundibulum. ***Functions*** are (i) transport of gametes (ii) Site of fertilization and helps in the survival of zygote by its secretions

Ovaries

- The female gonads consist of 2 ovaries, one on either side of the uterus.
- Each ovary is approximately 3 to 5 cm long, 2 to 3 cm wide and 1 to 3 cm thick in the menstrual years.
- The ovary is attached to the broad ligament by the **mesovarium.**
- The ovary is composed of a medulla and cortex, covered with germinal epithelium

Functions

- **Oogenesis:** Formation of mature ovum from the follicle into pelvic cavity.
- **Ovulation:** Expulsion of the matured ovum from graffian follicle into the fimbriated end of the fallopian tube.
- **Secretion of hormones:** Estrogens and progesterone.
- **Estrogen:** Secreted under the influence of FSH and work promotes the development and maintenance of female reproductive structures, feminine secondary characteristics and breasts. It also increases protein anabolism and stimulate long bone calcification.
- **Progesterone:** Secreted under the influence of LH and work with estrogen to prepare endometrium for implantation of fertilized ovum. It inhibits uterine contraction during pregnancy and prepares mammary glands to secrete milk.

Scanned with CamScanner

Target High - Fifth Premium Edition

Figure 2 ■ Anatomy of uterus and fallopian tube

Uterus

Anatomy of Uterus

- Uterus is a pear-shaped child bearing organ located in lesser pelvis.
- **Position:** Anteverted and Anteflexed.
- **Measurements:**
  - **Length:** 3 inches (8 cm).
  - **Breadth (at fundus):** 2 inches (5 cm).
  - **Thickness:** 1 inch (1.25 cm).
  - **Weight:** 50–80 g
- Uterine wall is composed of three layers
  - **Perimetrium:** outermost serous layer.
  - **Myometrium:** Middle layer
  - **Endometrium:** Innermost mucosal lining of uterine cavity. Thickness changes during menstrual cycle.
- The uterus is divided into two main parts:
  - **The body:** the large upper 2/3rd pear-shaped part
  - The cervix - a small lower 1/3rd cylindrical part
  - The junction between the body and cervix is called isthmus
  - The uterine tubes are attached to the upper part of the body. The point of fusion between the uterine tube and body is called **cornu of the uterus**
  - Ligaments supporting uterus (primary support): Round ligament, Uterosacral, transverse cervical, pubocervical.

Blood Supply (Fig. 3)

Fallopian Tubes (Uterine Tubes)

- **Fallopian (uterine) tubes** are approximately 10 cm (usually 7 to 12 cm) in length, connecting the ovaries to the uterus.
- Ova (egg cells) are carried to the uterus through the fallopian tubes following ovulation. Ampullary part of the tube is the site of fertilization of ova with sperm.
- **Fallopian tubes are divided into four parts**
  - **Interstitial portion (Intramural part):** 1.25 cm long and lies within the wall of the uterus. Its lumen is 1 mm wide.
  - **Isthmus (adjoins uterus):** Extends for 3–4 cm from the uterus.
  - **Ampulla (central portion):** Wider portion where fertilization usually occurs. It is 5 cm long. Ampulla is the largest and longest portion of the tube.
  - **Infundibulum:** Funnel shaped lateral end of the fallopian tube that overlies the ovary. Several finger-like processes elongated to edge of the infundibulum is known as fimbriae.

Accessory Reproduction Organs

Anatomy of Breast

- These are accessory reproductive organs located bilaterally in females and help in lactation following childbirth.
- The mammary glands, or breasts, are actually modified sebaceous glands.
- Mammary glands are the example of apocrine gland.
- It is made up of 15–20 lobules of glandular tissue embedded in fat
- Lobes are separated by fibrous septa

Figure 3 ■ Blood supply to uterus and fallopian tubes

Scanned with CamScanner

- Each lobule drains by its **lactiferous duct** on to the **nipple**.
- The pigmented area surrounding nipple is known as **areola**.
- **Montgomery tubercles** are small glands around the nipples on the areola
- **Blood supply:** Axillary artery, Internal thoracic (Internal Mammary) artery, Intercostal artery

Figure 4 ■ Anatomy of breast

MENSTRUAL CYCLE

- **Menstruation:** Discharge of bloody fluid containing endometrial cells, glandular secretions and blood cells, lasts for 3-5 days.
- **Average length of a menstrual cycle:** 28 days, but varies from 21-35 days with shorter and longer cycles
- **Menarche:** A woman's first menstruation; typically occurs around age 12.
- **Menopause:** End of a woman's reproductive phase, commonly occurs between ages 45 and 55. Age of menopause is largely the result of genetics.
- **Menstrual cycle can be divided into 3 phases:**
  - **Menstrual phase** ***(1st to 4th day).***
    - Endometrium becomes very thin, but due to low estrogen levels, hypophysis secretes more FSH.
    - FSH stimulates secretion of estrogen which serves as proliferation a signal to the endometrial basal layer.
  - **Proliferative/follicular (estrogen) phase** ***(5th to 13th day; ovulation between 13th and 16th day)***
    - Due to the rise of follicle stimulating hormone (FSH) during the first days of the cycle, several ovarian follicles are stimulated.
    - The follicle that reaches maturity is called a Graffian follicle.
    - At end of this phase, ovulation occurs.
  - **Secretory/luteal phase (progesterone) phase** ***(14th to 28th day)***
    - Corpus luteum: Solid body formed in an ovary after the ovum has been released into the fallopian tube.
    - Produces significant amount of progesterone, which plays a vital role in making the endometrium receptive to implantation of the blastocyst
    - Falling levels of progesterone trigger menstruation and the beginning of the next cycle

Note

This diagram shows a 28-day cycle. Some women's cycle may be longer or shorter.

Figure 5 ■ Changes during a normal menstrual cycle

Dysmenorrhea

- Painful menstrual cramps.
- Painful menses without evidence of a physical abnormality only primary dysmenorrhea does not have pathology.
- Believed to be normal body response to uterine contractions.
- **Other symptoms:**
  - Nausea, vomiting, gastrointestinal disturbances and fainting.

Scanned with CamScanner

- Prostaglandins cause frequent uterine contractions called cramps.
- Fibroids, polyps, IUD, PID, or endometriosis.

FUNDAMENTALS OF REPRODUCTION

- **Oogenesis:** The process of development of a mature ovum is called oogenesis.
- **Spermatogenesis:** The process of development of spermatids from primordial male germ cells and differentiation into spermatozoa is called spermatogenesis.
- **Ovulation:** Release of secondary oocyte from ovary following maturation of Graffian follicles (to become available for conception).

Fertilization

- Fusion of male spermatozoon with mature ovum.
- It usually takes place in the ampulla of uterine tube (fallopian tube).
- The result of fertilization is the production of a zygote, or fertilized egg, initiating prenatal development.
- The life span of oocyte is 12–24 hours and that of the sperm is 48–72 hours.
- After the fusion of sperm with eggs, penetration of other sperms is prevented by Zona reaction (hardening) and oolemma block.
- The spermatozoon determines the sex of the child.

Morula

After zygote formation nucleus divides into two blastomeres by mitotic division. The blastomeres continue to divide until 16 cell stage occurs called the ***morula***.

Blastocyst

On day 4th and 5th the morula is covered by mucus and the cells of morula separates to form blastocyst. **Outer side** of morula becomes the **trophectoderm** that finally differentiates into **chorion** while the **inner cells** become inner cell mass which subsequently forms the **embryo.**

Trophoblast

Before implantation the trophectoderm differentiates into inner cellular layer called the cytotrophoblast and outer syncytiotrophoblast. Placenta and the fetal membranes are derived from trophoblast.

Implantation

Implantation occurs in the endometrium on **6th day** that corresponds to 20th day of regular menstrual cycle . It involves ***four stages***:- (i) apposition (ii) adhesion (iii) penetration (iv)invasion. The deeper penetration of the blastocyst is termed as interstitial implantation

Decidua

The endometrium of pregnant uterus is called the decidua. In endometrium there is increased structural and secretory activity following implantation due to progesterone which is called decidual reaction. After the interstitial implantation the deciduas is renamed as (i) Decidua basalis (ii) Decidua capsularis (iii) Decidua vera. *Deciduas basalis* becomes the maternal portion of placenta at term.

Chorion

It is the outermost layer of fetal membrane consisting of two embryonic layers-outer trophoblast and inner primitive mesenchyme that appears on 9th day. The chorion and the amnion together form the amniotic sac.

Chorionic Villi

At 3 weeks, the syncytiotrophoblast produces finger like projections called the primary stem villi which later develop into chorionic villi.

Development of the Inner Mass Cells

Figure 6 ■ Schematic representation on mitotic division of zygote

PRINCIPAL EVENTS OF EMBRYONIC AND FETAL DEVELOPMENT

Table 1

Gestational age	Principal event
14–21 days	Notochord develops Ectoderm thickens to form neural plate and neural fold
21–28 days	Neural fold fuses to form neural tube. Four primitive cardiac chambers, first heart beat on day 21
4–6 weeks	Optic vesicles appear, complete neural tube closure, limb buds appear, formation of face
6–8 weeks	All major structures form. Complete ventricular septum.
8–12 weeks	External genitalia develop
20 weeks	Skin is covered with lanugo, vernix caseosa present
28 weeks	Testis descends into the internal inguinal ring, baby viable
36 weeks	One testicle descends into the scrotum. Lanugo tend to disappear
40 weeks	Both testicles descend into the scrotum. Nails project beyond finger tip

Scanned with CamScanner

PLACENTA

- Placenta is a circular disc attaches to the uterine wall
- Measurement: diameter **15-20 cm** and **3 cm thick** at its center.
- Weight: around 500 gms
- It has two surfaces
  - **Fetal surface:** It is covered by smooth glistening amnion with umbilical cord attached at or near its center
  - **Maternal surface:** It is rough and spongy and has a dull red color due to maternal blood. It has 15-20 convex polygons called the lobes or cotyledons.
- Volume of blood in mature placenta is about **500 ml.**

Functions

- **Nutritive function**: Transfer of nutrients and wastes products between mother and fetus, i.e. respiratory, excretory and nutritive function.
- **Endocrine function**: Produces steroid and peptide hormones to sustain pregnancy
- **Barrier function**: Protects fetus against noxious agents circulating in maternal blood
- **Immunological function**: Though fetus and placenta contains antigens foreign to mother, but it is not rejected due to immunological protection of placenta.

Figure 7 ■ Normal placenta as received in pathology

Fetal Membranes

- **Chorion**: It is outer layer representing remnants of chorion leave and ends at the margin of placenta.
- **Amnion**: It is inner layer of fetal membrane. Amnion is smooth and shiny and is in contact with liquor amnii. Amnion has no blood and nerve supply and no lymphatic drainage.

Functions

- Formation of liquor amnii
- Prevent ascending uterine infection
- Helps in cervical dilatation during labor
- Regulates enzymatic activity for steroid metabolism
- Rich source of glycerophospholipid, precursor of prostaglandin

UMBILICAL CORD

- It connects fetus and placenta though fetal blood flows to and from placenta.
- Length - 40 cm (average). It varies from 30-100 cm)
- Diameter about 1.5 cm (range 1–1.25 cm) with non-uniform thickness having nodes or swelling at places.
- It consist of covering epithelium, Wharton's jelly and blood vessels.
- The umbilical vein carries the oxygenated blood from placenta to fetus.
- There are **two arteries and one vein** present in the umbilical cord singleton pregnancy.

AMNIOTIC FLUID

- **Amount**:
  - 50 ml at 12 week
  - 400 ml at 20 week
  - Reaches to its peak of 1 liter **at 36-38 week** and finally starts diminishing afterwards and it **about 600-800 ml** at term.
  - If pregnancy continues post term, **it further reduces** to 200 ml at about 43 week
  - **Specific gravity**: 1.010
  - **Osmolarity**: 250 mOsm/L suggests fetal maturity
  - **Color**: In early pregnancy- colorless, near term- pale straw color due to the presence of exfoliated lanugo and epidermal cells, may look turbid due to vernix caseosa

Table 2

Abnormal color of amniotic fluid is suggestive of

Color of Amniotic fluid	Interpretation
Colorless, pale straw color	Normal
Green (fetal distress)	Fetal distress , Meconium Stained - Breech pre
Golden	Rh incompatibility
Greenish Yellow of Saffron	Post maturity
Dark colored or blood stained	Abruption (concealed accidental hemorrhage)
Dark brown (tobacco juice)	Intrauterine Death
Purulent	Chorioamnionitis

Yellow - Erythroblastosis Fetalis (Hemolytic disease)

Circulation

Figure 8 ■ The origin and circulation of amniotic fluid

Scanned with CamScanner

Target High - Fifth Premium Edition

Functions

- *During Pregnancy*
  - Shock absorber
  - Maintains even temperature
  - Allows the growth of fetus and its movement within the amniotic cavity
  - Adequate water supply with minimal nutritive value
- *During Labor*
  - Helps in dilatation of cervix
  - Prevents interference with placental circulation during uterine contraction
  - Prevents umbilical cord compression
  - Flushes the birth canal to prevent ascending infection into uterine cavity at first stage of labor.

Clinical Importance

- Amniotic fluid study tells about the fetal maturity
- Used for induction of abortion by instilling intra amniotic chemicals
- AFI-amniotic fluid index helps to diagnose polyhydraminos or oligohydraminos.

FETAL CIRCULATION

- Single umbilical vein carry 80% oxygenated blood from placenta towards the fetus. While it is moving toward the heart of the fetus one branch will give blood to the fetal liver. Then the umbilical vein enter into the inferior vena cava through ductus venosus and it empty into right atrium.
- From right atrium majority of the blood will move towards left atrium via foramen ovale and the remaining blood will move towards right ventricle through tricuspid valve.

Figure 9 ■ Fetal circulation

- The blood in the left atrium will move towards left ventricle via bicuspid valve (mitral valve).
- During systole the blood in the left ventricle move towards aorta and it supplies the body parts of fetus.
- The blood in the right ventricle moves towards pulmonary artery. But in the fetal state pulmonary system pressure is higher than the systemic pressure so blood will moves from pulmonary artery to aorta via ductus arteriosus.

- Two umbilical artery carry deoxygenated blood from various parts of the fetal body towards the placenta.
- After the birth of the newborn all these connections will close and
  - ductus venosus become ligamentum venosum
  - ductus arteriosus become ligamentum arteriosum
  - foramen ovale become fossa ovalis

FEMALE PELVIS

- There are four pelvic bones
  - Two innominate bones or hip bones
  - One Sacrum
  - One Coccyx
- Each **innominate bone** is composed of three parts
  - **The Illium:** larger flared out part
  - **Ischium:** thick lower part.
  - **Pubic bones:** forms the anterior part.
  - **Sacrum:** A wedge shaped bone consisting 5 fused vertebrae.
- **Coccyx:** A small triangular bone, a vestigial tail. Consists of 4 fused vertebra.
- There are **four pelvic joints**
  - **One symphysis pubis:** form the junction of two pubic bones
  - **Two Sacroiliac joints:** connects the spine to the pelvis
  - **One Sacro:** coccygeal joint

Figure 10 ■ Female pelvis

TYPES OF PELVIS

- **Gynecoid Pelvis (Female Pelvis)**
  - It is the most suitable female pelvic shape. Round pelvic inlet and shallow pelvic cavity with short ischial spines.
  - Transverse diameter is more than anteroposterior diameter.
  - It allows normal child birth with ease and is most suitable for child birth.
- **Android Pelvis (Male Pelvis)**
  - Male type or wedge shaped pelvis.
  - Has triangular or heart-shaped inlet and is narrower from the front.
- **Anthropoid Pelvis**
  - Oval shaped inlet with large anteriorposterior diameter and comparatively smaller transverse diameter.
  - It has larger outlet. The problem in this pelvis is the inlet.
- **Platypelloid Pelvis**
  - Flat type pelvis. It has narrow anterioposterior diameter of pelvic inlet.
  - The pelvic inlet is specifically kidney shaped.

Scanned with CamScanner

Figure 11 ■ Types of pelvis

PELVIC DIAMETER

Diameters of Pelvic Inlet

- **Anteroposterior diameter:**
  - Anatomical anteroposterior diameter (true conjugate) = 11 cm
  - From the mid of the sacral promontory to the inner margin of upper border of the symphysis pubis.
  - Obstetric conjugate = 10 cm
    From the tip of the sacral promontory to the most bulging point on the back of symphysis pubis. **It is the shortest anteroposterior diameter.**
  - Diagonal conjugate = 12 cm
    - 1.5 cm longer than the true conjugate. From the tip of sacral promontory to the lower border of symphysis pubis.

Figure 12 ■ Pelvic diameter

Table 3 Diameters of pelvis at inlet, cavity and outlet

Diameter of pelvis	Pelvis type		
	Pelvic inlet	Pelvic cavity	Pelvic outlet
Anteroposterior diameter (cm)	11	12	13
Oblique diameter (cm)	12	12	--
Transverse diameter (cm)	13	12	11

Figure 13 ■ Figure representing diameters of pelvis at inlet, cavity and outlet

- **Transverse diameters:**
  - Anatomical transverse diameter = 13 cm
    - Between the farthest two points on the iliopectineal lines.
    - It is the **largest diameter** in the pelvis.
  - Obstetric transverse diameter:
    - It bisects the true conjugate and is slightly shorter than the anatomical transverse diameter.
- **Diagonal/Oblique diameters:**
  - Right oblique diameter = 12 cm
    - From the right sacroiliac joint to the left iliopectineal eminence.
  - Left oblique diameter = 12 cm
    - From the left sacroiliac joint to the right iliopectineal eminence.

Diameters of Pelvic Outlet

- Anteroposterior diameters:
  - Anatomical anteroposterior diameter =11 cm
    From the tip of the coccyx to the lower border of symphysis pubis.
  - Obstetric anteroposterior diameter = 13 cm
    From the tip of the sacrum to the lower border of symphysis pubis as the coccyx moves backwards during the second stage of labor.
- Transverse diameters:
  - Bituberous diameter = 11 cm
    Between the inner aspects of the ischial tuberosities.
  - Bispinous diameter = 10.5 cm
    Between the tips of ischial spines.

Composite measurements of the diameters of the inlet, cavity and outlet in cm.

(Table to be prepared from https://epomedicine.com/medical-students/female-pelvis/)

FETAL SKULL

As compared to an adult skull; fetus skull is a larger portion as compared to other body part. Adaptation of this fetal skull with maternal pelvis is one of the important thing need to take place during the process of delivery in order to avoid further complication or adverse events.

Scanned with CamScanner

Target High - Fifth Premium Edition

Parts of Fetal Skull

Figure 14 ■ Fetal skull

Bones in Fetal Skull

- 2 Frontal Bone
- 2 Parietal Bone
- 2 Temporal Bone
- 1 Occipital Bone

Table 4 Types of sutures and their location on fetal skull

Sutures	Locations
Frontal suture	Between two frontal bones
Coronal suture	Between frontal and parietal bone
Lambdoid suture	Two parietal bone and occipital bone
Sagittal suture	Two parietal bones

Fontanelle

Two frontal bone forms sinciput of the fetal skull. The space between the bones of the skull is suture and the area where the sutures meet is known as fontanelle. These sutures and fontanelle helps the fetal skull to mold during the process of delivery.

- **Anterior fontanelle (bregma)**: Formed at the junction between frontal, coronal and sagittal sutures, since it is at the junction of 4 sutures it is diamond in shape. It is closed by 18 months of age.
- **Posterior fontanelle (lambda)**: It is formed at the junction between lambdoid suture on either side and sagittal suture, and is triangle in shape. It is closed by the age of 2-3 months of age.

Figure 15 ■ Parts of fetal skull

Figure 16 ■ Fetal skull—Diameters

ASSESSMENT

Breast Examination

- The breast examination is the best means of early detection of breast cancer combined with routine mammography and regular breast self-examination (BSE).
- **Inspection**: The breast is first examined by inspection, with the patient's arms at her sides and then with her hands pressed against her hips and/or with her arms raised over her head.

Scanned with CamScanner

Breast Palpation Technique

Figure 17 ■ Radial and spiral

Figure 18 ■ Attempt to express fluid

- Discoloration or ulcerations of the skin of the breast, areola, or nipple, or edema of the lymphatics are abnormal.
- A clear or milky breast discharge is usually bilateral and associated with stimulation or elevated prolactin levels (galactorrhea).
- Bloody discharge from the breast is abnormal and usually unilateral. It usually does not represent carcinoma, but rather shows inflammation of a breast structure.
- Pus usually indicates infection, although an underlying tumor may be encountered.
- **Palpation** follows inspection, first with the patient's arms at her sides and then with the arms raised over her head.
- This part of the examination is usually done with the patient in the supine position.
- The examiner should cover the entire breast in a spiral or radial pattern, including the axillary tail. If masses are found, their size, shape, consistency (soft, hard, firm, cystic) and mobility, as well as their position, should be determined.
- If fluid is noted on inspection or is expressed, it should be sent for culture and sensitivity and cytopathology.

Breast Self-Examination (Key Points)

- BSE is a procedure that a woman can perform physically and visually examine her breasts and underarm areas for changes
- The best time to do a self-breast exam is a week after menstruation.
- Postmenopausal women should do the examination on the same day on every month.
- Any lumps, tenderness or abnormal discharge should be notified to the physician.

Figures 19 A to G ■ Breast self-examination (From step A to G)

Pelvic Examination

- Patient must empty the bladder before examination.
- Talk before you touch. Avoid anything unexpected.
- Pelvic examinations require relaxation of the muscles. Ask the patient to gently breath in through nose and breath out through mouth.
- **Position:** Lithotomy position.

Scanned with CamScanner

Target High - Fifth Premium Edition

- **Steps**
  - Inspection and examination of external genitalia
  - Speculum examination: **Pederson speculum** is suitable for nulliparous and postmenopausal women. **Graves speculum** for multiparous women.
- **Bimanual examination** of the uterus is done by lifting the uterus up toward the abdominal fingers so that it may be palpated between the vaginal and abdominal hands.
- In pregnant women pelvic examination done after 37 weeks of gestation to assess the pelvic capacity for labor process.

PRENATAL PERIOD

Key Points

- **Gravida:** A woman who is or has been pregnant
- **Primigravida:** A woman who is in or who has experienced her first pregnancy (pregnant for first time).
- **Multigravida:** A woman who has been pregnant more than once.
- **Nulligravida:** A woman who has never been pregnant.
- **Primipara:** A women who is giving birth for first time.
- **Multipara:** A woman who has given birth two or more times.
- **Nullipara:** A woman who has never given birth or who has never had a pregnancy progress beyond 28 weeks.
- **Term birth:** Birth between 37 and 42 weeks of gestation.
- **Preterm birth:** Birth between 20 and 36 weeks of gestation.
- **Post-term birth:** Birth after 42 weeks of gestation

Physiological Changes During Prenatal Period

Amenorrhea occurs when the ovulation is inhibited by the high levels of circulating estrogen and progesterone.

- **Breast Changes**
  - **Darkening of areola and nipples**
  - Montgomery's tubercles : Hypertrophied sebaceous gland termed as **fullness, tingling, soreness**
- **Changes in uterus**
  - **Goodell's sign:** Softening of the cervix.
  - **Hegar's sign:** Softening of the lower uterine segment.
  - **Chadwick's sign:** Purplish hue to the cervix and vaginal mucosa.
  - **Uterus** enlarges from 70 g to 1000 g at term.
- **Endocrine system**
  - **Human chorionic gonadotrophin (hCG)** is secreted by normal trophoblast cells of the placenta during 2nd week of the pregnancy. It maintains corpus luteum during 1st trimester. Responsible for a positive pregnancy test.
  - Estrogen and progesterone level increases and continues to be secreted by placenta during the last 6 months of pregnancy.
  - Thyroid and parathyroid activity is increased
- **Circulatory system**
  - Physiologic anemia occurs due to hemodilution of blood.
  - Reduced hematocrit value.
  - Cardiac output increases 30–50%, peaking at 28–32 weeks.
  - Heart rate increases 10–15 beats/min in second half of pregnancy.
  - BP may drop in second trimester of pregnancy.
  - WBC, fibrinogen and clotting factors increase.
  - Edema of extremities is common in the last 6 weeks of pregnancy.
  - Supine hypotensive syndrome occur as a result of compression of inferior vena cava by enlarging uterus during late second and third trimester.
- **Respiratory system**
  - Oxygen circulation is increased by about 15% from 16th week of pregnancy.
  - Dyspnea occurs due to the presence of enlarged uterus on diaphragm during 3rd trimester.
  - Dyspnea subsides when lightening occurs at 38 weeks.
- **Gastrointestinal system**
  - Nausea and vomiting (morning sickness) in the first trimester.
  - Constipation is caused by hypoperistalsis, lack of fluids and low fiber intake.
  - Excessive salivation (Ptylasim) may occur.
  - Food craving may occur.
  - Increased Vitamin C and iron intake is indicated.
- **Skin Changes system**
  - Dark patches on the face (**melasma, chloasma gravidarum**)
  - **Linea nigra:** Brownish black pigmented area in the midline stretching from the xiphisternum to the symphysis pubis. It is due to increased melanin.
  - **Striae gravidarum:** Straie on abdomen and thighs caused by skin stretching as pregnancy advances. Initially they are pinkish but after delivery they become glistening white in appearance and are called **striae albicans**
- **Excretory system**
  - Increased urinary frequency.
  - Bladder capacity increases to 1500 mL.
  - Glycosuria and occasional proteinuria occurs.
- **Skeletal system**
  - Softening of ligaments and joints (symphysis pubis and sacroiliac joints) due to hormonal activity.

Psychological (Emotional) Changes

- Mood swings.
- Anxiety and irritability related to child birth and responsibilities.

Conformation/Diagnosis of Pregnancy

- **Presumptive Signs (Subjective)**
  - Amenorrhea.
  - Fatigue.
  - Nausea and vomiting (morning sickness).
  - Breast changes, urinary frequency.
  - Darkening of pigmentation on face, breasts and abdomen.
  - Quickening (16-20 weeks).
- **Probable Signs (Objective)**
  - Uterine changes: Chadwik's sign, Goodell's sign, Hegar's sign, enlargement of uterus, Piskacek sign, Osiander sign.
  - Pregnancy tests: Urine and blood test for detection of hCG.
  - Braxton-Hicks/Contractions.
- **Positive signs: (Confirmatory)**
  - Fetal heartbeat.
  - Ultrasonography.
  - Fetal outline and movement felt by examiner.

Scanned with CamScanner

Signs of Pregnancy

Table 5

Time	Sign	Explanation
	Hartman sign	Implantation bleeding
	Braxton Hicks contractions	Painless irregular spasmodic contraction without any effect on dilation of cervix can also be felt in pedunculated fibroid Submucous type and hematometra
4-8 weeks	Palmers sign	Regular rhythmic contraction during bimanual examination
6 weeks	Goodell's sign	Softening of lower part of cervix
6-10 weeks	Hegar's sign	And by manual examination abdominal and vaginal fingers opposes each other
6-8 weeks	Piskacek sign	Asymmetric enlargement of uterus
8 weeks	Osiander sign [Octa-8]	Increased pulsation felt through lateral fornix of vagina
8 weeks	Chadwick sign/ Jacquemier's sign	Bluish coloration of vestibule

Estimation of Expected Date of Delivery (EDD)

- **Naegele's Rule:** LMP - 3 months + 7 days + 1year = EDD.
- It can also be calculated by adding 9 months and 7 days to the date of LMP, when the cycle is of 28 days and is also regular.

Estimation of Gestational Age

- **Symphysiofundal Height**
  - *At 16 weeks:* Fundus found halfway between symphysis pubis and umbilicus.
  - *At 18–20 weeks:* Fundal height approximately equals the fetus age in weeks ± 2 cm.
  - *At 20 -22 weeks:* Fundus is at umbilicus.
  - *At 36 weeks:* Fundus is at xiphoid process.
- **Ultrasonography** establishes gestational age by crown to rump measurement during first 11 weeks.

Screening Tests During Pregnancy

- Alpha-Feto protein (AFP) testing for neural tube defects, Down syndrome and other congenital anomalies at 14–16 weeks.
- Screening for tuberculosis and HIV, rubella, toxoplasmosis, varicella-zoster virus.
- Blood type and count.
- Rh factor and indirect Coomb's test to determine hemolytic conditions.
- Serum glucose monitoring for gestational diabetes at 26-28 weeks.
- Group B streptococcus culture at 36 weeks.
- Chorionic villi sampling or amniocentesis for women at high risk or >35 years of age to determine chromosomal abnormalities.

INTRANATAL PERIOD (INTRAPARTUM)

Figure 20 ■ Symphysio-fundal height

Key Terminologies

Attitude: The relationship of the fetal head and limbs to its trunk is called attitude.

Presentation: The leading anatomical part of the fetus closest to the pelvic inlet of the birth canal. Example cephalic, breech, or shoulder presentation.

Denominator: The arbitrary bony part of the presenting part is called denominator. **Example:** Occiput in vertex, brow in face, sacrum inn breech presentation.

Lie

- **The lie refers to the relationship of the long axis of the fetus to the long axis of the centralized uterus or maternal spine,** the most common lie being longitudinal (99.5%)

Types of Lie

Figures 21 A to D ■ Types of lie

Scanned with CamScanner

Presentation: Body parts of the fetus that engage in the true pelvis.

- **Cephalic (head):** Vertex, brow or face.
- **Breech:** Frank, complete, on single or double footling
- **Shoulder:** Fetus cannot travel through birth canal.
- **Denominator:** Is the name of the part of the presentation. e.g. vertex-occiput, Breech-sacrum, face- mentum.
- **Presenting part:** Part of the fetus that lies over the cervical OS during labor.
- It should not be confused with presentation.

Position: Relationship of presenting fetal part to four quadrants of the mother's pelvis.

(L-left; R-Right; O-Occiput; A-Anterior; P-Posterior; M-Mentum; S-Sacrum).

- **Vertex:** Occiput, LOA, LOP, ROA, ROP
- **Face:** Chin, LMA, LMP, RMA, RMP
- **Breech:** Sacrum, LSA, RSA, LSP, RSP

Station: Relationship of presenting part of the false and true pelvis

- **Floating:** Presenting part movable above the true pelvic inlet
- **Engaged:** Suboccipitobregmatic diameter fixed into the pelvic inlet
- **Station 0:** Presenting part at the level of ischial spines; level above spines: -1,-2-3; level below spins: +1, +2, +3.

Figure 22 ■ Station of head in relation to ischial spine

Spontaneous rupture of membranes (SROM or SRM): Usually occurs during mid or late labor but can also occurs before labor begins.

Artificial rupture of membrane (AROM): Should not be done until presenting part is engaged against cervix.

Nitrazine paper test: Used to confirm the presence of amniotic fluid. Test positive when pH is above 7.

LABOR AND ITS MECHANISM

Labor

Series of events taking place in the genital organs to expel the viable product of conception from the womb through the vagina into the outer world.

Delivery

Process of extraction/expulsion of viable product of fetus out of the womb. Delivery and labor are not same.

Table 6 Difference between true labor and false labor

True labor	False labor
Regular uterine contractions that increases in frequency	Contractions are irregular
Increase in intensity and duration with walking	Usually stop with walking
Felt in lower back, radiating to lower portion of abdomen	Contractions felt in abdomen above umbilicus
Bloody show	No Bloody show
Dilation and Effacement	No change in cervix
Fetus usually engaged	Fetus is ballotable

Normal Mechanism of Labor (Steps)

- **Engagement, decent with flexion:** Head descends and chin flexes on chest
- **Internal rotation:** Head internally rotates to pass through the ischial spines.
- **Extension:** Occiput pivot under symphysis pubis and the head is born with extension.
- **Crowning:** Occiput slips beneath the subpubic arch when the head no longer recedes back
- **External rotation (Restitution):** Shoulders rotates to anterior posterior position.
- **Expulsion:** Rest of the body is born with lateral flexion.

Different Positions and Presentations of Fetus

Fig. 16: Different fetal presentations and positions during labor *(Ref: See in Appendices- Page no. A-100)* 106

Figure 23 ■ Breech presentation

Scanned with CamScanner

Figure 24 ■ Degree of internal rotation, restitution and external rotation in left occipitolateral position

Key Points

Nursing Care

- Monitor fetal heart rate by auscultation, Doppler or fetal monitor.
- Spiral scale electrode inserted clockwise; removed anticlockwise
- **FHR between contractions:** 110–160 beats/min
- **Tachycardia:** FHR above 160 beats/min; may be a sign of fetal hypoxia.
- **Bradycardia:** FHR below 110 beats/min; may be caused by fetal hypoxia due to anesthetics.
- Elevate mother's lower extremities, reposition into side lying position, administer oxygen.
- Early deceleration (FHR not below 100) requires no nursing intervention.
- Late deceleration (FHR may decrease to 60): Discontinue oxytocin, reposition to left lateral position, Oxygen by mask (8-10 L/min).
- Prevent supine hypotension by positioning mother to side lying position.

STAGES OF LABOR

First Stage of Labor (From Onset of True Labor to Full Dilation of Cervix)

- **Latent Phase:**
  - Cervix dilates to 3 to 4 cm
  - Mild and short contractions.
- **Active Phase:**
  - Moderate to strong contractions (5 minutes apart).
  - Cervix dilates to 4–7 cm.
  - Bloody show.
  - Membranes may rupture.
  - Supportive measures (encouragement, back rubs, rest between contractions).
  - Medications may be necessary for discomfort.
- **Transition Phase:**
  - Strong contractions (1–2 minutes apart).
  - Cervix dilates 7–10 cm.
  - Increased bloody show.
  - Irritable, restless, agitated, emotional.
  - Leg tremors, perspiration, flushed face, sudden nausea and vomiting.

Second Stage of Labor (From Full Dilation of Cervix to Birth of Newborn)

- **Latent Phase**
  - May last up to 1 hour
  - Decrease in frequency and increase in strength of contraction.
- **Active Phase**
  - Urge to push.
  - Stronger and closer contractions.
- **Transition phase:**
  - Begins with fetal head on perineum; perineum bulges.
  - Leg cramps are common.

Key Points

Nursing Care

- Permit mother to choose pushing and position technique (If unmedicated)
- Assist mother in pushing
- Position both legs simultaneously to avoid trauma to uterine ligaments
- Monitor FHR every 5 minutes
- Administer Inj. Methergin after delivery of anterior shoulder contraindicated in cardiac and hypertensive mothers

Scanned with CamScanner

Third Stage of Labor (From Birth of Newborn to Delivery of Placenta)

Key Points

Nursing care

Care of newborn

- Clear airway mucous
- APGAR scoring: 1 and 5 minutes after birth
- Temperature maintenance; dry infant; skin-to-skin position-ing
- Administer antibiotic ophthalmic medication into each eye
- Vitamin K injection to prevent hemorrhagic disorder
- Apply identification bracelets to mother and infant
- Assist with expulsion of placenta

Fourth Stage (From Expulsion of Placenta Until 2 Hours After Birth)

- Fundus on midline and at the level or slightly above umbilicus.
- Lochia rubra (bloody vaginal discharge)
- Fatigue, thirst, chills.

Key Points

Nursing care

- Palpate fundus every 15 minutes for firmness and height, if relaxed, massage until it become firm
- Fundus should be 2 cm below umbilicus immediately after birth.
- It is raised at the level of umbilicus 1 hour after birth.
- Encourage voiding. Check for bladder distention
- Check perineum for vaginal or suture line bleeding.
- Check for hematoma at episiotomy and laceration site.
- Administer oxytocic medications as ordered.
- Provide food and fluid as tolerated.
- Within first hour of birth, encourage and teach breast-feeding.

Partograph

Partograph is a single graph sheet of paper which records the events take place during the process of delivery in mother and fetus.

Components of Partograph

- Mother information
- Fetal well-being
- Labor progress
- Medications
- Maternal well-being

In partograph fetal heart rate need to be recorded every 30 min

The condition of membrane and liquor need to be recorded as intact (I), clear (C), meconium stained (M)

Cervicogram indicates the cervical dilation and descend of fetal head. Alert line starts at 3 cm dilation and ends at 10 cm dilation at a rate of 1cm/hr.

(Please see next page for partograph)

Oxytocics

- Oxytocics are used to stimulate uterine contractions
- Used to induce labor.
- Given in small doses (slowly) during labor.
- Used to control postpartum uterine atony (may be given rapidly). E.g. Oxytocin (Pitocin, syntocinon).
- **Maternal adverse effects** includes hypotension, dysrhythmia, tachycardia, hypertonic uterus, fluid retention, uterine rupture, seizure and coma.
- **Fetal adverse effects** includes coma anorexia, asphyxia, dysrhythmia, hyperbilirubinemia.

Maternal Analgesia

- **Regional analgesia and anesthesia**
  - Epidural (during labor or for anesthesia during LSCS).
  - Spinal (used for anesthesia during LSCS; single dose).
  - Combination intrathecal.
  - Pudendal (during second stage of labor).
  - Local infiltration (for episiotomy repair).
- **Opioid analgesics**
  - Meperidine hydrochloride (Demerol) during active labor.
    - **Route:** IV, IM, epidural, or intrathecal
    - Risk of respiratory depression newborn.
    - Naloxone (antidote to opinoid) used to counter the respiratory depression.
  - Butorphanol (IM).
    - More effective than meperidine (30–40 times)
    - Less neonatal depression.
  - Nalbuphine (IV or IM)
  - Fentanyl (IV, IM, epidural or intrathecal).
    - More effective than meperidine.
    - Minimal neonatal depression.

NURSING CARE DURING POSTPARTUM PERIOD (IMPORTANT POINTS TO REMEMBER)

- **Postnatal assessment:** BUBBLER (Breast, Uterus, Bowels, Bladder, Lochia, Episiotomy (REEDA), Rest and sleep)
- REEDA is a scale for grading the severity of perineal trauma associated with episiotomy. (Redness, Edema, Ecchymosis, Discharge and Approximation)
- **Lochia:** Vaginal discharge after giving birth (puerperium) containing blood, mucus and uterine tissue. It is typically continuous
  - **Color**
    - **Rubra:** 1–4 days.
    - **Serosa:** 5–9 days.
    - **Alba:** 10–15 days.
  - **Amount (pad in use for <2 hours)**
    - **1 g (pad):** 1 mL of discharge
    - **Scant:** less than 1 inch.
    - **Light:** 1 to 4 inches.
    - **Moderate:** 4 to 6 inches.
    - **Heavy:** more than 6 inches.
- **Episiotomy:** Assess for REEDA (redness, edema, ecchymosis, discharge and approximation).
- **Homan's sign:** To assess for Deep Venous Thrombosis (DVT).
- **Observe vital signs:** Temperature above 100.4°F for 2 consecutive days considered to be sign of beginning of puerperal infection.
- **Encourage Kegel exercises:** Pelvic floor exercise or Kegel exercise consists of repeatedly contracting and relaxing the muscles that form part of the pelvic floor. Kegel exercises strengthen the **pelvic floor** muscles, which support the **uterus, bladder, small intestine** and **rectum.**
- If Rh- mother, assess need for administration of RhoGAM.

Scanned with CamScanner

Cause - First Trimester, First Pregnancy
- Hydatiform mole
- Hormonal (HCG)

COMMON DISORDERS OF PREGNANCY

Hyperemesis Gravidarum

- Severe vomiting in pregnancy that can deteriorate mother's health and interfere in her daily activities.
- **Incidence**: 1 in 1000 pregnancies
- **Adverse effects**:-Dehydration, metabolic acidosis, alkalosis, electrolyte imbalance, weight loss, oliguria, epigastric pain
- **Common measures to be taken:** Dry Tongue, Acetone smell
  - Small and frequent meals
  - Avoid drinking fluid after meals and take in between meals
  - Do not lie down after having meals
  - Avoid food causing gastric irritation
  - Avoid fatty food or food with odors that can trigger nausea and vomiting
- **Management**
  - Admission is required
  - Oral feed is withheld for at least 24 hours or till vomiting persists
  - IV fluids
  - **Antiemetic drugs:** Promethazine (phenergan)-25 mg or prochlorperazine (stemetil) 5 mg, metoclorpramide
  - **Hydrocortisone:** 100 mg in case of intractable vomiting or hypotension
  - **Nutritional supplement:** Vit B1, Vit B 12, Vit B 6, Vit C

Ectopic Pregnancy

- A pregnancy in which the fetus develops outside the uterus.
- Most common site is a fallopian tube (ampulla); other sites include ovaries, cervix and abdomen.
- Risk factors for ectopic pregnancy include: pelvic inflammatory disease (PID), tobacco, smoking and the use of assisted reproductive technology.
- **Signs and symptoms** classically include abdominal pain and vaginal bleeding.
- **Treatment:** Methotrexate to terminates the fetal growth and subsequent abortion. Surgical intervention may be necessary.
- Administer RhoGAM to Rh negative mothers.

Placenta Previa

- Placenta is implanted partially or wholly in the lower uterine segment (near cervical os).
- It is a leading cause of antepartum hemorrhage.

Figure 26 ■ Placenta previa

Figure 27 ■ Types of placenta previa

Type I, II Anterior - Vaginal
Type II Post, III, IV - CS.

- There are four types of placenta previa

I ■ **Low-Lying:** Placenta implanted in the lower segment of uterus but does not reaches (covers) the cervical os. Vaginal birth is possible.

II ■ **Marginal:** Border of the placenta touches (approaches) the cervical os. Vaginal birth are normally safe.

III ■ **Partial:** The placenta only partially obstructs cervical os. Vaginal birth is still possible mostly CS is preferred for partial type.

IV ■ **Complete:** Implantation totally covers the cervical os. Cesarean section is usually recommended.

(Type II posterior) :- ↓ Ant-Poste-Plume
C Dangerous Placenta Previa
&
Stallwarthy Sign

Bleeding in Resting

- **Signs and symptoms:** Pain, bright red bleeding, soft uterus, anemia, uterine contractions. Painless bleeding is associated with placenta previa.
- **Treatment:** For minimal to no bleeding, bed rest. For Heavy bleeding, C-section may be recommended.

Position - Reverse Trendelenberg

Abruptio Placenta

- The separation of the placenta from its site of implantation after 20 weeks of gestation or during the course of delivery.
- **Types:** Concealed abruption, revealed abruption, mixed type.
- **Risk factors:** Increased age and parity; vascular diseases, Supine hypotensive syndrome, Smoking, cocaine use, uterine myoma. Trauma, Infection

Scanned with CamScanner

Type AP :- 1) Revealed :- blood expell by vagina
2) Concealed :- Blood collect behind placenta
3) Mix :- Revealed & concealed

Accreta - Myometrium
Increta - Inved in myometrium
Percreta - cross "

- **Signs and symptoms:**
  - Vaginal bleeding accompanied with abdominal pain
  - Bloody amniotic fluid – painfull bleeding
  - Pallor skin, hypotension – Uterus firm
  - Signs of shock. – Dark vaginal bleeding
  - Placenta in upper segme
- **Treatment:** Depends on gestational age. It ranges from symptomatic management to C-Section or vaginal delivery.

Grade 0' :- No any sym, only diagnosis show disease

Grade '1' Mild vaginal Bleeding
Grade '2' - Moderate Blee
- Most common clinical
- FHR ↓ge
Grade '3' - Severe
- FHR Absent
- Shock present
> 30% loss blood

Figure 28 ■ Abruptio placenta

Cord Abnormalities

- **Battledore placenta:** Placental cord is attached to the margin (Border)
- **Long cord:** The cord is unduly long – up to 300 cm
- **Short cord:** True short cord may be less than 20 cm or 8"
- **Acordia:** Absent cord

Single umbilical artery: Single umbilical artery may be present due to failure of development or atrophy in later months.

Velamentous insertion
The umbilical cord inserts into the fetal membranes (Choriamniotic membranes), then travels within the membrane to the placenta

Marginal insertion
The umbilical cord inserts into the edge of the placental disc; also called as **battledore placenta**

Succenturiate lobe
- One or more small accessory lobes may develop in the membranes at a distance from the main placenta
- Incidence is 5%
- One or more accessory lobe
- Complication
  - pph
  - Vasa previa

Abnormalities of Placenta and Cord

- **Placenta extrachorialis:** It has two types:-
  - ***Circumvallate placenta*** (Thick ring, Double fold)
  - **Placenta marginata**
- **Placenta membranecea:** Unduly large and thin placenta.
- **Placenta bilobate:** Placenta with two equal sized discs
- **Multilobed placenta:** Placenta with three or more equal sized lobes.
- **Placenta fenestrate:** Placental disc has missing central portion.

Circummarginate
Fibrin and old hemorrhage lie between the placenta and the overlying amniochorion

Circumvallate
- The peripheral chorion is a thickened, opaque, gray-white circular ridge composed of a double fold of chorion and amnion (Ring)
- **Complication:**
  - Abortion
  - IUGR
  - APH
  - Preterm labour
  - Placental abruption

(Fetal plat is smaller than Basal plate)

Bilobate/triplex placenta
Bilobate placenta is a placenta with two roughly equal-sized lobes separated by a membrane. Triplex placenta refers to three equal-sized lobes.

Figure 29 ■ Types of placenta

- Weight of Placenta - 500 gm
- Hemochorial, shape - Discoid (Dia - 15-20 cm)

Decidua Basalis (Maternal 20%) + Chorion Frondosum (Fetal 80%)

Placenta made from - Trophoblast (7 day)

Amniotic Fluid Disorders

Polyhydraminos

normal - 500 - 1500

- Amniotic fluid exceeds 2000ml.
- Sonographically seen when Amniotic Fluid Index (AFI) is greater than 24 cm (>95th percentile)
- **Polyhydraminos can be**
  - **Mild:** DVP > 8-11 cm
  - **Moderate:** DVP 12-15 cm
  - **Severe:** DVP ≥ 16 cm (DVP = deepest vertical pocket)

Etiology

- ***Fetal anomalies***: anencephaly, open spina bifida, esophageal/duodenal atresia, facial clefts, hydrops fetalis, genetic syndrome

Scanned with CamScanner

Management

- Diet with 2000-2500 kcal/day for normal weight women
- Diet with 1200-1800 kcal/day for overweight women
- Complex carbohydrates preferred
- Mean plasma glucose level of 105-110 mg/dl gives good fetal outcome
- Exercise like brisk walking and aerobics
- Insulin therapy if fasting blood sugar >90 mg/dl and 2 hours post prandial > 120 mg / dl
- Women with good glycemic control may wait for spontaneous induction of labor
- Elective delivery (caesarean/ induction) with patients requiring insulin or complications like macrosomia at around 38 weeks

Preeclampsia

(after 20 wk)

- A condition in pregnancy characterized by combination of hypertension, proteinuria and pathological edema or pitting edema (fluid retention).

systolic +30
Diastolic + 15 to 20 MAP>105

- **Mild preeclampsia:** BP >140/90 mm Hg on 2 or more occasions and proteinuria > 300 mg/24 hours or end organ damage.
- **Severe preeclampsia:** BP >160/100 mm Hg on 2 or more occasions and proteinuria >5 g/24 hours.
- Diuretics, antihypertensive drugs such as labetalol, hydralazine, nifedipine, nitroglycerine, sodium nitroprusside are the drug of choice.

MgSO4

Eclampsia

- Preeclampsia with convulsions.
- **Signs and symptoms:** Flushing, headaches, blurred vision, deep tendon reflex, decreased urinary output.
- **Eclamptic fits consist of four stages**
  - Premonitory stage – Aura – olfactory hallucination
  - Tonic stage – opisthotonous
  - Clonic stage – Rigid jaw muscle
  - Stage of coma – Sometime unconscious
- **Treatment**
  - Control of hypertension with labetalol, hydralazine.
  - Magnesium sulphate is effective in eclampsia.
  - Magnesium sulfate act as membrane stabilizer and neuro-protector
  - Repeat this injection only if knee jerk reflexes are present, respiratory rate >12/min and urine output exceeds 30 ml/hr
  - Therapeutic level of Magnesium is 4–7 mEq/L
  - Recovery/lateral recumbent position to be given
  - Maintain open airway
  - O_2 administration through non rebreather mask (10 L/min)
  - Fluids administration- colloid/crystalloid ≤ 125 ml/h

Postpartum Hemorrhage (PPH)

- Loss of blood more than 500 mL within first 24 hours after delivery is called PPH.
- **Types of PPH:**
  - **Third stage hemorrhage:** before expulsion of placenta
  - **Primary PPH:** After expulsion of placenta within 24 hrs (True)
  - **Secondary PPH:** After 24 hrs to 6 weeks. (around 8 day)
- **Causes:** (Four T's)
  - Tone: Atonicity of uterus
  - Traumatic injury
  - Tissues: Retained tissues
  - Thrombin: Blood coagulation disorders

mild – 500-1000
moderate – 1000-1500 ml
severe – > 2000

BP ↓se
Pulse ↑se

- **Signs and symptoms:** Decreased BP, increased heart rate and uncontrolled bleeding.
- **Treatment**
  - Bimanual massage of the uterus (Atonic)
  - Start NS/RL with oxytocin (1 L with 20 units) @ 60 drops/ minute.
  - Administer oxytocin 10 units Im/methergine 0.2 mg IV
  - Catheterize the bladder
  - Apply fundal pressure and control cord traction to separate the placenta
  - Manual removal of placenta is to be done under general anesthesia if placenta does not separate.

- Uterine Tamponade
- Tight Packing
- Uterine artery ligate
- Hysterectomy

Preterm Labor

- It is defined as uterine contractions occurring after 28 weeks of gestation and before 37 completed weeks of gestation.
- Common signs are palpable uterine contractions, blood discharge, backache, pressure and cramping.
- **Treatment**
  - Administer tocolytics to decrease frequency and duration of contraction, postponing delivery.
    - E.g. Oxytocin antagonists (Atosiban).
    - Beta mimetic agents (Ritodrine).
    - Magnesium Sulphate.
    - Indomethacin.
  - Glucocorticoid therapy
    - Betamethasone.
    - Administer 24–48 hrs before birth.

Premature Rupture of Membranes

- Spontaneous rupture of membranes beyond 28 weeks of pregnancy but before the onset of labor.
- **Management**
  - **Term PROM**
    - Careful observation is made
    - In 90% of cases spontaneous labor ensue within 24 hours
    - If labor does not start, induction with oxytocin
    - In obstetric indication Cesarean section is performed
  - **Preterm PROM**
    - **>34 weeks:** Spontaneous labor ensues within 48 hours otherwise induction with oxytocin
    - Cesarean section for presentation other than cephalic
    - **<34 week:** Conservative attitude
    - **Use of antibiotics:** To minimize risk of infection
    - **Use corticosteroids:** To enhance lung maturity

Prolonged Labor

- Labor is said to be prolonged when total duration of first and second stage is more than 18 hours
- **Causes**
  - **First stage:** Failure in cervical dilatation
  - **Second stage:** Non descent of presenting part
- **Prevention**
  - Early detection of any malpresentation, malposition or congenital abnormality
  - **Use of partograph:** Change in position during labor
  - Judicious use of augmentation
- **Definitive treatment:** For subnormal uterine activity
  - Amniotomy and/or oxytocin infusion
  - Pain relief by pethidine or epidural analgesia
  - Caesarean section if vaginal delivery is not safe

Scanned with CamScanner

Obstructed Labor

- Labor is said to be obstructed when the descent of presenting part is arrested because of mechanical obstruction despite having good uterine contraction.
- **Causes:**
  - **Fault in passage:** Cephalopelvic disproportion (CPD), contracted pelvis, soft tissue obstruction like cervical dystocia, tumor, previous operative scar, etc.
  - **Fault in passenger:** Brow presentation, transverse lie, congenital malformations, big baby, locked twins
- **Management:**
  - Early detection
  - Cesarean section

Post-term Pregnancy

- Continuation of pregnancy beyond 2 weeks of expected date of delivery.
- **Features**
  - Absence of vernix caseosa.
  - Placental calcification.
  - Scanty saffron-colored meconium and subsequent oligohydramnios.
  - Overgrown nails.
  - Wrinkled skin appearance in newborn.

COMMON GYNECOLOGICAL DISORDERS

Endometriosis

- Common cause of dysmenorrhea, dyspareunia and infertility.
- Endometrium fragments and lodges in other parts of the pelvic cavity.
- Causes inflammation, bleeding, scarring, and adhesions.
- Treated through hormonal therapy, laparoscopic surgery, or major surgical management.

Polycystic Ovarian Disease (PCOD)

- Characterized by increased testosterone and increased FSH/LH levels.
- **Symptoms**
  - Irregular or no menstrual periods (amenorrhea)
  - Excess body and facial hair (hirsutism), acne, pelvic pain, and infertility.
- **Treatment**
  - Diet, exercise.
  - Pharmacotherapy includes ethinyl estradiol, Cyproterone acetate, metformin.

Menstrual Disorders

- **Amenorrhea** is the absence of menstruation.
- **Primary amenorrhea:** Woman has not begun to menstruate till 16 years of age.
- **Secondary amenorrhea:** Absence of menses for 6 months in a woman who previously had regular menstrual cycle.
- **Dysmenorrhea** is painful menstruation.
- **Menorrhagia:** Excessive vaginal bleeding at normal intervals.

- **Metrorrhagia:** Vaginal bleeding between menses. Bleeding may occur as spotting or outright bleeding.
- **Polymenorrhea:** Cyclic bleeding where cycle length is reduced to less than 21 days and remains constant at that frequency.
- **Hypomenorrhea:** Scant bleeding lasting for less than 2 days.
- **Oligomenorrhea:** Cyclic bleeding where cycle length is increased to more than 35 days.

HIV IN PREGNANCY

- **HIV in pregnancy:** Incidence in Asian countries < 0.5 %
- **Management:**
  - For all pregnant and lactating women, NACO recommends to start Antiretroviral Therapy (ART) irrespective of CD4 count

Table 9 ART for pregnant women presenting in active labor with no prior ART

Maternal status	Intrapartum	Postpartum
Presenting in active labor, No Prior ARV prophylaxis	Tenofovir (TDF)- 300 mg OD Lamivudine (3TC) – 300 mg OD Efavirenz (EFV) – 600 mg OD	Tenofovir (TDF)- 300 mg OD Lamivudine (3TC) – 300 mg OD Efavirenz (EFV) – 600 mg OD

Intrapartum Care

- Zidovudine infusion to be started at:
  - Onset of labor
  - 4 hours before caesarean section
  - Loading dose 2mg/kg/hr
  - Maintenance dose 1mg/kg/hr until cord is clamped
- Women who was on ART
  - Have vaginal delivery if viral load < 50 copies/ml
  - Elective caesarean delivery at 38 weeks if viral load >50 copies/ml
- **Elective cesarean reduces the risk of vertical transmission by 50%**
- Broad spectrum antibiotics to be administered as per hospital policy
- Invasive procedures like instrumentation are contraindicated.
- Universal precautions to be taken

Postpartum Care (Neonatal Care)

- Antiretroviral therapy (ARV)– To be given within 4 hours delivery

Table 10 Infant nevirapine (NVP) prophylaxis dosing

Birth weight	NVP daily dose (in mg)	Duration
Less than 2000 g	2 mg/kg once daily.	Up to 6 weeks irrespective of whether exclusively breastfed or exclusively replacement fed
2000 – 2500 g	10 mg, once daily	
More than 2500 g	15 mg once daily	

Source: National Aids Control Organization (NACO), India.

Scanned with CamScanner

GONORRHEA

- Infection caused by *Neisseria gonorrheae*. It can be symptomatic with cervicitis and vaginal discharge, or it may be asymptomatic.
- Gonorrhea may lead to pelvic inflammatory disease.

SYPHILIS

- Syphilis is a systemic disease caused by the bacteria ***Treponema pallidum***.
- If not treated, syphilis may progress from a primary infection characterized by a painless ulcer (chancre), to secondary and tertiary infections.
- Serological tests may be negative in the early stages of infection.

PELVIC INFLAMMATORY DISEASES (PID)

- Ascending pelvic infection that involves upper genital tract.
- Commonly caused by bacteria.
- **Signs and symptoms**
  - Pain ranges from dull aching to severe cramping in lower abdomen.
  - Nausea, elevated temperature, foul smelling purulent discharge.

CERVICAL CANCER SCREENING

- Cervical intraepithelial neoplasia (CIN) is the precursor lesion to cervical cancer.
- Pap smear test allow early diagnosis of most cases
- Recommendations for cervical cancer screening for women.
  - Annual cervical cytology screening should begin approximately 3 years after initiation of sexual intercourse, but no later than age 21 years.
  - Women younger than 30 years should undergo annual cervical cytology screening.
  - The use of combination cervical cytology and human papillomavirus (HPV) and DNA screening is appropriate for women 30 years and older.
  - Women who underwent **total hysterectomy** for reasons other than cervical cancer no longer need to be screened for cervical cancer.

Golden points to remember

- In female reproductive system **external genital organs (vulva)** include mons pubis, labia majora, labia minora and clitoris.
- **Clitoris** is measuring about 1.5-2 cm. It is situated in the most anterior part of the vulva.
- There are the **four openings** in the vestibule:
  - Urethral
  - Vaginal orifice and hymen
  - Opening of Bartholin's duct
  - Skene's gland
- The **internal genital organs** in female include vagina, uterus, fallopian tube and ovaries.
- The normal position of the uterus is either **anteversion** or **anteflexion.**
- In the nonpregnant state:
  - The uterus **weight** varies from **50-80 g**, and **average is 60 g**.
  - The **length** of the uterine cavity is usually **6.5-7 cm.**
- Peritoneal fold present behind the uterus is called **pouch of Douglas.**
- **Fallopian tube is divided into 4 parts** that is interstitial, isthmus, ampulla, and infundibulum.
- The **length** of each **fallopian tube** is approximately **10 cm.**
- The **diameter** of the fallopian tube is about 1 cm.
- The **length** of each **ampulla** is **5 cm.**
- The term **parturition** refers to the process of giving birth to a child including both labor and delivery.
- **A parturient** is a woman in labor.
- Development of mature ovum is called **oogenesis.**
- Full mature ovum is the largest cell in the body and is about **130 microns in diameter.**
- Release of oocyte (ovum) from the ovary following rupture of mature Graafian follicle and available for conception is known as **ovulation.**
- Ovulation usually occurs 14th day in a 28-day cycle.
- **Fertilization** is the process of fusion of the spermatozoon with the mature ovum.
- **Fertilization** occurs in **ampullary part** of the fallopian tube.
- **Fertilizable life span** of oocyte ranges from 12 to 24 hours.
- Penetration of zona pellucida is facilitated by the release of **hyaluronidase** from the **acrosomal cap.**
- Implantation of fertilized ovum occurs through four stages, i.e. **apposition, adhesion, penetration** and **invasion.**

Contd...

Scanned with CamScanner

- The decidua is the endometrial layer of the pregnant uterus.
- The **embryo** can be differentiated as human at 8th week of pregnancy.
- There are two surfaces present in the placement, namely maternal and fetal surface.
- The **maternal surface** of placenta is rough and spongy.
- The umbilical cord is attached to the **chorionic plate.**
- Fetal membrane consists of **two layers** known as the **outer chorion** and **inner amnion.**
- Daily urine output of fetus at term is **400-1200 mL.**
- **Amniotic fluid volume** reaches the **peak (1000 mL) at 36-38 weeks.**
- The specific gravity of amniotic fluid is **1.010.**
- Amniotic fluid is **alkaline in nature.**
- **The green color of amniotic fluid** indicates the presence of **meconium.** (fetal distress)
- Amniotic fluid appears **golden color** in case of Rh incompatibility.
- Amniotic fluid appears **dark-brown** color in **intrauterine death.**
- Amniotic fluid contains 98-99% water, 1-2% solid.
- **Nitrazine paper test** is used to distinguish amniotic fluid from urine. Paper turns **blue** in case of amniotic fluid and **yellow** in case of urine.
- **Protection of the fetus** is the main function of amniotic fluid.
- **Funis** is other name of the **umbilical cord.**
- **Embryonic period begins** at 3rd weeks up to 8 weeks post-conception.
- Fetus length from vertex to the coccyx is known as **Crown-rump length.**
- Fetus length from vertex to the heel is **crown-heel length.**
- The fetus is **viable** if born after 28 weeks of gestation.
- At term the weight of fetus varies from **2.5 kg to 3.5 kg** (In India).
- **Hematopoiesis** begins first in the yolk sac by 14th day of conception.
- At term 75-80% of the total hemoglobin is of fetal type HbF.
- At term fetal **IgG level is 10% higher** than the mother.
- The maternal **immunoglobulin G (IgG)** crosses the placenta from 12 weeks of pregnancy onward.
- **Alveoli of fetus** expands at 24 weeks.
- **L:S ratio of 2:1** in the liquor amnii signifies full maturity of the fetal lungs.
- **Fetal cortisol** is the natural trigger for augmentation **surfactant synthesis.**
- The umbilical vein carries the oxygenated blood from placenta to fetus.
- There are **two arteries** and **one vein** present in the umbilical cord singleton pregnancy.
- Oxygenated blood enters the fetal circulation from umbilical vein via ductus venosus.
- Closure of the umbilical arteries takes about 2-3 months after delivery.
- Functional closure of **foramen ovale occurs soon after birth** but **anatomical closure** takes place in about one year.
- The weight of the uterus at term is **900-1000 g.**
- The weight of the uterus in non-pregnant state is **60 g.**
- Shape of the nonpregnant uterus is **pyriform.**
- During pregnancy, uterus becomes **globular at 12 weeks.**
- **Dextrorotation** is rotation of uterus on its long axis to the right.
- Irregular, spasmodic and painless contraction without dilatation of cervix is known as **Braxton-Hicks contraction.**
- Braxton- Hicks contraction is **not felt in abdominal pregnancy.**
- **Montgomery's tubercles:** During pregnancy sebaceous glands in areola become hypertrophied and called as **Montgomery's tubercles.**
- Secretion can be squeezed out of breast at **12 weeks.**
- **Chloasma gravidarum or melasma** is pigmentation around the cheek, forehead and around the eyes. Chloasma gravidarum is also known as **pregnancy mask.**
- Pigmented area from xiphisternum to symphysis pubis is called **Linea Nigra.**
- Pigmentary changes take place during the pregnancy due to melanocyte stimulation by anterior pituitary.
- **Aldosterone production** during pregnancy is responsible for stretching of skin in mother.
- A normal healthy woman should gain about 10-12 kg of weight during pregnancy.
- Water retention at term is **6.5 liters.**
- Due to elevation of the diaphragm (because of the enlarged uterus), the **heart is pushed upward and outward.**
- **Cardiac output** starts to increase at 5th week of pregnancy.
- Total iron requirement during pregnancy is estimated approximately 1000 mg of elemental iron.
- Hormones essential for **follicular maturation** are FHS and small proportion of LH.
- **Human Chorionic Gonodotrophin (hCG)** is secreted by the syncytiotrophoblast cell.
- During pregnancy preparation of breast is called **mammogenesis.**

Contd

Scanned with CamScanner

- Ejection of breast milk is known as **galactokinesis.**
- **Galactopoiesis** refers to maintenance of lactation.
- Thick yellow secretion from the breast occurs at **16 weeks**.
- On examination the height of uterus remains at:
  - The level of symphysis pubis at **12 weeks of pregnancy**.
  - The level of umbilicus at **24 weeks of pregnancy.**
  - Midway between the symphysis pubis and umbilicus at **16th weeks of pregnancy.**
- Reproductive period of a woman begins at **menarche** and ends in **menopause**.
- The normal period of pregnancy is **280 days (40 weeks).**
- Discoloration and cyanosis of the vulva, vagina, and cervix (Chadwick sign), Goodell's sign, Hegar's sign, uterine enlargement, Braxton Hicks contractions, positive blood pregnancy test are known as **probable signs of pregnancy** (non-specific).
- The positive signs of pregnancy include the detection of a fetal heartbeat, the recognition of fetal movements and visualization of fetus through ultrasound.
- A positive over-the-counter pregnancy test is considered as a positive sign of pregnancy.
- Over-the-counter pregnancy tests detect the presence of Human Chorionic Gonadotropin (hCG) hormone.
- Pregnancy test using detection of hCG in maternal serum or urine is possible from 8 to 11 days after conception.
- **Urine Pregnancy Test** is not reliable after 12 weeks of conception.
- Discoloration of the vestibule and anterior wall of vagina is known as **Jacquemier's sign.**
- **Chadwick's sign:** Purplish discoloration of vaginal mucosa visible at 8th week of pregnancy.
- Regular and rhythmic uterine contraction elicited during bimanual examination is known as **palmer's sign.**
- Naegele's formula is used to calculate EDD from LMP. Add 9 calendar months and 7 days to the first day of the last normal period. EDD = LMP + 9 months + 7 days.
- The perception of 1st active fetal movement by women is known as Quickening (feeling of life). It occurs about 18-20 weeks in a **primigravida** and as early as 16 weeks in the **multigravida**.
- **Lightening**: Decrease in fundal height a few weeks before onset of labor is known as **lightening (38th week).**
- Lightening is called as **Welcome sign** of the baby (38th week).
- Greatest weight gain of the fetus occurs in third trimester of pregnancy.
- Greatest growth in height/length of fetus occurs in second trimester of pregnancy.
- **Chloasma** appears at 24 weeks of pregnancy.
- **Linea nigra** is visible as early as 20th week of pregnancy.
- Palpation of the fetal parts is possible at 20the week of pregnancy.
- Active fetal movement can be felt by placing the hand over the uterus by 20th week of pregnancy.
- Fetal heart sound is the most **conclusive clinical sign of pregnancy.**
- Fetal heart starts to beat near to 22 days (3 weeks) after the woman has conceived but the sound is too soft to hear. It can be heard by 6th – 7th week at the earliest through ultrasound.
- Fetal Heart Tone (FHT) can be observed through Doppler as early as 8-10 weeks and through fetoscope at 18-20 weeks of gestation.
- Fetal heart tones can usually be detected with a stethoscope between 16 and 20 weeks.
- Uterine shape is changed from cylindrical to spherical after 36th week of pregnancy.
- Crown-rump length of fetus can be detected in ultrasonogrphy at 7th week.
- **Johnson's formula** is used for the estimation of fetal weight.
- Relationship of the long axis of the fetus to the long axis of the centralized uterus or maternal spine is called **fetus lie.**
- **Presentation** is the part of the fetus which occupies the lower pole of the uterus.
- Relation of the denominator to the different quadrant of the pelvis is called **position.**
- Abdominal examinations beyond 28 weeks of pregnancy can reasonably diagnose presentation, position, and attitude of the fetus.
- **Pawlik's grip** is the 3rd obstetric grips on abdominal examination.
- **Obstetric grip** is also known as **Leopold maneuvers.**
- **Pelvic grip** examination is done facing the patient's feet.
- On examination, divergence of fingers shows engaged head.
- **Coronal sutures** run between parietal and frontal bones on either side.
- Lambdoid sutures separate the occipital bone and the two parietal bones.
- **Anterior fontanelle** becomes ossified around 18th month after birth.
- **Posterior fontanelle** becomes ossified around 6 weeks after birth.
- Largest diameter of the fetus skull is **mentovertical (14 cm).**
- **Biparietal diameter** of fetal head measure about 9.5 cm.
- The formation of swelling due to stagnation of fluid in the layers of the scalp is called **caput succedaneum.**
- Pelvic bone is composed of **four bones:**
  - Two innominate bones,
  - Sacrum, and
  - Coccyx.

Contd...

Scanned with CamScanner

- **Female pelvic joint** is two sacroiliac joint, sacrococcygeal joint and symphysis pubic.
- The transverse diameter of the pelvic inlet is 13 cm.
- Systemic supervision of women during pregnancy is called **antenatal care.**
- "Para" is defined as the number of past pregnancies gone beyond period of viability.
- Total number of pregnancies a woman had is called as 'Gravida'.
- **Primigravida** is one who is pregnant for the first time.
- **According to WHO,** four antenatal visits to mother should be done.
- **Prenatal Checkups**:
  - **1–7 months:** Once a month
  - **8th month:** Twice a month
  - **9th month:** Every week
- Supplemental iron therapy should be provided from 16th weeks onwards.
- Highest level of Alpha-Feto Protein (AFP) in fetal serum and amniotic fluid is reached around 13 weeks.
- **Amniocentesis** is performed between 14 and 16 weeks of pregnancy.
- **Cordocentesis** is also known as percutaneous umbilical blood sampling.
- Increasing the intake of vegetables, fruits and fluid is the best method to relieve from constipation during pregnancy.
- A sedentary woman needs 1,875 calories per day. **In Addition,** pregnant mother requires 300 calories. Totally pregnant mother requires 2,175 calories per day.
- **Abdominal circumference** is the single measurement which best **reflects fetal nutrition.**
- **Contraction Stress Test (CST)** is to observe the response of the fetus at risk for uteroplacental insufficiency in relation to uterine contraction.
- **Triple test includes** MSAFP, hCG, and uE3. It is used for detection of Down's syndrome. It is performed at **15 to 18 weeks** of pregnancy.
- Expulsion of the viable products of conception out of womb through the vagina into outer world is called **labor.**
- Normal labor also called **Eutocia.**
- Abnormal labor also called **Dystocia.**
- False labor pain is manifested by:
  - Abdominal discomfort
  - Contractions irregular in nature
  - Contraction lessen with activity or rest
  - Cervical dilation is not seen in false pains
  - Pain is relied by enema
- The major sites of **synthesis of prostaglandins** are amnion, chorion, decidual cell and myometrium.
- There are the **FOUR** stages of labor: 1. Thinning (effacement) and opening (dilation) of the cervix 2. Baby moving through birth canal 3. Afterbirth 4. Recovery.
- Average duration of **the 1st stage of labor is 12 hours in primigravidae,** and **6 hours in multiparae.**
- Second stage of labor got 2 phases that is **propulsive** and **expulsive.**
- **Pacemaker of the uterine contraction** is situated in the region of the **tubal ostia.**
- Intra-amniotic pressure rises 20 mm Hg during uterine contraction.
- Coordination between fundal contraction and cervical dilatation called **polarity of uterus.**
- Following child birth during which the body tissues, especially the pelvic organs revert back to the pre-pregnant state both anatomically and physiologically. This is called normal **Puerperium.**
- **Puerperium period** starts from after delivery up to the 6 weeks.
- Regeneration of the placental site takes 6 weeks.
- Following delivery, fundus lies about 13.5 cm above the symphysis pubic.
- Vaginal discharge for the first fortnight (two weeks from delivery) Puerperium is called **Lochia.**
- There are three **types of Lochia.** They are:
  - Lochia Rubra (1-4 days)
  - Lochia Serosa (5-9 days)
  - Lochia Alba (10-15 days)
- **Lochia rubra** consists of blood, shreds of fetal membranes and decidua, vernix caseosa, lanugo and meconium.
- The characteristics of lochia rubra (1-4 days) is **bloody with fishy odor.**
- Menstruation and ovulation occur around 10 weeks after delivery in lactating mothers and in 4 weeks after delivery in non-lactating mothers.
- The immunoglobulin present in colostrums is **IgA.**
- **Oxytocin** is the major galactokinetic (milk ejection) hormones.
- **Prolactin** appears to be the single most important galactopoietic **(milk production)** hormones.
- Medicine used to increase the secretion of breast milk is Metoclopramide (10 mg TDS).
- Excessive vomiting in 1st trimester is called **Hyperemesis Gravidarum.**

Contd..

Scanned with CamScanner

- Abortion is considered before the 20th week of gestation.
- The most common cause of 1st trimester abortion is **trisomy**.
- Second **trimester abortions** occur mostly due to incompetent cervix.
- Abortion associated with clinical evidence of infection of the uterus and its contents is called **septic abortion.**
- Missed abortion is also known as **silent abortion**.
- **Incomplete abortion:** In this, fetus is expelled but parts of the placenta and membranes are not expelled.
- In India, the abortion was legalized by Medical Termination of Pregnancy Act (MTP Act) of 1971, and has been **enforced in April 1972.**
- Two methods of induction of labor include medical and surgical method.
- An **ectopic pregnancy** is one in which the fertilized ovum is implanted and develops outside the normal endometrial cavity.
- The site of ectopic pregnancy in tube is isthmus, ampullary, and interstitial.
- **Transvaginal sonography (TVS)** gives the most appropriate finding related to ectopic pregnancy.
- Sonography feature of molar pregnancy is **"Snow storm" appearance.**
- Cullen's sign is superficial edema and bruising in the subcutaneous fatty tissue around the umbilicus in ruptured ectopic pregnancy.
- **Hydatidiform mole** is a rare mass or growth that forms inside the uterus at the beginning of a pregnancy. It is a type of **gestational trophoblastic disease (GTD).**
- Hydatidiform mole is also known as **vesicular mole**.
- **Vanishing twin**, also known as fetal resorption, is a fetus in a multigestational pregnancy which dies in utero and is then partially and completely reabsorbed by the twin.
- Miscarriage rate is increased, especially with monozygotic twins.
- In the active management of labor, IM injection of **Ergometrine** (500 mcg in 1ml) is given **after delivery of the anterior shoulder,** or at the latest, immediately after delivery of the child. In multiple births, it should not be administered until the last child has been delivered.
- **Quadruplets**: Number of the baby is four.
- **Quintuplets**: Number of the baby is five.
- **Polyhydramnios** is a state where liquor amnii exceeds 2000 mL.
- In Polyhydramnios, amniotic fluid index is more than 24cm (>95th percentile for gestational age).
- **Indomethacin** is given to decrease amniotic fluid.
- Liquor amnii less than 200 mL at term is called **Oligohydramnios.**
- Failure of secretion by the cell of the amnion covering the placenta is called **amnion nodosum.**
- Absence of communicating blood vessels in placenta is **called placenta spuria**.
- One or more small lobe of placenta placed at varying distance from main placenta is called **placenta succenturiata.**
- Cord attached to the margin of placenta is called **battledore placenta**.
- Cord length less than 20 cm is called short **cord**.
- Hypertension extent of 140/90 mm Hg with proteinuria after the 20th week of pregnancy is called **pre-eclampsia.**
- **HELLP syndrome:** Hemolysis, Elevated Liver enzyme, Low Platelet count.
- Urinary output less than 400 mL/24 hours in preeclamptic woman is termed oliguria (diminished urinary output).
- **Biochemical marker of pre- eclampsia** is uric acid (>4.5 mg/dL).
- Pre-eclampsia when complicated with generalized tonic-clonic convulsion and coma is called **eclampsia.**
- In **premonitory stage of eclampsia** eyeballs roll or are turned to one side and become fixed.
- All the voluntary muscles undergo alternate contraction and relaxation in the **clonic phase of eclampsia.**
- **Magnesium sulphate** is the drug of choice in **eclampsia to control fits.**
- The therapeutic level of magnesium sulphate in blood is 4-7 mEq/L.
- Loss of Patellar reflex (deep tendon reflex) is the early warning sign of magnesium toxicity.
- When repeated doses of magnesium sulphate are given parenterally, **knee jerk reflexes** should be tested before each dose. If reflexes are absent, no additional magnesium should be given until reflex return.
- Parenteral administration of magnesium sulphate is contraindicated in patients with heart block or myocardial damage.
- **Calcium gluconate** is the drug of choice to treat magnesium sulfate toxicity.
- Placenta implanted partially or completely over the lower uterine segment is called **placenta previa.**
- Bleeding from or into the genital tract after 28th weeks of pregnancy is called **Antepartum Hemorrhage (APH).**
- In APH **ultrasonography** is the initial procedure either to confirm or to rule out the diagnosis.
- Premature separation of normally situated placenta is called **abruptio placenta.**
- **Betamethasone** is given to accelerate fetal lung maturity in preterm.
- During pregnancy, **anemia** is defined as Hb < 10 g/DL.
- **Leishman stain** (study the morphology of the red cells) gives better idea about type of anemia.
- **Mean corpuscular hemoglobin concentration (MCHC)** is the most sensitive index of iron deficiency anemia (<30).
- **Megaloblastic anemia** in pregnancy is always due to folic and B12 deficiency.
- Daily requirement of folic acid in pregnancy is 400 ug/day (4 mg/daily).
- Increase in homocysteine and normal methylmalonate indicates folate deficiency.

Contd...

Scanned with CamScanner

- Maternal hyperglycemia during pregnancy can lead to fetal **macrosomia.**
- **Lugol's** solution is used in hyperthyroidism.
- **Streptomycin** crosses placental barrier, so it is contraindicated during pregnancy.
- **Preterm labor** is defined as **regular contractions** of the uterus resulting in changes in the cervix that start before 37 weeks of pregnancy.
- Labor occurs after 20 weeks but before 37 weeks is termed as **preterm labor.**
- Pregnancy continuing beyond two weeks of the expected date of delivery (>294 days) is called **post-term or post-maturity.**
- The main clinical significance of post-term maturity is **dysmaturity** or **macrosomia.**
- Scar dehiscence means asymptomatic separation of thinning of the scar without involving the peritoneal coat and without any hemorrhage.
- **Landsteiner** and **Weiner (1940) discovered** specific unknown antigen in human red cell known as **Rh antigen.**
- **Antenatal prophylaxis with anti-D immunoglobulin** in non-sensitized Rh-negative pregnant women at 28 and 34 weeks of gestation to prevent RhD alloimmunization is recommended by WHO.
- Rh-negative unsensitised women should receive **300 µg** within **72 hours** of induced or spontaneous abortion.
- Rh-negative unsensitized women should receive **300 mcg Rh immunoglobulin (Anti-D immunoglobulin)** within **72 hours** of full-term delivery.
- Artificial rupture of membrane is called **Amniotomy.**
- One dose of **anti-D 300 µg immunoglobulin** is given prophylactically at around 28th weeks and the second dose should be given after delivery within 72 hours if the infant is D-negative.
- Pelvis is divided into four types— gynecoid, anthropoid, android, and platypelloid.
- **Gynecoid pelvis** is the **most suitable** pelvic shape for **childbirth.**
- The shape of gynecoid is round.
- An ischial spine is prominent in android pelvic.
- Android pelvis is the least suited pelvis type for childbearing.
- Absence of one ala of the sacrum is called **Naegele's pelvic.** Absence of both sacral alae is called **Robert's pelvis.**
- The disparity in the relation between the head and the pelvis is called **cephalopelvic disproportion.**
- The fetus head can be pushed down up to the level of ischial spines and there is no overlapping of the parietal bone over the symphysis pubis. This means **no disproportion.**
- **Constriction ring** is situated at the junction of the upper and lower segment around a constricted part of fetus.
- When the combined duration of the first and second stage is less than two hours, it is called **precipitated labor.**
- **Prolonged labor** when the combination of the first and second stage of labor is more than 18th hours.
- Labor is prolonged when the cervical dilatation is less than 1 cm/h in primi and 1.5 cm/h in a multi.
- Both the thighs and legs are partially extended bringing the legs to present at the brim in **footling presentation.**
- In the **breech delivery** the engaging diameter of the shoulder is bisacromial.
- **Frank breech** is the most common type of breech presentation.
- Burns Marshall Method is used to deliver the fetus in breach presentation.
- The number of positions in the face presentation is **four.**
- When the fetus position is constantly changed after the 36 weeks of pregnancy this stage is called **unstable lie.**
- When the cephalic presentation is complicated by the presence of hand or foot or both alongside the head by the side of breech is called **compound presentation.**
- Cord is lying inside the vagina or outside the vulva following rupture of the membranes is called **cord prolapse.**
- Sim's position should be maintained if cord is prolapsed.
- Abnormally a large-size baby weighing more than 4 kg is considered **macrosomic.**
- **Cleidotomy** is one or both clavicles may be cut with scissors to reduce the shoulder girth.
- **Folic acid supplementation** will reduce the incidence of **Neural Tube Defects (NTD).**
- Blood loss in excess of 500 mL following birth of the baby is called **Post-Partum Hemorrhage (PPH).**
- In atonic hemorrhage the uterus turns flabby and becomes hard on massaging.
- In PPH, inj. Oxytocin drip started (10 units in 500 mL of normal saline) at the rate of 40-60 drop/min.
- The placenta is said to be retained when it is not expelled out even **30 minutes** after the **birth of the baby.**
- Placenta directly anchored to the myometrium is called **placenta accrete.**
- The uterus is turned inside out partially or completely is called **inversion of uterus.**
- An infection of the genital tract which occurs as a complication of delivery is termed **puerperal sepsis.**
- Rise of temperature **reaching 100.4** or more on two separated occasions at 24 hours apart from first 10 days following delivery is called **puerperal pyrexia.**
- **Dicloxacillin** (500 mg every 6 hourly) is drug of choice in the acute mastitis.
- **Immediate puerperal emergencies** are PPH, shock, postpartum eclampsia, pulmonary embolism.
- After the delivery **molding** subsides within 5 days.
- **Brushfield's spots** (white or greyish brown spots) in the iris is seen in Down's syndrome.
- The dose of Vitamin K is 1 mg for a term baby. Single dose given after delivery or within 6 hours of birth. 0.5 mg given for preterm baby.

Contd...

Scanned with CamScanner

- **Rooming-in** promotes maternal-infant bonding.
- Baby born before completing 37 weeks of gestational age is called **preterm baby**.
- **Asymmetrical Moro reflex** in newborn is associated with brachial plexus, cervical or humerus injuries.
- Progressive thinning and shortening of cervix are defined as effacement.
- The increase in diameter of cervix is called as dilation.
- Hundred percent effacement and 10 cm cervical dilation occurs in second stage just before the delivery of fetus.
- **Bishop's score** parameter includes cervical dilatation, effacement, consistency, position and station of head.
- The favorable Bishop's score is 6-13 and unfavorable score is 0-5.
- In **cervicograph** the alter line starts at 3 cm.
- Normal **fetal heart rate** is 110-160 beats/min.
- A significant predictor of fetal well-being is fetal heart rate between 120 and 160 beats/min.
- **Tocolytics** (terbutalin 0.25 mg SC) are used when uterus is hypertonic and there is non -reassuring FHR.
- **Omphalitis** is the inflammation of the umbilical cord; it is also called umbilical sepsis.
- Low level of AFP found in Down's syndrome.
- Down's syndrome is the **trisomy 21**.
- Upward and outward slanting of the eyes with epicanthic folds; short upper lip with small mouth, macroglossia and Mongolian signs are the feature of **Down's syndrome.**
- Oxytocin has a half-life of 3-4 minutes and duration of action is approximately 20 minutes.
- **Synthetic oxytocin** is widely used. It has only got oxytocic effect without any vasopressor (syntocinon, 5 IU/mL) effect.
- **Dangers of oxytocin** are uterine hyperstimulation, uterine rupture, water intoxication, and hypotension.
- Uterine tetany could result from the use of oxytocin to induce labor because oxytocin promotes powerful **uterine contractions.**
- Method of **surgical induction of labor** includes ARM and stripping the membranes.
- **Intracervical application of dinoprostone gel** is the gold standard for cervical ripening.
- **Radical mastectomy** refers to removal of breast/s, pectoral muscle, pectoral fascia and nodes.
- **Cessation of menses** in women is due to the inability of the ovary to respond to gonadotropic hormone.
- **Bilateral oophorectomy** is the term used for surgical menopause.
- Main blood supply for uterus is carried out by **Uterine and Ovarian Arteries.**
- The most common preterm complication is respiratory distress.
- **Erb's palsy** is one of the complications of breech delivery. It is characterized by flaccid arms with elbows extended.
- **Intervention** is usually undertaken to help treat or cure a condition. It is a range of motion exercises.
- Morning after pill acts by preventing the implantation of the fertilized ovum if taken within 12 hours post-intercourse.
- The visual examination of the cervix and vagina by special instruments is called Colposcopy.
- Prematurity and still birth, Congenital anomalies, Macrosomia (large size of the baby) are common in woman with Gestational Diabetes Mellitus.
- Formal Diabetes screening should be done at 24-28 weeks of gestation to identify gestational diabetes mellitus (American Diabetes Association).
- The best time for insertion of IUD is after 2-3 days after the period is over. Intra uterine devices (IUD) insertion is scheduled within 7 days from starting of period. Because internal os is slightly open during the first 7 days of periods and chance of already being pregnant is ruled out in this period.
- The most common problem with IUD is **spontaneous expulsion of device.**
- **Excessive menstrual bleeding is the most common side effects of IUDs**
- Mitral stenosis is the valvular lesions that causes a risk of maternal death during labor.
- The main cause of genital warts (Condylomata Acuminata) is Human Papilloma Virus (HPV).
- Genital herpes simplex increases the risk of **cervix cancer.**
- **Circlage operation** (encircling cervix with suture) is done for patients with incompetent cervix.
- Prolapse of the uterus with eversion of the entire vagina is termed as Procidentia.
- The gold standard for the treatment of hot flushes is **Estrogen administration.** Hot flushes commonly occur due to menopause.
- When the posterior bladder wall protrudes downward through the anterior vaginal wall, it is known as cystocele.

Image-Based Questions

1. **Identify the instrument given in the picture?**

a. Hegar's dilator
b. Uterine sound
c. Uterine curette
d. Vaginal wall retractor

2. **Use of the instrument shown in the picture is**

a. To remove tissue from uterine wall
b. To dilate vaginal wall
c. To measure the length and direction of the cervical canal and uterus
d. None of the above retractor

3. **Identify the instrument shown in the image?**
(Refer explanation at the end)

a. Ovum forceps
b. Tissue forceps
c. Alligator forceps
d. Biopsy forceps

4. **Identify the instrument shown in the image?**

a. Hegar's dilator
b. Uterine curette
c. Uterine sound
d. Sims anterior vaginal wall retractor

5. **Identify the instrument shown in the image**

a. Hegar's dilator
b. Vaginal wall retractor
c. Sims uterine sound
d. Sims uterine curette

6. **The instrument given in the picture is used for**

a. Removing tissue from the lining of the uterus
b. D & C procedure
c. Both a & b
d. None of the above

7. **Identify the instrument given in the picture?**

a. Hegar's dilator
b. Uterine sound
c. Uterine curette
d. IUCD removing hook

8. **Identify the equipment given in the picture?**

a. Chest drainage tube clamp
b. Umbilical cord clamp
c. Hemostatic clamp
d. Satinsky clamp

Ans.

1.	b
2.	c
3.	a
4.	d
5.	d
6.	c

9. **Identify the equipment given in the picture?**
(Refer explanation at the end)

a. Hegar's dilators
b. Uterine sound
c. Uterine curette
d. Vaginal wall retractor

10. **Identify the equipment given in the picture?**
(Refer explanation at the end)

a. Hegar's dilator
b. Simpson retractor
c. Simpson perforator
d. Vaginal wall retractor

11. **Identify the equipment given in the picture?**
(Refer explanation at the end)

a. Metal cup ventouse
b. Silicon cup ventouse
c. Soft cup ventouse
d. Rubber cup ventouse

12. **Identify the equipment given in the picture?**

a. Metal cup ventouse
b. Silicon cup ventouse
c. Bird's cup
d. Malmstrom cup

13. **Diagnose the condition shown in photograph**
[Recent Question 2012]

a. Cracked nipple
b. Papilloma of nipple
c. Inverted nipple
d. Retention cyst of a Gland of Montgomery

14. **Identify the uterine anomaly shown in photograph**

a. Didelphic
b. Arcuate
c. Unicornuate
d. Bicornuate

15. **Identify the procedure shown in the image that is usually done in a labor room**

a. Colour Doppler
b. Amniocentesis
c. NST
d. EMG

16. **Identify the instrument**

a. Allis forceps
b. Artery forceps
c. Episiotomy scissors
d. Surgical scissors

17. Look at the image below and identify the grip

a. Pelvic grip
b. Abdominal grip
c. Fundal grip
d. Umbilical grip

18. What is the presentation shown in the picture?

a. LOP
b. LOA
c. ROP
d. ROA

19. Narrowest part of structure (arrows) shown in the photograph

a. Infundibulum
b. Intersititium
c. Isthumus
d. Ampulla

20. Congenital anomaly of organ (arrow) shown in photograph

a. Unicornuate
b. Bicornuate
c. Septate
d. Arcuate

21. Identify uterine anomaly shown in the photograph

a. Hypoplasia uterus
b. Unicornuate uterus
c. Bicornuate uterus
d. Uterus didelphus

22. Clinical examination shown in photograph is used to detect

a. Pregnancy
b. Hepatomegaly
c. Breech presentation
d. Ascites

23. Method shown in photograph is commonly used for screening of

a. Mastitis
b. Pleural effusion
c. Breast cancer
d. All of the above

24. Identify the type of pelvic prolapse (arrow) shown in photograph

a. Cystocele
b. Rectocele
c. Enterocele
d. Uterine prolapse

22. d
23. c
24. d

Scanned with CamScanner

25. Causes of female fertility are most commonly attributed to

a. 1
b. 2
c. 3
d. 4

26. Gynecological procedure shown in the photograph is

a. Swab of vaginal discharge
b. Pap smear
c. VIA test
d. Punch biopsy

27. Use of Instrument shown in the photograph is

a. Pap smear
b. Cervical dilation
c. Retraction
d. Curetting

28. Identify the device/instrument shown in the photograph

a. Doyen's retractor
b. Deaver's retractor
c. Anterior vaginal wall retractor
d. Cusco's speculum

29. Identify the device/instrument shown in the photograph

a. Ayre's spatula
b. Cusco's speculum
c. Sim's Speculum
d. Das Cervical dilator

30. Largest diameter of fetal skull in photograph is

a. 1
b. 2
c. 3
d. 4

31. Pelvis shape type as shown in the photograph is

a. Gynaecoid
b. Android
c. Platypelloid
d. Anthropoid

32. Structure 5 in the photograph of breast represents

a. Coopers ligament
b. Lobule with alveoli
c. Lactiferous duct
d. Areolar tissue

Ans.

25. c
26. b
27. a
28. d
29. c
30. a
31. b
32. c

Scanned with CamScanner

49. Pelvis shape type as shown in the photograph is:

a. Gynaecoid
b. Android
c. Platypelloid
d. Anthropoid

50. Measurement of diameter '1' of fetal skull shown in photograph:

a. 8 cm
b. 9.5 cm
c. 11 cm
d. 13.5 cm

51. Position shown in photograph increase vaginal opening by:

a. 1 cm
b. 2 cm
c. 3 cm
d. 4 cm

52. Identify the instrument shown in the photograph:

a. Cusco's speculum
b. Doyer's retractor
c. Pinard stethoscope
d. Circumcision clamp

53. Identify the scheme/program/plan launched by Government of India *(Refer explanation at the end)*

a. Janani Shishu Suraksha Karyakram (JSSK)
b. Kangaroo Mother Care
c. BFHI
d. RCH Program

54. Technique shown in photograph is used for *(Refer explanation at the end)*

a. Expression of breast milk
b. Retracted nipple
c. Accessory nippple
d. Sore nipples

Explanations of Image-Based Questions

3. Ans. (a) Ovum forceps

- Used to remove placental fragments and product of conception inside the uterus
- Also used as haemostatic clamp.

9. Ans. (a) Hegar's dilator

- These dilators are used to treat vaginismus and to increase cervical dilation.
- These dilators are also used to increase the size of stoma following colostomy.

10. Ans. (c) Simpson perforator

- Used to remove fetus or to perforate fetus skull in an arrested labor where mother's life is at risk.

11. Ans. (a) Metal cup ventouse

- It is a metal cup ventouse used for vacuum extraction. It is connected with a rubber tube and a metal chain.

53. Ans. (a) Janani Shishu Suraksha Karyakram (JSSK)

[Ref. Park, 23/e p456]

Janani-Shishu Suraksha Karyakram (JSSK) (Photograph)

- **Pregnant women components:**
  - Free deliveries (including caesarean section) in public health institutions
  - Free drugs and consumables
  - Free diet (Normal delivery: 3 days; Caesarean section: 7 days)
  - Free diagnostics
  - Free blood transfusion (whenever required)
  - Free transport from home to institution
- **Child health components:**
  - Nutritional rehabilitation centres (NRCs)
  - Integrated management of neonatal and childhood illnesses (IMNCI):
    - Pre-service IMNCI
    - Facility based IMNCI (F-IMNCI)
  - Facility based newborn care:
    - Newborn care corner (NBCC)
    - Newborn stabilization unit (NBSU)
    - Special newborn care unit (SNCU)
  - Triage of sick newborns
  - Home-based newborn care (HBNC)

54. Ans. (b) Retracted nipple

[Ref. Ghai, 8/e p154]

Syringe Method of Treatment (Photograph)

- Inverted or retracted nipples makes latching (attachment) difficult to baby
- Treatment is started after birth of the baby
- Nipple is manually everted, stretched & rolled out several times a day
- A plastic syringe is used to draw out to correct the problem

"He who has health has hope; and he who has hope has everything."
—Arabian proverb

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

1. Breast is composed of: *(NCFL 2019) (AP)*
a. Glandular tissues only
b. Connective tissues only
c. Connective and fatty tissues
d. Glandular and fatty tissues

Explanation: Breast is composed of Glandular tissue (special tissue which produces milk) and the collection of fats cells called as adipose tissue.

2. The cause of change in size and appearance of breasts during pregnancy is: *(Safdarjung NO 2018)*
a. Due to the secretion of estrogen and progesterone
b. Because of the weight gain
c. Due to increased metabolic rate that causes the breasts to become larger
d. Cortisol secreted by the adrenal

Explanation: The secretion of estrogen and progesterone causes the change in size and appearance of breasts during pregnancy. Weight gain causes stretching of breast, not a change in size and appearance.

3. Vulva consists of:
a. Uterus and fallopian tube
b. Uterus, cervix and Fallopian tube
c. Ovary, uterus, vagina and cervix
d. Labia majora, labia minora, mons pubis and clitoris

4. Vulva is composed of:
a. Vagina, uterus, cervix and labia majora
b. Clitoris, vestibule and fourchette
c. Labia majora, labia minora and clitoris
d. Cervix, uterus and ovary

Explanation: The vulva consists of the external female sex organs. The vulva includes the mons pubis, labia majora, labia minora, clitoris, vestibular bulbs, vulval vestibule, urinary meatus, the vaginal opening, and Bartholin's and Skene's vestibular glands. The urinary meatus is also included as it opens into the vulval vestibule.

5. Nerve supply to vulva is through:
a. Ilioinguinal nerve
b. Pudendal nerve
c. Genitofemoral nerve
d. All of the above

6. The structure that provides a pad of fatty tissue for the external female genitalia is:
a. Perineum
b. Labia minora and majora
c. Mons pubis
d. Vulva

7. Identify the part of uterus among the following? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Body
b. Isthmus
c. Cervix
d. All of the above

Explanation: The uterus has four major regions: Fundus, Body, Isthmus and cervix. So all three given options are part of uterus.

8. The most common anatomical position of uterus is:
a. Anteverted and antiflexed
b. Retroverted and retroflexed
c. Retroverted and antiflexed
d. Antiverted and retroflexed

Explanation: Normal uterus is anteversion and anteflexion. The normal position is an anteverted uterus, which is tipped forward. The uterine position is also sometimes described in relation to the location of the fundus; that is, an anteflexed uterus, which is normal and where the fundus tilts forward.

9. The lower uterine segment is formed from the----------
a. Cervix
b. Isthmus and cervix
c. Body of the uterus
d. Isthmus

10. The most important muscle of the pelvic floor is ----------
a. Levator ani muscle
b. Ischiocavernosus
c. Bulbocavernosus
d. Pubococcygeus

11. Structures that support the uterus include .....
a. Round ligament
b. Broad ligament
c. Cervicovaginal junction
d. All of the above

12. The strongest ligament in the female pelvis is: *(RRB Feb 2017)*
a. Reverse cervical
b. Oblique cervical
c. Transverse cervical
d. None

13. At term uterus weight is
a. 200-300 gm
b. 400-500 gm
c. 600-700 kg
d. 900-1000 gm

14. The shape non-pregnant uterus is
a. Globular
b. Pear shaped (pyriform)
c. Oval
d. Cylindrical

15. True support of uterus
a. Broad ligament
b. Round ligament
c. Cardinal ligament
d. Uterosacral ligament

16. Blood supply of the uterus is by
a. Ovarian artery
b. Uterine artery
c. Both
d. None of the above

Ans.

1.	d
2.	a
3.	d
4.	b
5.	d
6.	c
7.	d
8.	a
9.	b
10.	a
11.	d
12.	c
13.	d
14.	b
15.	c
16.	c

Scanned with CamScanner

17. Uterine artery is a branch of:
a. Abdominal aorta b. External iliac artery
c. Femoral artery d. Internal iliac artery

18. The layer of uterus that is sloughed off during menstruation is
a. Endometrium b. Myometrium
c. Perimetrium d. Serous layer

19. The first episode of menstrual bleeding is called:
a. Thelarche b. Menarche
c. Menopause d. Menorrhea

20. The muscle which stretches from the perineum to ischial tuberosity is .....
a. Bulbous cavernosum b. Ischiocavernosus
c. Gluteus minimus d. Gluteus maximus

21. Identify the changes occur to the uterus during pregnant state:
a. Hypertrophy and hyperplasia of blood vessels
b. Stretching of muscle fibers
c. Hypertrophy of lymphatic system
d. All of the above

22. Station '0' in descent indicate head is at .....level
a. Ischial spine level b. Coccyx level
c. Symphysis pubis level d. Ischial tuberosity level

23. Unicornuate uterus refers to .....
a. Menstruation occurs but is not visible due to an obstruction of the outflow tract
b. Distension of the vagina caused by accumulation of fluid due to congenital vaginal obstruction
c. Uterus is formed from only one of the paired Müllerian ducts
d. Complete duplication of uterine horns as well as duplication of the cervix

24. A type of Mullerian duct anomaly in which there is complete duplication of uterine horns as well as duplication of the cervix with no communication between them is known as
a. Unicornuate uterus b. Bicornuate uterus
c. Hyperplasia uterus d. Uterus didelphys

25. Oestrogen and progesterone in birth control pills prevent pregnancy by
a. Having a positive feedback effect on FSH and LH production
b. Preventing ovulation from occurring
c. Not allowing the endometrium of the uterus to fully develop
d. Preventing the sperms from entering the ovum

26. The origin of the ovaries is from
a. Genital ridge b. Genital tubercle
c. Wolffian duct d. Mullerian duct

27. Ovarian artery is a branch of
a. Renal artery
b. Internal iliac artery
c. Abdominal part of the aorta
d. External iliac artery

28. Arrange the parts of fallopian tube from medial to lateral order
A. Interstitial B. Isthmus
C. Ampulla D. Infundibulum
a. A, B, C, D b. D, C, B, A
c. A, C, B, D d. B, D, A, C

Explanation: Intramural or interstitial, isthmus, ampulla and infundibulum is the order of arrangement from medial to lateral.

29. Go through the following statements regarding fallopian tube and identify the incorrect statement
a. Serosa, muscular and mucosa are the layers of fallopian tube
b. Columnar ciliated epithelium is predominant in fallopian tube
c. Uterine and ovarian artery supply blood to it
d. The main function is to produce ova

Explanation: All other statements are correct regarding fallopian tube, but the production of ova is the responsibility of ovary and transportation of it to uterus is the responsibility of fallopian tube.

30. Which chemical present in the acromial tip of sperm facilitate the penetration of zona pellucida of ovum?
a. Hydrochloric acid b. Hyaluronidase
c. Formalin d. Acetyl choline

Explanation: Hyaluronidase is a chemical present in the acromial tip of the sperm which facilitates the penetration of zonapellucida of ovum.

31. After ovulation corpus luteum formed in the ovary releases: *(Staff Nurse G II 2014)*
a. Testosterone b. Aldosterone
c. Progesterone d. Estrogen

32. Fertilized ovum reaches the uterus
a. 3-4 days b. 6-8 days
c. 10-12 days d. 12-14 days

33. The first evidence of pubertal development in female is usually manifest as: *(Banaras HU 2015)*
a. Onset of menarche
b. Appearance of breast buds
c. Appearance of axillary and pubic hair
d. Onset of growth spurt

34. Characteristic hormone of the placenta is: *(Kerala PSC, Nov 2014)*
a. Oestrogen b. Chorionic gonadotropin
c. Corticotrophin d. Oxytocin

35. Normal weight of placenta at term is: *(Staff Nurse G II 2014)*
a. 1/4th of baby weight
b. 1/6th of baby weight
c. 500 g
d. 900 g

36. Vaginal pH during pregnancy is .....
a. Acidic b. Basic
c. Neutral d. Fluctuating

37. Vaginal pH is
a. 3.8-4.5 b. 4.5-6.0
c. 5.0-6.5 d. 6.5-7.5

38. The normal vaginal pH during child bearing period is
a. 4.5 b. 5.7
c. 6.8 d. 7

39. Most common hernia in females is
a. Femoral hernia b. Inguinal hernia
c. Spigelion hernia d. Obturator hernia

40. The blood vessels in the umbilical cord consist of: *(LNJP H D 2012)*
a. Two veins and one artery
b. Two arteries and two veins
c. One artery and one vein
d. Two arteries and one vein

Ans.

17.	d
18.	a
19.	b
20.	b
21.	d
22.	a
23.	c
24.	d
25.	b
26.	a
27.	c
28.	a
29.	d
30.	b
31.	c
32.	a
33.	b
34.	b
35.	b
36.	a
37.	a
38.	a
39.	b
40.	d

Scanned with CamScanner

41. The outermost membrane of the placenta is: *(LNJP H D 2012)*
a. Chorion
b. Amnion
c. Cotyledons
d. Yolk sac

42. The average length of umbilical cord is....cm. *(RRB Feb 2012)*
a. 25 cm
b. 30 cm
c. 10 cm
d. 55 cm

43. Bartholin gland is found in: *(RRB Feb 2012)*
a. Cervix
b. Ovary
c. Vagina
d. Uterus

44. Puberty onset in girls starts with .....
a. Menarche
b. Growth spurt
c. Menopause
d. Thelarche and growth of pubic hair.

45. What all are the changes occurred to pituitary gland during pregnancy?
a. Increase in weight and enlarge in size
b. Elevated growth hormone level and serum prolactin level
c. Low level of pituitary gonadotropins
d. All of the above

46. Which of the following hormone inhibits the secretion of follicle stimulating hormone?
a. Progesterone
b. Oestrogen
c. Androgen
d. Testosterone

Ans.

41.	a
42.	d
43.	c
44.	d
45.	d
46.	b
47.	c
48.	d
49.	a
50.	b
51.	b
52.	d
53.	b
54.	d
55.	a
56.	a
57.	c

Explanation: Estrogens and inhibin B are both inhibitory factors for the secretion of FSH. Activin is a promotor of many actions of FSH in that it increases FSH secretion, promotes ovarian follicular development and inhibits androgen production.

47. Gonadotropin releasing hormone (GnRH) stimulates the release of: *(DSSSB 2008)*
a. ACTH
b. Growth hormone
c. Luteinizing hormone (LH)
d. Thyroid stimulating hormone (TSH)

Explanation: GnRH stimulates the release of follicle-stimulating hormone (FSH) and luteinizing hormone (LH) from the anterior pituitary.

48. Gonadotropin releasing hormone (GnRH) stimulates the release of: *(DSSSB 08)*
a. Follicle stimulating hormone
b. Luteinizing hormone (LH)
c. Growth hormone
d. Both A and B

Explanation: GnRH is a trophic peptide hormone produced by anterior lobe of pituitary and is responsible for the release of follicle-stimulating hormone (FSH) and luteinizing hormone (LH) .

49. Pacemaker of uterine contraction is
a. Tubal ostia
b. SA node
c. AV node
d. Purkinje fibers

Explanation: Tubal ostia is the pacemaker of uterine contraction. SA node is the pacemaker of heart.

50. After the birth umbilical arteries are called as .....
a. Ligamentumvenosum
b. Umbilical ligament
c. Ligamentumteres
d. Ligamentumarteriosum

Explanation: Medial umbilical ligament is the remnant of distal portion of umbilical artery.

51. Which of these is not a symptom of vaginal atrophy? *(AIIMS Raipur Grade II 2017)*
a. Tightening of vaginal wall
b. Lengthening of vaginal canal
c. Decreased vaginal lubrication
d. Urinary incontinence

Explanation: The symptoms of vaginal atrophy include shortening and tightening of vaginal wall, decreased vaginal lubrication during sexual activity, discomfort with intercourse, light bleeding after intercourse, urinary incontinence, more urinary tract infections, urgency and burning with urination, genital itching, vaginal burning, dryness and discharge.

52. Inflammation of the fallopian tube is: *(AIIMS Bhopal Nursing Officer, 2018)*
a. Endometritis
b. Vagintits
c. Cervicitis
d. Salpingitis

Explanation: Salpingitis is inflammation of fallopian tube. Endometritis is the inflammation of endometrial layer of uterus. Cervicitis is the inflammation of cervix and vaginitis is the inflammation of vagina.

53. Uterus with depression at the fundus is called: *(AIIMS BPL NO 2018)*
a. Uterus didelphys
b. Arcuate uterus
c. Septate uterus
d. Bicornuate

Explanation: An arcuate uterus is characterized by a mild indentation of the endometrium at the uterine fundus. It occurs due to a failure of complete resorption of the uterovaginal septum, and is the most common Mullerian duct anomaly.

EMBRYONIC DEVELOPMENT

54. Daughter cells formed after meiosis I contain ..... chromosome
a. Polyploid
b. Aneuploid
c. Diploid
d. Haploid

55. True regarding primary oocytes is .....
a. All primary oocytes are formed in prenatal life.
b. all primary oocytes are formed just after the birth
c. All primary oocytes are formed after menarche.
d. Primary oocytes are formed just before menstruation

56. The primary oocytes remain suspended in ..... Phase of meiosis I
a. Prophase
b. Metaphase
c. Anaphase
d. Telophase

57. Mrs. Amrita had an abortion during sixth week of gestation. The developmental stage of product of conception during this period is known as
a. Fetus
b. Zygote
c. Embryo
d. Blastocyst

embr 3-8 wk

Scanned with CamScanner

58. Seven weeks after the conception, the growing structure inside a uterus is now called: *(RAK MSc 2018)*

a. Zygote b. Embryo
c. Fetus d. Neonate

Explanation:
- Conception to 8th week of gestation – Embryo
- 8th week to delivery – fetus
- Birth to 4 weeks (28 days) – Neonate
- 4 weeks to 1 year - Infant

59. Ovulatory function is stimulated by .....gland

a. Parathyroid
b. Pineal gland
c. Pituitary gland
d. Adrenal gland.

60. Location of Graafian follicle is .....

a. Uterus b. Fallopian tubes
c. Ovaries d. Cervix

61. Granulosa cells of developing ovarian follicle secretes..... *(RRB Feb 2012)*

a. LH b. Progesterone
c. Oestrogen d. None

62. After ovulation graafian follicle becomes .....

a. Corpus luteum b. Placenta
c. Umbilical cord d. Amnion and chorion

Explanation: Graffian follicle is changed to corpus luteum. It will secrete progesterone, 17 alpha progesterone and oestradiol, adrostenedione. At 6-8 week there is transfer of function of corpus luteum to the placenta.

63. Hormone responsible for ovulation is *(Safdarjung NO 2018)*

a. FSH b. LH
c. Estrogen d. Progesterone

Explanation: Luteinizing hormone is a hormone produced by gonadotropic cells in the anterior pituitary gland. In females, an acute rise of LH triggers ovulation and development of the corpus luteum. FSH is responsible for follicle maturation.

64. Time of ovulation corresponds to: *(JIPMER 2012)*

a. Oxytocin level is high
b. Blood level of LH is high
c. Progesterone level is high
d. Endometrial wall is sloughed off

Explanation: Luteinizing Hormone (LH) is a gonadotropin synthesized and secreted by the anterior pituitary gland in response to GnRH. When follicle maturation is complete, an LH surge triggers ovulation.

65. The hormone responsible for the menstrual cycle are: *(Safdarjung NO 2018)*

a. Gonadotrophins
b. Estrogen and progesterone
c. Gonadotrophins and estrogen
d. Gonadotrophins, estrogen and progesterone

Explanation: Gonadotrophins (LH and FSH) released from anterior pituitary that stimulates the follicles in the ovary causing the maturation and then final release of the ovum. Growing follicles releases the estrogen and progesterone that causes the uterine cells hyperplasia and increases the endometrial thickness of uterus.

66. The phenomenon of mittelschmerz indicates: *(AIIMS BPL NO 2018)*

a. Menstruation b. Ovulation
c. Implantation d. Fertilization

Explanation: Mittelschmerz is one-sided lower abdominal pain and pelvic region associated with ovulation. This occurs roughly midway through a woman's menstrual cycle. The pain can appear suddenly and usually subsides within hours, although it may sometimes last two or three days.

67. Fleeting abdominal pain due to follicular bleeding causing peritoneal irritation is called as: *(Safdarjung NO 2018)*

a. Corpus hemorrhagicum
b. Mittelschmerz
c. Corpus luteum
d. Corpus albicans

Explanation: Minor bleeding from the follicle into the abdominal cavity may cause peritoneal irritation and fleeting lower abdominal pain. It is known as **mittelschmerz.**

After ovulation, hemorrhage into the remains of the follicle usually occurs resulting in a structure called a **corpus hemorrhagicum.**

68. When is the best time to achieve pregnancy? *(RAK MSc 2018)*

a. Midway between 7th and 8th day of ovulation
b. Immediately after starting of menses
c. 14 days after the beginning of period
d. 7 days before the next period is expected

Explanation: The best time to achieve pregnancy is 14 days before the next period is expected, if cycle is of 28 days. It is the time of ovulation, i.e. release of ovum and the LH surge precedes before ovulation that provides the best conditions for the fertilization.

69. The process of maturation of the female egg is termed as

a. Spermatogenesis b. Oogenesis
c. Archiogenesis d. Ovogenesis

70. What is the fertilization life span or viability for oocyte?

a. <12 hours b. 12-24 hours
c. 24-48 hours d. 48-72 hours

71. Spermatozoa is viable for a period of .....

a. 12-24 hrs b. 24-48 hrs
c. 48-72 hrs d. Up to 5 days

72. Discharge of ovum from the ovary is referred as

a. Maturation b. Ovulation
c. Proliferation d. Nidation

73. The fertilization of ovum in female takes place in the: *(LNJP H D 2012)*

a. Vagina b. Cervix
c. Oviduct d. Uterus

74. Site of fertilization in female reproductive system is: *(RRB Feb 2012)*

a. Ovary b. Cervix
c. Uterus d. Fallopian tube

Explanation: Fertilization occurs at the ampullary part of fallopian tube.

75. Fertilized ovum is known as embryo upto _____ weeks of gestational age *(Staff Nurse G II 2014)*

a. 8 weeks b. 10 weeks
c. 12 weeks d. 16 weeks

Ans.

58.	b
59.	c
60.	c
61.	c
62.	a
63.	b
64.	b
65.	d
66.	b
67.	b
68.	c
69.	b
70.	b
71.	c
72.	b
73.	c
74.	d
75.	b

Scanned with CamScanner

76. Which one of the period of gestation is the most susceptible period for congenital malformations:
a. 1st week
b. 2nd week
c. 3rd week- 8th week
d. 9th week-12th week

77. Fertilized ovum up to 3–8 weeks is called: *(RRB Feb 2012)*
a. Morula
b. Embryo
c. Fetus
d. Blastula

78. Which of the following term refers to infrequent and irregular ovulation
a. Oligoovulation
b. Hypoovulation
c. Polyovulation
d. None of the above

79. After fertilization of ovum, the initial mitotic division of the zygote results in the formation of _____
a. Morula
b. Blastomeres
c. Oocytes
d. Blastocysts

80. Implantation occurs on----------
a. 3rd day after fertilization
b. 5th day after fertilization
c. 6th day after fertilization
d. 12th day after fertilization

81. Identify the correct statement regarding implantation
a. Implantation occur anterior or posterior wall of the body near to fundus
b. Implantation occur on 6th day following fertilization which corresponding to 20th day of regular menstrual cycle.
c. Implantation occur through four stages apposition, adhesion, penetration and invasion
d. All of the above

Ans.

76.	c
77.	b
78.	a
79.	b
80.	c
81.	d
82.	d
83.	a
84.	c
85.	c
86.	d
87.	d
88.	d
89.	b
90.	c
91.	d
92.	a
93.	a
94.	a
95.	b
96.	d
97.	c
98.	c

Explanation: All the above-mentioned statements are correct regarding implantation. Implantation means fertilized ovum is transferred from site of fertilization to uterus.

82. The large amount of progesterone secreted during the secretory phase of the menstrual cycle is responsible for: *(Safdarjung NO 2018)*
a. The onset of ovulation
b. The regulation of menstruation
c. The incidence of capillary fragility
d. Sustaining the thick endometrium of the uterus

Explanation: Progesterone is important hormone that condition the endometrium by sustaining the thick endometrium in preparation for implantation of a fertilized ovum. Progesterone prepares the uterus for receiving the fertilized ovum.

83. Implantation of zygote is facilitated by
a. Trophoblast
b. Medulla
c. Cortex
d. Blastocysts

84. In urine pregnancy test hormone played is .....
a. Progesterone
b. Estrogen
c. HCG
d. Oxytocin

85. hCG can be detected in blood after conception as early as ....days *(RRB Feb 2012)*
a. 2 days
b. 4 days
c. 9 days
d. 15 days

86. Correct regarding hCG hormone is
a. Maintenance of corpus luteum till 6 weeks of pregnancy
b. Syncytiotrophoblast of the placenta secrete this hormone
c. 60-70 days of pregnancy hCG reaches maximum level in the blood
d. All of the above

87. Hormone human chorionic gonadotropin can be detected in case of .....
a. Pregnancy
b. Hydatiform mole
c. Choriocarcinoma
d. All of the above

Explanation: In all the above mentioned conditions hCG will be present. In normal pregnancy it will disappear from blood following 2 weeks after delivery.

88. Structure acts as power house of hormone production during pregnancy?
a. Hypothalamus
b. Umbilical cord
c. Pituitary
d. Placenta

89. Humans placenta fully develop at ..... months of pregnancy: *(RRB Feb 2012)*
a. 2 months
b. 3 months
c. 1 month
d. 4 months

90. Normal volume of amniotic fluid at term is..... ml. *(RRB Feb 2012)*
a. 400-500 ml
b. 500-600 ml
c. 600-800 ml
d. 1000-1200 ml

91. Which of the following structure is necessary for maintenance of pregnancy before placental development?
a. Hypothalamus
b. Umbilical cord
c. Pituitary
d. Corpus luteum

92. Endometrium of the pregnant uterus is known as
a. Decidua
b. Trophoblast
c. Amnion
d. Chorion

Explanation: Endometrium of pregnant uterus is known as decidua. It will shed following delivery.

93. The structure that supplies nutrition to the growing ovum before placenta takes the function is
a. Corpus luteum
b. Decidua
c. Myometrium
d. Corpus callosum

94. Which structure is responsible for secreting progesterone hormone during first six weeks of pregnancy?
a. Corpus luteum
b. Umbilical cord
c. Placenta
d. Decidua basalis

95. About how much blood a mature placenta contains?
a. 250 ml
b. 500 ml
c. 700 ml
d. 1000 ml

96. Identify correct regarding human placenta
a. Human placenta is discoid
b. Human placenta is hemochorial
c. Placenta establish connection between mother and baby through umbilical cord
d. All of the above

Explanation: All the above statements are correct regarding human placenta. Placenta developed from two sources, principal component is fetal component named chorion and maternal component named decidua basalis.

97. Endometrium after conception is known as: *(RRB Feb 2012)*
a. Perimetrium
b. Myometrium
c. Decidua
d. Prometrium

98. Implantation occurs on.....
a. 6th day after fertilization
b. 20th day of regular menstrual cycle
c. Both A and B
d. None of the above

Scanned with CamScanner

99. In case of in-vitro fertilization fertilized ovum transferred into the uterine cavity at .....
a. 1–2 cell stage b. 2–4 cell stage
c. 4–8 cell stage d. 16–24 cell stage

100. Gestation sac can be seen in ultrasound at .....period of gestation: *(RAK MSc 2018)*
a. 5 weeks b. 6 weeks
c. 8 weeks d. 10 weeks

Explanation: Gestation sac can be seen in ultrasound at 5 weeks of gestation.

Table: Progress of fetal development

Gestational Age (Weeks)	Fetal Structures
4	Chorionic sac
5	Gestation sac
5.5	Yolk sac
6	Fetal pole and cardiac activity
7	Lower limb buds midgut herniation
8	Upper limb buds, stomach
9	Supine, choroid plexus

101. How many pairs of chromosomes in man? *(RRB Feb 2012)*
a. 24 b. 23
c. 22 d. None

102. Corpus luteum is found in: *(RRB Feb 2012)*
a. Fetus b. Placenta
c. Uterus d. Ovary

103. A child's heredity is determined at the time of: *(RRB Feb 2012)*
a. Viability b. Delivery
c. Conception d. Infancy

104. Fusion of sperm and ovum is called: *(RRB Feb 2012)*
a. Fertilization b. Transfusion
c. Combination d. None

105. Percentage of water in amniotic fluid is *(RRB Feb 2012)*
a. 80 b. 90
c. 70 d. 98

106. The function of amniotic fluid is: *(RRB Feb 2012)*
a. Respiration b. Shock protection
c. Endocrine function d. Nutrition

107. Go through the following statement regarding amniotic fluid and find out incorrect statement
a. Liquor amnii surrounds fetus everywhere except at its attachment with body stalk
b. Amniotic fluid is completely changed and replaced every 3 hours
c. At term the amount of amniotic fluid is 1000-1500 mL.
d. Amniotic fluid is colorless and near term it becomes pale straw colored

Explanation: Option C is incorrect. At term the mount of amniotic fluid is about 600-800 mL. All other options are true. Amniotic fluid is colorless and near term it becomes pale straw colored because of the presence of exfoliated lanugo and epidermal cells from skin

108. The vaginal pH varies with the range of between----------
a. 4-5 b. 5-6
c. 6-7 d. 7-8

109. The normal length of the uterine cavity is usually----------
a. 5.5-6cm b. 6.5-7cm
c. 7.5-8cm d. 8.5-9 cm

110. Ischial tuberosity helps for----------
a. Bearing of body weight while sitting
b. Normal labor
c. Normal walking
d. Normal standing

111. The hormone responsible for differentiation of male reproductive organs during fetal life EXCEPT----------
a. Dehydroepiandosterone sulfate
b. Dyhydrotestosterone
c. Mullerian duct inhibitor (MDI)
d. Testosterone

112. The thin rim of endometrial stroma overlying the blastocyst is known as .....
a. Decidua capsularis b. Decidua vera
c. Decidua basalis d. Decidua parietalis

113. The cardinal function of decidua is----------
a. Immune response
b. Production of hormones
c. Maintenance of pregnancy
d. None of the above

114. O_2 and CO_2 are exchanged in the placenta through the process of----------
a. Pinocytosis b. Diffusion
c. Facilitated diffusion d. Active transport

115. The nervous system of the fetus is formed by----------
a. Ectoderm b. Endoderm
c. Mesoderm d. Parenchyma

116. During the first two months of pregnancy the chief source of estrogen and progesterone is the----------
a. Placenta b. Adrenal cortex
c. Corpus luteum d. None of the above

117. The phase in which the lining cells of the ovarian follicle are stimulated by luteinizing hormone to develop the corpus luteum, to produce progesterone and estrogen is: *(AIIMS Raipur Grade II 2017)*
a. Menstrual phase b. Proliferative phase
c. Secretory phase d. Follicular phase

118. A hormone that prevents menstruation and maintains pregnancy by sustaining the function of the corpus luteum is: *(AIIMS Raipur Grade II 2017)*
a. Follicle stimulating hormone
b. Leuteinizing hormone
c. Gonadotrophinreleasingg hormone
d. Human chorionic gonadotrophin hormone

Explanation: Follicle stimulating hormone is essential for pubertal development and plays a key role in function of women's ovaries and men's testes. Leutinizing hormone triggers ovulation in females and development of corpus leuteum and in males it stimulates Leydig cell production of testosterone. Gonadotropin releasing hormone is released by the hypothalamus which stimulates the pituitary gland to release the gonadotropin hormones follicle-stimulating hormone (FSH) and luteinizing hormone

119. Placenta shape is .....
a. Round b. Global
c. Discoid d. Fusiform

120. Which structure establishes connection between the fetus and mother during intra uterine life?
a. Uterus b. Ampulla
c. Placenta d. Fallopian tube

Ans.

Scanned with CamScanner

121. Placenta secretes all the following hormones, except: *(AIIMS Bhopal Nursing Officer, 2018)*
a. Oestrogen
b. Luteinising hormone
c. Progesterone
d. Human chorionic gonadotropin

Explanation: Luteinizing hormone is produced by gonadotropic cells in the anterior pituitary gland. All other hormones are secreted by placenta.

122. The following is not a part of conceptus ----------
a. Amniotic fluid b. Decidua
c. Fetus d. Membrane

123. Basal body temperature will ..... following ovulation
a. Increase b. Decrease
c. No change d. Fluctuation

124. Which hormone is essential for the continued activity of follicle stimulating hormone?
a. Progesterone b. Oestrogen
c. Androgen d. Testosterone

125. The average age of puberty in girls is
a. 9-10 years b. 10-12 years
c. 10-14 years d. 14-16 years

126. Visual examination of the vagina and cervix with an optical magnifying instrument is termed as
a. Proctoscope b. Colposcope
c. Salpingoscope d. Cystoscope

127. Time required to reach in two cell stage after fertilization is .....
a. 10 hours b. 20 hours
c. 30 hours d. 40 hours

128. Time required to reach in 16 cell stage after fertilization is .....
a. 2nd day b. 4th day
c. 6th day d. 8th day

129. All of the following are the common symptoms of perimenopause, except:
a. Irregular periods b. Increased libido
c. Vaginal dryness d. Hot flashes

130. Ovulation occurs soon after the formation of .....
a. Primary spermatozoa b. Secondary spermatozoa
c. Primary oocyte d. Secondary oocyte

131. The physiochemical changes that occur in the sperm to make it capable of fertilizing the ovum is known as
a. Spermatogenesis b. Degeneration
c. Capacitation d. Oogenesis

132. Where does oogenesis occurs in human?
a. Inner most layer of ovary b. Outermost layer of ovary
c. Fallopian tube d. Uterus

133. Correct order of oogenesis is .....
a. Oogonia → primary oocyte → secondary oocyte → ovulation
b. Primary oocyte → secondary oocyte → oogonia → ovulation
c. Ovulation → primary oocye → secondary oocyte → oogonia
d. Oogonia → ovulation → primary oocyte → secondary oocyte

134. How many numbers of chromosomes a primary oocyte/ primary spermatocyte contains?
a. 46 b. 44
c. 23 d. 22

135. Number of chromosomes in secondary oocyte/ secondary spermatocyte contains?
a. 46 b. 44
c. 23 d. 22

136. Sex of the child is determined by the pattern of the sex chromosome supplied by
a. Spermatozoon b. Oocyte
c. Morula d. Blastocyst

137. Largest cell in the human body is .....
a. Myelin cell b. Glial cell
c. Osteocyte d. Ovum

138. Fetus forms from .....
a. Morula b. Blastocyst
c. Inner cell mass d. Syncytiotrophoblast

139. At what week embryo can be differentiate as human?
a. 2nd week b. 4th week
c. 6 th week d. 8th week

140. Implantation of fertilized egg ideally occurs during the .....phase of menstrual cycle
a. Secretory phase b. Menstrual phase
c. Proliferative phase d. Ovulation phase

141. Fertilization means .....
a. Fusion of gametes and the spermatozoa
b. Fusion of sperm and spermatozoa
c. Fusion of spermatozoa with mature ovum
d. None of the above

142. Functions of the amniotic fluid includes all of the following, except:
a. Protection of the fetus from injury
b. Protection of the fetus from infection
c. Temperature maintenance
d. Providing oxygenation to fetus

143. Labor takes place after.....day of last menstrual period:
a. 260 b. 270 *(RRB Feb 2012)*
c. 250 d. 280

144. As per embryologist point of view duration of pregnancy is .....
a. 10 lunar month b. 9 calendar month +7 days
c. 40 weeks d. 266 days

145. Duration of pregnancy is
a. 10 lunar months
b. 9 calendar months and 7 days
c. 280 days
d. All of the above

Explanation: Duration of pregnancy can be expressed in all the above given methods and also as 40 weeks, which is calculated from first day of last menstrual cycle. This is called menstrual age or gestational age.

146. Neural tube develops from
a. Ectoderm b. Endoderm
c. Mesoderm d. All of the above

147. Closure of neural tube begins at
a. Cervical b. Cephalic
c. Podalic d. Lumbar

Explanation: The closure of neural tube begins in the cervical area (in the middle of the embryo) and extends from there in both the cranial and caudal directions.

148. Ligamentum teres is the remnant of
a. Hypogastric arteries b. Umbilical vein
c. Ductus venosus d. Ductus arteriosus

149. **The heart is developed from**
   a. Paraxial mesoderm
   b. Intermediate mesoderm
   c. Splanchnopleuric intraembryonic mesoderm
   d. Somatoleuric intraembryonic mesoderm

150. **Rectum develops from**
   a. Cloaca b. Hind gut
   c. Allantoic remnants d. Urogenital sinus

151. **Small intestine develops from**
   a. Foregut b. Midgut
   c. Hindgut d. Endodermal cloaca

152. **Coronary sinus develops from**
   a. Truncus arteriosus b. Conus
   c. Sinus venosus d. AV canal

MENSTRUAL CYCLE

153. **Which gland is responsible for initiating the menstrual cycle?** *(RAK MSc 2018)*
   a. Hypothalamus
   b. Anterior pituitary gland (APG)
   c. Posterior pituitary gland (PPG)
   d. Ovaries

Explanation: Initiation of menstrual cycle is being carried out by hypothalamus. It secretes GnRH which thereby stimulates pituitary gland to secrete FSH and results in follicle development and also secretes LH for releasing ovum from the ovary.

The other options have a role in menstrual cycle but not initiating menstrual cycle.

154. **The entire transitional phase between sexual maturity and menopause is called:** *(AIIMS BPL NO 2018)*
   a. Menarche b. Puberty
   c. Thelarche d. Climacteric

Explanation: Climacteric is manifested by a disturbance in the regularity of the menstrual cycle until it ceases completely, which signals the onset of a new period in a woman's life, the menopause. The climacteric generally begins at the ages of 45-54 years, usually at about 47 years of age, and continues for an average of 15–18 months.

155. **Menarche is:** *(LNJP H D 2012)*
   a. The entire span of the menstrual cycle from onset to menopause
   b. A girl's first menstruation
   c. The first year of menstruation which usually occurs without ovulation
   d. The onset of uterine maturation

156. **Average age of menarche is .....**
   a. 10 years b. 13 years
   c. 16 years d. 19 years

157. **Hormone responsible for thelarche is .....**
   a. Oestrogen b. Progesterone
   c. Oxytocin d. Androgens

158. **A permanent cessation of menstruation at the end of reproductive life is called as:** *(AIIMS Bhopal Nursing Officer, 2018)*
   a. Menarche b. Menopause
   c. Precocious puberty d. Thelarche

Explanation: Permanent cessation of menstrual cycle is known as menopause. Initiation of menstruation is known as menarche.

159. **Hormonal change occurs in menopause is all, EXCEPT**
   a. Fall in serum estradiol level
   b. Increase in FSH level
   c. Increase in LH level
   d. Fall in serum testosterone level

Explanation: In premenopausal women, Estradiol is the main form of estrogen. But serum level significantly falls after menopause. FSH and LH rise after menopause. FSH rise precedes LH rise. FSH is the diagnostic marker for ovarian failure. Androgen level may increase after menopause.

160. **Identify the changes occur in female genitalia after menopause**
   a. Uterus becomes smaller
   b. The vagina become narrower and dry
   c. Ovaries become small in size
   d. All of the above

161. **The gold standard for the treatment of hot flushes is:** *(AIIMS-BBS SNO 2019)*
   a. Oxytocin administration
   b. Progesterone administration
   c. Estrogen administration
   d. Serotonin administration.

Explanation: Decrease in level of estrogen is a cause of hot flushes. Hot flushes mean sudden feeling of warmth, usually most intense over the face, neck, chest and profuse sweating. It commonly occurs due to menopause. The gold standard for the treatment of hot flushes is **Estrogen administration.**

162. **After menopause increased facial hair growth and change in voice occur due to**
   a. Fall in FSH level
   b. Increase in FSH level
   c. Increase androgen level
   d. Decrease androgen level

163. **After menopause in women the chances of her developing osteoporosis increase because of:** *(RRB SSNE 2015)*
   a. Decrease in oestrogen levels
   b. Increase in oestogen levels
   c. Decrease in LH levels
   d. Decrease in FSH levels

164. **Which among the following drug will be prescribed by physician for a woman who is experiencing perimenopausal symptoms?**
   a. Progesterone
   b. Estrogen
   c. Luteinizing hormone
   d. Analgesics

165. **Client is not willing to take hormonal replacement therapy after menopause to manage the age related problems, the important management for this client is .....**
   a. Maintaining usual sexual activity
   b. Take more dietary fibers and liquids
   c. Do regular aerobic, weight-bearing exercise
   d. Take multivitamin supplements.

166. **Which among the following is an age-related change that occurs in female reproductive system?**
   a. Sore nipple
   b. Vaginal dryness
   c. Decreased risk of vaginal yeast infections
   d. Increased level of estrogen

Scanned with CamScanner

167. Chances of occurrence of osteoporosis will decline in obese patient after puberty, because
a. Fall in FSH level
b. Fall in LH level
c. Conversion of more androgens into estrogen
d. Due to ore calcium

168. Delayed puberty is .....
a. The absence of testicular development by age 14 years in male
b. The absence of breast development by the age of 13 years in females
c. Primary amenorrhea with normal breast development by the age of 15 in females.
d. All of the above

169. 169. LMP of a woman who has 28 days regular cycle is March 31, 2020. The next ovulation day is most likely to be
a. April 17, 2020
b. April 15, 2020
c. April 13, 2020
d. April 11, 2020

170. Arachidonic acid in placenta is synthesized under the influence of .....
a. Estrogen b. Progesterone
c. Oxytocin d. Phospholipase A2

171. The biochemical and organic compounds present in amniotic fluid are all EXCEPT
a. Protein b. Lipid and glucose
c. Urea and creatinine d. Ammonia

172. A procedure that allows the physician to examine the lining of the bladder is called as
a. Colposcopy b. Urethroscopy
c. Ureteroscopy d. Cystoscopy

173. Inspection of the uterine cavity by endoscopy with access through the cervix is known as
a. Hysteroscopy b. Salpingoscopy
c. Salpingogram d. Hysterosalpingography

174. Identify the correct statement among the following
a. At birth the uterine body and the cervix ratio is about 1 : 2
b. At menarche the uterine body and the cervix ratio is about 1 : 1
c. After menarche the uterine body and the cervix ratio is about 2 : 1
d. All of the above

175. Delayed menopause is .....
a. Menopause fails to occur beyond 45 years of age
b. Menopause fails to occur beyond 50 years of age
c. Menopause fails to occur beyond 55 years of age
d. Menopause fails to occur beyond 60 years of age

176. Which of the following is NOT true about pre-menstrual syndrome? *(AIIMS-BBS SNO 2019)*
a. It occurs during the last half of menstrual cycle
b. It resolves with the onset of menstruations
c. It occurs during the luteal phase
d. It resolves with the onset of ovulation

Explanation: Pre-menstrual syndrome (PMS) refers to physical and emotional symptoms that occur in the 1 to 2 weeks before menses. Physical symptoms include breast tenderness, bloating and psychological symptoms include mood swings, anger, etc. It occurs in the last half of menstrual cycle (luteal phase) and typically **ends with the onset of menstrual flow.**

177. Mild premenstrual syndrome can be treated with
a. Anxiolytics
b. Dietary advice, exercise and evening primrose oil
c. Vitamins and mineral supplements
d. Antidepressants

178. Which of the following can be used to restore menstrual cycle in a women with amenorrhoea due to polycystic ovarian disease?
a. Danocrine b. Combined oral pills
c. Progesterone therapy d. Estrogen therapy

179. Hormonal influence of menstrual cycle includes .....
a. Ovarian hormones
b. Pituitary hormones
c. Hypothalamic releasing hormones
d. All of the above

180. Primary dysmenorrhea cause is .....
a. Narrowing of the cervical canal
b. Uterine hypoplasia and contraction
c. Increased vasopressin release
d. All of the above

181. Bleeding between the menstrual period is known as .....
a. Menorrhagia b. Metrorrhagia
c. Polymenorrhea d. Dysmenorrhoea

182. Absence of a menstrual period in a woman of reproductive age is known as
a. Hypomenorrhoea b. Amenorrhoea
c. Dysmenorrhoea d. Eumenorrhoea

183. Short and scanty periods that lasts for less than 2 days is known as
a. Amenorrhoea b. Hypomenorrhoea
c. Menorrhagia d. Metrorrhagia

184. Too frequent menstruation, occurring at any time, but particularly at the beginning and end of menstrual life is known as
a. Metorrhagia b. Hypomenorrhoea
c. Hypermenorrhoea d. Epimenorrhoea

185. Increased uterine blood flow occurring at regular intervals or loss of more than 80 mL of blood is called as: *(AIIMS BPL NO 2018)*
a. Epimenorrhea b. Hypermenorrhea
c. Cryptomenorrhea d. Metrorrhagia

Explanation: Heavy menstrual bleeding or hypermenorrhea is defined as total menstrual flow >80 mL per cycle, or soaking a pad/tampon every 2 hours or less.

186. Epimenorrhoea is also known as .....
a. Menorrhagia b. Polymenorrhoea
c. Metrorrhagia d. Dysmenorrhoea

187. Abnormally heavy bleeding at menstruation is known as...
a. Menorrhagia b. Metrorrhagia
c. Polymenorrhea d. Dysmenorrhoea

188. Menorrhagia is caused by .....
a. Fibroid uterus
b. Adenomyosis
c. Dysfunctional uterine bleeding
d. All of the above

189. A condition in which prolonged or excessive uterine bleeding occurs irregularly and more frequently than normal is known as
a. Menorrhagia b. Metrorrhagia
c. Menometrorrhagia d. Epimenorrhoea

Scanned with CamScanner

190. Hypomenorrhoea is caused by .....
a. Endometrial tuberculosis
b. Malnutrition
c. Uterine synechiae
d. All of the above

191. Dysmenorrhoea is due to
a. Ovulation
b. Decreased progesterone
c. Increased progesterone
d. Secretory epithelium

192. Specific manifestation in menopause is: *(Staff Nurse G II 2014)*
a. Hot flashes b. Hypotension
c. Hypothermia d. Anorexia

193. A condition in which the menstruation occurs but is not visible because of an obstruction of the outflow tract is known as
a. Cryptomenorrhoea b. Dysmenorrhoea
c. Xerocolpos d. Menorrhagia

194. Distention of the vagina caused by accumulation of fluid due to congenital vaginal obstruction is known as
a. Hydro vaginitis b. Hydrocolpos
c. Hydro vaginosis d. Vaginismus

195. Commonest cause of cryptomenorrhoea is .....
a. Recto vaginal fistula b. Imperforate hymen
c. Adhesions d. Cervical stenosis

196. Failure of menses to occur by age 16 years, in the presence of normal growth and secondary sexual characteristics is known as
a. Primary amenorrhea
b. Secondary amenorrhea
c. Dysmenorrhea
d. Menorrhagia

197. Secondary amenorrhoea is .....
a. Cessation of regular menses for three months
b. Cessation of irregular menses for six months
c. Both A & B
d. Absence of menses for more than one year

198. Reason behind secondary amenorrhea in polycystic ovarian disease is .....
a. More estrogen b. More progesterone
c. More androgens d. More FSH

199. The most common type of dysmenorrhoea is the
a. Membranous type b. Congestive type
c. Spasmodic type d. Mixed type

200. The single most important investigation in cases of menorrhagia is
a. Ultrasound b. Pap smear
c. Pipelle sampling d. Hysteroscopy

201. Causes of infertility in females includes all of the following EXCEPT
a. Hormonal causes b. Defects of the cervix
c. Ovarian abnormalities d. Tubal blockage

MATERNAL PELVIS

202. Number of bones in female pelvis is .....
a. 1 b. 2
c. 3 d. 4

Explanation: The pelvis consists of four bones: the right and left hip bones, the sacrum, and the coccyx.

203. Which bone is the part of pelvis?
a. Innominate bone b. Sacrum
c. Coccyx d. All of the above

Explanation: All the above-mentioned bones are part of pelvis. Two innominate bones are present. These bones are united by 4 joints such as two sacroiliac joints, sacrococcygeal joint and symphysis pubis.

204. True pelvis is divided as .....
a. Inlet, cavity, outlet
b. Brim, cavity, outlet
c. Brim, inlet, outlet
d. Brim, inlet, exit

Explanation: For descriptive purpose true pelvis can be divided as inlet, cavity and outlet.

205. The innominate bone consists of
a. Ilium, Ischium, pubis, sacrum and coccyx
b. Ischium, ischium, sacrum and coccyx
c. Ilium, ischium and coccyx
d. Ilium, ischium and pubis

206. The pelvic shape has the poorest prognosis from vaginal delivery is----------
a. Platypelloid b. Anthropoid
c. Android d. Gynecoid

207. Which one of the following is the female pelvis?
a. Android
b. Gynaecoid
c. False pelvis
d. Anthropoid

208. Brim of Gynaecoid pelvis is.....in shape. *(RRB Feb 2012, RAK MSc 2018)*
a. Heart b. Kidney
c. Oval d. Round

Explanation: The shape of brim of gynecoid pelvis is almost round. Gynecoid pelvis is the most suitable pelvis for vaginal delivery.

Table: Comparison of various types of pelvis

	Gynecoid (50% of women)	Android (23% of women)	Anthropoid (24% of women)	Platypelloid (3% of women)
Brim	Slightly ovoid or transversely rounded	Heart-shaped, angulated	Oval, wider antero-posteriorly	Flattened Antero-posteriorly, wide transversely
	Round	Heart	Oval	Flat

209. The ideal pelvis for child bearing is.....pelvis *(RRB Feb 2012)*
a. Anthropoid b. Platypoid
c. Gynaecoid d. Android

Explanation: The gynecoid pelvis is more delicate, wider than, and not as high as the male pelvis. The angle of the female pubic arch is wide and round. The female sacrum is wider than the male's and the iliac bone is flatter. The pelvic basin of the female is more spacious and less funnel-shaped.

210. Deep transverse arrest occurs in ---------
a. Gynecoid pelvis b. Platypelloid pelvis
c. Android pelvis d. Anthropoid pelvis

Ans.

Scanned with CamScanner

211. Absence of one sacral ala of pelvis is called as---------
a. Rickety flat pelvis b. Naegele's pelvis
c. Robert's pelvis d. Kyphotic pelvis

212. The brim of the anthropoid pelvis is..... shape. *(RRB Feb 2012)*
a. Kidney b. Round
c. Heart d. Oval

213. The type of pelvis in which the features are heart shaped brim, narrow forepelvis and sciatic notch with prominent ischial spines and suprapubic angle < 90°: *(AIIMS Raipur Grade II 2017)*
a. Gynacoid pelvis b. Android Pelvis
c. Anthropoid pelvis d. Platypelloid pelvis

Explanation: Gynacoid pelvis also known as True pelvis is oval at inlet, wide subpubic arch and pelvic brim which is transverse ellipse. Anthropoid pelvis is oval at inlet, pelvic brim is anteroposterior ellipse, suprapubic arch slightly narrowed. Platypoid pelvis is flattened at inlet and has prominent sacrum, pelvic brim is transverse kidney shaped.

214. The innominate bone of the pelvis is not composed of the----
a. Sacrum b. Ilium
c. Pubis d. Ischium

215. The passage of bi-parietal diameter through the pelvic inlet is referred as----------
a. Descent b. Flexion
c. Engagement d. Extension

216. Which one of the following pairs regarding pelvis is NOT correct? *(Banaras HU 2015)*
a. Gynecoid: Female type
b. Android: Male type
c. Anthropoid: Wedge type
d. Platypelloid: Flat type

217. The suture line between two parietal bones is called: *(Kerala PSC, Nov 2014)*
a. Coronal b. Lambdoidal
c. Frontal d. Sagittal

218. Largest diameter in pelvic inlet is.....
a. Anterior Posterior b. Transverse Diameter
c. Oblique Diameter d. None of these

219. Transverse diameter of inlet of pelvis is about
a. 11 cm b. 12cm
c. 13 cm d. 14 cm

220. Pelvis is composed of .....
a. Innominate bones b. Sacrum
c. Coccyx d. All of the above

221. Angle of inclination in human pelvis is .....
a. 45° b. Between 55°–60°
c. 65° d. 75°

222. Landmark used while assessing the descend of head during the process of delivery?
a. Ischial spines b. Pubic symphysis
c. Coccyx d. Sacrum

223. Anatomical anterioposterior conjugate is also known as
a. True conjugate b. Obstetric conjugate
c. Diagonal conjugate d. External conjugate

224. The pelvic diameter which is measured from the tip of the sacral promontory to the most bulging point on the back of symphysis pubis is known as
a. Obstetric conjugate b. Diagonal conjugate
c. Anatomical conjugate d. Oblique diameter

225. The pelvic diameter which is measured from middle of sacral promontory to the upper inner surface of the pubic symphysis is known as:
a. Obstetric conjugate
b. Diagonal conjugate
c. Anatomical conjugate
d. Oblique diameter

226. The distance between middle of sacral promontory to lower inner border of symphysis pubis is known as:
a. Obstetric conjugate
b. Diagonal conjugate
c. Anatomical conjugate
d. Oblique diameter

227. The measurement between one sacroiliac joint and the opposite iliopubic eminence
a. Obstetric conjugate b. Diagonal conjugate
c. Anatomical conjugate d. Oblique diameter

FETAL SKULL

228. The average Submentovertical diameter is: *(AIIMS Raipur Grade II 2017)*
a. 9. 5 cm b. 10 cm
c. 11. 5 cm d. 13. 5 cm

Explanation:

1. Suboccipito-bregmatic – 9. 5 cm
2. Suboccipito-frontal – 10.0 cm
3. Occipito-frontal – 11. 5 cm
4. Mento-vertical – 14 cm
5. Submento-bregmatic – 9. 5 cm
6. Submento-vertical – 11. 5 cm

(Ref; D.C. Dutta's Text book of Obstetrics. 7th ed)

229. In the fetal skull, the bregma is found: *(AIIMS Raipur Grade II 2017)*
a. At the junction of the sagittal, coronal and frontal sutures
b. At the junction of the lambdoidal and sagittal sutures
c. Between the two halves of the frontal bone
d. Between the frontal bones and parietal bones

Explanation: Posterior fontanelle/Lambda are situated at the junction of Lambdoidal and saggital sutures. Frontal suture is situated between two halves of frontal bone. Coronal suture is found between frontal and parietal bone.

230. The suture run between parietal and frontal bone is-----
a. Coronal b. Sagittal
c. Frontal d. Lambdoid

Ans.

211.	b
212.	d
213.	b
214.	a
215.	c

230.	a

Scanned with CamScanner

231. The sagittal sutures lies between:
a. Occipital bone and two parietal bones
b. Parietal and frontal bone
c. Two frontal bones
d. Two parietal bones

Explanation: Skull contains four sutures Frontal suture, Coronal suture, Sagittal suture, Lamdoidal suture.

232. The suture lies between two parietal bone is known as.
a. Sagittal b. Longitudinal
c. Coronal d. Both A and B

Explanation: Suture lies between two parietal bone is known as longitudinal suture which is also known as sagittal suture

233. The sagittal sutures lie between
a. Frontal bones
b. Parietal bones
c. Temporal bones and parietal bones
d. Parietal and occipital bones

234. Identify correct statement regarding anterior fontanelle
a. Formed by joining four bones (4 bones or 2 sutures) in the midline
b. Shape is like a diamond
c. Ossified by 18 months of age
d. All of the above

235. Wide gap in the suture is----------
a. Diameter b. Circumference
c. Fontanelles d. Inlet

236. Soft spot in the skull in between the sutures is known as .....
a. Attitude b. Vertex
c. Diameter d. Fontanelle

237. Identify the correct statement regarding posterior fontanele
a. It is formed by two sutures or three bones
b. Triangular in shape
c. It generally closes in 6–8 weeks from birth
d. All of the above

238. The diameter extends from the nape of the neck to the center of the bregma is called as ----------
a. Suboccipitobregmatic b. Suboccipito frontal
c. Occipito frontal d. Submentobregmatic

239. Engaging diameter of face presentation is----------
a. Mentobregmatic b. Sub-mentobregmatic
c. Mento vertical d. Sub-mentovertical

240. Suboccipitobregmatic diameter measures about .....
a. 9.5 cm b. 10 cm
c. 11.5 cm d. 14 cm

241. Suboccipito-frontal diameter measures about .....
a. 9.5 cm b. 10 cm
c. 11.5 cm d. 14 cm

242. Occipito frontal diameter measures about .....
a. 9.5 cm b. 10 cm
c. 11.5 cm d. 14 cm

243. Mento-vertical diameter measures about .....
a. 9.5 cm b. 10 cm
c. 11.5 cm d. 14 cm

244. Submentovertical diameter measures about .....
a. 9.5 cm b. 10 cm
c. 11.5 cm d. 14 cm

245. Submentobregmatic diameter measures about .....
a. 9.5 cm b. 10 cm
c. 11.5 cm d. 14 cm

246. Biparietal diameter in fetal skull is .....
a. 9.5 cm b. 8.5 cm
c. 8 cm d. 7.5 cm

247. Super-subparietal diameter is .....
a. 9.5 cm b. 8.5 cm
c. 8 cm d. 7.5 cm

248. Bitemporal diameter is .....
a. 9.5 cm b. 8.5 cm
c. 8 cm d. 7.5 cm

249. Bimastoid diameter is .....
a. 9.5 cm b. 8.5 cm
c. 8 cm d. 7.5 cm

250. Which of the following is the largest diameter of the fetal skull?
a. Mento vertical b. Submento vertical
c. Biparietal d. Suboccipitobregmatic

251. What will be the attitude of head during face and brow presentation?
a. Well flexed b. Complete extension
c. Adduction d. Abduction

252. Universal attitude is .....
a. Well flexed b. Complete extension
c. Adduction d. Abduction

253. Denominator in vertex presentation?
a. Occiput b. Mentum
c. Frontal eminence d. Sacrum

254. Denominator in face presentation?
a. Occiput b. Mentum
c. Frontal eminence d. Sacrum

255. Denominator in brow presentation?
a. Occiput b. Mentum
c. Frontal eminence d. Sacrum

256. Denominator in breech presentation?
a. Occiput b. Mentum
c. Frontal eminence d. Sacrum

FETAL CIRCULATION

257. Normal umbilical cord contains .....
a. One vein and two arteries
b. One artery and two veins
c. One vein and one artery
d. Two arteries and two veins

258. The connection between umbilical vein and inferior vena cava in the fetal life is known as .....
a. Umbilical artery b. Ductus Venosus
c. Ductusarteriosus d. Pulmonary artery

Explanation: Option B is the correct answer, this vessel has the highest oxygen concentration in the fetal life. Ductusarteriosus is the connection between aorta and pulmonary artery.

259. In fetal circulation deoxygenated blood is present in .....
a. Umbilical artery b. Umbilical vein
c. Pulmonary artery d. All of the above

Explanation: Umbilical artery contains deoxygenated blood. All other blood vessels contain oxygenated blood

260. Which among the following vessel contain highest oxygen concentration in fetal circulation?
a. Umbilical vein b. Pulmonary artery
c. Ductus venosus d. Ductus arteriosus

Ans.

231.	d
232.	d
233.	b
234.	d
235.	c
236.	d
237.	d
238.	a
239.	b
240.	a
241.	b
242.	c
243.	d

252.	a
253.	a
254.	b
255.	c
256.	d
257.	a
258.	b
259.	a
260.	a

Scanned with CamScanner

261. The amount of fetal blood flow per minute through the placenta at term is
a. 100–200 ml b. 200–300 ml
c. 300–400 ml d. 500–600 ml

262. Communication between right and left atrium in fetal circulation is known as .....
a. Foramen ovale b. Ductus arteriosus
c. Ductus venosus d. Fossa ovalis

263. Communication between aorta and pulmonary artery in fetal circulation is known as .....
a. Foramen ovale b. Ductus arteriosus
c. Ductus venosus d. Fossa ovalis

264. Communication between umbilical vein and inferior vena cava in fetal circulation is known as .....
a. Foramen ovale b. Ductus arteriosus
c. Ductus venosus d. Fossa ovalis

265. After the birth of the baby formen ovale closes and it becomes .....
a. Ligamentum venosum b. Ductus arteriosus
c. Ductus venosus d. Fossa ovalis

266. Main process behind the changes in circulation from fetal period to newborn is occur due to .....
a. Clamping of umbilical cord
b. Closure of Ductus Arteriosus
c. Expansion of the lungs
d. Closure of Ductus Venosus.

267. Oxygenated blood from placenta goes to fetal heart via
a. Ductus arteriosus b. Ductus venosus
c. Foramen ovale d. Umbilical artery

268. After birth, in a normal neonate the ductus arteriosus becomes:
a. Venous ligament b. Ligamentum venosum
c. Ligamentum teres d. Ligamentum arteriosum

269. After birth, the umbilical vein collapses and forms: *(Daman & Diu NO 2018)*
a. Ligamentum arteriosum b. Ligamentum venosum
c. Ligamentum umbilicus d. Ligamentum teres

Ans.
261. d
262. a
263. b
264. c
265. d
266. c
267. b
268. d
269. d
270. b
271. b
272. d
273. a
274. c
275. a
276. b

Explanation:

Fetal Structure (before birth)	Neonate Structure (after birth)
Foramen ovale	Fossa ovalis
Umbilical vein (intra-abdominal part)	Ligamentum teres
Ductus venosus	Ligamentum venosum
Umbilical arteries and abdominal ligaments	Medial umbilical ligaments, superior vesicular artery (supplies bladder)
Ductus arteriosum	Ligamentum arteriosum

270. After the closure foramen ovale becomes .....
a. Ligamentum venosum
b. Fossa ovalis
c. Ligamentum teres
d. Ligamentum arteriosum

Explanation: The fossa ovalis is a depression in the right atrium of the heart, at the level of the interatrial septum, the wall between right and left atrium. The fossa ovalis is the remnant of a thin fibrous sheet that covered the foramen ovale during fetal development.

ANTENATAL CARE

271. The confirmatory sign early in the pregnancy is:
a. Auscultation of fetal heart rate
b. Ultrasonographic findings
c. Palpation of fetal part
d. All of the above

272. What is the positive sign of pregnancy? *(RAK MSc 2018)*
a. Frequency of micturition
b. Vomiting
c. Braxton Hicks contractions
d. Fetal outline by sonography

Explanation: Positive signs of pregnancy are the signs, which confirm the pregnancy. USG confirms the accurate finding of pregnancy. Frequent micturition and vomiting are presumptive symptoms of pregnancy. Braxton Hicks contraction is probable sign of pregnancy.

273. Positive-definite sign of pregnancy is: *(ESIC 2019)*
a. Visualization of fetus by ultrasound
b. Uterine enlargement
c. Amenorrhea
d. Quickening.

Explanation: Positive signs of pregnancy are those signs that are definitely confirmed as a pregnancy. They include fetal heart sounds, ultrasound scanning of the fetus, palpation of the entire fetus, palpation of fetal movements, x-ray, and actual delivery of an infant.

274. A positive over-the-counter pregnancy test is considered as: *(NCFL 2019)*
a. Possible sign of pregnancy
b. Presumptive sign of pregnancy
c. Probable sign of pregnancy
d. Positive sign of pregnancy

Explanation: Probable signs of pregnancy include Goodell sign, Chadwick sign, Hegar sign, positive serum and urine samples (Over the counter Urinary Pregnancy Test), Braxton Hicks contractions, and ballottement. Observation of these signs indicates that the woman is most likely pregnant.

275. Which of the following tests can be used to diagnose pregnancy on the first day of the missed period (28th day of cycle)? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Two site sandwich immunoassay
b. Enzyme-linked immune assay
c. Agglutination inhibition test
d. Direct latex agglutination test

Explanation: Two sites sandwich immunoassay test device designed for the qualitative determination of human chorionic gonadotropin (hCG) concentration in human urine samples, and therefore is an aid in the early detection of pregnancy.

276. At 8 weeks of gestation, the uterus looks like: *(AIIMS Raipur Grade II 2017)*
a. Small unripped pear b. Large orange
c. Size of grape fruit d. Golf ball

Explanation: At 12 weeks uterus looks like grapefruit, at 14-20 weeks uterus looks like size of papaya, at 28-40 weeks uterus looks like watermelon

Scanned with CamScanner

277. The uterus has already risen out of the pelvis and is experiencing farther growth into the abdominal area at about: *(RAK MSc 2018)*

a. 8th week of pregnancy
b. 10th week of pregnancy
c. 12th week of pregnancy
d. 18th week of pregnancy

Explanation: Until 12 weeks of pregnancy, the uterus remains as a pelvic organ. At approximately 12 weeks of gestation the uterus becomes large enough to be palpable just above the pubic symphysis.

278. A nurse is aware that the best place to detect fetal heart sounds in the first trimester of pregnancy?

a. Above the symphysis pubis
b. Above the umbilicus
c. At the umbilicus
d. Below the symphysis pubis

Explanation: Around 10th or 11th week of gestation, it is possible to hear fetal heart rate with an ultrasound fetoscope. To auscultate fetal heart rate, apply conductive gel to the patient's skin, then position the device at midline just above the symphysis pubis and apply firm pressure. A regular stethoscope or fetoscope can detect fetal heart sounds at 18 to 20 weeks and beyond.

279. With the ordinary stethoscope, the fetal heart sounds can be detected earliest between_____ weeks of pregnancy: *(AIIMS Bhopal Nursing Officer, 2018)*

a. 6 to 8
b. 18 to 20
c. 24 to 26
d. 8 to 10

Explanation: In ordinary stethoscope, the fetal heart sounds can be detected earliest at 18-20 weeks. Through fetal Doppler (Ultrasound), the fetal heartbeat should be audible 95% of the time in 12-week pregnancies, and nearly 100% of the time after 14 weeks.

280. A significant predictor of fetal well-being is, if fetal heart rate is: *(ESIC 2019)*

a. 100-120 beats/min
b. 180-200 beats/min
c. 110-160 beats/min
d. 160-200 beats/min

Explanation: A significant predictor of fetal well-being is fetal heart rate between 120 and 160 beats/min. FHR less than 120 beats/min or more than 160 is a concern.

281. The amount of elemental iron in one iron tablet for mother is: *(AIIMS Bhopal Grade-I 2018)*

a. 60 mg
b. 60 g
c. 50 g
d. 50 mg

Explanation: The equivalent of 60 mg of elemental iron is 300 mg ferrous sulfate heptahydrate, 180 mg ferrous fumarate or 500 mg of ferrous gluconate.

282. A Nurse is caring for a 16-year-old pregnant client. The client is taking an iron supplement. What should this client drink to increase the absorption of iron?

a. A cup of hot coffee
b. A glass of milk
c. A glass of orange juice
d. Antacid solution

Explanation: Orange is good source of vitamin C and helps in absorption of iron.

283. Which among the following is correct regarding iron supplementation?

a. Take it along with milk
b. Take it along with lemon juice
c. Take it along with water
d. Take it after having food.

Explanations: Acidic environment promotes iron absorption. Lemon juice provides acidic medium which promotes absorption of drug. Orange juice can be also taken. Taking iron preparations in empty stomach will also promote its absorption

284. Most widely used oral iron preparation during pregnancy is.

a. Ferrous gluconate
b. Ferrous sulphate
c. Ferrous fumarate
d. Ferrous succinate

Explanation: Most widely used iron preparation is ferrous sulphate. It contains 200 mg ferrous sulphate which contains 60 mg elementary iron.

285. Violet coloration of the mucus membrane of cervix and vagina at 4th week of pregnancy is termed: *(DSSSB PHN, 2015; JIPMER 2012)*

a. Chadwick's sign
b. Hegar's sign
c. Goodell's sign
d. Rovsing's sign

286. Purple blue tinge of the cervix is *(DSSSB 2013)*

a. Haegar sign
b. Goodell's sign
c. Chadwick's sign
d. McDonald's sign

Explanation: A sign of pregnancy consisting of a dark bluish or purplish-red color of the vaginal or cervical mucosa as a result of increased blood supply to the area.

287. Jacquemier's sign is also known as .....

a. Osiander sign
b. Chadwick's sign
c. Goodell's sign
d. Hegar's sign

288. The dusky hue of the vestibule and anterior vaginal wall due to local vascular congestion is called as: *(AIIMS Bhopal Nursing Officer, 2018)*

a. Osiander's sign
b. Chadwick's sign
c. Goodless sign
d. Homan's signs

Explanation: Above given definition is Chadwick's sign. It is also known as Jacquemier's sign.

Osiander sign is vaginal pulsation that mirrors the maternal heart rate as an early sign of pregnancy. Softening of the vaginal portion of the cervix from increased vascularization is known as goodless sign. Homans sign is discomfort behind the knee on forced dorsiflexion of the foot which indicates deep vein thrombosis.

289. The extreme softening of the cervix during the first trimester is known as: *(AIIMS Bhopal Grade-I 2018, RAK MSc 2018)*

a. Chadwick's sign
b. Osiander's sign
c. Piskacek's sign
d. Goodell's sign

Explanation: It is named after William Goodell. Goodell's sign is a significant softening of the vaginal portion of the cervix due to increased vascularization. This sign occurs at approximately four weeks' gestation.

Ans.

288.	b
289.	d

Scanned with CamScanner

290. Changes occur to cervix during pregnancy is .....
a. Softening of cervix
b. Hypertrophy and hyperplasia of elastic connective tissues
c. Increased vascularity
d. All of the above

291. Axillary tail, Montogomery's tubercles are occur during the time of pregnancy because of the changes in .....
a. Skin
b. Breast
c. Blood volume
d. Uterus

Explanation: Axillary tail occurs because of prolongation of breast tissue under cover of pectoralis major. Monogomery's tubercles are those placed around the nipple, its secretion keeps the areola healthy and moist

292. Normal range of fetal heart rate is .....
a. 80-100
b. 120-160
c. 120-170
d. >150

293. Hormone responsible for hyperemesis gravidarum is: *(Staff Nurse G II 2014)*
a. Human chorionic gonadotropin
b. Human placental lactogen
c. Progesterone
d. Relaxin

294. Which of these is a sign of previous childbirth? *(Daman and Diu NO 2018)*
a. Rigid abdominal wall
b. Conical cervix with round external os
c. Ovoid uterus
d. Gaping introitus

Ans.

290.	d
291.	b
292.	b
293.	a
294.	d
295.	d
296.	b
297.	b
298.	c
299.	a
300.	a
301.	a
302.	c
303.	c

Explanation: Gaping introitus is a condition in which the vaginal opening is wider which clearly indicates toward previous normal vaginal delivery.

295. Identify the signs which indicating a previous child birth
a. Presence of silvery white striae and linea alba
b. Abdominal wall is lax
c. Perineum is lax and evidence of old scarring indicating previous childbirth
d. All of the above

296. A prenatal client with a history of heart disease has been instructed on care at home. Which statement if made by the client would indicate that the client understands her needs? *(Safdarjung NO 2018)*
a. There is no restriction on people who visit me
b. I should avoid stressful situations
c. My weight gain is not important
d. I should rest on my right side

Explanation: A prenatal client who has a history of heart disease should be instructed to avoid stressful situations which can aggravate the sympathetic nervous system thereby increasing the risk for acute cardiac emergency. Remaining statements are related to healthy practices but do not directly give idea about patients understanding regarding heart disease.

297. Constipation may be a problem during pregnancy due to proximity of the rectum and uterus. Rectum is located .....---
a. In front of the uterus
b. At the back of the uterus
c. To the left of the uterus
d. Above the uterus

298. What is the common cause of constipation during pregnancy? *(AIIMS Raipur staff nurse grade I-2018)*
a. Lack of fluid intake
b. Decreased fiber intake
c. Reduced intestinal motility
d. Lack of activity

Explanation: In pregnancy, constipation occurs due to hemorrhages that relax the intestinal muscle and by the pressure of gravid uterus on the intestine.

299. Which of the following instructions should nurse give to a client who is 26 weeks pregnant and complains of constipation?
a. Encourage her to increase her intake of roughage and to drink at least six glasses of water per day.
b. Tell her to go to the evaluation unit because constipation may cause contractions.
c. Tell her to ask her caregiver for a mild laxative.
d. Suggest the use of an over-the-counter stool softener

Explanation: Natural remedies will not have any side effect and complication thus it will help in normal growth and development of fetus.

300. Risk of the damage of fetus by maternal rubella is highest if mother get infected in
a. 6 to 12 weeks of pregnancy
b. 16 to 22 weeks of pregnancy
c. 22 to 28 weeks of pregnancy
d. 30 to 36 weeks of pregnancy

301. Which of the following diseases may result in serious teratogenic defect in offspring? *(RAK MSc 2018)*
a. Rubella
b. Rubeola
c. Variola
d. Varicella

Explanation: Rubella or German measles is RNA virus, which is teratogenic and is transmitted by respiratory droplet exposure. The virus affects the fetus to extreme level, if contracted in first trimester. There is increased chances of abortion, congenital malformation or infant born with rubella. Rubella vaccine cannot be given during pregnancy as it is live attenuated vaccine.

302. The nurse preparing to administer the Rubella vaccine to a two days postpartum woman. The nurse should caution the client to avoid: *(Safdarjung NO 2018)*
a. Sunlight for 3 days
b. Scratching the injection site
c. Pregnancy for 2 to 3 months after the vaccination
d. Sexual intercourse for 2 to 3 months after the vaccination

Explanation: Pregnancy needs to be avoided for 1 to 3 months as Rubella is live vaccine which can give adverse effect on fetus. This vaccine is usually administered to the client who are IgG negative.

303. The perception of active fetal movement felt by the mother during pregnancy is known as: *(RRB Feb 2012; JIPMER 2012; Kerala PSC 2014; DSSSB PHN, 2015; AIIMS Bhopal Grade-I 2018)*
a. Ballotment
b. Engagement
c. Quickening
d. Lightening

Scanned with CamScanner

304. Quickening occurs at: *(LNJP HD 2012)*
a. 8–10 weeks
b. 16–20 weeks
c. 12–16 weeks
d. 20–24 weeks

Explanation: Quickening is the active fetal movement felt by the mother during pregnancy. A woman who becomes pregnant for the first time typically feels fetal movements at around 18-20 weeks of gestation, whereas multipara women feel fetal movements at around 15-17 weeks of gestation.

305. Regular rhythmic contraction felt during bimanual examination is known as
a. Quickening
b. Hegar's sin
c. Palmer's sign
d. Chloasma

Explanation: Palmar sign is a regular rhythmic contraction felt during bimanual examination.

Hegar's sign is a non-sensitive indication of pregnancy in women — its absence does not exclude pregnancy. It pertains to the features of the cervix and the uterine isthmus. It is demonstrated as a softening in the consistency of the uterus, and the uterus and cervix seem to be two separate regions.

- **Chloasma** is a mask of pregnancy when present in pregnant women, it is a tan or dark skin discoloration
- **Quickening** is the perception of active fetal movement by the mother. It is usually felt about at 18 to 20 weeks, and about 2 weeks earlier in multipara mother.

306. Chloasma will appear on ..... body part
a. Breast and nipples
b. Cheeks and nose
c. Abdomen
d. Limbs

Explanation: The mask of pregnancy technically called melasma or chloasma appears when a steep rise in estrogen levels stimulates excess melanin production (also known as hyperpigmentation).

307. A primigravida client at 25 weeks' gestation visits the clinic and tells the nurse that her lower back aches when she arrives home from work. The nurse should suggest that the client perform:
a. Leg lifting
b. Tailor sitting
c. Side lying
d. Squatting exercises

Explanation: Tailor sitting will help in removing the spasm and congestion which occurs due to pressure of growing fetus to the lower back.

308. Pregnant woman, who is 4 months pregnant asks the nurse how much and what type of exercise she should get during pregnancy. How should nurse counsel her?
a. "Exercise to raise the heart rate above 140 beats/minute for 20 minutes daily
b. "Perform gentle back-lying exercises for 30 minutes daily."
c. "Try high-intensity aerobics, but limit sessions to 15 minutes daily."
d. "Walk briskly for 10 to 15 minutes daily, and gradually increase this time.

Explanation: Walking briskly for 10 to 15 min daily will eliminate pelvic pressure and pain, bloating and discomfort.

309. Which of the following is NOT advised for a pregnant woman with a complaint of varicose veins?
a. Wear support stockings
b. Stand for long periods
c. Exercise the calf muscles
d. Elevate legs when sitting

310. Correct statement regarding changes occur in the alimentary system during pregnancy is .....
a. Increased reflux esophagitis
b. muscle tone and motility will decrease
c. Risk for peptic ulcer reduces
d. All of the above

311. Correct statement regarding changes occur in the respiratory system during pregnancy is .....
a. Subcostal angle decreases
b. Chest circumference increases
c. Increase in tidal volume
d. All of the above

312. Attitude of fetal head in occipito posterior position is: *(Staff Nurse G II 2014)*
a. Flexion
b. Adduction
c. Deflexion
d. Extension

313. Occurrence of seizures during pregnancy is termed: *(DSSSB PHN, 2015)*
a. Eclampsia
b. Preeclampsia
c. Epilepticus
d. Myoclonus

314. All of the following can be used to determine a chromosome analysis of the fetus, except: *(Banaras HU 2015)*
a. Amniocentesis
b. Chorionic villus sampling
c. Percutaneous umbilical blood sampling (PUBS)
d. Fetal umbilical Doppler velocimetry

315. A client is scheduled for amniocentesis. When preparing her for the procedure, nurse should do which of the following?
a. Ask her to void.
b. Instruct her to drink 1 L of fluid.
c. Place her on her left side.
d. Prepare her for I. V. anesthesia

Explanation: Voiding will decrease the discomfort for doing procedure.

316. Which is the biochemical marker detected in a mother's blood in neural tube defect? *(AIIMS Bhopal Grade-I 2018)*
a. Alpha-feto protein
b. Ascorbic acid
c. Alkaline phosphatase
d. Aminoacid

Explanation: Alpha-fetoprotein (AFP) is the first protein marker to be associated with fetal abnormalities that are easily detectable in mother's serum. High level of AFP in the mother's serum is associated with neural tube defect and decreased AFP level in mother's serum is associated with Down's syndrome

317. Maternal blood serum is examined for alpha fetoproteins to detect: *(Kerala PSC, Nov 2014)*
a. Inborn errors of metabolism
b. Spina bifida
c. Rh haemolytic disease
d. Haemophilia

318. Elevated level of maternal serum alpha feto protein (MSAFP) is seen in all the condition EXCEPT
a. Open neural tube defect
b. Rh isoimmunization
c. Anterior abdominal wall defect
d. Down syndrome

Explanation: Elevated MSAFP is present in all the condition except Down syndrome. In Down syndrome and gestational trophoblastic disease MSAFP will decrease.

Ans.

304.	b
305.	c
306.	b
307.	b
308.	d
309.	b
310.	d
311.	d
312.	a
313.	a
314.	d
315.	a
316.	a
317.	b
318.	d

Scanned with CamScanner

319. Maternal alpha feto protein level at 20 weeks of pregnancy is 30 ng/mL. Which among the following condition may present in fetus?
a. Meningocele
b. Meningomyelocele
c. Both A and B
d. Down syndrome

Explanation: Normal Maternal serum AFP (MSAFP) at 20 weeks is 74.9 ng/mL (median). Decreased serum AFP is seen in down syndrome, molar pregnancy, spontaneous abortion and Klinefelter syndrome and other chromosomal abnormality. Increased MSAFP indicates risk for neural tube defect.

320. Nuchal fold thickness is present in
a. Down's syndrome
b. Turner syndrome
c. Klinefelter syndrome
d. Edward syndrome

321. After determining that a pregnant client is Rh-negative, Gynecologist orders an indirect Coombs' test. What is the purpose of performing this test in a pregnant client? *(RAK MSC 2018)*
a. To determine the fetal blood Rh factor
b. To determine the maternal blood Rh factor
c. To detect maternal antibodies against fetal Rh-negative factor
d. To detect maternal antibodies against fetal Rh-positive factor

Explanation: Pregnant women get a prenatal antibody screening with an indirect Coombs test. It tests the mother's blood to see if there are Anti D antibodies that could pass to and harm her unborn baby. Women who are Rh D negative with a positive anti D antibody screen test are considered Rh alloimmunized.

322. Appropriate time for chorionic villus sampling is .....
a. 10-12 week
b. 14-16 week
c. 18-20 week
d. 20-22 week

Explanation: Option A is the correct answer, amniocentesis timing is 14-16 weeks and that of cordocentesis is 18-20 weeks.

323. What is the total weight gain occur during the course of singleton pregnancy? *(Staff Nurse G II 2014)*
a. 5-7 kg
b. 7-9k g
c. 10-12 kg
d. 12-14 kg

Explanation: Expected weight gain during the singleton of pregnancy is 11 kg, in which 1 kg in first trimester and 5 kg each in second and third trimester.

324. Formula used for calculating expected date of delivery (EDD)
a. Johnson's formula
b. Shepard's formula
c. Hadlock's formula
d. Naegele's formula

Explanation: EDD is calculated from LMP by adding 7 days to the first day of last menstrual cycle and 9 months to the months

325. How we can estimate EDD?
a. 1st day of last MC + 280 days
b. First day of last MC + 266 days
c. Ovulation day + 280 days
d. Ovulation day + 266 days

326. Calculate EDD if LMP was 7th May 2016.
a. 14th February 2017
b. 14th January 2017
c. 13th February 2017
d. 13th January 2017

Explanation: Adding 7 to the date become 7 + 7 = 14. Adding 9 calendar months become February.

327. Expected date of delivery for a lady whose LMP was Aug 15th is: *(JIPMER 2012)*
a. May 8th
b. May 22nd
c. June 24th
d. June 1st

328. LMP was on 01.09.2009, then EDD is on: *(RRB Feb 2012)*
a. 01/06/2010
b. 08/09/2010
c. 08/06/2010
d. 08/06/2009

329. First day of last menstrual period is October 19, 2017. What is the expected date of delivery? *(AIIMS Raipur NO 2019)*
a. July 12, 2018
b. July 26, 2018
c. August 12, 2018
d. August 26, 2018

Explanation:
- Naegele's formula - add 9 calendar months and 7 days to the LMP.
- In this example,
- LMP=19/10/17 + 9 months= 19/07/18 + 7 days
- EDD=July 26,2018

330. Babita LMP began June 10. Her EDD should be which of the following?
a. April 17
b. March 17
c. June 22
d. October 12

Explanation: To determine the EDD when the date of the client's LMP is known, use Naegele's formula
Note: Add 7 days, to the date and 9 months to the month.

331. The causes of physiological anemia in pregnancy is: *(RRB Feb 2012)*
a. Haemodilution
b. Haemolysis
c. Hematopoiesis
d. None

332. Physiological anaemia during pregnancy is a result of: *(LNJP H D 2012, RAK MSc 2018)*
a. Increased blood volume
b. Increased detoxification demands on mother's liver
c. Decreased dietary intake
d. Decreased erythropoiesis after first trimester

333. Which of the following conditions is common in pregnant clients in the 2nd trimester of pregnancy? *(RAK MSc 2018)*
a. Breast abscess
b. Metabolic acidosis
c. Physiologic anemia
d. Respiratory alkalosis

Explanation: Hb level of antenatal mother goes down in second trimester and gradually rise in third trimester. As a result of plasma volume increase Hb dilution takes place. The demand of iron is increased specially in 2nd trimester. Thus, mother experience physiologic anemia.

334. Fall in hematocrit value observed during pregnancy because .....
a. Hemodilution
b. Hemoconcentration
c. Blood loss
d. Due to progesterone hormone

Explanation: The disproportionate increase in plasma and RBC volume produce a state of hemodilution which leads to fall in hematocrit during pregnancy.

335. Injection TT is given to pregnant women to prevent: *(RRB Feb 2012)*
a. Typhoid
b. Maternal tetanus
c. Neonatal tetanus
d. Both b and c

Explanation: To prevent them and their neonate from tetanus (Depends upon previous tetanus vaccination to mother)

Ans.
319. d
320. a
321. d
322. a
323. c
324. d
325. a
326. a
327. b
328. c
329. b
330. b
331. a
332. a
333. c
334. a
335. d

Scanned with CamScanner

336. The first sign seen in pregnancy is: *(RRB Feb 2012)*
a. Quickening b. Amenorrhea
c. Hegar's sign d. None

337. All of the following are recognized causes of intrauterine growth retardation (IUGR) Except: *(RRB Feb 2012)*
a. Hypertension b. Smoking
c. Hypercholesterolemia d. Diabetes

338. In left occiput anterior foetal position, the foetal heart sound is located at: *(AIIMS Bhopal Nursing Officer, 2018)*
a. Around the umbilicus
b. Back towards the mother's flank of the same side
c. Middle of the spino-umbilical line of the same side
d. Below the umbilicus

Explanation:

339. The production of the first heart sound is because of which of the following? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Rushing of blood into ventricle
b. Closure of semilunar valves
c. Contraction of atrial musculature
d. Closure of atrioventricular valves

Explanation: First heart sound s1 is produced due to the closure of atrioventricular valve, i.e. tricuspid valve and bicuspid valve.

340. Severe vomiting in pregnancy is known as: *(RRB Feb 2012)*
a. Nausea
b. Hyperemesis gravidarum
c. Morning sickness
d. None

341. Positive sign of pregnancy is: *(RRB Feb 2012)*
a. Cullen's sign b. Hegar's sign
c. Foetal movement d. Morning sickness

342. Drugs and X-rays should be avoided in the ..... trimester of pregnancy: *(RRB Feb 2012)*
a. Second b. First
c. Third d. None

343. Amniotic fluid otherwise known as: *(RRB Feb 2012)*
a. Aqueous humor b. Liquor amnii
c. Liquor chorion d. None

344. The best investigation to diagnose anencephaly at 12 weeks of pregnancy is
a. X-ray b. Amniocentesis
c. Ultrasonography d. Serum AFP

345. Which of the following biochemical markers is not included in triple test screening in pregnancy?
a. Human Chorionic Gonadotropin
b. Alpha fetoprotein
c. Unconjugated oestriol
d. Placental Lactogen

346. The components of triple test includes
a. Maternal serum alpha feto protein
b. hCG
c. Unconjugated oestriol
d. All of the above

Explanation: All the above-mentioned are the components of triple screening, which help us to find out down's syndrome, neural tube defect and other chromosomal abnormality present in the fetus. It is performed between 15 and 18 week.

347. WHO recommended minimum antenatal visit in the developing country is .....
a. 3 b. 4
c. 6 d. 8

Explanation: WHO's new antenatal care model increases the number of contacts a pregnant woman has with health providers throughout her pregnancy from four to eight. Antenatal care model with a minimum of eight contacts recommended to reduce perinatal mortality and improve women's experience of care. Source: WHO News release, 7 Nov 2016.

348. Identify the incorrect statement regarding immunization in pregnant woman
a. Live vaccines are contraindicated in pregnancy
b. Immunization against tetanus can be given
c. Tetanus immunization protect both mother and baby
d. 3 dose of tetanus one in each trimester is recommended

Explanation: Option D is the incorrect statement, live vaccines during preganacy carry a risk for infection to the unborn baby also. 2 dose of TT immunization is recommended 0.5 mL IM in deltoid region at 6 weeks interval.

349. Which of the following vaccine is contraindicated in pregnancy? *(AIIMS Raipur staff nurse grade I-2018*
a. Measles
b. Rubella
c. Varicella
d. All of the above

Explanation: All the above-mentioned vaccines are live vaccines and fetus is at risk for developing active infection.

350. The appropriate gestational week to carry out chorionic villus biopsy for prenatal diagnosis is
a. 6 to 8 weeks b. 8 to 10 weeks
c. 10 to 12 weeks d. 12 to 14 weeks

351. Nuchal translucency screening should be done between
a. 6 to 10 weeks of pregnancy
b. 11 to 14 weeks of pregnancy
c. 14-18 weeks of pregnancy
d. 20 to 22 weeks of pregnancy

352. The purpose of speculum examination is to
a. Diagnose infections
b. Diagnose premature leaking liquor
c. Study the cervical lesions
d. All of the above

Ans.

336.	b
337.	c
338.	c
339.	d
340.	b
341.	c
342.	b
343.	b

346.	d
347.	b
348.	d
349.	d
350.	c
351.	b
352.	d

Scanned with CamScanner

353. As per Govt. of India guidelines, the recommended daily dose of elemental iron for prophylaxis during pregnancy
a. 50 mg/day for 100 days
b. 50 mg/day for 150 days
c. 100 mg/day for 100 days
d. 100 mg/day for 150 days

354. A client has come to the clinic for her first prenatal visit. Nurse should include which of the following statements about using drugs safely during pregnancy in her teaching?
a. "All medications are safe after you've reached the 5th month of pregnancy."
b. "Consult with your health care provider before taking any medications."
c. "During the first 3 months, avoid all medications except ones prescribed by your caregiver."
d. "Medications that are available over the counter are safe for you to use, even early on."

Explanation: Most of the drugs can cross the placenta and inhibit normal growth of fetus. So pregnant women must consult with their healthcare provider before taking any medications.

355. Urinary excretion of hCG is maximal between which days of gestation?
a. 50-60 b. 40-50
c. 60-70 d. 30-40

356. According to Manisha, her LMP is November 15, 2016, using the Naegele's rule, her EDD is----------
a. August 18, 2017 b. August 22, 2017
c. February 22, 2017 d. July 22, 2017

357. At 12th weeks of gestation amniotic fluid measures about----------
a. 40 ml b. 50 ml
c. 60 ml d. 70 ml

358. Main carbohydrate in amniotic fluid is ..... *(CMC Vellore 98)*
a. Glucose b. Fructose
c. Lactose d. Maltose

Explanation: Organic constituents of Amniotic fluid at preterm
- Glucose – 20 mg/dl
- Proteins – 0.3 mg/dl
- Urea – 30 mg/dl
- Non protein nitrogen – 30 mg/dl
- Uric acid – 9.9 mg/dl
- Creatinine – 2 mg/dl
- Lipids – 50 mg/dl
- Hormones – Insulin, prolactin, renin

Inorganic constituents of Amniotic fluid at preterm
- Na, K, Cl

359. The functions of amniotic fluid are: *(AIIMS Raipur Grade II 2017)*
A. Protects fetus from jarring and injury
B. Maintains intrauterine temperature
C. Provides nutrients to fetus
D. Protects the placenta and umbilical cord
a. A, B, C b. B, C, D
c. A, C, D d. A, B, C, D

Explanation: The Ph of amniotic fluid is 7-7. 5. It serves as a cushion for the growing fetus and also facilitates the exchange of nutrients, water, and biochemical products between mother and fetus. It helps in maintaining intrauterine temperature and protects placenta and umbilical cord. From 10th to the 20th week amniotic fluid increases from 25 ml to 400 ml.

360. What is the normal color of amniotic fluid when the bag of waters ruptures?
a. Clear b. Greenish
c. Brownish d. Golden

Explanation:
- Green color : Meconium stained
- Golden color : Rh Isoimmunization
- Saffron color (greenish yellow) : Post maturity.
- Dark brown (Tobacco juice color) : Intrauterine Death

361. It is the dusky hue of the vestibule and anterior vaginal wall visible at about 8th week of pregnancy----------
a. Jacquemier's sign
b. Osiander sign
c. Piskacek's sign
d. Palmer sign

362. As a client progresses through pregnancy, she develops constipation. The primary cause of this problem during pregnancy is----------
a. Decreased appetite
b. Inadequate fluid intake
c. Prolonged gastric emptying
d. Reduced intestinal motility

363. The fundus of the uterus reaches up to the level of umbilicus when the duration of pregnancy is----------
a. 20 weeks b. 24 weeks
c. 26 weeks d. 36 weeks

364. Cardiac activity of the fetus seen through ultrasound by----------
a. 3 weeks b. 4 weeks
c. 5 weeks d. 7 weeks

365. Golden color of amniotic fluid seen in----------
a. Rh- Incompatibility b. fetal death
c. IUGR d. Fetal distress

366. Ultrasound is the useful diagnostic method to diagnose the ----------
a. Endometrial carcinoma
b. Cancer cervix
c. Leiomyosarcoma
d. Fibroid uterus

367. Best parameter to assess the gestational age of fetus is ------
a. Biparietal diameter b. Length of femur
c. Crown-rump length d. Chest diameter

368. Polyhydramnios occur in all of the following EXCEPT --------
a. Diabetes mellitus b. Anencephaly
c. Multiple pregnancy d. Renal agenesis of fetus

369. Which of the following conditions is most likely to cause dyspnea on exertion in a pregnant woman?
a. Abruptio placenta
b. Placenta Previa
c. Eclampsia
d. Polyhydramnios

370. Fetal movement can be felt by the mother
a. During the first trimester of pregnancy
b. At 16-20 weeks of gestation
c. Around 2 weeks before due date
d. By the end of 30 weeks

Ans.
353. c
354. b
355. c
356. b
357. b
358. a
359. d
360. a
361. a
362. d
363. b
364. d
365. a
366. d
367. c
368. d
369. d
370. b

Scanned with CamScanner

371. During which week of Pregnancy for the first time breast milk can be squeezed?
(AIIMS Raipur Staff Nurse Grade I-2018)
a. 6th week
b. 12th week
c. 18th week
d. 24th week

372. Which among the following is the appropriate measure for reducing the breast tenderness in the first trimester of pregnancy?
a. Wash breast with warm water and keep it dry
b. Wear tight clothes to support the breast
c. Expose the breast to air 2 hourly
d. Wash with soap and water 4 hourly

Explanation: Option A is the correct answer, soap use should be minimized and soap should not be applied in the areola because it will cause dryness.

373. What can be the cause of low estradiol level during pregnancy?
a. Trisomy 18
b. Down syndrome
c. Neural tube defect
d. All of the above

374. Appropriate time for TT immunization in a pregnant woman without previous TT immunization is
a. At first contact or as early as possible in pregnancy
b. Between 12 and 16 weeks of pregnancy
c. Between 20 and 24 weeks of pregnancy
d. Two weeks before EDD

Explanation:

Table: Tetanus toxoid immunization schedule for women of childbearing age and pregnant women without previous exposure to TT/Td or DTP[a].

Dose of TT or Td (According to card or history)	When to give	Expected duration of protection
1	At first contact or as early as possible in pregnancy	None
2	At least 4 weeks after TT1	1–3 years
3	At least 6 months after TT2 or during subsequent pregnancy	At least 5 years
4	At least one year after TT3 or during subsequent pregnancy	At least 10 years
5	At least one year after TT4 or during subsequent pregnancy	For all childbearing age year and possibly longer

375. Which of the following fetal defect can be detected by alpha-fetoprotein test?
a. Fetal distress
b. Sickle cell anaemia
c. Down syndrome
d. IUGR

376. Position of fetus in breech presentation is .....
a. Left sacroanterior
b. Left mentoanterior
c. Right occipitoanterior
d. Left mentoposterior

377. Identify correct statement regarding amniotic fluid
a. Maintains optimum temperature of the fetus.
b. Contains fetal urine, fetal lanugo and epithelial cells.
c. Provides cushion against injury to the fetus.
d. All of the above

378. Fundal grip helps to find out .....
a. To know the fetal part at the fundus
b. To assess the degree of flexion or attitude
c. To have an idea what the fetal presenting part is
d. To know if engagement occurred or not

Explanation: Fundal grip-to find out the fetal part at fundus

Lateral grip-to find out the location of back, limbs and anterior shoulders

Pawlik's grip (third leopold)- To have an idea what the fetal presenting part is

The fourth maneuver is only done if the presentation is in cephalic. The nurse assesses the degree of flexion in this presentation maneuver.

379. Which of the following grip is also known as umbilical grip? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Fundal grip
b. Lateral grip
c. Pawlik's grip
d. Pelvic grip

Explanation: Lateral grip is also known as umbilical grip and the aim of this grip to identify the fetal back in mother's abdomen.

380. Which of following is also known as Pawlik's grip?
a. First pelvic grip
b. Third leopold
c. Both A and B
d. Second leopold

381. Which obstetric grip permits determination of the fetal presentation?
a. Fundal grip
b. Lateral grip
c. Pawlik's grip
d. Pelvic grip

382. Which obstetrics grip permits determination of the fetal position?
a. Fundal grip
b. Lateral grip
c. Pawlik's grip
d. Pelvic grip

Explanation: The first maneuver (fundal grip) permitts determination of the uterine fundus level as well as the fetal presentation. The second maneuver (Lateral Grip) permits determination of the fetal position

383. Synonymous of obstetric grip is .....
a. Leopold maneuvers
b. Fundal grip
c. Umbilical grip
d. Pawlik's grip

Explanation: Obstetric grip also known as Leopold maneuvers which includes fundal grip (first leopold), lateral or umbilical grip (second leopold), Pawlik's grip (third Leopold), pelvic grip (fourth Leopold)

384. To determine fetal position using Leopold's maneuvers, the first maneuver is to: *(RAK MSc 2018)*
a. Determine degree of molding
b. Determine the position of fetus
c. Determine what part of fetus is in the fundus
d. Locate the back, arms and legs

Ans.

371. b
372. a
373. d
374. a
375. c
376. a
377. d
378. a
379. b
380. c
381. a
382. b
383. a
384. c

Scanned with CamScanner

Explanation:

Table: Four grips of Leopold's maneuver

Grip	Name	Purpose
First Leopold	Fundal grip	To determine what part of fetus is lying in the fundus
Second Leopold	Lateral or Umbilical grip	To find out the position of back, limbs and the anterior shoulder
Third Leopold	Pawlik's grip or First pelvic grip	To assess the engagement of presenting part
Fourth Leopold	Pelvic grip or Second pelvic grip	To note precise of presenting part, attitude and engagement in vertex presentation.

NOTE: *Refer to Appendices for graphical illustration of Leopold's maneuver (Page no. A-101).*

385. Which of the following is also known as Leopold fourth maneuver?
a. Fundal grip b. Lateral grip
c. Pawlik's grip d. Pelvic grip
Ref: D.C. Dutta. Textbook of Obstetrics. 7th Ed. Pg. 79.

Explanation:
- Fundal grip - First Leopold
- Lateral grip - Second Leopold
- Pawlik's grip - Third Leopold
- Pelvic grip - Fourth Leopold

386. Which of the following obstetric grip is also known as third maneuver of leopold?
a. Fundal grip b. Lateral grip
c. Second pelvic grip d. Pawlik's grip

387. Which of the following obstetric grip is used to assess the descent of head in a pregnant woman?
a. Fundal grip b. Lateral grip
c. First pelvic grip d. Second pelvic grip

388. Grand multiparas are at risk for .....
a. Malpresentation b. Macrosomia
c. Anemia d. All of these

389. In pregnancy diagnosis of appendicitis will be late because .....
a. Vomiting may misinterpret as hyperemesis
b. ESR and WBC count will be elevated in normal pregnancy as well as appendicitis
c. Location of pain will be shifted to higher level and may misdiagnose as cholelithiasis or renal infection
d. All of the above

390. Supine hypotensive syndrome most commonly seen during .....trimester
a. 1st Trimester b. 2nd Trimester
c. 3rd Trimester d. Whole antenatal period

391. A women is now at 16 weeks of gestation. After how many weeks of gestation the midwife need to instruct the women to return for a follow up visit?
a. One b. Two
c. Three d. Four

392. Following are basic elements involved in the uterine contractile systems EXCEPT:
a. Enzyme adenosine triphosphates
b. Actin
c. Myosin
d. Adenyl-cyclase

393. The reason for leg cramps in antenatal woman is
a. Decrease in the serum calcium level
b. Decrease in phosphorus level
c. Retention of salt and fluid
d. Increase in serum progesterone

394. Degree of uterine systole is measured in terms of .....
a. Tonus b. Intensity
c. Strength d. Number

395. Height of fundus is midway between umbilicus and xiphisternum at .....
a. 24th week b. 26th week
c. 28th week d. 30th week

396. Height of fundus is at the level of umbilicus at .....
a. 24th week b. 26th week
c. 28th week d. 30th week

397. The height of the uterus is at the level of umbilicus at ..... period of gestation
a. 16-18 weeks b. 20-22 weeks
c. 24-26 weeks d. 26-28 weeks

398. The height of a uterus is midway between the symphysis pubis and umbilicus at which week of gestation?
(AIIMS Bhopal Nursing Officer, 2018)
a. 12 weeks b. 8 weeks
c. 16 weeks d. 28 weeks

Explanation:

399. Calcium requirement during pregnancy is .....
a. 1.5 gm/day b. 2.0 gm/day
c. 2.5 gm/day d. 3.0 gm/day

Explanation: According to WHO 1.5–2.0 gm oral elemental calcium

400. Additional amount of calorie that should be taken by a pregnant woman *[NCFL 2019; RUHS-Pre MSc. 2007]*
a. 300 Kcal b. 500 Kcal
c. 1000 Kcal d. 100 Kcal

401. First of all fetal heart-sound can be assessed *[AIIMS-2011]*
a. Between 2-3 weeks b. Between 8-10 weeks
c. Between 10-12 weeks d. Between 16-18 weeks

402. A predisposing factor which causes morning sickness during the first trimester of pregnancy is the adaptation to increased levels of
a. Oestrogen b. Progesterone
c. Luteinizing hormone d. Chorionic gonadotropin

Scanned with CamScanner

403. Hormone responsible for morning sickness is .....
a. hCG b. Oxytocin
c. Prolactin d. Relaxin

Explanation: High level of serum Human Chorionic Gonadotropin (hCG), estrogen and altered level of immunological states are considered as responsible for morning sickness.

404. Which stage of labor is evidenced with effacement of cervix?
a. 1st stage of labor b. 2nd stage of labor
c. 3rd stage of labor d. 4th stage of labor

405. Persistent severe vomiting leading to weight loss and dehydration, as a condition occurring during pregnancy is known as
a. Morning sickness
b. Nausea vomiting
c. Hyperemesis gravidarum
d. All of the above

406. Duration of latent phase in primi-gravida is about:
a. 4 hours b. 6 hours
c. 8 hours d. 10 hours

407. What is reason behind when a patient is advised to walk during her first stage of labor if the membranes are not ruptured?
a. Promote the descent of fetal head
b. Diversion to reduce pain
c. Ensure fetoplacental blood flow
d. Promote placental separation

408. Duration of latent phase in multipara is about:
a. 4 hours b. 6 hours
c. 8 hours d. 10 hours

409. Tingling, numbness and pain in the thumb and fingers of a pregnant women suggestive of which condition?
a. Osteoporosis
b. Rheumatoid arthritis
c. Carpal tunnel syndrome
d. Calcium deficiency

410. First fetal movement felt by mother is .....
a. Quickening
b. Hardening
c. FHS
d. Braxton Hicks contractions

411. Breast is the modification of which gland?
a. Sebaceous gland b. Endocrine gland
c. Bartholin's gland d. Sweat gland

412. First trimester is
a. First 12 week b. 13-28 weeks
c. 29-40 weeks d. None of the above

413. Second trimester is .....
a. First 12 week b. 13-28 weeks
c. 29-40 weeks d. None of the above

414. Third trimester is .....
a. First 12 week
b. 13-28 weeks
c. 29-40 weeks
d. None of the above

415. Folic acid deficiency during the pregnancy will lead to .....
a. Exstrophy bladder
b. Oesophageal atresia
c. Neural tube defect
d. Congenital diaphragmatic hernia

416. Ketoacidosis occur due to the deficient intake of .....
a. Carbohydrates b. Protein
c. Fat d. Minerals

417. Pallor, bradycardia, sweating, nausea, hypotension and dizziness occurs when a pregnant woman lies on her back is known as .....
a. Malignant hypothermia
b. Orthostatic hypotension
c. Respiratory distress syndrome
d. Supine hypotensive syndrome

418. Identify correct statement regarding non-stress test (NST)
a. Continuous monitoring of fetal heart rate along with fetal movement (cardiotocography)
b. It will assess the relationship between fetal movement and heart rate
c. FHR acceleration along with fetal movement is expected
d. All of the above

419. Which of the following statement best describes contraction stress test for the pregnant woman: *(Safdarjung NO 2018)*
a. Small amount of oxytocin (Pitocin) are administered during internal fetal monitor to stimulate uterine contraction
b. An external fetal monitor is attached, and the woman ambulates on a treadmill until contractions begins
c. The uterus is stimulated to contract by the use of small amounts of oxytocin (Pitocin) or by the nipple stimulation
d. Uterine contractions are stimulated by Leopold's maneuver's

Explanation: Uterine contractions are stimulated by nipple stimulation or by administering oxytocin in diluted forms. The variation in heart rate is noted through external fetal monitoring system. It is done to assess the uteroplacental insufficiency. Internal fetal monitoring is not done.

420. Contraction stress test (CST) is also known as .....
a. Oxytocin challenge test
b. NST
c. Both A and B
d. None of the above

421. The hormone responsible for the maintenance of pregnancy is
a. Estrogen b. Progesterone
c. hCG d. Human placental lactogen

422. Function of progesterone is.....
a. Prepare the uterus to receive the fertilized egg
b. Secondary sexual characteristics
c. Milk production
d. Stimulation of ovary

Explanation: Progesterone is hormone secreted by the ovaries, placenta, and adrenal glands that function mainly to regulate the condition of the inner lining (endometrium) of the uterus to receive the fertilized ovum.

423. CST is used to .....
a. Measure the baby's heart rate during uterine contractions.
b. Determine the intensity of uterine contraction
c. Determination of maternal wellbeing
d. All of the above

424. Gender determination can be done by ..... POG
a. 6-12 weeks b. 12-16 weeks
c. 16-18 weeks d. 18-24 weeks

Ans.

Scanned with CamScanner

425. Amniotic fluid volume during pregnancy is .....
a. 500-700ml
b. 700-1000ml
c. 1000-1500ml
d. Above 1500ml

426. Which areolar glands become hypertrophied during pregnancy that remains non- dominating during non-pregnant state?
a. Bulbourethral gland
b. Montgomery's tubercles
c. Lactiferous sinuses
d. Axillary tail

427. Which of the following is an important sign of pregnancy
a. Increase in the size of breast
b. Alkaline vagina
c. Amenorrhoea
d. All

428. Correct regarding changes which occur during pregnancy is/are .....
a. Blood volume will increase
b. RBC mass increases to 20-30%
c. During pregnancy albumin level increase
d. All of the above

429. Left occipito posterior position means .....
a. Occiput is placed over the right sacroiliac joint
b. Occiput is placed over the left sacroiliac joint
c. Occiput is placed over the right ischeal spine
d. Occiput is placed over the left ischeal spine

430. 3rd position of the vertex is also known as .....
a. Right occipito posterior position
b. Left occipito anterior position
c. Right occipito anterior position
d. Left occipito posterior position

431. Polyhydroamniosis is a condition when the amniotic fluid volume exceeds more than ..... mL.
a. 1000 b. 1500
c. 2000 d. 2500

Explanation: When the volume is more than 2000 mL it is called as polyhydroamniosis. If the amniotic fluid volume is less than 200 mL, it is known as oligohydroamniosis.

432. An amniotic fluid index of less than 5 cm indicates: *(Daman & Diu NO 2018)*
a. Anhydramnios b. Hydramnios
c. Polyhydramnios d. Oligohydramnios

Explanation:
- **Oligohydramnios:** Amniotic fluid index of less than 5 cm or 200 mL
- **Polyhydramnios:** An amniotic fluid index more than 25 cm or 2000 mL
- **Anhydramnios:** The absence of the amniotic fluid (liquor amnii)

433. Oligohydramnios is a condition when amniotic fluid is less than: *(RAK MSc 2018)*
a. 75 mL at term b. 100 mL at term
c. 150 mL at term d. 200 mL at term

Explanation: Oligohydramnios is a condition in which amniotic fluid is deficient in amount less than 200 mL at term. Sonographically oligohydramnios is defined when amniotic Fluid Index (AFI) is less than 5 cm.

434. Gravida indicates
a. Pregnancy state both present and past
b. State of previous pregnancy beyond the period of viability
c. The number of babies has
d. All of the above

435. A woman who is pregnant for the first time.
a. Primipara
b. Multipara
c. Nuligravida
d. Primigravida

436. A woman who has never completed the pregnancy beyond the stage of viability is known as
a. Primipara
b. Nullipara
c. Nulligravida
d. Primigravida

437. Woman who has never been pregnant is .....
a. Primipara b. Nullipara
c. Nulligravida d. Primigravida

438. A female who has given birth to one viable child is termed as: *(RAK MSc 2018)*
a. Primipara b. Multipara
c. Nulligravida d. Primigravida

Explanation:
- The pregnancy beyond the period of viability is called parity. A woman who has given birth to one viable child will be referred as Primipara.
- **Multipara:** A mother who has completed two or more pregnancies to the stage of viability.
- Primigravida is the woman who has been pregnant for the first time. Gravida (G) denotes a pregnant state (number of times female has been pregnant) both present and past, irrespective of period of gestation.
- **Nulligravida:** A women who has not now and never been pregnant.

439. Rama is pregnant for the first time and at 12 weeks POG, her USG is suggestive of twin pregnancy. Her gravida is ...
a. Gravida 0 b. Gravida 1
c. Gravida 2 d. Gravida 1+1

Explanation: Rama is pregnant for the first time so gravida 1. Even if the woman is having twin pregnancy it will be considered as gravida 1.

440. Sheela comes to the ANC clinic for her 2nd antenatal visit. Her history is suggestive of 2 previous abortions and one term delivery. Her gravid and parity is .....
a. G1P1 b. G2P1
c. G3P1 d. G4P1

Explanation: Sheela has history of 2 abortions, one term delivery and presently she is pregnant so gravida is 4. Since she has only one term delivery her para is still 1.

441. G3P 1 +2 means .....
a. Three time pregnant with 1 viable birth and 2 abortion
b. Three time pregnant with 1 abortion and 2 viable birth
c. Three time pregnant with 1 single baby and 2 twins
d. Three time pregnant with 1 twin delivery and 2 abortions

Explanation: G3 means three time pregnant. P1+2 means 1 viable birth and 2 miscarriage (abortion).

Scanned with CamScanner

442. Grand multipara is:
a. Pregnant women with previous history of four or more birth
b. Pregnant women with first pregnancy at the age of 30 or above
c. Pregnant women with previous history of 2 abortions
d. Woman with pregnancy at the age of 18 years

443. Elderly primigravida is defined as: *(RAK MSc 2018)*
a. Women having her first pregnancy above the age of 25
b. Women having pregnancy above the age of 30
c. Women having their first pregnancy below the age of 18
d. Women having her first pregnancy above the age of 35

Explanation: Women having pregnancy above the age of 35 years are considered elderly primigravida (FIGO classification). Women having their first pregnancy below the age of 18 years are called adolescent mother

444. Diagnostic test used for locating the placenta is .....
a. X-ray
b. Ultrasonography
c. Bio-physiological monitoring
d. Coombs test

445. The period of gestation, when development of placenta is completed is
a. 3 weeks b. 12 weeks
c. 16 weeks d. 20 weeks

446. Commonest cause of bleeding at term is .....
a. Abruptio placentae
b. Placenta previa
c. PPH
d. Atonic uterus

447. Chief source of estrogen in the third trimester of pregnancy is .....
a. Placenta
b. Corpus luteum
c. Ovary
d. Pituitary

Explanation: In the early week of gestation, i.e. before the formation of placenta corpus luteum will secrete these hormones but after the formation of placenta, production of estrogen and progesterone is its function.

448. Progressive thinning and shortening of cervix are defined as: *(AIIMS Nagpur NO 2018)*
a. Expulsion b. Dilation
c. Effacement d. Contraction

Explanation: The processing of thinning of the cervix is known as effacement and the increase in diameter of cervix is called as dilation.

449. Identify correct statement among the following
a. Cervix will gradually soften, shorten and become thinner is known as effacement
b. In primigravida effacement precedes dilation of the cervix
c. In multipara both the dilation of cervix and effacement occur simultaneously
d. All of the above

450. In a primi mother average descend in active phase occur will be .....?
a. 1.0 cm/hr b. 1.2 cm/hr
c. 2.0 cm/hr d. 2.2 cm/hr

Explanation: Active phase <1.5 cm/hr

451. Which of the following dietary supplements should be recommended for a pregnant woman who is on heparin therapy?
a. Folic acid b. Zinc
c. Potassium d. Calcium

452. During a routine prenatal visit, a pregnant client reports heartburn. To minimize her discomfort, nurse should include which suggestion in the plan of care? *(RAK MSc 2018)*
a. Drink more citrus juice b. Eat small, frequent meals
c. Limit fluid intake sharply d. Take sodium bicarbonate

Explanation: To minimize heartburn patient is advised to avoid overeating and not to go to the bed immediately after having food. Patient can eat small food in frequent intervals.

453. Characteristic of dizygotic pregnancy is .....
a. Four amnions will be there
b. Sex may be different
c. Genetic features are different
d. All of the above

454. Which of the following is NOT a presumptive sign of pregnancy?
a. Amenorrhea
b. Braxton-Hicks contraction
c. Urinary frequency
d. Breast changes

455. Fertilization of two or more ova from the same cycle by sperm from separate acts of sexual intercourse is known as .....
a. Superfetation
b. Superfecundation
c. Dizygotic pregnancy
d. Monozygotic pregnancy

456. Fetus develop its own blood supply from .....week
a. 10th to 12th week b. 12th to 14th week
c. 12th to 16th week d. 12th to 20th week

457. Physiological functions of estrogen include .....
a. Responsible for myometrial growth after implantation
b. Stimulates hypertrophy of the endometrium.
c. Decreases the secretion of FSH
d. All of the above

458. How much weight should a healthy well-nourished expectant mother gain during pregnancy?
a. 6–8 kg b. 8–10 kg
c. 10–12 kg d. 12–14 kg

459. Identify the formula which is used for the estimation of fetal weight
a. Johnson's formula b. Shepard's formula
c. Hadlock's formula d. All of the above

Explanation: Estimation of fetal weight by Johnson's formula
McDonald's measurement of symphysiofundal height
Station of the presenting part by abdominal and vaginal examination when in labor.
Fetal weight (gms) = (McDonald's measurement -X) × 155.
Where,
X = 13, when presenting part is at minus station
X = 12, when presenting part at 0 station
X = 11, when presenting part at plus station.
Estimation of fetal weight by Hadlock's formula
Biparietal Diameter (BPD) is measured on the frozen image from the outer edge of the proximal skull to the inner edge of the distal skull.

Scanned with CamScanner

Abdominal circumference (AC) is measured at the level of umbilical vein as it enters liver. Stomach bubble was also taken as landmark. It was measured using ellipse is.

460. How much amount of elemental iron contained by one tablet of ferrous sulfate?
a. 40 mg
b. 50 mg
c. 60 mg
d. 70 mg

461. How much amount of absorbable iron contained by one tablet of ferrous sulfate?
a. 10 mg
b. 15 mg
c. 20 mg
d. 25 mg

462. Which of the following is the early symptom of first trimester of pregnancy?
a. Braxton-Hicks contraction
b. Fetal heart sound can be heard through fetoscope
c. Fetal heart rate through USG
d. Cessation of menstrual cycle

463. Crown rump length of fetus is measured from ..... To .....
a. Coccyx to the heel
b. Vertex to the heel
c. Vertex to the coccyx
d. Head to coccyx

464. Jacquemier's sign is
a. Bluish coloration of the anterior vaginal mucosa
b. increased pulsation felt through the lateral fornices
c. cervix become soft as early as 6th week
d. one half of the uterus is more firm than the other half

465. Osiander sign is .....
a. bluish coloration of the anterior vaginal mucosa
b. Increased pulsation felt through the lateral fornices
c. Cervix become soft as early as 6th week
d. One half of the uterus is more firm than the other half

466. Goodell's sign is .....
a. Bluish coloration of the anterior vaginal mucosa
b. Increased pulsation felt through the lateral fornices
c. Cervix become soft as early as 6th week
d. One half of the uterus is more firm than the other half

467. Piskacek's sign is .....
a. Bluish coloration of the anterior vaginal mucosa
b. Increased pulsation felt through the lateral fornices
c. Cervix become soft as early as 6th week
d. One half of the uterus is more firm than the other half

468. Pigmented line extending from xiphisternum to the symphysis pubis is termed as
a. Striae gravidarum
b. Linea nigra
c. Striae albicans
d. Linea albicans

Explanation: Linea nigra is a brownish pigmented area in the midline stretching from the xiphisternum to the symphysis pubis and is visible as early as 20th week of gestation.

469. All of the following statements are true regarding Linea nigra, EXCEPT
a. Brownish black pigmented area in the midline
b. It is probably due to melanocyte stimulating hormone from anterior pituitary
c. Pigmentation disappears after delivery
d. It appears all over the abdomen

Explanation: Linea nigra is a dark vertical line that appears on the abdomen in about 75% of all pregnancies. The brownish streak is usually about a centimeter in width. The line runs vertically along the midline of the abdomen from the pubis to the umbilicus and it may extend till xiphisternum. Linea nigra is due to increased melanocyte-stimulating hormone made by the placenta which also causes melasma and darkened nipples. Linea nigra typically disappears within a few months after delivery.

470. The fetus measures 40 cm and weight 1.5 kg expected at ..... weeks of pregnancy
a. 20
b. 26
c. 30
d. 34

471. Teratogenic effect of un-prescribed drug affect the fetus most commonly in ..... trimester
a. 1st trimester
b. 2nd trimester
c. 3rd trimester
d. Whole antenatal period

472. Which among the following food group is the most preferred food group by pregnant mothers?
a. High fat and low protein.
b. High protein and low carbohydrate.
c. High protein and low fat.
d. High carbohydrate and high fat.

473. Painless uterine contractions felt on abdominal palpation occurring every 15 minutes referred as----------
a. Braxton Hicks contraction
b. Quickening
c. Osiander sign
d. None of the above

474. Expulsion of cervical mucus plug mixed with blood is called----------
a. Bleeding per vagina
b. Bag of water
c. Show
d. Cervical secretion

475. It is the visible movement of the head due to untwisting of the neck sustained during internal rotation is----------
a. Crowning
b. External rotation
c. Restitution
d. Torsion of the neck

476. Station '0' is indicative of the presenting part being----------
a. Slightly above the ischial spine
b. At the level of ischial spine
c. Slightly below the ischial spine
d. On perineum

477. Cord prolapse seen less commonly in --------
a. Complete breech
b. Frank breech
c. Kneeling breech
d. Footling breech

478. The most commonest cause for rupture in uterus is----------
a. Obstructed labor
b. Post caesarian gestation
c. Shoulder presentation
d. Hydramnios

479. Which hormone is responsible for sensitizing the myometrium for oxytocin and prostaglandin?
a. Progesterone
b. Oestrogen
c. Androgen
d. Testosterone

480. Cervical ripening occurs due to which hormones?
a. Progesterone
b. Oestrogen
c. Androgen
d. Testosterone

481. The period between onset of true labor pain up until the cervix is 4 cm dilated is known as
a. Active phase of labor
b. Latent phase of labor
c. Prolonged phase of labor
d. None of the above

482. Correct sequence in mechanism of labor is .....
a. Engagement → descent → flexion → internal rotation
b. Engagement → flexion → crowning → restitution
c. Engagement → decent → internal rotation → flexion
d. Engagement → flexion → extension → crowning

Scanned with CamScanner

483. What is the normal color of amniotic fluid when the bag of waters ruptures?
a. As like water b. Bluish
c. Brownish d. Yellowish

(Ref: Hiralal Konar. DC Dutta's Textbook of Obstetrics 9th edition 2018 Jaypee Publications, p. 34.)

Explanation:
- Amniotic fluid is clear liquid as like water
- It never appears bluish
- Dark brown color indicates IUD
- In case of Rh incompatibility, it is Golden yellow color

484. In which condition oral pills should not be given to a women?
a. Menstrual problems
b. Hypertension
c. Asthma
d. Vaginal infection

485. Meconium stained (dark green) amniotic fluid indicates .....
a. Respiratory distress
b. Rh incompatibility
c. Post maturity of Fetus
d. Intra Uterine Death of Fetus

486. Yellow-colored amniotic fluid indicates .....
a. Respiratory distress
b. Rh incompatibility
c. Post maturity of Fetus
d. hemolytic disease of the new born

487. Dark red brown amniotic fluid indicates .....
a. Respiratory distress b. Rh incompatibility
c. Post maturity of Fetus d. Fetal death

488. Greenish yellow color amniotic fluid indicates .....
a. Respiratory distress b. Rh incompatibility
c. Post maturity of fetus d. Fetal death

489. Amniotic Fluid Index (AFI) is measured by _____
a. Abdominal girth b. Ultrasonography
c. Leopold maneuver d. Ballottement

Explanation: Amniotic Fluid Index is measured with the help of ultrasonography by dividing the abdomen into four quadrant. For dividing the abdomen into four quadrant linianigra is considered as vertical point and umbilicus is considered as horizontal point.
- In each quadrant deepest pocket is measured in cm. Sum of all pocket is considered as AFI.
- Normal value of AFI varies from 8-18 cm
- AFI less than 5-6 cm is considered as oligo-hydroamniosis
- AFI more than 20-24 cm is considered as polyhydroamniosis

490. Internal rotation occurs in normal labor when fetus is at occipito-lateral position?
a. 1/8th of circle b. 2/8th circle
c. 3/8th of circle d. 4/8th circle

491. Station +1 indicates that the presenting part is lying
a. Slightly below the ischial spine
b. Slightly above the ischial spine
c. High in the false pelvis
d. On the perineum

492. Relaxation of smooth muscles and vasodilation occur because of the effect of ..... hormone
a. Estrogen b. Ergometrine
c. Progesterone d. Relaxin

493. General causes of breech presentation is
a. Malnutrition
b. Prematurity
c. Uterine inertia
d. Poor bearing down effort

494. The commonest causes of breech presentation is: *(RAK MSc 2018)*
a. Hydrocephalus b. Prematurity
c. Multipara d. Hydramnios

Explanation:
Prematurity is the most common cause of breech presentation as smaller size of fetus and comparatively larger volume of amniotic fluid allows the fetus to undergo spontaneous version (movements) by kicking.

495. Which of the following is a cephalic presentation?
a. Vertex b. Face
c. Brow d. All of the above

496. A drop in fetal heart rate that lasts less than 2 minutes and is usually associated with umbilical cord compression is known as
a. Variable deceleration b. Prolonged deceleration
c. Early deceleration d. Late deceleration

497. Components of Bishop's cervical scoring system include .....
a. Dilatation b. Effacement
c. Consistency d. All of the above

498. Movement occurred in head to untwist the neck sustained during internal rotation is termed as .....
a. Extension b. Restitution
c. Crowning d. External rotation

499. Compound presentation is .....
a. Cephalic presentation is complicated by the presence of a hand or a foot or both alongside the head
b. When the presenting part is two buttocks and genitalia
c. In cephalic presentation when the presenting part is face
d. In cephalic presentation presenting part is brow

500. The drug of choice in treatment of typhoid fever during pregnancy is
a. Quinolones b. Ceftriaxone
c. Levofloxacin d. Norfloxacin

Explanation: Drug of choice for typhoid during pregnancy - 3rd Generation cephalosporins (e.g. Ceftriaxone) or Ampicillin/ Amoxicillin.

Quinolones are preferred choice in Non-pregnant individuals.

501. Which of the following antihypertensives is NOT safe during pregnancy?
a. Labetalol b. ACE inhibitors
c. Diuretics d. Nifedipine

502. Lateral position is given to pregnant mothers in order to avoid .....
a. Supine hypotension b. Orthostatic hypotension
c. Aspiration d. Promotes venous return

Explanation: Lateral position is given to a mother to avoid supine hypotension (postural hypotension). Gravid uterus compresses inferior vena cava when the patient is in supine position and cause hypotension, tachycardia and syncope. This can be avoided by providing lateral position to the client.

Ans.

483.	a
484.	b
485.	a
486.	d
487.	d
488.	c
489.	b
490.	b
491.	a
492.	d
493.	b
494.	b
495.	d
496.	a
497.	d
498.	b
499.	a
500.	b
501.	b
502.	a

Scanned with CamScanner

503. Which of the following drug is safe for the treatment of cholera in pregnant women

a. Doxycycline b. Chloramphenicol
c. Olfloxacin d. Azithromycin

Ref: CDC. www.cdc.gov/cholera/treatment/antibiotic-treatment.html

Explanation: According to CDC guidelines, Azithromycin is more effective than erythromycin and ciprofloxacin and is an appropriate first line treatment for pregnant women and children.

Tetracycline (Doxycycline) is an effective treatment for cholera and is superior to furazolidone, cholamphenicol and sulfaguanidine but are not recommended during pregnancy.

504. All of the following drugs are unsafe in pregnant women EXCEPT

a. Methatexate b. Warfarin
c. Heparin d. ACE inhibitors

505. Which of the following drug is administered in woman with premature spontaneous rupture of membrane before the 37th week of pregnancy?

a. Methergine b. Dexamethasone
c. Captopril d. Magnesium sulfate

506. The transmission of infection from the mother to the fetus through placenta is termed: *(DSSSB PHN, 2015)*

a. Iatrogenic b. Teratogenic
c. Nosocomial d. Vertical

507. Stillbirth rate includes babies' death after: *(RRB SSNE 2015)*

a. 20 weeks b. 24 weeks
c. 28 weeks d. 32 weeks

508. Which of the following is the most common cause of maternal mortality in India?

a. Obstetric hemorrhage b. Malnutrition
c. Anaemia d. Septicemia

509. While measuring fundal height, client complaining of feeling dizzy and lightheaded. What is the most appropriate nursing action?

a. Check the vitals of the client
b. Check the fetal heart rate
c. Turn the mother to one side
d. Check the urine protein level

Explanation: While measuring fundal height woman was on supine position and she was experiencing supine hypotension. By changing her position, i.e. from supine to lateral it will help to remove the compression and restore cardiac output and blood pressure.

510. Which sign is considered as welcome sign in pregnancy?

a. Lightening b. Show
c. Onset of labor pain d. Quickening

Explanation: Presenting part sink onto the pelvis, this sign is considered as welcome sign of pregnancy as it rule out cephalopelvic disproportion and corresponding conditions that preventing the head from entering in the pelvic inlet.

511. 38 week pregnant mother complaining of discomfort due to irregularly occurring contraction. The best advice by the nurse is .....

a. Lie down in supine position
b. Take some warm drinks
c. Walk around
d. Take some analgesics

Explanation: Patient experiencing Braxton Hicks contractions, it is also known as prodromal labor or practice contractions, or false labor, are sporadic uterine contractions that sometimes start around six weeks into a pregnancy. However, they are not usually felt until the second trimester or third trimester of pregnancy. It can be relieved by walking around until it subsides

512. Full form of HELLP is .....

a. Hemolysis, elevated liver enzymes and low platelet level
b. Hematuria, elevated leucocytes and low pro-thrombin time
c. Hematuria, elevated leucocytes and low partial thromboplastin time
d. Hematuria, elevated leucocytes and low platelet level

INTRANATAL CARE

513. Perinatal Period corresponds to:

a. 28 weeks of gestation to 07 days after birth
b. Period of Labor to new born period
c. Third trimester of pregnancy to new born period
d. 36 weeks of gestation to 3 days after birth

514. Labor is divided into how many stages?

a. Two b. Three
c. Four d. Five

Explanation: There are total four stages of labor. First stage starts from the onset of true labor pain and ends with the full dilatation of the cervix. Second stage starts from full dilatation of cervix and ends with delivery of the fetus. Third stage starts from delivery of the fetus and ends with expulsion of placenta and membrane. Fourth stage is the observation.

515. First stage of labor is also called as:

a. Cervical stage b. Expulsive stage
c. Propulsive stage d. Vaginal stage

516. A Primigravida patient is admitted to the labor delivery area. Assessment reveals that she is in early part of the first stage of labor. Her pain is likely to be most intense:

a. Around the pelvic girdle
b. Around the pelvic girdle and in the upper arms
c. Around the pelvic girdle and at the perineum
d. At the perineum

Explanation: In pelvic girdle there will be increase pressure of presenting part during the labor process.

517. What you mean by first stage of labor?

a. Onset of true labor pain till full dilation of cervix
b. Full dilation of cervix to expulsion of fetus
c. Expulsion of fetus to expulsion of placenta
d. Observation for at least 1 hour after the expulsion of placenta

518. The expulsion of cervical mucus plug from the vagina mixed with blood is known as:

a. Amniotic fluid b. Descend
c. Cervical discharge d. Show

519. Other name for normal labor is .....

a. Eutocia b. Dystocia
c. Eutonia d. Precipitated labor

520. Characteristics of true labor pain include.....

a. Effacement and dilatation of cervix
b. Uterine contraction at regular interval
c. Frequency of contraction increases gradually
d. All of the above

Ans.

503. d
504. c
505. b
506. d
507. c
508. a
509. c
510. a
511. c
512. a
513. a
514. c
515. a
516. a
517. a
518. d
519. a
520. d

Scanned with CamScanner

521. True labor is characterized by: *(RAK MSc 2018)*
a. Effacement and dilatation of cervix
b. Painful uterine contraction
c. Frequency of contractions increase gradually
d. All of the above

Explanation: True labor pain is characterized by following symptoms:

- Painful and progressive uterine contraction at regular intervals
- Associated with show
- Progressive effacement and dilatation of cervix
- Frequency of contractions increase gradually
- Formation of bag of membrane
- Decent of the presenting part
- Not relived by enema, sedatives or by walk
- Pain is felt in the abdomen and radiating to the back.

522. Most reliable indicator of true labor is
a. Effacement and dilatation of cervix
b. Painful uterine contraction
c. Supra pubic discomfort at regular interval
d. All of the above

Explanation: Effacement indicates thinning of the cervix which mainly occurs along with dilatation of the cervix.

523. All are the characteristics of true labor pain EXCEPT:
a. Intensity and duration of contraction increases progressively
b. Associated with show
c. Progressive effacement and dilation of cervix
d. Pain in confined to lower abdomen and groin

Explanation: Option d is the characteristics of false labor pain and all others are the characteristic of true labor pain.

524. Which of the following is a feature of false labor pain? *(AIIMS Bhopal Grade-I 2018)*
a. Not associated with the hardening of the uterus
b. Frequency of contraction increases
c. Associated with 'show'
d. Progressive dilation of cervix

Explanation: False labor pain referred to as Braxton Hicks contractions that occur predominantly in the third trimester but not associated with hardening of uterus. These are typically less painful than those of true labor and also unpredictable, do not occur at regular interval and do not become more intense over time.

525. False labor manifestation are as follows, EXCEPT *(ESIC 2019)*
a. Contraction lessen with activity or rest.
b. Cervix progressively effaced and dilated
c. Abdominal discomfort.
d. Contractions irregular.

Explanation: Progressive effacement and dilated cervix are the features of true labor. All other given manifestations are features of false labor.

526. Which among the following is NOT a feature of false labor pain? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Pain in confined to lower abdomen and groin
b. No effects on dilatation of cervix
c. Relieved by enema
d. Formation of bag of waters

Explanation: Except option D all other are the characteristics of false labor pain.

False labor pain	True labor pain
Contractions are unpredictable, irregular, vary in length and intensity, unrelated to hardening of the uterus	Contractions are regular and in short interval, increase in intensity and last longer
Pain in confined to lower abdomen and groin	Pain is felt in the abdomen and radiating to the back
Relieved by enema	Pain will persist irrespective of what we do
There is no formation of bag of water or blood show	Formation of bag of water and bloody show

527. Premature rupture of membrane (PROM) refers to rupture of membrane
a. Before onset of labor at 37 weeks or beyond
b. Before onset of labor between 28 weeks and 37 weeks of gestation
c. Before 37 completed week of pregnancy
d. More than 24 hours before delivery

528. Term pre-labor rupture of membrane means rupture of membrane .....
a. Before onset of labor at 37 weeks or beyond
b. Before onset of labor between 28 weeks and 37 weeks of gestation
c. Before 37 completed week of pregnancy
d. More than 24 hours before delivery

529. Preterm pre-labor rupture of membrane refers to rupture of membrane that occurs
a. Before onset of labor at 37 weeks or beyond
b. Before 37 weeks of gestation and before onset of labor
c. Before 37 completed week of pregnancy
d. More than 24 hours before delivery

Explanation: Prelabor or Premature Rupture of the Membranes (PROM) refers to rupture of the fetal membranes prior to the onset of regular uterine contractions. It is known as premature rupture of membrane if rupture occurs before the onset of labor at ≥37 weeks of gestation. It is termed as preterm premature rupture of membrane if PROM occurs before 37 weeks of gestation.

530. Prolonged rupture of membrane means rupture of membrane.....
a. Before onset of labor at 37 weeks or beyond
b. Before 37 weeks of gestation and before onset of labor
c. Before 37 completed week of pregnancy
d. More than 24 hours before delivery

531. To promote comfort during labor, Nurse advises a client to assume certain positions and avoid others. Which position may cause maternal hypotension and fetal hypoxia?
a. Lateral position
b. Squatting position
c. Supine position
d. Standing position

Explanation: In supine position, the weight of the uterine contents presses on the inferior vena cava and slows the venous return of blood to heart, hence leads to maternal hypotension and fetal hypoxia.

Ans.

521. d
522. a
523. d
524. a
525. b
526. d
527. a
528. a
529. b
530. d
531. c

Scanned with CamScanner

532. **Which one of the following pairs regarding presentation and presenting part in women during labor is not correct?** *(Banaras HU 2015)*
   a. Cephalic presentation : Chin
   b. Face presentation : Face
   c. Transverse presentation : Shoulder
   d. Breach presentation : Buttock

533. **The most important observation for a patient in labor in Pitocin augmentation is:** *(JIPMER 2012)*
   a. Monitoring FHS
   b. Monitoring TPR
   c. Preparing for emergency CS
   d. Monitoring and recording the length of contraction

534. **Station+1 during labor indicates that the presenting part is:** *(JIPMER 2012)*
   a. On the perineum
   b. High in pelvis
   c. Slightly below the ischial spine
   d. Slightly above the ischial spine

535. **The safest position for a lady with cord prolapse in labor is:** *(JIPMER 2012; LNJP H D 2012)*
   a. Fowler's position
   b. Prone
   c. Supine
   d. Trendelenburg

536. **Primary power of labor is ----------**
   a. Abdominal contraction
   b. Intrathoracic pressure
   c. Pushing effort of the mother
   d. Uterine contractions

537. **In which stage of labor lower uterine segment will form?**
   a. 1st stage of labor
   b. 2nd stage of labor
   c. 3rd stage of labor
   d. 4th stage of labor

538. **All among indicate transition from first stage to second stage, EXCEPT**
   a. Increase intensity of uterine contraction
   b. Urge to defecate with descent of the presenting part
   c. Complete dilation of cervix
   d. Relaxation in mother

539. **Ripening of the cervix occurs during the ----------**
   a. First stage of labor
   b. Second stage of labor
   c. Third stage of labor
   d. Fourth stage of labor

540. **Initiation of second stage of labor and cessation of first stage of labor occur when .....**
   a. The baby is delivered
   b. The cervix is completely dilated.
   c. After the delivery of placenta
   d. After clamping and cutting the umbilical cord

541. **Complete dilation of cervix to birth of a baby is staged as:** *(ESIC 2019)*
   a. Stage 1 of labor
   b. Stage 2 of labor.
   c. Stage 3 of labor
   d. Stage 4 of labor.

Explanation:
- **Stage 1:** onset of true labor pain to full cervical dilation (9 to 10 cm)
- **Stage 2:** Complete dilation (9 to 10 cm) of cervix to birth of a baby
- **Stage 3:** birth of baby till delivery of placenta
- **Stage 4:** after placental expulsion till 4 hours

542. **A 31 year old multipara is admitted to the birthing room after initial examination reveals her cervix to be at 8 cm, completely effaced (100%), and at 0 station. What phase of labor is she in?**
   a. Active phase
   b. Expulsive phase
   c. Latent phase
   d. Transitional phase

Explanation: Transitional phase starts from 8 cm dilatation of the cervix and it is the starting of the second stage of labor.

543. **Relationship of the long axis of the fetus to the long axis of the centralized uterus or maternal spine is known as .....**
   a. Lie
   b. Attitude
   c. Denominator
   d. Position

Explanation: Option A is the correct answer. Attitude is relationship of one part of the body to others. Denominator is bony fixed point on presenting part. Position is the relationship of the denominator to different quadrants of pelvis.

544. **Neuromuscular harmony is described in terms of .....**
   a. Attitude
   b. Contraction
   c. Polarity
   d. Flexion

545. **A primi mother is on first stage of labor and she will be allowed to take only .....**
   a. Liquid diet
   b. Solid diet
   c. Semi solid diet
   d. NPO

546. **In a primi mother duration of second stage of labor is .....**
   a. 15 to 30 minutes
   b. 30 to 60 minutes
   c. 1 hour to 2 hours
   d. 2 hours to 3.5 hours

547. **Partograph is also known as .....**
   a. Cervicograph
   b. Uterograph
   c. Ovariograph
   d. Vaginograph

548. **Characteristic of monozygotic pregnancy is .....**
   a. One placenta
   b. Sex will be always identical
   c. Genetic features will be also same
   d. All of the above

549. **The classical method used in bringing down an arm in breech presentation is called:** *(AIIMS Bhopal Grade-I 2018)*
   a. Retgen's maneuver
   b. Lovset's maneuver
   c. Crede's maneuver
   d. Pinard's maneuver

Explanation: During breech delivery there may be problem arise due to the obstructed shoulders. This can occur when arms are raised as the shoulders pass through the mother's pelvis. So, Lovset's maneuver is used for lowering the arm so that the shoulders can descend. Pinard's maneuver is used for breech with extended leg.

550. **The primary purpose of administering magnesium sulfate intravenously for a patient who has premature rupture of membrane and has contraction in every 10 minutes is to:** *(AIIMS Bhopal Grade-I 2018)*
   a. Provide sedation
   b. Maintain blood pressure
   c. Inhibit contraction
   d. Improve fetal lung function

Explanation: Magnesium sulfate acts as a tocolytic agent which are used to stop uterine contractions. Tocolytics have no effect on placental perfusion or fetal pulmonary system

Ans.

532.	a
533.	d
534.	c
535.	d
536.	d
537.	a
538.	d
539.	a
540.	b
541.	b
542.	d
543.	a
544.	c
545.	a
546.	c
547.	a
548.	d
549.	b
550.	c

Scanned with CamScanner

551. The contraindications of Induction of Labor includes the following, EXCEPT: *(AIIMS Raipur Grade II 2017)*
a. Placenta Praevia
b. Fetal Macrosomia
c. Cord presentation
d. Cephalopelvic disproportion

Explanation: The contraindications include vasa previa, Placenta previa, myomectomy with entry into uterine cavity, previous classical hysterotomy, active genital herpes outbreak, umbilical cord prolapse, or transverse fetal lie.

552. Station of the head is expressed in relation to .....
a. Ischial spine
b. Pelvic brim
c. Cervix
d. Pelvic inlet

Explanation: Station of the head is expressed in terms of ischial spine. At the level of ischial spine, it is termed as 0 station, above which it is indicated in terms of negative numbers such as -1, -2, -3, -4 and -5nd below which are positive numbers such as 1, 2, 3, 4 and 5.

553. Failure to deliver the head even after correct and judicious application of forceps raise the suspicion on: *(AIIMS Raipur Grade II 2017)*
a. Cervical dystocia
b. Spastic lower segment
c. Constricting ring
d. Inco-ordinate uterine action

Explanation: Cervical dystocia is an abnormal labor as a result of ineffectual dilatation which is caused by inadequate uterine activity, trauma, idiopathic and following surgical procedures. Construction ring is a persistent localised annular spasm of the circular uterine muscles which occurs at any part of the uterus but usually at junction of the upper and lower uterine segments.

554. The indication of forceps delivery is: *(RAK MSc 2018)*
a. Delay in first stage due to hypotonic uterine contraction
b. Delay in first stage due to hypertonic uterine contraction
c. Delay in second stage due hypotonic uterine contraction
d. Delay in second stage due hypertonic uterine contraction

Explanation: Objective of forceps application is to cut short second stage of labor; it is also applicable when expulsive efforts are inadequate (hypotonic uterus).

555. What will be the attitude of head during face and brow presentation? *(AIIMS Raipur staff nurse grade I-2018)*
a. Flexion
b. Complete extension
c. Adduction
d. Abduction

Explanation: Complete extension is the attitude of head in brow presentation. In vertex presentation attitude will be flexion.

556. In the second stage of labor which of the following injections is given to improve uterine contractions? *(DSSB 2013)*
a. Prostaglandin
b. Oxytocin
c. Phenergan
d. Diazepam

Explanation: Oxytocin is a hormone secreted by posterior lobe of the pituitary and is necessary for uterine contraction. It also helps in milk ejection. So oxytocin reflex is also known as milk ejection reflex.

557. Color of amniotic fluid in post term pregnancy is .....
a. Colorless
b. Golden
c. Saffron
d. Brown

Explanation: Color of Amniotic fluid
- **Saffron colored:** post maturity.
- **Green colored:** meconium.
- **Golden colored:** Rh isoimmunisation.
- **Red colored:** abruption.
- **Tobacco juice:** Intrauterine death (IUD)
- **White with flakes:** Normal

558. Which one of the following leads to greenish discoloration of the amniotic fluid? *(DSSSB 2013)*
a. Lanugo
b. Hydramnios
c. Vernix
d. Meconium

Explanation: Greenish colored amniotic fluid indicates meconium stained amniotic fluid. It indicates chances of respiratory distress in newborn.

559. A patient in the second stage of labor is given which of the following injections to improve uterine contractions? *(DSSSB 2013)*
a. Oxytocin
b. Methergin
c. Phenergan
d. Diazepam

Explanation: Oxytocin will improve the uterine contraction, so it is the drug of choice to improve the uterine contraction.

560. The indication of forceps delivery is:
a. Delay in first stage due to hypotonic uterine contraction
b. Delay in first stage due to hypertonic uterine contraction
c. Delay in second stage due to hypotonic uterine contraction
d. Delay in second stage due to hypertonic uterine contraction

Explanation: The total duration of second stage for Primigravida mother is 2 hrs and 30 mins for mutigravida. If labor isn't progressing it indicates for emergency management.

561. Following are the methods of induction of labor except:
a. Artificial rupture of membrane
b. Methergin
c. Oxytocin
d. Prostaglandin

Explanation: Methergin directly acts on the myometrium. It excites uterine contraction which comes so frequent one after the other with increasing intensity that the uterus passes into the state of spasm without relaxation in between.

562. Major complication in third stage of labor is: *(RAK MSc 2018)*
a. Perineal injuries
b. PPH
c. Subinvolution
d. Uterine rupture

Explanation: Any type of bleeding (more than 500 mL) from birth canal after the birth of baby is called post-partum hemorrhage (PPH). It is most common complication in third stage of labor.

Ans.
551. b
552. a
553. c
554. c
555. b
556. b
557. c
558. d
559. a
560. c
561. b
562. b

Scanned with CamScanner

563. Ergometrine is useful for .....
a. Eclampsia
b. Pre-eclampsia
c. Postpartum hemorrhage
d. Twin delivery

Explanation: Ergometrine helpful in controlling PPH. It is given after the delivery of anterior shoulder. In twin delivery after the birth of first baby we are not supposed to give this drug.

564. Which of the following positions should the nurse place the client when the epidural regional block is administered? *(DSSSB 2002)*
a. Lithotomy
b. Supine
c. Prone
d. Lateral

Explanation: Client should be placed in lateral position or sitting up position.

565. Criteria for normal labor .....
a. Spontaneous in onset
b. Vertex presentation
c. Without undue prolongation
d. All of the above

Explanation: All the above are the criteria for normal labor. Other than these natural termination with minimum aid, without affecting the health of mother and baby is also the criteria for normal labor.

566. A client is in active labor with twins and the cervix is 5 cm dilated. The nurse observes that contractions occurring every 7 to 8 minutes in a 30 minute period. The most appropriate action by the nurse would be to
a. Administer oxygen at 4 liters by mask
b. Note the fetal heart rate patterns
c. Notify the physician immediately
d. Instruct the client to relax during the contractions

Explanation: The client is most likely experiencing hypotonic uterine contractions. The nurse must notify the physician immediately. The usual treatment is oxytocin administration unless cephalopelvic disproportion exists.

567. All among the following are principal movements occur during labor EXCEPT
a. Engagement
b. Retraction
c. Crowning
d. Restitution

Explanation: Option B retraction is not a principal movement that occurs during labor. Retraction is occurs in uterine muscle fibers which means these muscles are shortened permanently. The principal movements occurring during labor are engagement, descent, flexion, internal rotation, crowning, extension, restitution, external rotation and expulsion of trunk.

568. When the membrane gets ruptured before the onset of labor is called as.....
a. Early rupture
b. Premature rupture
c. Adequate rupture
d. Artificial rupture

Explanation: Option B is the correct answer, option A indicates rupture of membrane after the onset of labor and before full dilation of cervix.

569. Fifth formula is used for assessing .....
a. Uterine contraction
b. Progressive descend of the head
c. Fetal well being
d. Labor pain

Explanation: Descent of the head is measured by abdominal palpation and expressed in terms of fifths above the pelvic brim. It is found to be a more reliable way of gauging descent than vaginal examination where large caput formation often leads the inexperienced to confuse scalp descent with skull descent.

570. Delayed cord clamping is contraindicated in .....
a. Baby born to anemic mother
b. Baby with birthweight more than 3 kg
c. Rh-incompatibility
d. Preterm baby

Explanation: Rh-incompatibility is the contraindication for delayed cord clamping in order to prevent antibody transfer from mother to fetus.

571. Complication of tocolytic agent is.....
a. Uterine rupture
b. Hyperstimulation of uterus
c. Increased peristaltic movement
d. Pulmonary edema

Explanation: Pulmonary edema is the most common adverse effect associated with tocolytic agents.

572. Find out the absolute indication for elective cesarian section?
a. Uncorrectable abnormal lie
b. Placenta previa
c. Previous vertical caesarean section
d. All of the above

Explanation: Absolute indications for Caesarian section (it should be done even in the presence of dead fetus) include
- Previous class C.S. or CS extending to upper segment
- Two or more previous LSCS
- Previous LSCS with malpresentations
- Previous repair of vesicovaginal fistula
- Extreme degree of contracted pelvis
- Placenta previa centralis
- Uncorrectable abnormal lie

573. Which of the following stages of labor would the nurse assess "crowning"? *(DSSSB)*
a. First stage
b. Second stage
c. Third stage
d. Fourth stage

Explanation: Birth crowning, which is when baby's head starts to emerge bit by bit during each contraction, occurs during the second stage of labor

574. Cardinal movement occur before expulsion is? *(AIIMS 2008)*
a. Engagement
b. Crowning
c. Internal rotation
d. External rotation

Explanation: External rotation is the cardinal movement which occurs just before the expulsion.

Ans.

563.	c
564.	d
565.	d
566.	c
567.	b
568.	b
569.	b
570.	c
571.	d
572.	d
573.	b
574.	d

Scanned with CamScanner

575. **Continued bleeding may result to fetal distress. The nurse knows that the fetus is being compromised when she observed or notes which of the following:**
a. Fetal bradycardia b. Fetal tachycardia
c. Fetal thrashing d. All of the above

Explanation: These are the signs that a baby is unwell, or is not coping well with the demands of labor. Increase or decrease in the fetal heart rate is considered as distress.

576. **For a patient in active labor, the nurse midwife plans to use an internal electronic fetal monitoring (EFM) device. What must occur before the internal EFM can be applied?**
a. The cervix must be dilated fully
b. The fetus must be at 0 station
c. The membranes must rupture
d. The patient must receive anesthesia

Explanation: The membranes must rupture to decrease perinatal mortality and its complication.

577. **During delivery the risk of transmission of maternal infection to the fetus is highest in----**
a. Rubella
b. Cytomagalo virus
c. Herpes simplex virus
d. Human papillomavirus

578. **Modes of induction of mid trimester abortion EXCEPT-------**
a. Intra amniotic saline infusion
b. Intra amniotic prostaglandin infusion
c. Menstrual regulation
d. Hysterotomy

579. **The normal rate of dilation of cervix in a normal labor of primigravida women in latent/active phase is:**
a. 0.5-0.9 cm/hr b. 1.0-1.2 cm/hr
c. 1.2-1.5 cm/hr d. 1.5-2.0 cm/hr

580. **Correct statement regarding the onset of labor is .....**
a. Uterine distension and cervical dilation
b. Accelerated production of estrogen
c. Increased oxytocin and prostaglandin production
d. All of the above

581. **The process which reduces surface area at the placental site and helpful in separation of placenta is known as**
a. Constriction b. Contraction
c. Detachment d. Retraction

582. **Previous history of lower segment cesarean section is a significant antenatal history as it can lead to**
a. Abortion b. Antepartum haemorrhage
c. Incompetent cervix d. Uterine rupture

583. **Partograph was first devised by** *(RPSC NG-II, 2007)*
a. Friedman b. AL Mudaliar
c. William show d. Shirodkar

Explanation: The partograph was designed by **Friedman in 1954** and further **improved by Philpot and Castle** who introduced the alert and actions lines to facilitate interventions during labor.

584. **True labor can be differentiated from false labor in that labor contractions will**
a. Occur immediately after membrane rupture
b. Bring about progressive cervical dilation
c. Be less uncomfortable if client is in side-lying position
d. Stop when the client is encouraged to walk around

585. **Uterine contractions are less during the labor, it is termed as .....**
a. Hypotonia b. Polysytole
c. Hypertonia d. Oligosystole

586. **Series of single uterine contractions lasting 2 minutes or more OR a contraction frequency of five or more in 10 minutes is known as**
a. Hypotonia b. Polysytole
c. Hypertonia d. Oligosystole

587. **Morphine given to the mother during the process of delivery cause .....in newborn**
a. Respiratory depression
b. Hypoxic ischemia
c. Intestinal obstruction
d. Coagulopathy

588. **The realignment of fetal head with the body after the head comes out:** *(DSSSB PHN, 2015)*
a. Expulsion b. Descent
c. Engagement d. Restitution

589. **Premature separation of the placenta from the uterine wall before delivery is:** *(DSSSB PHN, 2015)*
a. Abruptio placenta b. Placenta previa
c. Fetal distress d. Cord prolapse

590. **During the delivery, the perineal tear extends through the sphincter of the rectum but the rectal mucosa is intact. How would you classify this type of perineal tear?** *(Banaras HU 2015)*
a. First-degree b. Second-degree
c. Third-degree d. Fourth-degree

591. **Compared to the use of the vacuum extractor, forceps delivery is associated with increased risk of:** *(Banaras HU 2015)*
a. Minor facial injuries b. Cephalohematoma
c. Retinal haemorrhage d. Intracranial haemorrhage

592. **An incision made into perineum to enlarge the vagina during delivery is:** *(DSSSB PHN, 2015)*
a. Amniotomy b. Episiotomy
c. Cesarean d. Forceps delivery

593. **A woman had a midline episiotomy performed at delivery. The primary purpose of the episiotomy is to:** *(LNJP H D 2012)*
a. Enlarge the vaginal opening
b. Allow forceps to be applied
c. Eliminate the need for caesarean birth
d. Eliminate the possibility of lacerations

594. **Most common incision in episiotomy is:** *(AIIMS BBS NO 2018)*
a. Lateral b. Medial
c. J-shaped d. Mediolateral

Explanation: Most common incision in episiotomy is mediolateral. Researches show that mediolateral episiotomy causes less perineal tear as compared to other types of episiotomy hence it is commonly practised

595. **Labor starts with pain and ends with the delivery of:** *(RRB Feb 2012)*
a. Umbilical cord b. Fetus
c. Placenta d. None

596. **The maximum amount of blood lost during delivery is .....ml.** *(RRB Feb 2012)*
a. 250 ml b. 100 ml
c. 500 ml d. 300 ml

Ans.

575. d

596. c

Scanned with CamScanner

597. The alternate term of normal labor is: *(RRB Feb 2012)*
a. Procidentia b. Eutocia
c. Dystocia d. None

598. In the second stage of labor, the important factor determine the expulsion of the fetus from birth canal is----------
a. Maternal bearing down
b. Cervical dilatation
c. Uterine contractions
d. Adequate pelvic size

599. It is a manipulative procedure designed to change the lie or to bring the comparatively favorable pole to the lower pole of the uterus----------
a. Destructive operations b. Evisceration
c. Ventouse d. Version

600. In classical caesarean section more chances of rupture of uterus occur in ----------
a. Upper uterine segment
b. Lower uterine segment
c. Utero cervical junction
d. Posterior uterine segment

601. Most important cause of mortality in obstetrical anaesthesia is --------
a. Aspiration of vomitus b. Shock
c. Cardiac arrest d. Hypoglycemia

602. The most unfavorable presentation for vaginal delivery is---------
a. Vertex b. Breech
c. Face d. Brow

603. Most common presentation of fetus with anencephaly is-----
a. Breech b. Face
c. Brow d. Shoulder

604. The commonest presenting part in cephalic presentation is:
a. Vertex b. Foot
c. Buttocks d. Face

Explanation: The commonest presenting part is vertex in cephalic presentation. It can be face or brow but they are not common.

605. The management option for primi-mother with Right Occipito Posterior position in second stage of labor is -----
a. Immediate caesarian section
b. Forceps application
c. Watchful expectancy
d. Breech extraction

606. In vasa previa bleeding is likely to occur from----------
a. Foetal blood vessels b. Placental site
c. Maternal blood vessels d. Marginal sinus

607. Dangers to the baby from forceps applications are the following EXCEPT----------
a. Intra cranial haemorrhage
b. Fracture of the skull bones
c. Brachial palsy
d. Facial palsy

608. Mauriceau–Smellie–Veit grip is used to deliver----------
a. The extended arms b. The extended legs
c. The extended head d. None of the above

609. In which of the following conditions would it be indicated to deliver the baby by forceps----------
a. Heart disease
b. Contracted pelvis
c. Cervix fails to dilate completely
d. Presence of meconium stained fluid in vertex presentation

610. In persistent occipito posterior position the rotation of head is usually done by----------
a. Wrigley's forceps b. Kielland's forceps
c. Haig Ferguson's forceps d. Branes nevilli's forceps

611. The fetal head is born by the process of .....
a. Crowning b. Restitution
c. Extension d. Internal rotation

612. Most common complication associated with breech delivery is .....
a. Abruption placenta b. Prolapse cord
c. Placental retention d. Precipitate labor

613. In occipito posterior position the occiput is towards .....
a. Ischial spine b. Sacroiliac joint
c. Iliopectineal eminence d. Pubic symphysis

614. Characteristic of true labor pain is .....
a. Uterine contraction at regular interval
b. Formation of bag of water
c. Pain is not relived by enema and sedatives
d. All of the above

615. Characteristic of false pain includes .....
a. Dull in nature and in lower abdomen and groin
b. No hardening of uterus
c. Relieved by enema and sedatives
d. All of the above

616. Instrument of choice for clamping the umbilical cord is .....
a. Allis tissue forceps
b. Kocher's haemostatic forceps
c. Long straight hemostatic forceps
d. Multiple toothed vulsellum

617. In normal vaginal delivery expected blood loss is about .....
a. 100-200 ml b. 150-250 ml
c. 200-300ml d. 300-400ml

618. Methods used for induction of delivery include .....
a. Prostaglandin administration
b. Artificial rupture of membrane
c. Oxytocin administration
d. All of the above

619. External cephalic version is indicated in .....
a. Breech presentation b. Transverse lie
c. Both A and B d. None of the above

620. The frequent change of fetal lie and presentation in late pregnancy is known as:
a. Breech presentation b. Footling presentation
c. Transverse lie d. Unstable lie

621. What do you mean by second stage of labor?
a. Onset of labor pain to full dilation of cervix
b. Full dilation of cervix to expulsion of fetus
c. Expulsion of fetus to expulsion of placenta
d. Observation for at least 1 hour after the expulsion of placenta

622. The most common cause of ruptured uterus is:
a. Incorrect use of oxytocin
b. Stimulation of uterus
c. Twin pregnancy
d. Precipitate labor

623. The fetus is in the longitudinal lie with the buttocks or lower extremity entering the pelvis first. This presentation is known as:
a. Cephalic presentation b. Brow presentation
c. Breech presentation d. Sacral presentation

Ans.

618. d
619. c
620. d
621. b
622. a
623. c

Scanned with CamScanner

648. Which among the following is the major side effect of oxytocin? *(RAK MSc 2018)*
a. Diuresis
b. water retention
c. Hyper stimulation of uterus
d. Uterine atony

Explanation: Uterine hyperstimulation is most common side effect. There may be increased duration of uterine contractions or increased frequency (more than 6 contractions per 10 minutes).

649. A nurse should monitor intake and output during oxytocin administration, because the drug _____.? *(Daman & Diu NO 2018)*
a. Causes toxicity for kidneys
b. Causes water intoxication
c. Increases thirst
d. Induces diuretic effect

Explanation: Oxytocin, due to its ADH like action, causes water intoxication, particularly if given with excessive IV fluid.

650. Complications of oxytocin include.....
a. Uterine hyper stimulation
b. uterine rupture
c. Water intoxication
d. All of the above

651. Oxytocin is contraindicated in .....
a. Contracted pelvis
b. Preeclampsia
c. History of assisted deliveries
d. PPH

652. Complication of medications used for ovulation induction is .....
a. Increased congenital anomalies
b. Ovarian hyperstimulation
c. Endometrial cancer
d. Ectopic pregnancy

653. Drug of choice to treat infertility due to antisperm antibodies is .....
a. GnRH therapy
b. Clomiphene citrate
c. Doxycycline
d. Dexamethasone

654. Drug of choice to induce ovulation in an infertile female is .....
a. Clomiphene citrate
b. FSH
c. GnRH
d. All of the above

655. Luteal phase defect is treated with .....
a. Progesterone therapy
b. Oestrogen therapy
c. Testosterone therapy
d. FSH therapy

656. The steroid used in preterm labor helps in:
a. Prevention of jaundice in newborn
b. Prevention of PPH in mother
c. Reducing respiratory distress syndrome
d. Prevention of seizures

657. Purpose of tocolytic agent is .....
a. Enhance the preterm labor
b. To delay the preterm delivery
c. To ensure lung maturity in preterm delivery
d. Enhance the uterine contraction

658. Tocolytic agents are used to: *(RAK MSc 2018)*
a. Enhance the preterm labor
b. Suppress the preterm labor
c. Enhance the normal labor
d. Suppress the normal labor

Explanation: Tocolytic agents are drugs used to delay preterm labor in order to improve perinatal mortality.

659. Ergot derivatives include .....
a. Methergine
b. Syntometrine
c. Ergometrin
d. All of the above

660. PGE2 stands for.....
a. Dinoprostone
b. Oxytocin
c. Misoprostol
d. Methergine

661. PGE1 stands for.....
a. Dinoprostone
b. Oxytocin
c. Misoprostol
d. Methergine

POSTNATAL, PUERPERIUM AND LACTATION

662. The mother's placenta weighs 500 gram. Approximately how much would be the weight of the full term newborn?
a. 3 kg
b. 2 kg
c. 4 kg
d. 5 kg

663. The following are the causes of separation of a normally situated placenta, Except *(AIIMS Raipur Grade II 2017)*
a. Sudden uterine decompression
b. Defective decidua
c. Supine hypotension syndrome
d. Thrombophilias

664. According to WHO, when should the mother start breastfeeding to the infant? *(RAK MSc 2018)*
a. Within 30 minutes after birth
b. Within 18 hours after birth
c. After infant's condition stabilizes
d. Within a day after birth

Explanation: As per WHO criteria breastfeeding should be started soon after birth (within 30 minutes to 1 hour). It helps in thermoregulation of baby by skin to skin contact. Release of oxytocin during breastfeeding helps in control of uterine bleeding. Other options are distractors.

665. The advantages of breast feeding include the following EXCEPT: *(AIIMS Raipur Grade II 2017)*
a. Promotion of gastrointestinal function
b. Fostering immune defense
c. Nutritional imbalance
d. Economic advantage

Explanation: The advantages of breast feeding for mother and baby include stronger bones, long term protection, lower SIDS, calorie incinerator, cheap, less risk of cancer, etc.

Ans.

648.	c
649.	b
650.	d
651.	a
652.	b
653.	d
654.	d
655.	a
656.	c
657.	b
658.	b
659.	d
660.	a
661.	c
662.	a
663.	b
664.	a
665.	c

Scanned with CamScanner

666. Benefits of breast feeding include all EXCEPT: *(NCFL 2019)*
a. It provides nutrients
b. Colostrum provides a high level of immune protection
c. Less prone for gastrointestinal infection
d. It provides adequate iron for premature newborn

Explanation: Human milk contains little iron, so infants who are exclusively breastfed are at increased risk of iron deficiency after four months of age. The iron storage in preterm infant is less because Iron is mostly accumulated during the third trimester of gestation.

667. Which of the following measures would the nurse include in the teaching plan about the method to prevent breast engorgement in post-partum period? *(RAK MSc 2018)*
a. Breastfeeding neonate at frequent intervals
b. Decreasing fluid intake for the first 24 to 48 hours
c. Feeding the neonate, a maximum of 5 minutes per side on the first day
d. Wearing a supportive brassiere with nipple shields

Explanation: Breast engorgement is accumulation of milk in alveoli of breast. It indicates poor breastfeeding so a nurse will teach the client to breastfeed the neonate in frequent interval in correct position.

668. Several minutes after a vaginal delivery, nursing assessment reveals gush of blood from the client's vagina, umbilical cord lengthening, and a globular-shaped uterus. Nurse should suspect which condition?
a. Cervical or vaginal laceration
b. Placental separation
c. Postpartum hemorrhage
d. Uterine involution

Explanation: There is mainly 4 signs of placenta separation traditionally. The most reliable sign is the lengthening of the umbilical cord. The uterus takes on a more globular shape and becomes firmer. The uterus rises in the abdomen. The descent of the placenta into the lower segment, and finally into the vagina, displaces the uterus upward and gush of blood occurs.

669. All the following are signs of placental separation and descent, except: *(AIIMS BBS NO 2018)*
a. Lengthening of cord
b. Fundus becoming rounder
c. Small fresh blood loss
d. Shortening of cord

Explanation: Lengthening of umbilical cord is a sign of placental separation. Shortening (option d) of cord is just opposite to this statement. So, shortening of cord is the correct answer.

- **Strategy:** Option A and option D are exactly opposite to each other. So any one out of these two is most probably the answer.

670. In which part of the uterine tube does the fertilisation process occur?
a. Isthmus
b. Ampulla
c. Infundibulum
d. Intramural part

671. A postpartum patient was in labor for 32 hours and had ruptured membranes for 24 hours. Which of the following condition is expected in this client?
a. Endometriosis
b. Endometritis
c. Pelvic thrombophlebitis
d. Salpingitis

Explanation: Endometritis is an infection of the uterine lining and can occur after prolonged rupture of membranes. Caesarean section, prolonged rupture of membranes and long labor with multiple vaginal examinations are important risk factors of endometritis.

672. After the delivery insulin requirement of a diabetic mother will .....
a. Decrease significantly
b. Increase significantly
c. No alteration
d. Insulin can be withdrawn

Explanation: During the delivery process most of the glucose will be consumed as part of metabolism for energy production. Which significantly reduces the insulin requirement in post-partum period.

673. Endocrine control of lactation can be seen in
a. Lactogenesis
b. Galactokinesis
c. Galactopoiesis
d. All of the above

Explanation: Endocrine control of lactation can be seen in Lactogenesis, Galactokinesis, Galactopoiesis and mammogenesis. Mammogenesis means preparation of breast, lactogenesis means synthesis and secretion of milk, galactokinesis means ejection of milk and galactopoiesis means maintenance of lactation. All these are the endocrine control and preparation for lactation.

674. Which of the following lochial findings is expected during the first 24 hours post-delivery?
a. Absence of lochia
b. A greenish discharge with foul odor
c. Bright red color
d. Large clots with lochia

Explanation: Color of the lochia in the first 24 hours is bright red color. Absence of lochia or foul odor indicates infection. Lochia should never contain tissue fragments, membranes or large clots.

675. When performing a postpartum assessment on a patient, a nurse notes the presence of clots in the lochia. The nurse examines the clots and notes that they are larger than 1 cm. Which of the following nursing actions is most appropriate: *(Safdarjung NO 2018)*
a. Document the findings
b. Notify the physician
c. Reassess the client in 2 hours
d. Encourage increased oral intake of fluids

Explanation: The presence of blood clots larger than 1 cm is indicative of hemorrhage, which needs to be notified to the physician/gynecologist immediately.

676. Which of the following drug is administered when a postpartum client, who is receiving heparin for thrombophlebitis, develops complications related to heparin therapy?
a. Vitamin K
b. Calcium gluconate
c. Protamine sulfate
d. Aspirin

Explanation: Protamine sulfate is a heparin antagonist. It is administered intravenously to counter the bleeding complications precipitated by heparin overdose.

Ans.

666.	d
667.	a
668.	b
669.	d
670.	b
671.	b
672.	a

Scanned with CamScanner

678. Lochia secreted following delivery in 1-4 days is known as .....

a. Lochia rubra
b. Lochia serosa
c. Lochia alba
d. Leucorrhea

Explanation: Lochia is the vaginal discharge for the first fortnight during puerperium. Lochia rubra red in color (1-4 days) lochia serosa (5-9 days) yellowish, pink or pale brownish. Lochia alba pale white 10-15 days

679. Major galacokinetic hormone is .....

a. Oxytocin
b. Prolactin
c. Estrogen
d. Progesterone

Explanation: Oxytocin is the hormone which helps in milk ejection, so it is considered as major galactokinetic hormone.

680. Let down reflex is also known as .....

a. Milk secreting reflex
b. Milk ejection reflex
c. Rooting reflex
d. Sucking reflex

Explanation: Let down reflex or milk ejecting reflex is produced by oxytocin hormone. It helps in the milk ejection from breast tissue.

681. Lochia is .....

a. Change in vital sign after delivery
b. Vaginal discharge after giving birth
c. Going back of the body to pre pregnant state
d. Decrease in pigmentation

Explanation: Lochia is the vaginal discharge after giving birth (puerperium) containing blood, mucus, and uterine tissue. Lochia discharge typically continues for 4 to 6 weeks after childbirth, which is known as the postpartum period.

682. Drug used to improve the milk production is .....

a. Metoclopromide
b. Sulpuride
c. Both A and B
d. Dopamine

Explanation: Metoclopromide 10 mg TDS will improve the milk production by increasing the prolactin level. Sulpiride, dopamine antagonist has also been found effective

683. On 3rd post-partum day Seema noticed some blood stained discharge from the vagina of her newborn female baby. The best response from the nurse is .....

a. Call the doctor immediately
b. Reassure the mother that it is a normal finding
c. Send blood sample of the newborn for coagulation studies
d. Assess the newborn for bleeding from other body parts

Explanation: It is a normal finding and is known as pseudo mensuration, it occurs because of the withdrawal of maternal hormones.

684. Which among the following is the potentially harmful side effect of epidural anesthesia?

a. Hypotension
b. Headache
c. Decreased urine output
d. Increased respiration

Ans.

677. d
678. a
679. a
680. b
681. b
682. c
683. b
684. a
685. a
686. c
687. b
688. a
689. c
690. b
691. b
692. c
693. a
694. d
695. a
696. b

Explanation: IgA provides immunological defence to the newborn and is present in breast milk.

686. Only immunoglobulin which can cross the placenta is .....

a. IgA
b. IgM
c. IgG
d. IgE

687. As per WHO breast feeding need to initiate with in ..... Min after delivery

a. 20 min
b. 30 min
c. 45 min
d. 60 min

Explanation: Breast feeding needs to initiate within 30 min following delivery.

688. Reversal of genital organ to its original state is called as.....

a. Involution
b. Sub involution
c. Retraction
d. Regression

Explanation: Involution refers to the shrinking or return of an organ to a former size.

689. The hind milk is rich in----------

a. Fat and vitamins
b. Vitamin and minerals
c. Fat and energy
d. Proteins and energy

690. The milk secreted, 2 weeks after delivery of the baby is known as----------

a. Colostrums
b. Mature milk
c. Transitional milk
d. Fore milk

691. Lactose present in a milk is a: *(Banaras HU 2015)*

a. Polysaccharide
b. Disaccharide
c. Heteropolysaccharide
d. Monosaccharide

692. Which one of the following is a major protein present in human milk? *(Banaras HU 2015)*

a. Lactalbumin
b. Lactoglobulin
c. Casein
d. Lactoferrin

693. The pituitary hormone that stimulates secretion of milk is *(JIPMER 2012; RRB Feb 2012)*

a. Prolactin
b. Oxytocin
c. Estrogen
d. Progesterone

694. Milk ejection occurs due to the hormone----------

a. Prolactin
b. Oestrogen
c. Vasopressin
d. Oxytocin

695. In a multiparous mother duration of third stage of labor .....

a. 10-15 minutes
b. 15-30 minutes
c. 30-45 minutes
d. 45-60 minutes

696. Separation begins at the center of the placenta and slides down the birth canal like a folded umbrella. This method of placental separation referred as----------

a. Duncan mechanism
b. Shultz mechanism
c. Brandt Andrews mechanism
d. Ritgen's maneuver

Scanned with CamScanner

Explanation: Venous stasis in the lower limbs is caused by increased vein distensibility and the gravid uterus acting as a mechanical impediment to venous return. Hypercoagulability, venous stasis and vascular damage are a triad of initiating factors for venous thrombosis. In addition, there are increased levels of most of the circulating clotting factors in preparation for placental separation.

698. The phase of ejection of milk is called:
a. Mammogenesis
b. Lactogenesis
c. Galactopoiesis
d. Galactokinesis

699. What do you mean by third stage of labor?
a. From onset of labor pain to full dilation of cervix
b. From full dilation of cervix to expulsion of fetus
c. From expulsion of fetus to expulsion of placenta
d. From observation for at least 1 hour after the expulsion of placenta

700. Mechanism behind placental separation is .....
a. Reduction in surface area at the placental site
b. More uterine contraction
c. Increases in the surface area at the placental site
d. All of the above

701. Blood and debris discharge from the uterus after delivery is termed: *(DSSSB PHN, 2015)*
a. Septic shock
b. Lochia
c. Pyuria
d. Hematuria

702. The failure of uterus to return to its normal size is: *(DSSSB PHN, 2015)*
a. Involution
b. Subinvolution
c. Protrusion
d. Retraction

703. Which of the following response is expected in a mother when the baby is sucking the breast? *(Banaras HU 2015)*
a. Increase of adrenaline
b. Increase of prolactin-inhibiting factor
c. Increase of hypothalamic dopamine
d. Increase of oxytocin

704. The practice of keeping mother and child together immediately after birth is known as: *(LNJP H D 2012)*
a. Rooming in
b. Bonding
c. Puerperium
d. Lying in

705. The most frequent causes of maternal death during child birth: *(RRB Feb 2012)*
a. Injection
b. Subinvolution
c. Hemorrhage
d. None

706. The most common cause of Post Partum Hemorrhage (PPH) is:
a. Vaginal lacerations
b. Hematological disorders
c. Bleeding disorders
d. Uterine atonicity

- PPH is defined as amount of blood loss in excess of 500 ml following birth of baby
- **The average blood loss in:**
  - Normal vaginal delivery: less than 500 mL
  - Cesarean section: 1000 mL
  - Cesarean hysterectomy: 1500 mL

708. Which of the following drug is most commonly used in the management of PPH
a. Prostaglandins
b. Oxytocin
c. Methergine
d. Estrogen

709. The process of milk synthesis and secretion from the breast alveoli is called ----------
a. Memmogenesis
b. Lactogenesis
c. Galactokinesis
d. Galactopoiesis

710. If the uterus becomes boggy after one hour of delivery, the initial response of the midwife would be to----------
a. Notify the physician
b. Check the blood pressure
c. Massage the uterus
d. Observe the amount of bleeding

711. Signs and symptoms of infection in post-partum period would include all the following EXCEPT--------
a. Foul smelling lochia
b. Rapid pulse
c. Generalized rash
d. Discomfort and tenderness of abdomen

712. What is the duration of puerperium?
a. 1 week
b. 6 weeks
c. 1 month
d. Less than 28 days

713. Puerperium starts with .....
a. Expulsion of fetus
b. Expulsion of placenta
c. Initiation of breast feeding
d. Onset of labor

714. The failure of uterus to return to its normal size is:
a. Involution
b. Subinvolution
c. Puerperium
d. Retraction

715. During involution of uterus, lower uterine segment revert back to the normal shape and size of the:
a. Cervix
b. Isthmus
c. Vagina
d. Internal os

716. Commonest cause of puerperal sepsis is .....
a. Endometriosis
b. Endometritis
c. Endoparametritis
d. All of the above

717. During postpartum stage, which of the following medicines can be used to suppress lactation?
a. Oxytocin
b. Levonorgestrel
c. Bromocriptine
d. Both B and C

718. Which of the following stage of labor is called observational stage?
a. Ist stage
b. IInd stage
c. IIIrd stage
d. IVth stage

Ans.

714.	b
715.	b
716.	b
717.	c
718.	d

Scanned with CamScanner

c. Fatigue and exhaustion
d. All of the above

722. Breast engorgement occurs due to .....
a. Poor sucking by the baby
b. Over production of breast milk
c. Accumulation in milk ducts
d. All of the above

723. Management of atonic uterus include .....
a. Massage the uterus
b. Methergine
c. Oxytocin infusion
d. All of the above

724. Lochia is retained, this condition is termed .....
a. Lochia rubra
b. Lochia Metra
c. Lochia serosa
d. Lochia alba

725. MMR is .....
a. Maternal death per 1,00,000 live birth
b. Maternal death per 10 thousand live birth
c. Maternal death per 1000 live birth
d. Maternal death per 100 live birth

726. The falling down of an organ from its normal anatomical position is termed as
a. Protrusion
b. Regurgitation
c. Procidentia
d. Hernia

727. The placenta is said to be retained when it is NOT expelled out within
a. 15 min
b. 30 min
c. 45 min
d. 60 min

728. Causes of post partum hemorrhage include *(RAK MSc 2018)*
a. Atonic uterus
b. Trauma
c. Blood coagulopathy
d. All of the above

Explanation: Atonicity of uterus is most common cause (80%) of post-partum hemorrhage. At the time of placental separation torn sinuses cannot be effectively compressed by imperfect contraction and retraction of uterine musculature. Other causes are rare (20%), that is traumatic cause, retained tissues and blood coagulopathy.

729. The commonest cause of PPH is .....
a. Atonic uterus
b. Traumatic
c. Retained placenta
d. Blood coagulopathy

Ans.

mechanism behind lactation.
a. Increased prolactin level → inhibits ovarian response to FSH → less follicular growth → hypo estrogen state → No menstrual cycle
b. Increased prolactin level → suppress the release of LH → No LH surge → Anovulation
c. All of the above
d. None of the above

736. Most common cause of MMR is .....
a. Eclampsia
b. Infections
c. Preterm labor
d. Hemorrhage

737. Major complication in third stage of labor is .....
a. Atonic uterus
b. Retained placenta
c. PPH
d. Perineal tear

738. When the normal delivery breastfeeding needs to be initiated .....
a. Soon after delivery
b. 15 minutes after delivery
c. 30 minutes after delivery
d. 1 hours after delivery

739. Which among the following parameter needs to be monitored by the nurse following delivery in a woman with stable vital signs?
a. Intake and output
b. Pain level
c. Determine characteristics of lochia
d. Abdominal girth

740. A primiparous women on the third day after delivery complains of after pains. Which of the following intervention by the nurse would relieve the pain?
a. Massaging the back
b. Massaging the uterus and expulsion of clots
c. Ensuring the client performs Kegels exercise
d. Applying hot water bag on abdomen

741. The incidence of previous cesarean scar rupture is .....
a. 0.5%
b. 0.5–1.0%
c. 1–2%
d. 2-3%

742. Which of the following is the most important nursing action when caring for a high risk post partum client
a. Psychological support
b. Promoting mother newborn contact
c. Postpartum exercises education
d. Discussing complication and treatment

Scanned with CamScanner

743. Mismanagement of third stage of labor may lead to
a. Hyperstimulation of uterus
b. Prolonged labor
c. Inversion of uterus
d. All of the above

744. Which among the following intervention will be helpful in preventing thrombophlebitis following delivery?
a. Elevate the foot end
b. Early frequent ambulation
c. Wear elastic stockings
d. ROM exercises

745. Which one of the following findings needs further evaluation and intervention during the first 24 hours of post-partum period?
a. Output exceeds the intake
b. Pulse below the baseline
c. Lochia with foul smell
d. Temperature is 38.6°C

746. The hormone responsible for synthesis of milk during the postnatal period is
a. Prolactin b. Oestrogen
c. Oxytocin d. Progesterone

747. Abdominal hysterectomy is the only intervention to remove retained placenta in
a. Type III Placenta previa
b. Type IV placenta previa
c. Placenta accreta
d. Uterine inertia

748. Hydatidiform mole is an abnormal condition affecting .....
a. Amnion b. Chorion
c. Villi d. Blastomere

749. Placenta attached to lower segment and only the lower margin encroaches into lower uterine segment is known as..
a. Low –lying b. Marginal
c. Incomplete d. Central

750. Placenta previa in which placenta reaches the margin of internal os and not covering it is known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

751. Placenta previa in which placenta partially cover the internal os is known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

752. Placenta previa in which placenta completely cover the internal os is known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

753. Type of placenta previa in which the placenta partially covers the os is
a. Type I b. Type II
c. Type III d. Type IV

754. Type 1 placenta also known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

755. Type 2 placenta also known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

756. Type 3 placenta also known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

757. Type 4 placenta also known as .....
a. Low –lying b. Marginal
c. Incomplete d. Central

758. The term abruptio placentae refers to
a. Premature delivery of placenta
b. Placenta covers the os partially or marginally
c. Premature separation of placenta after 28 weeks
d. Placenta having additional lobes

759. Drug of choice to enhance the third stage of labor is .....
a. Ergometrine b. Methergine
c. Oxytocin d. Prostaglandin

760. Organ subjected to drastic change and stress immediately following delivery is .....
a. Haematological
b. Pulmonary
c. Musculoskeletal
d. Gastrointestinal

761. Which one among the following indicates post-partum depression?
a. Suicidal thoughts
b. Desire to harm the infant
c. Feeling of worthlessness
d. All of the above

762. The most significant constituent of human breast milk by weight is:
a. Carbohydrate b. Water
c. Protein d. Fat

763. Breast milk contains all EXCEPT
a. Protein b. Immunoglobulin
c. Water d. Iron

764. Aerobic organism responsible for puerperal sepsis is
a. Bacteroides
b. Klebsiella
c. Clostridium welchii
d. Clostridium

765. Postpartum haemorrhage indicates loss of blood more than:
a. 100 ml b. 300 ml
c. 450 ml d. 500 ml

PLACENTA & CORD ABNORMALITIES

766. The abnormal condition in which the umbilicus is inserted through the membranes of placenta is known as:
(AIIMS Bhopal Grade-I 2018)
a. Succenturiate
b. Battledore
c. Marginal
d. Velamentous

Explanation: During pregnancy, normally the umbilical cord inserts into the middle of the placenta as it develops but in velamentous type, the umbilical cord inserts into the fetal membranes (choriamniotic membranes) then travels within the membrane to the placenta.

767. The placental abnormalities in which, the accessory lobe is developed from the activated villi on the chorionic laeve is:
(AIIMS Raipur Grade II 2017)
a. Placenta Succenturiata
b. Placenta Spuria
c. Placenta extrachorialis
d. Placenta marginata

Ans.

767.	a

Scanned with CamScanner

Explanation: Placenta succenturiata: One or more lobes of the placenta in the size of cotyledon may be placed at varying distance from main placenta margin. These cotyledons are connected to main placenta with small blood vessels. When a small piece of placenta is connected with the main placenta only by membrane without any blood vessel, it is called placenta spuria.

Placenta extrachorialis: Divided into two conditions

- **Circumvallate placenta:** Fetal surface is divided into central depressed zone surrounded by thickened white ring which is usually complete. Ring is situated at varying distance from margin of placenta. Ring is composed of double folded amnion and chorion.
- **Placenta marginata:** A thin fibrous ring is present at the margin of chorionic plate where the fetal vessels appear to terminate.
- **Placenta membraneous:** Placenta is large and thin and is developed not only from chorionic frondosum but also from chorion laeve. So the wall ovum is covered by placenta.

Ans.

768. c
769. d
770. a
771. c
772. d
773. b
774. a
775. c
776. a
777. b
778. a
779. a
780. d
781. b
782. d
783. b

769. Premature separation of a normally implanted placenta during the second half of pregnancy, usually with severe hemorrhage is known as: *(DSSSB 2013)*

a. Placenta previa
b. Ectopic pregnancy
c. Incompetent cervix
d. Abruptio placenta

Explanation: Abruptio placentae is defined as the premature separation of the placenta from the uterus. Patients with abruptioplacentae, also called placental abruption, typically present with bleeding, uterine contractions, and fetal distress.

770. In which condition, the umbilical cord is attached to the margins of placenta?

a. Battledore placenta
b. Circumvallate placenta
c. Placenta membranacea
d. Velamentous placenta

Explanation: The given definition refers to battledore placenta. In velamentous placenta, code is inserted into fetal membrane outside the placental margin.

771. What is the proportionate weight of the placenta to the baby at term?

a. 1:2
b. 1:4
c. 1:6
d. 1:8

772. Umbilical cord is attached to

a. Fetal surface of placenta
b. Maternal surface of placenta
c. Near to the center of the surface
d. Both A and C

Explanation: Umbilical cord is attached to fetal surface and is attached to center. It is about 40 cm in length usually vary from 30-100 cm.

773. Under USG guidance fetal blood sampling is performed in the .....

a. Umbilical artery
b. Umbilical vein
c. Placenta
d. Iliac vein

Explanation: Option A is the correct answer. Placenta extrachorialis is of two types (i) circumvallate placenta and (ii) placenta marginata. circumvallate placenta means due to smaller chorionic plate than the basal plate recurrent marginal hemorrhage will occur, and placenta marginata means thin fibrous ring present at the margin of the chorionic plate. Placenta membranecae means placenta is unduly thin and large. Battledore placenta is an abnormality of the cord in which cord is attached to the margin of the placenta.

775. What is velamentous placenta?

a. Fibrous ring present at the margin of placenta
b. Placenta is thin and large
c. Cord is attached to the membranes
d. Cord is attached to the margin of the placenta

Explanation: Option C is the correct answer. Option A is placenta marginata, option B is Placenta membranecae. Option D is battledore placenta

776. Acordia is .....

a. Absence of cord
b. Lengthy cord
c. Short cord
d. Twisted cord

Explanation: Option A is the correct answer, lengthy cord mean abnormal increase in the length of cord and it can be as long a 300 cm. Lengthy cord causes cord prolapse and cord entanglemen around the neck. Short cord means cord length less than 20 cm.

777. Morbidly adherent placenta is called as: *(Staff Nurse G II 201*

a. Battledore placenta
b. Placenta accreta
c. Placenta succenturiata
d. Placenta circumvallate

778. Gelatinous substance in the umbilical cord is known ....

a. Wharton's jelly
b. True knot
c. False knot
d. Vernix caseosa

779. Reason behind false knot in umbilical cord is .....

a. Accumulation of Wharton's jelly
b. Accumulation of amniotic fluid
c. Accumulation of blood
d. Dilation of umbilical blood vessels

780. Omphalitis is:

a. Abdominal sepsis
b. Placental sepsis
c. Peritoneal sepsis
d. Umbilical sepsis

781. At term approximate placental weight is .....

a. 300 gm
b. 500 gm
c. 700 gm
d. 900 gm

782. Fetal origin of placenta is .....

a. 1/5th
b. 2/5th
c. 3/5th
d. 4/5th

783. The umbilical cord is attached to the placental margin

a. Placenta succenturiata
b. Battledore placentae
c. Circumvallate placentae
d. Placenta accreta

Scanned with CamScanner

785. **Short cord is then if the length of the umbilical cord is less than .....**
a. 10 cm b. 20 cm
c. 30 cm d. 40 cm

786. **Complications of long umbilical cord include**
a. Cord prolapse
b. Cord entanglement
c. Fetal distress
d. All of the above

787. **Most commonly single umbilical artery is seen in .....**
a. Abruptio placenta b. Placenta previa
c. Multiple birth d. Battledore placentae

788. **Ratio between placental weight and fetal weight is .....**
a. 1 : 6 b. 1 : 5
c. 1 : 3 d. 1 : 2

789. **The umbilical vein carries .....**
a. Oxygenated blood b. Deoxygenated blood
c. Mixed blood d. All of the above

790. **Cord prolapse is .....**
a. When umbilical cord comes out of the vagina after delivery
b. Lengthy cord visible first in the USG
c. Cord lying behind the fetus
d. Umbilical cord comes out of the uterus with or before the presenting part of the fetus

HIGH RISK PREGNANCIES

791. **Two days after having a cesarean birth, a client complains of pain in the right leg. What should be the nurse's initial response?** *(AIIMS Raipur NO 2019)*
a. Apply warm soaks
b. Massage the affected area
c. Encourage ambulation and exercise
d. Maintain bed rest and notify the practitioner

Explanation: Temporary nerve irritation or injury can occur with anesthesia, which might cause leg pain after c-section. It is usually resolved within a few days after bed rest. Applying warm socks and massaging affected area is not recommended. Ambulation and post-natal exercise are encouraged as soon as possible but not an appropriate initial response to the complains of pain.

792. **Among the following, the event during pregnancy that requires immediate attention by the physician is:** *(AIIMS BPL NO 2018)*
a. Backache
b. Frequency of micturition
c. Dependent pedal edema
d. Bleeding per vagina

Explanation: Bleeding per vagina in early pregnancy can be sign of abortion, ectopic pregnancy or any other complications. Bleeding is not a usual sign of pregnancy. All other signs are expected during pregnancy.

Explanation: Pre-eclampsia with the onset of convulsions **(seizure)** is called eclampsia. Pre-eclampsia is characterized by high blood pressure **(SBP ≥ 140 or DBP ≥ 90), proteinuria, facial puffiness (mild facial edema),** rapid weight gain, epigastric and right abdominal pain, visual disturbances, headache, and change in reflexes.

BP greater than 160/110 mmHg on 2 occasions at least 4 hours apart is a feature of severe preeclampsia.

794. **The danger of convulsion in a woman with pre-eclampsia ends:** *(RAK MSc 2018)*
a. Soon after delivery b. 12 hrs. after delivery
c. 24 hrs. after delivery d. 48 hrs. after delivery

Explanation: The danger of convulsion in a woman with pre-eclampsia starts from the beginning of the labor and ends after 48 hours of the delivery. Patient is closely monitored for next 48 hours for convulsions

795. **Nurse caring a high-risk pregnant lady with heart diseases, must know which one of the following valvular lesions cause death during labor?** *(NCFL 2019)*
a. Aortic stenosis b. Aortic regurgitation
c. Mitral stenosis d. Mitral regurgitation

Explanation: The typical raise in volume and heart rate in pregnancy is not well tolerated in patients with more than mild mitral stenosis. Hence, Mitral stenosis is the valvular lesions cause death during labor.

Even a severe Aortic Mitral valve regurgitation is usually very well tolerated in pregnancy, unless there is no left ventricular failure. Patients with Aortic stenosis can tolerate pregnancy well with mild or moderate level of obstruction.

796. **Which of the following clinical presentation would a nurse expect while assessing a patient with abruption placenta?**
a. Rigid, board-like abdomen *(AIIMS Bhopal Grade-I 2018)*
b. Edema in legs
c. Excessive vaginal bleeding
d. Premature rupture of membranes

Explanation: Placental abruption is the premature separation of a normally located placenta from the uterine wall that occurs before delivery of the fetus characterized by excessive vaginal bleeding, uterine tenderness, rapid contractions, abdominal pain and fetal heart rate abnormalities.

797. **A client with abruptio placenta is at a risk for developing ...**
a. Thalassemia
b. Idiopathic thrombocytopenic purpura (ITP)
c. Disseminated intravascular coagulation (DIC)
d. All of the above

798. **Identify the danger sign in the antepartum period**
a. Vaginal bleeding b. Blurred vision
c. Leaking amniotic fluid d. All of the above

Explanation: All the above mentioned are danger signs in ante partum period, other than this rapid increase in weight and high BP are also danger signs

Scanned with CamScanner

799. During each prenatal checkup, weight, blood pressure and fundal height needs to be documented. What is the other parameter needs to be mentioned?

a. Determining the client's Rh factor
b. Evaluating the client for edema
c. Measuring the client's hemoglobin (Hb) level
d. Obtaining pelvic measurements

Explanation: Edema is an indication for preeclampsia during antenatal period

800. In which of the following condition liquor enters the maternal circulation causing sudden hypotension, hypoxia, dyspnea and often seizures?

a. Amniotic fluid embolism
b. Pulmonary embolism
c. Obstetrics shock
d. Uterine atony

801. Sodium and water retention occur during pregnancy because of.....

a. Increased ADH
b. Increased aldosterone
c. Increased estrogen and progesterone
d. All of the above

802. Which of the following prenatal laboratory test values would the nurse consider as significant?

a. Hemoglobin 12 mg/dl
b. Rubella titer 1:5
c. Blood pressure 120/80
d. Protein urea nil

Explanation: Normally rubella titer should be 1:8 or more, a value less than that need medical care.

803. During pregnancy leucorrhea will increase because of the influence of .....

a. Estrogen
b. Progesterone
c. Oxytocin
d. Prolactin

Explanation: Increased estrogen during pregnancy leads to hyperplasia of vaginal mucosa which in turn increases the secretions by the endocervical gland.

804. Which of the following is a drug of choice for a pregnant mother with chronic hypertension? *(AIIMS Bhopal Grade-I 2018)*

a. Methyldopa
b. Atenolol
c. Diazepam
d. Magnesium sulfate

Explanation: Methyldopa is drug of choice for pregnant mother with chronic hypertension because this drug does not alter the maternal cardiac output or blood flow to the uterus or kidneys, while other drugs like atenolol has been associated with intrauterine growth retardation. Magnesium sulfate used to treat women with pre-eclampsia. Diazepam is not an antihypertensive drug.

805. Which of these drugs is contraindicated in a mother in labor with hypertension? *(Daman & Diu NO 2018)*

a. Oxytocin
b. Prostaglandins
c. Magnesium sulphate
d. Methergine

Explanation: Methergine is a semisynthetic ergot alkaloid used for the prevention and control of postpartum hemorrhage. Methergine is contraindicated in high blood pressure and in pregnancy. So it is contraindicated in a mother in labor with hypertension.

806. The condition where the uterus turns inside out is known as: *(AIIMS Bhopal Grade-I 2018)*

a. Retroversion
b. Prolapse
c. Anteversion
d. Inversion

Explanation: Uterine inversion occurs when the placenta fails to detach from the uterus as it exits, pulls on the inside surface, and turns the organ inside out.

Uterine prolapse occurs when pelvic floor muscles and ligaments stretch and weaken, and no longer provide enough support for the uterus. As a result, the uterus slips down into or protrudes out of the vagina.

Anteversion of the uterus refers to the position of the uterus where the long axis of the uterus is bent forward on the long axis of the vagina, against the urinary bladder.

A retroverted uterus means the uterus is tilted backwards toward the rectum.

807. Which of the following is the reason for the development of hydramnios in a women with gestational diabetes? *(AIIMS Bhopal Grade-I 2018)*

a. Hyperplasia of blood vessels
b. Fetal diuresis
c. Absence of swallowing reflex in fetus
d. Increased transudation

Explanation: Hydramnios or polyhydramnios is a medical condition describing an excess of amniotic fluid in the amniotic sac. In most cases exact cause cannot be identified. Some of the maternal causes include cardiac problems, kidney problems and maternal diabetes mellitus. Gestational diabetes causes fetal hyperglycemia and resulting polyuria (Fetal diuresis).

808. The maternal observation following postpartum hemorrhage are: *(AIIMS Raipur Grade II 2017)*

a. Estimate the total volume of blood lost
b. Record pulse and temperature every 15 minutes
c. Monitor the central venous pressure
d. Administer IV fluids without interruption to combat the fluid loss

a. A, B, C
b. B, C, D
c. A, C, D
d. A, B, C, D

Explanation: For first hour following birth: Regular assessment of vital signs and uterine tone every 15 min. Assessments include estimation of blood loss, fundal height and tone , BP, and pulse

809. Which among the following can be seen in a partial mole? *(AIIMS Raipur Grade II 2017)*

a. Triploidy
b. Haploidy
c. Polyploidy
d. Diploidy

Explanation: Partial hydatidiformmole is type of gestational trophoblastic disease which is characterized by its focal distribution, slower transformation, the presence of an embryo or fetus, and a triploid karyotype. The signs and symptoms of partial hydatidiform mole include abdominal pain, cramps in lower abdomen and vaginal bleeding during pregnancy. The uterus is large for gestational age and fetal heart beat is usually absent

Scanned with CamScanner

Explanation: Nevirapine is the drug of choice to prevent transmission of HIV from mother to child. Nevirapine belongs to NNRTI group.

So all the above-mentioned drugs are contra indicated during pregnancy.

813. Absolute inability to conceive for one or more reason implies: *(AIIMS Bhopal Nursing Officer, 2018)*

a. Sterility
b. Fertility
c. Infertility
d. Impotence

Explanation: Infertility is the inability to conceive for one or more reason. Sterility means asepsis, free from microorganism. Fertility means potential for reproduction. Impotence means inability to sustain an erection sufficient for sexual intercourse.

814. Postpartum hemorrhage is loss of blood which is more than: *(DSSSB 2013)*

a. 800 mL
b. 100 mL
c. 500 mL
d. 900 mL

Explanation: Postpartum bleeding or postpartum hemorrhage (PPH) is often defined as the loss of more than 500 mL within the first 24 hours following childbirth.

815. Bleeding from or into the genital tract after the 28th week of pregnancy but before the birth of the baby is known as:

a. APH
b. IPH
c. IUD
d. PPH

Explanation: The 28 week is taken arbitrarily as the lower limit of fetal viability. The main causes are placental bleeding, unexplained and extra placental.

816. Most common site of ectopic pregnancy is:

a. Tubal
b. Ovarian
c. Abdominal
d. Cervical

Explanation: Ectopic pregnancy is a condition in which fertilized ovum is implanted outside the normal endometrial cavity. Most common site is fallopian tube (97%), in the tubal pregnancy ampulla is the most common part (55%), followed by isthmus (25%), infundibulum (18%), and interstitial (2%). Ovarian ectopic pregnancy is (0. 5%), abdominal is 1%.

819. Drug of choice for the management of eclampsis is .....

a. Sodium nitroprusside
b. Magnesium sulphate
c. Dopamine
d. Labetalol

Explanation: Magnesium sulphate is the drug of choice. It reduces the sensitivity to Ach. Its therapeutic level is 4-7 mEq/L

820. A client is on magnesium sulphate therapy for the repeated dose administration the nurse need to check .....

a. Urine output >30 mL/hr
b. Knee jerk reflex are present
c. Respiration is more than 12 bpm
d. All of the above

Explanation: For the subsequent dose administration the nurse needs to check all the above parameters. If these are not present then toxicity need to be suspected.

821. The first sign of excessive blood magnesium levels is

a. Development of cardiac arrhythmias
b. Disappearance of the knee-jerk reflex
c. Increase in respiratory rate
d. Disturbance in sensorium

822. A nurse needs to check the most important parameter if patient is on magnesium sulphate therapy: *(Safdarjung NO 2018)*

a. Urine output> 30mlfhr
b. Presence of knee jerk reflex
c. Respiration is > 12 per minute
d. Blood pressure < 140 /90 mm Hg

Explanation: Diminished/absence of deep tendon reflex is one of the earliest signs of magnesium toxicity. When a patient receives MgSO4 therapy, the nurse must assess Deep tendon reflexes (knee jerk reflex) frequently. Information from DTRs will help nurses develop judgment about titrating the administration and prevent magnesium toxicity.

823. Adolescent pregnant mother at risk for ..... complication during pregnancy

a. Iron deficiency anemia
b. Pre eclampsia
c. Eclampsia
d. Diabetic mellitus

Explanation: Most commonly observing complication among pregnant adolescent mother is iron deficiency anemia.

824. Garvida 2 mother with O negative blood whose husband's blood group is B positive comes to ANC clinic. Which among the following question is most appropriate for the nurse to ask?

a. How many ANC visit you had?
b. What is your LMP
c. Have you got Anti-D injection during last delivery?
d. What is the age of your first child

Explanation: This mother is at risk for developing Rh incompatibility, so question related to previous Rh injection during the last delivery is appropriate. Usually RhoGAMinjection needs to be given in the ANC period or 72 hours following the delivery.

825. "Snowstorm" pattern on ultrasound with no fetus or gestational sac is the characteristic of

a. Eclampsia
b. Placenta previa
c. Abruption placenta
d. Hydatidiform mole

Explanation: Above described ultrasound is the characteristic of hydatidiform mole. In this condition a rare mass or growth that forms inside the womb (uterus) at the beginning of a pregnancy. It is a type of gestational trophoblastic disease (GTD). The chorionic villi of a molar pregnancy resembles a snowstorm pattern on ultrasound. Bleeding with a hydatidiform mole is often dark brown and may occur erratically for weeks or months.

826. Nurse is caring for a patient who is experiencing eclamptic seizure at present. Which among the following is the priority nursing intervention? *(AIIMS 2016)*

a. Maintain patent airway
b. Administer MgSO4 I/M
c. Start IV fluid
d. Hold the patient tight

Explanation: priority nursing intervention is to maintain a patent airway. Once seizure is subsided then IV fluids and other medications will come into play.

827. Antidote of magnesium sulfate is .....

a. Calcium gluconate
b. Potassium chloride
c. Sodium nitroprusside
d. Verapamil

Explanation: Calcium gluconate is the anti-dote of magnesium sulfate. Client on magnesium sulphate therapy should be monitored for deep tendon reflexes are assessed hourly. Cardiac and renal function is monitored closely. The urine output should be maintained at 30 mL per hour because the medication is eliminated through the kidneys.

828. As per WHO post-partum hemorrhage is defined as blood loss more than ..... mL

a. 500
b. 1000
c. 1500
d. 2000

Explanation: Blood loss more than 500 mL is defined as PPH

829. Most common cause of PPH is .....

a. Atonic
b. Traumatic
c. Retained tissue
d. Blood coagulopathy

Explanation: All the above mentioned are the causes of PPH. But the most common cause is atonic uterus. In 80% of the cases the PPH occurs because of the uterine atony.

830. Following delivery nurse suspects atonic PPH in the client, which among the following is the priority nursing intervention?

a. Massage the uterus
b. Administer 10 unit of oxytocin
c. Administer ergometrin
d. Report to the doctor

Explanation: Although, administration of oxytocin helps to arrest PPH through uterine contraction, it is not considered to be a nursing intervention. The priority nursing intervention is to massage the uterus to induce letdown reflex.

831. All the below statements are correct regarding abruption placenta EXCEPT

a. Placenta is in upper segment of the uterus
b. Always revealed bleeding is there
c. Bleeding is dark red in color
d. Painful bleeding is present

Explanation: Option B is related to placenta previa. In abruption placenta bleeding can be revealed or concealed type.

832. As per WHO, anemia in pregnancy is diagnosed if the hemoglobin level is .....

a. Less than 10 gm/dl
b. Less than 11 gm/dl
c. Less than 12 gm/dl
d. Less than 13 gm/dl

Ref: https://www.who.int/vmnis/indicators/haemoglobin.pdf

Explanation: As per WHO, Anemia in pregnancy will be diagnosed if the hemoglobin level is less than 12 gm/dl in a non-pregnant woman. But during pregnancy hemodilution occurs, so hemoglobin less than 11 gm/dl is considered as anemia during pregnancy.

833. Maternity Nurse, must be aware that screening for diabetes mellitus in pregnancy is done at: *(NCFL 2019)*

a. 6 to 17 weeks
b. 18 to 23 weeks
c. 24 to 28 weeks
d. 29 to 32 weeks

Explanation: Guidelines of American Diabetes Association state that, formal Diabetes testing should be done be at 24-28 weeks of gestation. Standard Glucose Tolerance Test (GTT) is done after the overnight fasting (8-14 hours).

834. Hazard associated with gestational diabetes is .....

a. Polyhydroamniosis
b. Macrosomia
c. Birth trauma
d. All of the above

835. Which drug is used for the management of menorrhagia?

a. Tanexemic acid
b. Oral contraceptive pills
c. NSAID
d. All of the above

836. Vertical transmission of HIV is more commonly occurs during .....

a. Antenatal period
b. Intranatal period
c. Post natal period
d. Equal chance in all stage

Explanation: HIV is more commonly transmitted during intra natal period.

837. The single umbilical artery is most common in:

a. Oligohydramnios
b. Placenta praevia
c. Twins
d. All of the above

Explanation: Monochorionic monozygotic twins is the condition in which there will be single umbilical artery.

Scanned with CamScanner

838. In India, an HIV positive antenatal mother who is on ARV therapy approached the nurse to discuss regarding breastfeeding practices for her newborn after delivery. Which of the following response by the nurse is most appropriate?

a. Encourage exclusive breastfeeding
b. Encourage exclusive replacement feeding
c. Encourage mixed feeding
d. Encourage partial breastfeeding

Explanation: Exclusive breastfeeding is the recommended infant feeding choice for the first 6 months, irrespective of whether mother or infant is provided with ARV drugs for the duration of breastfeeding. Mixed feeding should not be practiced. Only in situations where breastfeeding cannot be done or on individual parents' informed decision, replacement feeding may be considered.

839. Bleeding due to the premature separation of a normally situated placenta is called: *(Kerala PSC, Nov 2014)*

a. Placenta previa b. Incidental haemorrhage
c. Post partum haemorrhage d. Abruptio placentae

840. Which out of the following is not a feature of preeclampsia? *(Staff Nurse G II 2014)*

a. Fits b. Oedema
c. Hypertension d. Proteinuria

841. Hypertensive disorders of pregnancy is: *(RRB Feb 2012)*

a. Stage II HTN b. Prehypertension
c. Eclampsia d. None

842. HIV transmission from mother to fetus occurs most commonly during

a. First trimester b. Second trimester
c. Third trimester d. Delivery

843. Abruptio placenta occurs in all EXCEPT----------

a. Smokers
b. Pregnancy Induced Hypertension
c. Gestational Diabetes Mellitus
d. Folic acid deficiency

844. Eclampsia is mostly seen at----------

a. Antepartum period b. Intrapartum period
c. Postpartum period d. During parturition

845. Death of mother in abruption placenta occurs due to--------

a. Infection b. Toxemia
c. Hemorrahage d. Thrombophlebitis

846. Treatment of hydatidiform mole in a 40-years old woman is--------

a. Hysterotomy b. Hysterectomy
c. Suction evacuation d. Dilatation and Curettage

847. Pathognomonic features of abdominal pregnancy is--------

a. Fetus appears lateral to lumbar spine on X ray
b. Small uterus
c. Fetus easily palpable d. Positive pregnancy test

848. In tubal pregnancy, the tube may rupture causing----------

a. Sudden knife-like abdominal pain in lower quadrant
b. Painless vaginal bleeding
c. Continuous dull pain in lower abdomen
d. Intermittent abdominal contractions

849. Which of the following condition may lead to hypoglycaemia in pregnant women with diabetes?

a. Wait gain b. Hyperemesis
c. Albuminuria d. All of the above

850. A primipara, aged 40 years is hospitalized for severe pregnancy induced hypertension. What can be the first nursing action as the patient got admitted?

a. Start IV for oxytocin administration
b. Record baseline vital signs
c. Administer antihypertensive drugs
d. Collect blood

851. Which of the following hemoglobin value denotes anaemia in a pregnant woman?

a. Hb 10 g/dl b. Hb 11 g/dl
c. Hb 12 g/dl d. Hb 13 g/dl

Explanation: Indian Council of Medical Research considers haemoglobin (Hb) level below 10.9 g/dl as cutoff point for anemia during pregnancy.

852. TORCH indicate.....

a. Toxoplasma, rubella, candida and herpes simplex
b. Toxoplasma, rubella, cytomegalovirus and herpes simplex
c. Tetanus, rubella, cytomegalovirus and herpes simplex
d. Tetanus , rabies, CMV, and herpes simplex

853. The painful vaginal bleeding during the last trimester is caused by

a. Abruptio placenta b. Frequent intercourse
c. Placenta previa d. Over distension of uterus

854. Bleeding from or into the genital tract after 24 week of pregnancy but before the child birth is known as .....

a. Antepartum hemorrhage b. Intrapartum hemorrhage
c. Postpartum hemorrhage d. Missed abortion

855. A woman is 37 weeks pregnant and she is bleeding profusely with no pain is suggestive of: *(Safdarjung NO 2018)*

a. Antepartum hemorrhage b. Unavoidable hemorrhage
c. Accidental hemorrhage d. Concealed hemorrhage

Explanation: Woman is 37 weeks pregnant and she is bleeding profusely without pain, it is suggestive of antepartum hemorrhage (APH). Bleeding from or into the genital tract after 24 week of pregnancy but before the child birth is known as antepartum hemorrhage.

856. All of the following drugs can be used in management of Post Partum Hemorrhage EXCEPT

a. Mifepristone b. Misoprostol
c. Syntocinon d. Syntometrine

Explanation: Misoprostol, syntocinon and syntometrine are used for the management of Post Partum Hemorrhage (PPH). Mifepristone in combination with misoprostol is used for Medical Termination of Pregnancy in first trimester of pregnancy. However, Mifepristone is not used for the management of PPH

857. The drug administered to reduce the vertical transmission of HIV from mother to fetus is

a. Zidovudine b. Lamivudine
c. Indinavir d. Nevirapine

858. The most common characteristic manifestation of uterine rupture during labor is

a. Fetal bradycardia
b. Contractions that become stronger and intense
c. Hypertension
d. None of the above

859. Trial labor is contraindicated in all EXCEPT--------

a. Minor CPD b. Major CPD
c. Elderly primi d. Bad obstetrical history

860. Labor is termed as precipitate if total labor process completes within----------

a. 1 hour b. 2 hours
c. 4 hours d. 5 hours

Scanned with CamScanner

861. A women is in labor present with transverse lie, cervix 4 cm dilated, membrane is intact, fetal bradycardia, the treatment of choice is----------
a. External cephalic version
b. Internal podalic version
c. Caeserian section
d. Expectant management

862. Obstructed labor seen in all EXCEPT--------
a. Fetal ascites
b. Congenital equinovarus of fetus
c. Contracted pelvis
d. Inter-hydrocephalus of fetus

863. Combined duration of first stage and second stage of labor is more than the arbitrary time limit of 18 hours is known as ...
a. Obstructed labor
b. Precipitate labor
c. Prolonged labor
d. Premature labor

864. Progressive descent of the presenting part is arrested due to mechanical obstruction despite of good uterine contraction is known as .....
a. Obstructed labor
b. Precipitate labor
c. Prolonged labor
d. Premature labor

865. Conjoined twins united in or near the thoracic region is termed as:
a. Thoracopagus
b. Pyopagus
c. Craniopagus
d. Ischiopagus

866. Conjoined twins united in or near the posterior region is termed as:
a. Thoracopagus
b. Pyopagus
c. Craniopagus
d. Ischiopagus

867. Conjoined twins united in or near the cephalic region is termed as:
a. Thoracopagus
b. Pyopagus
c. Craniopagus
d. Ischiopagus

868. Conjoined twins united in or near the caudal region is termed as:
a. Thoracopagus
b. Pyopagus
c. Craniopagus
d. Ischiopagus

869. Causes of prolonged labor include .....
a. Uterine inertia
b. Cervical dystonia in fetus
c. Malposition
d. All of the above

870. Bed rest is essential in preeclampsia since it *(RPSC NSg. Tutor 2009)*
a. Prevents eclampsia
b. Mobilizes tissue fluid thereby lowering blood pressure
c. Improves blood circulations and decreases oedema
d. Prevents premature labor

871. Which of the following you will examine in the placenta to make the diagnosis of antepartum hemorrhage?
a. Infarction
b. Calcification
c. Missing abortion
d. Blood clots

872. Primary PPH is .....
a. Hemorrhage occurs within 24 hours following the birth of the baby
b. Hemorrhage occurs beyond 24 hours and within puerperium
c. Bleeding occurs after 28 weeks but before the onset of labor pain
d. Bleeding occurs at any time during pregnancy

873. Secondary PPH is .....
a. Hemorrhage occurs within 24 hours following the birth of the baby
b. Hemorrhage occur beyond 24 hours and within puerperium
c. Bleeding occurs after 28 weeks but before the onset of labor pain
d. Bleeding occurs at any time during pregnancy

874. Surgical management for PPH includes .....
a. Ligation of uterine artery
b. Ligation of ovarian and uterine artery anastomosis
c. Ligation of anterior division of internal iliac artery
d. All of the above

875. Which of the following condition can place a client at risk for development of postpartum hemorrhage?
a. Twin pregnancy
b. Breech pregnancy
c. Premature rupture of membranes
d. Cesarean delivery

876. When are the chances of acute endometritis developing in a woman? *(RRB SSNE 2015)*
a. After menopause
b. After menarche
c. After abortion or childbirth
d. In childhood

877. A vaginal fistula that opens into the rectum is called: *(LNJP H D 2012)*
a. Rectovaginal fistula
b. Enterovaginal fistula
c. Vesicovaginal fistula
d. Colovaginal fistula

878. Obstetrical emergencies include all, except: *(LNJP H D 2012)*
a. Ectopic pregnancy
b. Eclampsia
c. Placenta anterior
d. Placenta previa

879. Etiology for contracted pelvis include .....
a. Disease or injuries affecting the pelvis
b. Short stature of women
c. Severe infection during childhood
d. All of the above

880. Premonitory stage of eclamptic seizure is manifested by
a. Cyanosis
b. Clenched hands
c. Eyeballs roll and are fixed in one direction
d. Looks puffy and comatose

881. Clinical feature of hydatidiform mole is .....
a. Snow storm appearance in USG
b. Elevated levels of hCG
c. Absence of fetal parts and FHS
d. All of the above

882. Rh-isoimmunization is given to an Rh-negative pregnant woman if
a. The first baby born is Rh-negative
b. The husband is Rh-positive
c. The husband is Rh-negative
d. All of the above

883. Rh Negative mother should receive __ globulin *(ESIC 2019)*
a. RhO (M) globulin
b. RhO (D) immunoglobulin
c. Lecithin/Sphingomyelin
d. Acetylcholinesterase

Explanation: Rh negative mother should receive RhO (D) immunoglobulin. The mother who is Rh negative and baby is Rh positive then the mother should receive Anti D immunoglobin intramuscularly, 300 mcg, within 72 hours of childbirth.

Scanned with CamScanner

884. Which of the following doses of Rh immunoglobulin RhoGAM is appropriate for a pregnant client at 28 weeks of gestation? *(RAK MSc 2018)*

a. 0.6 mcg in a sensitized client
b. 50 mcg in an unsensitized client
c. 30 mcg in a sensitized client
d. 300 mcg in an unsensitized client

Explanation: A pregnant, Rh unsensitised woman should be administered 300 mcg of RhoGAM at 28 weeks of gestation after indirect Coomb's test. 50 mcg of RhoGAM is usually given after first semester abortion.

885. Which is the most difficult time to control diabetes during maternity cycle?

a. First trimester
b. Second trimester
c. Third trimester
d. Labor & delivery

886. Acquired risk factor for genital prolapse is .....

a. Vaginal delivery with consequent injury to the supporting structures
b. Congenital weakness of the supporting structures
c. Malnutrition and aging
d. Increased weight of the uterus

887. Descent of the uterus toward introitus is known as .....

a. Ist degree uterine prolapse
b. IInd degree uterine prolapse
c. IIIrd degree uterine prolapse
d. IVth degree uterine prolapse

888. The degree of uterine prolapse in which the uterine body descends to lie outside the introitus is .....

a. 1st degree
b. IInd degree
c. IIIrd degree
d. IVth degree

889. Criteria of prolonged labor is .....

a. Cervical dilatation is less than 1 cm /hr
b. Descent of the presenting part is less than 1cm/hour
c. Both A and B
d. None of the above

890. Reasons for prolonged labor due to fault in power include..

a. Uterine inertia
b. Incoordinate uterine contraction
c. All of the above
d. None of the above

891. Reasons for prolonged labor due to fault in passage include .....

a. Contracted pelvis
b. Cervical dystonia
c. Pelvic tumor
d. All of the above

892. Reasons for prolonged labor due to fault in passenger include .....

a. Malposition
b. Malpresentation
c. Congenital abnormalities
d. All of the above

893. Genital prolapse manifestation includes all EXCEPT

a. Difficulty in passing urine
b. Backache
c. Difficulty in passing stool
d. Chancroid

894. Identify the correct statement regarding kartagener syndrome

a. It is a rare hereditary disease autosomal recessive caused by a gene defect
b. There is loss of ciliary function and sperm motility
c. Primary ciliary dyskinesia and situs inversus are the abnormalities seen along with this condition
d. All of the above

895. Snow storm of appearance in USG is the characteristic of .....

a. Preeclampsia
b. Hydatidiform mole
c. Battledore placenta
d. PPH

896. All of the following are the effects of polyhydramnios EXCEPT

a. Lung hypoplasia
b. Fetal distress
c. Macrosomia
d. Meconium staining and amniotic bands

897. Vulval cancer can be due to

a. Fungal infection
b. Bacterial infection
c. HPV infection
d. All of the above

898. What is the cause of primary cervical dystocia?

a. Rigid cervix
b. Inefficient uterine contraction
c. First birth in which external os fail to dilate
d. All of the above

899. What is the cause of secondary cervical dystocia?

a. Scarring of the cervix
b. Post delivery
c. Postoperative scarring
d. All of the above

900. Cerclage (encircling cervix with suture) is done for patients with_____ *(ESIC 2019)*

a. Complete abortion
b. Threatened abortion
c. Incomplete abortion
d. Incompetent cervix

Explanation: Cerclage (encircling cervix with suture) is done for patients with incompetent cervix. Incompetent cervix refers to impaired retentive power of the cervix (internal OS). Cerclage operation reinforces the weak cervix by a non-absorbable tape, placed around the cervix at the level of internal OS.

901. In a woman with pre-eclamptic toxaemia the danger of convulsion resolved by .....

a. Soon after delivery
b. 12 hrs after delivery
c. 24 hrs after delivery
d. 48 hrs after delivery

902. Cervical incompetence results in

a. Second trimester miscarriage
b. Third trimester miscarriage
c. Recurrent abortion/preterm labor
d. All of the above

903. The Glomerular Filtration Rate (GFR) in preeclampsia

a. Decreases
b. Increases
c. Remains the same
d. None of the above

904. When the placenta lies over the lower uterine segment it is known as

a. Abruptio placenta
b. Placenta previa
c. Battledore placenta
d. Velamentous placenta

905. Risk factors for placenta previa include .....

a. Smoking
b. Placental size
c. Multiparity
d. All of the above

906. Clinical feature of placenta previa is .....

a. Bleeding is always revealed
b. Bright red in color
c. F.H.S. usually present
d. All of the above

Scanned with CamScanner

907. In placenta previa, vaginal examination should not be done to avoid---------
a. Infection
b. Hemorrhage
c. Discomfort
d. Precipitate labor

908. USG of a pregnant women with placenta previa shows that placenta reaches the margin of internal os and is not covering it. The degree of placenta previa is .....
a. Low lying
b. Marginal
c. Incomplete
d. Total

Explanation: Option B is the correct answer. In low lying (type 1) major portion of the placenta is in the upper segment and only the lower margin comes into lower segment and is not up to internal os.

Incomplete (type 3 or partial central): Placenta covers the internal os partially

Total (central or type 4) placenta completely covers the internal os.

909. Which of the following is the usual treatment for partial placenta previa?
a. Heparin therapy
b. Induction of labor with oxytocin
c. Activity limited to bed rest
d. Blood transfusion

Explanation: Activity limited to bed rest, hydration, and careful monitoring of the client's bleeding are the recommended treatment for a client with partial placenta previa.

910. Definitive treatment for grade III placenta previa is
a. Vacuum delivery
b. Blood transfusion
c. Steroid therapy
d. Caesarean section

911. Definitive treatment of placenta previa includes: *(RAK MSc 2018)*
a. Bed rest
b. Supplementary hematinics
c. Use of tocolytics
d. Cesarean section

Explanation:
- Caesarean section is the definitive management for most of the mothers diagnosed with placenta previa.
- Other management strategies in case of placenta previa is as follows:
  - Bed rest to minimize movements of mother
  - Supplementary hematinics are administered to supplement against blood loss.
  - Blood transfusion in case of anemia
  - Use of tocolytics to delay preterm labor
  - Use of cervical cerclage to reduce bleeding
  - Rh immunoglobulin in case of Rh-negative mother.

912. Which of the following is the most important predisposing factor of abruption placenta?
a. Hypertension in pregnancy
b. Uterine inertia
c. Malnutrition
d. Cephalo pelvic disproportion

913. The following are the complications of Rh isoimmunization, EXCEPT
a. Hydrops foetalis
b. Kernicterus
c. Anemia
d. Post maturity

914. Cephalopelvic disproportion can be assessed with the help of .....
a. Chassar-Moirs method
b. Munro-Kerr's method
c. Left-hand grip
d. All of the above

915. Clinical features of abruptio placenta is .....
a. Dark colored bleeding
b. FHS usually absent
c. Revealed, concealed or mixed type
d. All of the above

916. At 28 weeks of gestation, a woman is at risk for diabetes as a result of
a. Increasing human placental lactogen
b. Increasing choriogonadotropin
c. Increasing human somatotropin
d. Decreasing foetal insulin

917. The risk factor for the development of thromboembolic phenomenon in a woman with cardiac disease will be the intake of
a. Antihypertensive drugs
b. Antiarrhythmic drugs
c. Intrauterine devices
d. Steroidal contraceptives

918. Which among the following valvular abnormality can cause death in the process of labor?
a. Aortic stenosis
b. Aortic regurgitation
c. Mitral stenosis
d. Mitral regurgitation

919. Complications of multiple gestation include .....
a. Abortion
b. Congenital malformations
c. Low birth weight
d. All of the above

920. Causes of tubal pregnancy include .....
a. Contraceptive failure
b. Tubal surgery and previous tubal pregnancy
c. Pelvic Inflammatory Disease
d. All of the above

921. Hyperemesis gravidarum means .....
a. Burning micturition
b. Severe type of diarrhoea
c. Severe type of constipation
d. Severe type of vomiting in pregnancy

922. The commonest cause of primary dysfunctional labor in primigravida is .....
a. Inadequate uterine contraction
b. lack of pain
c. Cervical dystocia
d. Macro baby

923. Cause of fetal death in abruption placenta is .....
a. Hypoxia
b. Anoxia
c. Cord tightening
d. Hemorrhage.

924. Most important risk factor for puerperal sepsis include .....
a. Lack of breast feeding
b. Malnutrition and anemia during pregnancy
c. Unclean deliveries
d. Tetanus neonatorum

925. Mrs. X, a postnatal mother, admitted with history of fever 102°F, abdominal pain and foul smelling lochia on 8th postnatal day, which of the following complication does this indicate?
a. Puerperal sepsis
b. Peritonitis
c. Perineal tear
d. Sub involution

926. All are the treatment of choice in precipitate labor EXCEPT
a. Administration of ether
b. Administration of magnesium sulfate
c. Oxytocin augmentation
d. Low rupture of membrane

Scanned with CamScanner

927. Gestational trophoblastic disease (GTD) is .....
a. Melanoma
b. Vesicular mole
c. Fibroid uterus
d. Uterine dystocia

928. Drug of choice to suppress uterine contraction in precipitated labor is .....
a. Ether
b. Magnesium sulfate
c. Prostaglandin
d. Methergine

929. Infection of genital tract due to complication of delivery is termed as
a. Puerperal sepsis
b. Cervical infection
c. Peritoneal sepsis
d. Vaginal infection

930. In which condition, the uterus is turned inside out partially or completely
a. Atonic uterus
b. Inversion of the uterus
c. Anteversion
d. Retraction

931. Which of the following sign in a client indicates thrombophlebitis?
a. Orthostatic hypotension
b. Shortness of breath when climbing the stairs
c. Diarrhoea
d. A painful swelling usually in one leg

932. The reason for the development of polyhydroamniosis in a woman with gestational diabetes is
a. Absence of swallowing reflex in fetus.
b. Fetal diuresis
c. Increased transudation
d. Hyperplasia of blood vessels

933. Which of the following is the major cause of pelvic inflammatory disease?
a. Abruptio placenta
b. Post partum hemorrhage
c. Uterine prolapse
d. Placenta previa

934. Which of the following complaint reported by a 32-week pregnant woman is considered crucial?
a. Heartburn
b. Constipation
c. Shortness of breath when climbing up the stairs
d. Frontal and recurring headaches

935. The first assessable objective sign of a convulsion in a client with eclampsia is:
a. Rolling of the eyes to one side with a fixed stare
b. Spots or flashes of light before the eyes
c. Persistent headache and blurred vision
d. Epigastric pain, nausea and vomiting

936. Which of the following finding is expected when assessing a preeclamptic woman?
a. Hypotension
b. Haematuria
c. Polyuria
d. Proteinuria

937. In eclampsia patient becomes unconscious twitching of facial muscles eye balls roll or are turned to one side and become fixed is known as ..... Stage
a. Pre monitory stage
b. Tonic stage
c. Clonic stage
d. Stage of coma

938. In eclampsia whole body goes into tonic spasm, the trunk opisthotonus, limbs are flexed and hands clenched is known as .....
a. Pre monitory stage
b. Tonic stage
c. Clonic stage
d. Stage of coma

939. In eclampsia voluntary muscles undergo alternative contraction and relaxation, this stage is known as .....
a. Pre monitory stage
b. Tonic stage
c. Clonic stage
d. Stage of coma

940. Clinical manifestation of preeclampsia is .....
a. Pitting edema
b. Proteinuria
c. All of the above
d. None of the above

941. Hematological change occurred during preeclampsia and eclampsia include .....
a. Decreased plasma volume
b. Hemoconcentration
c. Coagulation disorder
d. All of the above

942. Cardiovascular changes occurred during preeclampsia and eclampsia include .....
a. Generalized vasospasm
b. Increased peripheral vascular resistance
c. Decreased CVP
d. All of the above

943. Renal change occurred during preeclampsia and eclampsia includes .....
a. Decreased GFR
b. Decreased renal plasma flow
c. Increased serum uric acid
d. All of the above

944. The labor is said to be prolonged when the combined duration of the first and second stage is more than
a. 6 hrs
b. 12 hrs
c. 14 hrs
d. 18 hrs

945. The most appropriate position to place the patient if cord prolapse occurs and the fetus is visible
a. Left lateral position
b. Knee chest position
c. Elevated Sims' position
d. Lithotomy position

946. A primigravida is receiving IV Magnesium sulfate. Which of the following assessment is the priority in this case?
a. Urine for glucose
b. Urine for protein
c. Calf tenderness
d. Deep tendon reflexes

947. The most dependable method to diagnose ectopic pregnancy is
a. Transabdominal ultrasound
b. Transvaginal ultrasound
c. Doppler ultrasound
d. HCG test

948. In an eclampsic woman fluid intake should not be more than .....
a. Previous 24 hours urine output
b. Previous 24 hours urine output + 1000ml
c. Total blood volume of the patient
d. 10ml/kg body weight

949. Which of the following conditions increases the risk of ectopic pregnancy?
a. Salpingitis
b. Uterine infections
c. Pelvic inflammatory disease
d. All of the above

950. Nursing care in a case of a ruptured ectopic pregnancy includes
a. Monitor for presence and amount of vaginal bleeding
b. Monitor for abdominal distension
c. Monitor for hypovolemia
d. All of the above

951. Ectopic pregnancy is treated with _____
a. Normal saline
b. Prostaglandins
c. Methotrexate
d. Oxytocin

952. Molar pregnancy is usually treated by _____
a. Antibiotics
b. Surgical suction and evacuation
c. Hysterectomy
d. Oxytocin

953. Preeclampsia is .....
a. Hypertension to the extent of 140/90 or more with proteinuria after 20th week of POG
b. Preeclampsia complicated with generalized tonic-clonic seizure
c. Sustained raise in BP to 140/90 or more at least two occasions four or more hours apart
d. None of the above

954. Eclampsia is .....
a. Hypertension to the extent of 140/90 or more with proteinuria after 20th week of POG
b. Preeclampsia complicated with generalized tonic-clonic seizure
c. Sustained raise in BP to 140/90 or more at least two occasions four or more hours apart
d. None of the above

955. Gestational hypertension is .....
a. Hypertension to the extent of 140/90 or more with proteinuria after 20th week of POG
b. Pre-eclampsia complicated with generalized tonic-clonic seizure
c. Sustained raise in BP to 140/90 or more at least two occasions four or more hours apart
d. None of the above

956. The most reliable diagnostic procedure for the diagnosis of molar pregnancy is
a. Biopsy
b. Urinary hCG
c. Ultrasound
d. Tissue sampling

957. Which of the following is the treatment of choice for most benign ovarian tumours?
a. Allowing the tumour for a spontaneous resolution
b. Chemotherapy
c. Radiation therapy
d. Surgical removal

958. The most common type of ovarian cancer is
a. Adenocarcinomas
b. Endometrial tumours
c. Epithelial ovarian cancer
d. Mucinous adenocarcinomas

959. Complications of hydatidiform mole includes
a. Choriocarcinoma
b. Abortion
c. Ectopic pregnancy
d. All of the above

960. The purpose of maintaining the Foley catheter in the bladder after a hysterectomy, is to prevent
a. Infection
b. Bladder distension
c. Stress incontinence
d. Haematuria

961. Which of the following is the disadvantage of using ring pessary for the management of genital prolapsed?
a. It causes dyspareunia
b. It causes vaginitis and ulceration
c. It does not cure stress incontinence
d. All of the above

962. State of abnormal uterine bleeding without any clinically detectable organic pelvic pathology and is due to changes in hormone levels is known as .....
a. Menorrhagia
b. Metrorrhagia
c. Dysfunctional uterine bleeding
d. Epimenorrhoea

963. Drug of choice for the management of DUB is .....
a. Contraceptive pills
b. Norethisterone acetate
c. 17 alpha ethinyl testosterone
d. All of the above

964. As a management of dysfunctional uterine bleed endometrial resection is done in .....
a. Age over 35
b. Completed her family
c. Not has any significant endometrial pathology such as cancer
d. All of the above

965. Moniliasis is caused by .....
a. Candida albicans
b. Chlamydia trachomatis
c. Treponema pallidum
d. Neisseria gonorrhea

966. Vaginitis is caused by .....
a. Trichomoniasis
b. Chlamydia trachomatis
c. Treponema pallidum
d. Neisseria gonorrhea

967. Which of the following is NOT a common cause for vaginitis? *(AIIMS-BBS SNO 2019)*
a. Salmonella
b. Trichomonas
c. Candida
d. Gardnerella

968. Inflammation of vagina in postmenopausal women is known as .....
a. Toxic shock syndrome
b. Senile vaginitis
c. Chancroid
d. Pelvic inflammatory disease

969. Postmenopausal yellowish or blood stained vaginal discharge, soreness in the vulva and pruritus vulvae are the manifestations of
a. Menopause
b. Chancroid
c. Pelvic inflammatory disease
d. Senile vaginitis

970. Senile vaginitis is caused by .....
a. Increase FSH level
b. Estrogen deficiency
c. Progesterone deficiency
d. LH deficiency

971. Chances of acute endometritis is more after .....
a. Menopause
b. Menarchae
c. Abortion or childbirth
d. Infection

972. PID is more common among .....
a. Menstruating teenagers and multiple sexual partners
b. Using intra uterine devices
c. Absence of contraceptive pill use
d. All of the above

Scanned with CamScanner

973. Which of the following sexually transmitted diseases has a bacterial origin: *(AIIMS Bhopal Nursing Officer, 2018)*

a. Syphilis
b. Hepatitis B
c. Trichomonas Vaginitis
d. Scabies

Explanation:

Disease	Causative organism
Syphilis	Bacteria
Chlamydia	Bacteria
Genital herpes	Virus
Gonorrhea	Bacteria
HIV/AIDS	Virus
HPV	Virus
Trichomoniasis	Parasite

974. Incubation period for syphilis is .....

a. 1 week b. 2 weeks
c. 3 weeks d. 4 weeks

975. Which among the following perinatal infection does not offer long lasting immunity?

a. Hepatitis B Virus b. Syphilis
c. Toxoplasmosis d. Rubella

976. VDRL blood test is a screening test for

a. Anaemia b. Syphilis
c. HIV d. Hepatitis B

977. Before a client with syphilis can be treated the nurse must determine the: *(Safdarjung NO 2018)*

a. Portal of entry
b. Size of the chancre
c. Existence of allergies
d. Name of sexual contacts

Explanation: Penicillin injection is the treatment of syphilis. Allergic reaction to the penicillin can be life threatening. whenever the patient comes for the penicillin injection, each time antibiotic sensitivity test is to be repeated and if skin reaction is positive for allergic reaction, then the patient can be given alternative therapy as ceftriaxone or erythromycin.

978. Which of the following information is appropriate for a pregnant woman who has a positive history of genital herpes but has no lesions during the present pregnancy. *(Safdarjung NO 2018)*

a. You will be isolated from your newborn infant following delivery
b. She will be evaluated at the time of delivery for herpetic genital tract lesions, and if lesions are present a cesarean section will be needed
c. There is little risk to your newborn infant during this pregnancy, birth and following delivery
d. Vaginal deliveries can reduce neonatal infection risks even if you have an active lesion at birth

Explanation: The woman is evaluated for active genital herpes lesions at the time of delivery, and if lesions are present a cesarean delivery will be needed. It is one of the indications of the cesarean section.

979. Which among the following condition is seen often in patient with gonorrhea?

a. Trachoma b. Chlamydia
c. Herprs d. Syphilis

Explanation: Most women who are suffering from gonorrhea will be also having chlamydia. So treatment of both condition is required simultaneously.

980. Most commonly transmitted STD among female is .....

a. Human Immunodeficiency virus (HIV)
b. Hepatitis B
c. Chlamydia
d. Syphilis

981. Chlamydia infection leads to .....

a. Trachoma
b. Salpingitis
c. Non gonococcal urethritis
d. All of the above

982. Which of the following is one of the most frequent causes of salpingitis or pelvic inflammatory disease?

a. Chlamydia b. Streptococcus
c. Staphylococcus d. Treponema

983. Semi-Fowler's position is recommended in pelvic inflammatory disease for .....

a. Easy observation
b. Promoting drainage to prevent abscesses
c. Easily healing
d. More comfort of the patient

984. Ophthalmia neonatorum is caused by .....

a. Chlamydia trachomatis
b. Neisseria gonorrhea
c. Both A & B
d. None of the above

985. Lymphogranuloma venereum is caused by ..... organism

a. Candida Albicans b. Chlamydia Trachomatis
c. Treponema pallidum d. Neisseria gonorrhea

986. Identify correct statement regarding gonococcal salpingitis

a. It is a sexually transmitted disease
b. It is usually bilateral infection
c. The symptoms usually appears following menstruation
d. All of the above

987. Accumulation of pus in the fallopian tube is known as .....

a. Salpingitis b. Pyosalpinx
c. Hydrosalpinx d. Hydro-oopinex

988. The earliest sign of pregnancy-induced hypertension is

a. Excessive weight gain b. Proteinuria
c. Blurring of vision d. Headache

989. Commonest benign solid tumor in female is .....

a. Fibroid uterus
b. Endometriosis
c. Cancer of uterus
d. Cervical cancer

990. Fibroid uterus is more common in .....

a. Nulliparous women
b. Postmenopausal women
c. Women with multiple sexual partner
d. After 35 years of age

991. Clinical manifestation of fibroid uterus includes .....

a. Heavy periods b. Severe abdominal pain
c. Both A & B d. None of the above

Ans.

Scanned with CamScanner

992. Complication associated with uterine fibroid is .....
a. Persistent menorrhagia leading to anemia
b. Menstrual pain
c. Abdominal cramps
d. All of the above

993. Changes occur to the uterus in uterine fibroid is .....
a. Increased surface area of the endometrium
b. Interference with normal uterine contractility
c. Pelvic congestion
d. All of the above

994. Cause behind infertility in fibroid uterus is .....
a. Ovum production is not there
b. Sperms are malformed
c. Fibroid uterus prevents rhythmic uterine, contraction during intercourse
d. None of the above

995. Normal lining of the uterus grows outside the uterus is known as .....
a. Cancer of cervix
b. Endometriosis
c. Adenoma of uterus
d. Fibroid uterus

Explanation: A disorder in which tissue that normally lines the uterus grows outside the uterus. With endometriosis, the tissue can be found on the ovaries, fallopian tubes or the intestines. The most common symptoms are pain and menstrual irregularities. Effective treatments, such as hormones and excision surgery, are available.

996. Common site of endometriosis includes .....
a. Ovary
b. Fallopian tube
c. Intestine
d. All of the above

997. Treatment of choice for endometriosis is .....
a. Estrogen and progesterone pill
b. Danazol
c. GnRH analogues
d. All of the above

998. Cervical cancer staging is primarily based upon .....
a. Biopsy
b. Age of female
c. Clinical examination
d. Marital status

999. Primary prevention for cervical cancer includes .....
a. Raising the age of marriage
b. Use of condom during early intercourse
c. Effective therapy of STDs
d. All of the above

1000. Commonest cause of vesicovaginal fistula is .....
a. Hysterectomy
b. Vaginal delivery
c. Abdominal surgery
d. Vaginal tuberculosis

1001. Correction of vesicovaginal fistula done at .....
a. During menstruation
b. 5th day of menstruation
c. 3-6 months following delivery
d. After menopause

1002. The commonest cause of uretero vaginal fistula is .....
a. Vaginal tuberculosis
b. Trauma during pelvic surgery
c. Cancer of cervix
d. Hormonal therapy

1003. The drug of choice in eclampsia is----------
a. Diazepam
b. Phenergan
c. MgSO4
d. Phenobarbitone

1004. Which of the following drug is administered to control eclamptic fits?
a. Interferon
b. Calcium gluconate
c. Magnesium sulfate
d. Magnesium trisilicate

1005. Drug of choice for the management of vaginal trichomoniasis is .....
a. Prostaglandin
b. Oxytocin
c. Metronidazole
d. Gentamycin

1006. First antihypertensive drug of choice in obstetric is
a. Methyldopa
b. Atenolol
c. Amlodipine
d. ACE inhibitors

1007. All are tocolytic agents EXCEPT
a. Indomethacin
b. Nitric oxide donors
c. Magnesium sulfate
d. Diazepam

1008. The drug used to prevent circulatory overload during the first stage of labor of a woman with cardiac disease?
a. Betamethasone
b. Dexamethasone
c. Furosemide
d. Mannitol

1009. Vaginal trichomoniasis is best treated with
a. Systemic antifungal agents
b. Oral metronidazole for the couple
c. Local anaesthetics and antifungal agents
d. Local antifungal agents

1010. Parameter needs to be monitored in a client receiving Magnesium sulfate is .....
a. Half hourly pulse, respiration and BP
b. Deep tendon reflexes every 4 hours
c. Hourly urine output
d. All of the above

1011. The most common cause of vaginitis in postmenopausal women is
a. Malignancy
b. Infection
c. Oestrogen deficiency
d. Trauma or foreign body

1012. The drugs of choice in eclampsia is
a. Magnesium sulfate
b. Naloxone
c. Calcium Gluconate
d. Protamine sulfate

1013. Complications of hydatidiform mole is EXCEPT——
a. Development of carcinoma
b. Asicitis
c. Acute pulmonary insufficiency
d. Pregnancy Induced Hypertension

1014. Trophoblastic tumor marker is .....
a. hCG
b. Estrogen
c. Progesterone
d. FSH

1015. The nurse administers injection MgSO4 to a woman who is hospitalized with severe pre-eclampsia. What medication would the nurse have available to counter MgSO4 toxicity?
a. Sodium chloride
b. Calcium gluconate
c. Epinephrine
d. Sodium bicarbonate

NEONATOLOGY

1016. A localised edema or collection of fluid on the fetal scalp that develops during labor is known as:
(AIIMS Bhopal Grade-I 2018)
a. Caput succedaneum
b. Crowing
c. Molding
d. Cephalhematoma

Scanned with CamScanner

Explanation: Caput succedaneum is a neonatal condition involving a serosanguinous, subcutaneous, extraperiosteal fluid collection with poorly defined margins. Caput succedaneum presents as a scalp swelling that extends across the midline and over suture line and is associated with head molding. It usually resolves over the first few days.

1017. The congenital anomaly of the hand, in which there is persistence of the webbing between adjacent digits of the hands, so that they are attached to each other is called: *(AIIMS Raipur Grade II 2017)*

a. Polydactyl
b. Monodactyl
c. Syndactyl
d. Reduction deformities

Explanation: Polydactyly or hyperdactyly, is a congenital physical anomaly in people resulting in supernumerary fingers and/or toes. Monodactyl is a condition in which there is only one finger or toe on each hand or foot. Reduction deformities is congenital absence or attenuation of one or more body parts.

1018. Formation of swelling due to stagnation of fluid in the layers of scalp beneath the girdle of contact is .....

a. Moulding
b. Caput succedaneum
c. Hemangioma
d. Hematoma

Explanation: Option B is the correct answer. Molding means alteration in the shape of forecoming head while passing through resistant birth passage during labor.

1019. Among the following which sign indicate that newborn is adapting well with the external environment

a. Nasal flare
b. Chest in drawing
c. Retractions
d. Respiration rate 40-60 breaths/min

Explanation: Respiratory rate of 40-60 breaths/min is normal in newborn and is showing the adaptation with extra uterine environment

1020. A neonate has been diagnosed with cephalohematoma. Which is the incorrect statement regarding the diagnosis?

a. Collection of blood between pericranium and flat skull bone
b. It is never present at the time of birth
c. Swelling is limited by the suture line
d. It involves swelling of the tissue over the presenting part of the head

Explanation: Option D is the statement related to caput succedaneum. All other statements are correct in relation to cephalohematoma.

1021. Newborn at risk for developing RDS is

a. Newborn with period of gestation < 30 week
b. Newborn of diabetic mother
c. Newborn who passed meconium in the uterus
d. All of the above

Explanation: In all the above condition newborn is at risk for developing RDS.

1022. Neonates born to women infected with hepatitis B should undergo which treatment

a. Hepatitis B vaccine at birth and 1 month
b. Hepatitis B immune globulin at birth, no hepatitis B vaccine
c. Hepatitis B immune globulin within 48 hours of birth and Hepatitis B vaccine at 1 month
d. Hepatitis B immune globulin within 12 hours of birth and Hepatitis B vaccine at birth, 1 month, 6 months

Explanation: Hepatitis B immune globulin should be given as soon as possible after birth but within 12 hours.

1023. Which among the following is the characteristic of postdate fetuses? *(NIMHANS)*

a. Slethargic and irritable
b. Areola is not pigmented
c. Desquamation of the epidermis
d. Vernixcaseosa covering the body

Explanation: Desquamation of epidermis can be seen in postdate fetuses.

1024. ART of choice for the newborn born to HIV positive mother is .....

a. Nevirapine
b. Lamivudine
c. Indinavir
d. Ritonavir

Explanation: The drug of choice is Nevirapine

1025. Blood of choice for exchange transfusion in newborn is...

a. Rh negative blood of same group of baby
b. O negative
c. Both A and B
d. Same blood group of that newborn

Explanation: Rh negative of same blood group is recommended if it is not available then O negative blood should be given.

1026. Mother has given with opioid during labor process, which among the following drug most commonly ordered by doctor for the newborn baby?

a. Naloxone
b. Morphine
c. Calcium gluconate
d. Adrenaline

Explanation: Use of opioid cause respiratory depression in newborn baby. The ante dote naloxone will be ordered by the doctor for newborn baby.

1027. All are true regarding vernix caseosa EXCEPT

a. Secreted by sebaceous gland
b. Mixture of sebum and epidermis
c. Appear like white covering over the skin
d. It is distributed uniformly

1028. At what gestational age does the switchover from fetal to adult haemoglobin synthesis begin?

a. 24 weeks
b. 30 weeks
c. 36 weeks
d. Immediately after birth

1029. Which of the following is NOT one of the causes of intrauterine growth retardation?

a. Leucocytosis
b. Pregnancy induced hypertension
c. Gestational diabetes
d. Maternal heart disease

Ans.

1017. c
1018. b
1019. d
1020. d
1021. d
1022. d
1023. c
1024. a
1025. c
1026. a
1027. d
1028. b
1029. c

Scanned with CamScanner

1030. Which of the following is NOT a risk factor associated with Macrosomia?
a. Gestational diabetes mellitus
b. Prolonged pregnancy
c. Maternal obesity
d. Short stature

1031. The primary site of hematopoiesis in the fetus before midpregnancy is:
a. Liver
b. Bone
c. Kidney
d. Pancreas

1032. Nuchal translucency screening of fetus is done to diagnose
a. Chromosomal anomalies
b. Congenital heart disease
c. Microcephaly
d. Meningeal abnormalities

1033. It is the alternative of the shape of the forecoming head while passing through the resistant birth passage during labor----------
a. Caput succedaneum
b. Moulding
c. Cephalhematoma
d. Retinoblastoma

1034. The suction cup leaves a small swelling on your baby's head during vacuum delivery and is known as .....
a. Caput succeaneum
b. Cephalo-hematoma
c. Chignon
d. Neonatal tetanus

1035. Caput succedaneum is .....
a. Hemorrhage
b. It is the swelling on the face of the baby.
c. The swelling due to collection of fluid under the scalp
d. Occur during vacuum delivery

1036. Lack of .....vitamin is responsible for most of the congenital malformation
a. Folic acid
b. Riboflavin
c. niacin
d. Calcium and iron

1037. The drug of choice for Ophthalmia neonatorum is
a. Ampicillin
b. Atropine
c. Gentamycin
d. Amoxicillin

1038. A newborn who is above the 90th percentile on the Intrauterine Growth Curve is termed: *(DSSSB PHN, 2015)*
a. Post-term baby
b. Large for gestational age
c. Small for gestational age
d. Preterm baby

1039. Which of the following findings in a new born baby girl is normal? *(LNJP H D 2012)*
a. Bleeding from umbilicus
b. Respiratory rate of 70/minute at rest
c. Yellow skin tone at 12 hours of age
d. Passage of meconium within the first 24 hours

1040. Average births weight of an Indian baby is ..... kg.
a. 3.5 kg
b. 2 kg *(RRB Feb 2012)*
c. 4 kg
d. 3 kg

1041. Human fetus has a coat of hair called: *(RRB Feb 2012)*
a. Lanugo
b. Vernix
c. Striac
d. None

1042. Hypoglycemia in a baby of diabetic mother is because of: *(RRB Feb 2012)*
a. Decreased glucagon
b. Increased glucagon
c. Increased insulin
d. None

1043. The killing of a newborn child by its parents is called *(RRB Feb 2012)*
a. Restitution
b. Infanticide
c. Neocide
d. Infantism

1044. An important principle to be considered with an infant receiving phototherapy would be to ----------
a. Cover eyes with eye pads to prevent retinal hemorrhage
b. Dress the infant to prevent chilling
c. Isolate the infant to prevent cross-infection.
d. Avoid handling the infant because it interferes with treatment.

1045. Caput succedaneum is----------
a. Birth mark.
b. It is the swelling on the face of the baby.
c. The swelling due to collection of fluid under the scalp
d. Collection of fluid in the abdomen

1046. In preterm babies to avoid retrolental fibroplasia, O_2 concentration should not be more than.....
a. 50%
b. 60%
c. 30%
d. 45%

1047. Asymmetric moro reflexes are frequently associated with
a. Cerebral or cerebellar injuries
b. Cranial nerve damage
c. Brachial plexus, clavicle injuries
d. Down's syndrome

1048. Neonatal ophthalmitis may occur in the newborn if the mother has
a. Fungal vaginitis
b. Syphilis
c. Gonorrhea
d. Vaginal candidiasis

1049. Asphyxia neonatorum means .....
a. Increase in oxygen and decrease in carbon dioxide
b. Decrease in oxygen and increase in carbon dioxide
c. Increase in oxygen and increase in carbon dioxide
d. Decrease in oxygen and decrease in carbon dioxide

1050. Lack of surfactant leads to .....
a. Green stick fracture
b. Mental retardation
c. Respiratory distress syndrome
d. Macrosomia

1051. Klumpke's paralysis is a result of damage to the lower brachial plexus of
a. 5th and 6th cervical nerve
b. 7th and 8th cervical nerve
c. 3rd and 4th thoracic nerve
d. 4th and 5th thoracic nerve

1052. Symmetric bluish discoloration of the extremities in a newborn is called as
a. Acrocyanosis
b. Cutis marmorata
c. Harlequin color
d. Erythema toxicum

1053. Pathological jaundice usually appear within _____ of birth
a. 1 hrs
b. 6 hrs
c. 24 hrs
d. 72 hrs

1054. Baby born before 37 completed week of gestation is known as
a. Low birth weight baby
b. Preterm baby
c. Small for gestational age
d. Very low birth weight baby

1055. Pregnancy is considered full term after how many weeks?
a. 28 weeks.
b. 32 weeks.
c. 36 weeks.
d. 40 weeks

Ans.

1052. a
1053. c
1054. b
1055. d

Scanned with CamScanner

1056. The nurse, on performing newborn examination found that the left eye is open and immobile and the angle of the mouth is drawn upwards on the left side. This condition is described as:
a. Erb's palsy b. Facial palsy
c. Brachial palsy d. Klumpke's palsy

1057. Newborn baby automatically turn the face toward the stimulus and make sucking. This reflex is known as .....
a. Startle reflex b. Rooting reflex
c. Glabellar reflex d. Corneal reflex

1058. Serious danger associated with LBW baby is .....
a. Respiratory distress
b. Feeding problem
c. Thermoregulation problem
d. Hemorrhage

1059. The collection of blood in between the pericranium and the flat bone of the skull of the newborn is known as .....
a. Cephalhematoma
b. Caput succedaneum
c. Extradural haemorrhage
d. Subarachnoid haemorrhage

1060. The most common complication in the preterm infant is
a. Brain damage b. Respiratory distress
c. Aspiration of mucus d. Haemorrhage

1061. Newborn is said to be anemic, if cord blood hemoglobin is less than
a. 8mg % b. 10mg%
c. 12mg% d. 14mg%

1062. The chromosomal pattern in Klinefelter's syndrome is:
a. 46, xy b. 47, xxy
c. 45, xxy d. 46, xxy

ABORTION, MTP & FAMILY PLANNING

1063. The safest method of termination of pregnancy before 12 weeks is: *(LNJP H D 2012)*
a. Laminaria tent b. Prostaglandins
c. Suction evacuation d. Dilation and curettage

1064. Abortion is the termination of pregnancy before ..... weeks of pregnancy: *(RRB Feb 2012)*
a. 16th weeks b. 12th weeks
c. 10th weeks d. 24th weeks

1065. Abortions during second trimester of pregnancy mainly occur due to
a. Congenital anomalies of fetus
b. Hormonal deficiency in mother
c. Congenital anomalies of the uterus
d. Malnutrition

1066. Which of the following is the method of termination of pregnancy in the second trimester (13 to 20 weeks)? *(AIIMS BPL SNO 2018)*
a. Oxytocin infusion b. Methotrexate
c. Vacuum aspiration d. Mifepristone

Explanation: Oxytocin intravenous infusion is the most successful method to terminate pregnancy in second trimester. The process is achieved as mini labor in second trimester. Oxytocin helps to induce contractions.

Vacuum aspiration, Methotrexate, misoprostol and mifepristone are used for medical abortion up to 12 weeks.

1067. Age of viability of fetus is at
a. 15 weeks b. 20 weeks
c. 24 weeks d. 30 weeks

Explanation: The age of viability as being about 24 weeks of gestation. 20 to 35 percent of babies born at 24 weeks of gestation survive, while 50 to 70 percent of babies born at 25 weeks, and more than 90 percent born at 26 to 27 weeks, survive. It is rare for a baby weighing less than 500 g to survive.

1068. The index for finding effectiveness of contraception is: *(AIIMS Bhopal Grade-I 2018)*
a. Pearl b. Ponderal
c. Lorentz d. Broca

Explanation: Contraceptive efficacy was measured by the pearl index. Pearl index measures the number of pregnancies that occurs for each contraceptive method if used by 100 women for one year (where a women year is defined as 13 menstrual cycles).

1069. A clinical entity where the process of abortion has started but has not progressed to a state from which recovery is impossible is: *(AIIMS Raipur Grade II 2017)*
a. Spontaneous abortion b. Threatened abortion
c. Inevitable abortion d. Missed abortion

Explanation: Spontaneous abortion is non induced embroyonic or fetal death or passage of products of conception before 20 weeks of gestation. Inevitable abortion is characterized by rupture of membranes or cervical dilatation in a previable pregnancy in the presence of vaginal bleeding and contractions. A missed abortion is a misscarriage in which fetus didn't develop or has died but placenta and embryonic tissues are still in uterus.

1070. The inevitable abortion distinguished from threatened abortion by--------
a. Dilatation of cervical canal
b. Rupture of the membrane
c. Bleeding
d. Uterine contraction

1071. A state of miscarriage in which product of conception is retained inside the uterus for a variable period of time is known as ..... *(AIIMS Raipur Grade II 2017)*
a. Complete abortion b. Incomplete abortion
c. Missed abortion d. Recurrent absorption

Explanation: Complete abortion is one which all contents are expelled. Incomplete abortion is one in which entire products of conception are not expelled, instead a part of its left inside the uterine cavity. Recurrent abortion/habitual abortion/recurrent pregnancy loss is three or more consecutive pregnancy losses.

1072. Missed abortion is also known as:
a. Complete abortion b. Inevitable abortion
c. Silent miscarriage d. Septic abortion

Explanation: When the fetus is dead and retained inside the uterus for a variable period it is called missed abortion or silent abortion/ early fetal demise.

1073. A state of miscarriage in which process has started and progressed to a stage from which continuation of pregnancy is not possible is known as .....
a. Missed abortion b. Threatened abortion
c. Inevitable abortion d. Complete abortion

Ans.
1056. b
1057. b
1058. a
1059. a

1073. c

Scanned with CamScanner

1074. Mrs. X with 8 weeks of gestation has come to the emergency department with moderate bright red vaginal bleeding. On per-vaginal examination, her cervix is 2 cm dilated. Which of the following terms best describes Mrs. X's condition?
a. Incompetent cervix b. Inevitable abortion
c. Threatened abortion d. Missed Abortion

1075. A state of miscarriage in which product of conception is completely expelled is known as
a. Missed abortion b. Threatened abortion
c. Inevitable abortion d. Complete abortion

1076. When the fetus is dead and retained inside the uterus for a variable period is called as.....
a. Missed miscarriage b. Incomplete miscarriage
c. Complete miscarriage d. Inevitable miscarriage

Explanation: Option A is the correct answer, option B means entire product of conception are not expelled, instead a part of it is left inside the cavity. Option C indicates when the product of conception is completely expelled. Inevitable miscarriage occurs when the changes have progressed to a state from where continuation of pregnancy is not possible.

1077. Majority of total abortions occur during
a. First trimester
b. Second trimester
c. Third trimester
d. Fourth trimester

1078. Signs of inevitable abortion include .....
a. Increased vaginal bleeding
b. Aggravation of pain in the lower abdomen
c. Dilated internal os
d. All of the above

1079. Signs and symptoms of complete abortion include .....
a. Uterus is smaller than the period of amenorrhea
b. Subsidence of abdominal pain and vaginal bleeding
c. Cervical os is closed
d. All of the above

1080. Common cause of mid-term abortions includes .....
a. Cervical incompetence
b. Hyperstimulation of uterus
c. Hyper secretion of oxytocin
d. Rubella infection

1081. The most common cause of abortion in first trimester
a. Chromosomal abnormality
b. Trauma
c. Maternal disease
d. RTI

1082. _____ is the most common cause of septic abortion
a. Pelvic Inflammatory disease
b. Surgical abortion
c. Illegal abortion
d. Sexually Transmitted diseases

1083. The most common reason for wilful abortion is:
a. Congenital anomalies in Fetus
b. Birth control
c. Maternal infections
d. Pregnancy as a result of rape

1084. Sign of septic abortion includes
a. Haematuria
b. Polyuria
c. Tenderness of the abdomen
d. All of the above

1085. Commonest chromosomal abnormality in early spontaneous abortion is----------
a. Monosomy
b. Autosomal trisomy
c. Triploidy
d. Tetraplody

1086. Which stage of labour starts from full dilatation of the cervix, and ends with expulsion of the fetus from birth canal?
a. Fourth stage b. Second stage
c. First stage d. Third stage

1087. In which year Medical Termination of Pregnancy Act was enacted by the Indian Parliament?
a. 1970 b. 1971
c. 1972 d. 1975

1088. The Medical Termination of Pregnancy act came into force in the year: *(Safdarjung NO 2018)*
a. 1964 b. 1962
c. 1972 d. 1966

Explanation: The Medical Termination of Pregnancy Act was enacted by the Indian Parliament in 1971 and came into force from April 1972. The MTP ACT was again revised in 1975. The MTP Act lays down the condition under which a pregnancy can be terminated, the persons and the place to perform it.

1089. Indication for termination under MTP ACT is
a. To save the life of mother
b. Social indication
c. Eugenic
d. All of the above

Explanation: All the above mentioned are the indications for termination of pregnancy under MTP ACT. To save mother mean if the continuation of pregnancy causes serious or life threatening complications to mother. Social indication means to prevent grave injury to the physical and mental health of pregnant women. Eugenic means when there is a risk the child will born with serious physical and mental abnormality.

1090. Identify the natural method of contraception among the following
a. Rhythm method
b. Coitus interrupts
c. Breast feeding
d. All of the above

Explanation: All the above mentioned methods are natural contraceptive methods, temporary methods include condom, intra-uterine devices and steroidal contraception. Permanent methods include vasectomy in male and tubectomy in female.

1091. Most appropriate method for abortion in the first trimester of pregnancy is .....
a. Mifepristone and Misoprostol
b. Prostaglandin
c. Intrauterine instillation of hypertonic saline
d. Vacuum aspiration

Explanation: In the first trimester Mifepristone and Misoprostol are the appropriate methods. Prostaglandin, intrauterine instillation of hypertonic saline and vacuum aspirations are preferred in the late trimester.

Ans.

1074. b
1075. d
1076. a
1077. a
1078. d
1079. d
1080. a
1081. a
1082. c
1083. b
1084. c
1085. b
1086. b
1087. b
1088. c

1090. d
1091. a

Scanned with CamScanner

1092. Mini lap is a procedure related to .....
a. Family Planning b. Cervical cancer
c. Cesarian section d. Normal labor

Explanation: Mini lap is a procedure related to family planning. In this OPD basis tubectomy will be performed.

1093. Identify the emergency contraceptive among the following? *(CGHS 2010)*
a. Prostaglandin b. Progesterone only
c. Mala-D d. Levonorgestrel (EM-Kit)

Explanation: Levonorgestrel is used as an emergency contraceptive.

1094. Midterm abortions are commonly due to----------
a. Cervical incompetence b. Cervical erosion
c. Cervical laceration d. Cervical infections

1095. MTP methods adopted in first trimester of pregnancy include .....
a. Mifepristone and misoprostol
b. Manual vacuum aspiration
c. Dilatation and evacuation
d. All of the above

1096. Complications of abortion include:
a. Infection b Risk of heavy bleeding
c. Cervical laceration d. All of the above

1097. During suction evacuation in MTP the negative pressure of suction should be ----------
a. 100-200 mm Hg b. 200-300 mm Hg
c. 400-600 mm Hg d. 700-900 mm Hg

1098. All of the following are natural method of birth control EXCEPT
a. Coitus interruptus b. Breastfeeding
c. Vasectomy d. Safe period

1099. Which of the following is a permanent contraceptive method?
a. Condom b. OCP
c. Tubectomy d. IUD

1100. A mother with 9-month baby is planning for tubectomy. What is the ideal time for surgery following menstruation? *(Daman & Diu NO 2018)*
a. Secretory phase
b. Ovulatory phase
c. Menstrual phase
d. Proliferative phase

Explanation: The ideal time for tubectomy is during the Proliferative phase during which the endometrial thickness is about 2-3 mm.

1101. Characteristics of a good contraceptive method include all of the following EXCEPT
a. It should be effective
b. It should be safe and cost effective
c. Irreversible
d. No or minimal side effects

1102. Which of the following is a non-surgical method of contraception?
a. Vasectomy b. Tubectomy
c. Copper-T d. Tubal ligation

1103. Exclusive breastfeeding can be a contraceptive method for a period of
a. 1 month b. 3 months
c. 6 months d. 9 months

1104. CU - T 380 the number 380 represents .....
a. Duration of device
b. Surface area of copper
c. Can be used for 380 intercourse
d. This device was discovered by 380 persons

1105. Which IUCD needs to be replaced only after 10 years?
a. Coper 'T' 200 b. Progestasert *(NCFL 2019)*
c. Cu-'T'380 A d. 'T' Nova 'T'

Explanation:

IUDs	To be replaced in
Cu T 200	4 years
Cu T 380 A	10 years
Multiload Cu 250	3 years
Multiload 375	5 years
Levonorgestrel intrauterine system	7 years

1106. IUD needs to be removed if ..... Complication occurs
a. Excessive bleeding b. Uterine perforation
c. Planning for pregnancy d. All of the above

1107. Oral contraceptive pills need to be started on .....
a. 1st day of menstruation
b. 3rd day of menstruation
c. 5th day of menstruation
d. 7th day of menstruation

1108. Absolute contraindication for the use of oral contraceptive pill is .....
a. Hypertension
b. Ischemic heart disease
c. Undiagnosed genital tract bleeding
d. All of the above

1109. Other than contraception OCP is useful for .....
a. Menorrhagia
b. Dysfunctional uterine bleeding
c. Pelvic inflammatory disease
d. All of the above

1110. The action of spermicidal agent is to
a. Prevent the motility of the sperm
b. Kill sperm immediately
c. Render the sperm inactive
d. Prevent sperm from sticking to the uterine wall

1111. The contraceptive method advised in clients with molar pregnancy is
a. Oral contraceptives b. Barrier method
c. Intrauterine device d. Norplant

1112. All of the following are contraindications for combined oral contraceptive pills EXCEPT
a. Diabetes mellitus
b. Previous history of stroke
c. Previous history of thrombo-embolism
d. Peripheral vascular disease

1113. Which of the following is a third generation intrauterine device?
a. CuT b. TCu-300
c. TCu-380A d. Progestasert

Explanation: Progestasert is a T-shaped IUD made of ethylene and vinyl acetate copolymer containing titanium dioxide. The vertical stem contains a reservoir of 38 mg progesterone together with barium sulfate dispersed in silicone fluid. The progesterone is released at the rate of 65 μg per day.

Ans.

1092. a
1093. d
1094. a
1095. d
1096. d
1097. c
1098. c
1099. c
1100. d
1101. c
1102. c
1103. c
1104. b
1105. c
1106. d
1107. c
1108. d
1109. d
1110. b
1111. a
1112. a
1113. d

Scanned with CamScanner

1114. The following contraceptive method would be avoided for a woman who is 38 years old, has 3 children and smokes a pack of cigarette per day is ----------
a. Cervical cap
b. Diaphragm
c. IUD (Intra-uterine device)
d. Oral contraceptives

1115. The composition of Mala-N used for spacing pregnancy is
a. Norgestrel
b. Ethinyl estradiol
c. Desogestrel
d. Gestodene

1116. The dose (in mg) of levonorgestrel and ethinyl estradiol in Mala N is:
a. 0.15 and 0.03
b. 0.8 and 0.03
c. 3.5 and 3.0
d. 3.0 and 3.0

1117. Correct regarding the use of vaginal diaphragm is .....
a. Introduce it just before ejaculation and remove it after ejaculation
b. Addition of spermicidal jelly has no proved effect on its effectiveness
c. It should be introduced up to 3 hours before intercourse and is to be kept for at least 6 hours after the coital act
d. It should be introduced up to 3 hours before intercourse and should be removed immediately after ejaculation

1118. Mini lap is used for .....
a. Family planning
b. D&C procedure
c. Induction of labor
d. Take pap smear

1119. Best method of contraception in a nulliparous woman is ...
a. Barrier method
b. Rhythm method
c. Intrauterine devices
d. Combined oral pills

1120. Emergency contraception prevents pregnancy by all of the following mechanisms, except
a. Delaying/inhibiting ovulation
b. Inhibiting fertilization
c. Interrupting an early pregnancy
d. Preventing implantation of the fertilized egg

1121. The optimum time to insert intrauterine device is
a. Prior to menstruation
b. During secretary phase of menstrual cycle
c. Midway to menstruation
d. During menses

1122. Hormone replacement therapy after menopause is contra-indicated in
a. Asthma
b. Diabetes
c. Clients at risk of stroke and thromboembolism
d. Osteoporosis

MISCELLANEOUS

1123. What is the site of referred pain when pain is arising from cervix? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Anterior and medial aspect of thigh
b. Upper sacral region
c. Lower sacral region
d. Above the mid-inguinal point

Explanation: Upper sacral region is the site for referred pain which arises from cervix.

1124. Pseudocyesis is .....
a. False believe of a woman that she is pregnant.
b. Abnormal enlargement of uterus
c. False diagnosis that a person is pregnant
d. All of the above

1125. Instrument used for the collection of pap smear is .....
a. Ayre spatula
b. Piper forceps
c. Neville Barnes forceps
d. Simpson's forceps

Explanation: Ayre spatula is a device used to collect Pap smear. It is a wooden spatula with U shaped openings on one side and a flat surface on another.

1126. A client is scheduled for a pap smear. The nurse provides instructions to the client regarding preparation for the test: *(Safdarjung NO 2018)*
a. The test can be performed during menstruation
b. Fluids are restricted on the day of the test
c. The test is painless
d. Vaginal douching is required 2 hours before the test

Explanation: Vaginal douching is required 2 hours before the test, as it will cleanse the cervix and prevent exfoliated or dead tissues in sample.

1127. Intrauterine insemination is a treatment of choice for .....
a. Cervical stenosis
b. Hypospadias
c. Asthenospermia
d. All of the above

1128. The amount of semen usually injected in artificial insemination is .....
a. 0.1 ml
b. 0.2 ml
c. 0.3 ml
d. 0.4 ml

1129. Complications of hysteroscopy include:
a. Hemorrhage
b. Uterine perforation
c. Infections
d. All of the above

1130. As per the guidelines of American Cancer Society, for a woman aged 45 to 54 years, a mammography is recommended
a. Once a year
b. Once in two years
c. Once in five years
d. Once in ten years

1131. Breast self-examination is recommended _____
a. Any time during the cycle
b. First day of period
c. 3 to 5 days after period starts
d. 14 days after period starts

1132. Chancroid is caused by .....
a. Chlamydia trachomatis
b. Treponema pallidum
c. Neisseria gonorrhea
d. Haemophilus ducreyi

Explanation: Chancroid is a bacterial sexually transmitted disease that causes open sores on or around the genitals of men and women. It is a venereal infection caused by haemophilus ducreyi.

1133. Maternal ketosis is due to deficient intake of.....
a. Protein
b. Carbohydrate
c. Fat
d. Salt

Ans.
1114. d
1115. b
1116. a
1117. c
1118. a
1119. d
1120. a
1121. d
1122. c
1123. b
1124. a
1125. a
1126. d
1127. d
1128. c
1129. d
1130. a
1131. c
1132. d
1133. b

Scanned with CamScanner

1134. False pregnancy is .....
a. Striae gravidarum b. Pseudocyesis
c. Linea nigra d. Striae albicans

1135. What is the duration of pregnancy in human being?
a. 10 lunar month b. 9 calendar month +7 days
c. 40 weeks d. All of the above

1136. A couple with one child had been trying, without success for several years to have another child. The following terms would describe the situation.
a. Primary infertility b. Secondary infertility
c. Irreversible infertility d. Sterility

1137. Management of mastitis includes .....
a. Analgesics b. Breast support
c. Antibiotics d. All of the above

1138. A client with a prolapse uterus is scheduled for a vaginoplasty. Preoperatively the nurse may expect to
a. Encourage ambulation
b. Apply moist compress
c. Elevate the foot of the bed
d. Manipulate the procidentia

1139. Early identification of cervical cancer can be done by
a. HPV vaccine b. Colposcopy
c. Pap smears d. Ultrasonogram

1140. Serial hCG titers is helpful to diagnose .....
a. Carcinoma cervix b. Choriocarcinoma
c. Molar pregnancy d. Both B and C

1141. The main nursing diagnosis for a 35-year-old female client who has undergone a total vaginectomy is
a. Social isolation b. Altered body image
c. Sexual dysfunction d. Altered coping

1142. The most common treatment modality for vaginal cancer is
a. Chemotherapy b. Radiotherapy
c. Surgery d. Complementary therapy

1143. Which of the following surgery is appropriate for stage I and stage II cervical cancer?
a. Bilateral salpingo-oophorectomy
b. Simple total abdominal hysterectomy
c. Radical hysterectomy
d. Bilateral salpigectomy

1144. Which of the following clinical manifestations suggests the presence of vulvo-vaginal candidiasis?
a. Mucoid discharge and redness
b. Multiple ulcerative lesions with pruritus
c. Greenish yellow discharge and pruritus
d. Curdy discharge, moist reddened skin and pruritus

1145. Which instrument used for dilatation of cervix during D and E procedure?
a. Manual vacuum aspiration syringe
b. karman's cannula
c. Laminaria tent
d. Uterine curette

1146. Indications for craniotomy include .....
a. Hydrocephalus
b. Interlocking head of twins
c. Cephalic presentation producing obstructed labor with dead fetus
d. All of the above

1147. The benign growth in the muscle fibers of the uterus is called as
a. Myoma b. Cyst
c. Congenital anomaly d. Uterine prolapse

1148. Highly contagious perinatal infection among the following is .....
a. Pneumococci pneumonia
b. Hepatitis B
c. HIV- AIDS
d. Herpes simplex virus (HSV)

1149. Traits are passed on from parents to their offspring by:
a. Genes b. Chromosomes
c. Hormones d. Enzymes

1150. Among the following, which of the following age group women are most vulnerable for vulvar cancer?
a. 45–60 years b. 60–70 years
c. 70–80 years d. Above 80 years

1151. The therapeutic uses of laparoscopy are:
a. Treatment of endometriosis
b. Tubal ligation
c. Ectopic pregnancy
d. All of the above

1152. Indications for hysteroscopy is .....
a. Investigation of the cause of irregular bleeding per vaginum
b. Cervical stenosis
c. Dysmenorrhea d. Vaginal fistula

1153. Low progesterone level can be seen in .....
a. Ectopic pregnancy b. Multiple gestation
c. APH d. PPH

1154. Most common organism responsible for mastitis is .....
a. Streptococcus b. Staphylococcus aureus
c. Meningococcus d. Pneumococcus

1155. "Phlegmasia alba dolens" is found in:
a. Breast complication
b. Deep vein thrombosis
c. Placenta previa
d. Pulmonary embolism

1156. A surgical procedure in which the entire breast and axillary lymph nodes are removed is termed as
a. Radical mastectomy
b. Lobectomy
c. Radical mastectomy with lymphadenectomy
d. Lumpectomy

1157. The most common complication after a mastectomy is:
a. Haemorrhage with pain
b. Wound drainage
c. Wound infection
d. Oedema and stiffness of the arm

1158. Which of the following conditions may be caused by a gonococcal infection?
a. Bartholin's cyst
b. Infertility
c. Pelvic inflammatory disease
d. All of the above

1159. Pelvic inflammatory disease can be caused by all of the following EXCEPT
a. Illegal abortion
b. Sexually Transmitted Infections.
c. Uterine leiomyoma
d. The insertion of an intrauterine contraceptive device.

1160. Oxytocin cause all of the following except:
a. Contraction of uterine muscles
b. Milk ejection
c. Lactogenesis
d. Myoepithelial cell contraction

Ans.

1134. b
1135. d
1136. b
1137. d
1138. b
1139. c
1140. d
1141. c
1142. c
1143. c
1144. d
1145. c
1146. d
1147. a
1148. d
1149. a
1150. b
1151. d
1152. d
1153. a
1154. b
1155. b
1156. a
1157. d
1158. d
1159. c
1160. c

Scanned with CamScanner

1161. Predisposing factor for developing cervical cancer is:
a. 45 years old nullipara
b. 45 years old multipara
c. 36 years old who had first child at 22 years
d. 30 years old who is on oral contraceptives

1162. Cancer of the cervix is caused by _____ infection
a. Treponema pallidum
b. Trichomonas vaginalis
c. Neisseria gonorrheae
d. Human papillomavirus

1163. Health education regarding STD include .....
a. Avoid multiple sexual partners
b. Always use barrier technique
c. Regularly screen for STD
d. Use different positions during intercourse

1164. Commonly used diagnostic test for infertility among females is .....
a. Ultrasonography
b. Hysterosalpingogram
c. Pap smear
d. Postcoital studies

1165. Most common hernia in female is .....
a. Umbilical hernia
b. Indirect inguinal hernia
c. Hiatal hernia
d. Incisional hernia

1166. Position given to the patient during vaginal surgery increases the risk for .....
a. DVT
b. Pulmonary edema
c. Dysrhythmia
d. Jaundice

1167. Diagnostic method for determining whether the fallopian tubes in the human female are occluded is .....
a. Rubin's test
b. stress test
c. Ballot test
d. Homan's test

1168. Characteristic of vaginal discharge during vaginitis is .....
a. Profuse and purulent
b. Watery
c. Pus stained
d. Blood stained

1169. Which among the following contraceptive is associated with lowest risk of transmitting sexually transmitted disease in women?
a. Copper T
b. Condom
c. Injectable hormonal supplements
d. Oral contraceptives

1170. Treatment for gonorrhea includes both ceftriaxone and doxycycline, because .....
a. To prevent drug resistance
b. To cure the disease completely
c. Single drug is not successful
d. Chance of coexisting chlamydial infection

1171. Which one of the following anti-tuberculosis drugs cannot be given during pregnancy? *(AIIMS Raipur No 2019)*
a. Rifampicin
b. Ethambutol
c. Streptomycin
d. INH

Explanation: Rifampicin, INH and ethambutol are safe during pregnancy. Streptomycin can cause harmful effects in the fetus as it readily crosses the placental barrier.

Ans.
1161. b
1162. d
1163. a
1164. b
1165. b
1166. a
1167. a
1168. a
1169. b
1170. d
1171. c

SYNOPSIS

GROWTH AND DEVELOPMENT

Growth

It denotes the net increase in size or mass of tissue. It is a quantitative measurement.

Development

It specifies the maturation of function. It is a qualitative measurement.

Stages of Growth and Development

Prenatal Period

Ovum	0–14 days after conception
Embryo	14 days to 8 weeks
Fetus	8 weeks to birth (8–40 weeks)

Postnatal Period

Neonate/newborn	0–28 days
Infancy	29 days - 1 year
Toddler	1-3 years
Pre-school child	3–6 years
School going child	6–10 years (girls) 6–12 years (boys)
Adolescent	puberty–adulthood
Early adolescent	12–14 years
Middle adolescent	14–16 years
Late adolescent	16–20 years

Factors Affecting Growth and Development

- Age
- Race
- Genetic factors
- Antenatal factors
- Natal factors
- Nutritional factors
- Hormonal factors
- Environmental factors (Infections, illness, trauma to growing part of bones)
- Social factors (Socioeconomic class, cultural habits, education of parents, education of child, psychological factors and psychosocial factors)
- Sex
- Biorhythm
- Seasonal variation

Principles of Growth and Development

- Growth and development in children is a continuous orderly process.
- Growth pattern of every individual is unique.
- Different body tissue grows at different rate
- Development is a continuous process.
- Development depends upon the maturation of nervous system.
- The sequence of attainment of milestone is same in all children.
- The process of development progresses is in cephalocaudal direction and proximodistal direction.
- Certain primitive reflexes have to be lost before attainment of relevant milestone.
- The initial disorganized mass activity is gradually replaced by specific and willful actions.
- Development depends on maturation and learning.

WEIGHT

The average weight of a neonate is 3 kg. In Indian children 2.5 to 3.5 kg weight of neonate is considered as normal.

In the first few days after birth newborn loses extracellular fluid equivalent to 10% of the body weight. So, there will be slight decline in the birth weight of the baby. The usual pattern of gaining weight is shown in the table.

Table 1 Average weight chart for children

Age of the baby*	Weight of the baby*
Birth	X
5–6 months	2x
1 year	3x
2 years	4x
3 years	5x
5 years	6x
7 years	7x
10 years	10x

(*approximate values are given in the table)
'x' denotes birth weight of the baby.

Weight between ages 3 months and 12 years can be calculated by using Weech's formula;

3-12 months:

$$\text{Expected weight (kg)} = \frac{\text{Age in months} + 9}{2}$$

1–6 years:

$$\text{Expected weight} = (\text{Age in years} \times 2) + 8$$

7–12 years:

$$\text{Expected weight (kg)} = \frac{(\text{Age in years} \times 7) - 5}{2}$$

An easy formula to calculate weight in children between 2 and 12 years is

$$\text{Weight (kg)} = \text{Age}\ \frac{(\text{Age in years} + 3) \times 5}{2}$$

Scanned with CamScanner

LENGTH/HEIGHT

Table 2 Length/Height

Age of the baby*	Length/height of the baby*
Birth	50 cm
3 months	60 cm
6 months	65 cm
9 months	70 cm
1 year	75 cm
2 years	90 cm
4 years— Double Triple 23 yr	100 cm

(*approximate values are given in the table)

After 4 years a child gains approximately 6 cm height every year until 12 years of age.

HEAD CIRCUMFERENCE (HC)

Table 3 Head circumference for age

Age	Head circumference (cm)
At birth	34-35
2 months	38
3 months	40
4 months	41
6 months	42-43
1 years	45-46
2 years	47-48

- Head circumference is measured by placing tape over occipital protuberance at the back and just over the supraorbital ridge and glabella in front.
- Increased head circumference: Hydrocephalous, Macrocephaly
- Decreased head circumference: Microcephaly

CHEST CIRCUMFERENCE (CC)

- The CC is about 3 cm less than the HC at the time of birth (31 cm approx.)
- HC and CC become almost equal by 1 year of age and after that CC exceeds the HC.
- CC is measured at the level of nipples in mid inspiration.
- >5 years age - measure in standing position
- 5 years or below: measure in lying position

MID UPPER ARM CIRCUMFERENCE (MUAC)

At birth, average MUAC is about 9-11 cm in normal newborn baby

- At 1 year it is 12–16 cm
- At 1–5 year it is 16–17 cm
- At 12 years it is 17–18 cm
- At 15 years it is 20–21 cm

Arm Span (Wing Span)

- It is the distance between the tips of the middle finger of both arms when they are outstretched at right angles to the body. The arm span is 1–2 cm less than height of children below 5 years and by 10–12 years both will be equal. Then arm span exceeds the height.
- Arm span is greater than height in:
  - Marfan syndrome, Klinefelter syndrome, Homocystinuria
- Arm span is less than height in:
  - Achondroplasia, cretinism

SKIN FOLD THICKNESS (SFT)

- Instrument used for measurement is Lange's or Harpenden's skin-fold calipers.
  - It holds a fold of arm over triceps area on the left side
  - Measure the area between thumb and index finger
  - Triceps skin fold are most popular
  - Ratio of total body water and body weight is a more accurate index of body fat.

ERUPTION OF TEETH

1C PM
2 1 0 2
2 1 2 3

Primary Teeth

The primary dentition consists of 20 teeth. There are four incisors (two central and two lateral), two canines and four molars in each jaw.

Table 4

Age	Eruption
Birth	Nil
8–12 months	Central incisors
9–13 months	Lateral incisors
13–19 months	First molar
16–22 months	Canines
25–33 months	Second molars

Permanent Teeth

Table 5

Age (Years)	Eruption
6 years	First molars
7–8 years	Central and lateral incisors
9 years	First premolar
10–11 years	Second premolar
11–12 years	Canines
12-13 years	Second molars
17–22 years	Third molars (wisdom teeth)

DEVELOPMENTAL MILESTONES IN FIRST TWO YEARS OF LIFE

Table 6

Age in months	Milestones
Gross motor	
2 months	Holds Head steady while sitting
3 months	No head lag Self-discovery of hands
4 months	Asymmetric tonic neck reflex disappears
6 months	Sits without support
6.5 months	Roll back to stomach
12 months	Walks alone
16 months	Runs
Fine motor	
3.5 months	Grasps rattle
4 months	Palmer grasps disappears Reaches for objects
5.5 months	Objects are transferred from hand to hand
8 months	Thumb-finger grasp
12 months	Turns pages of books
13 months	Scribbles
15 months	Builds tower of 2 cubes
22 months	Build tower of 6 cubes
Communication and Language	
1.5 months	Smiles
6 months	Monosyllabic babbles
7 months	Follows one step command with gesture
10 months	Follows one step command without gesture Says "mama" or "dada"
Points to objects	
12 months	Speaks first real word
15 months	Speaks 4–6 words
18 months	Speaks 10–15 words
19 months	Speaks two word sentences
Cognitive	
2 months	Stares momentarily at spot where object disappears
4 months	Self-discovery, cause and effect
8 months	Bangs two cubes Uncovers toy which was hidden
12 months	Egocentric symbolic play
17 months	Uses stick to reach toy Pretends to play with doll

NEW BALLARD SCALE (MATURATION ASSESSMENT SCALE)

- It is frequently used scale for assessment of the gestational age, developed by Ballard, Khoury and others. It assesses six external physical and six neuromuscular characteristics.
- It can be used in newborns as young as 20 weeks of gestation.
- It has two components
  - Neuromuscular maturity
  - Physical maturity.

Components of Neuromuscular Maturity

- Posture
- Arm recoil
- Scarf sign
- Square window
- Popliteal angle
- Heel to ear.

The components in neuromuscular maturity can be easily remembered with the help of SHArPPS

S — Square window
Ar — Arm recoil
P — Posture
H — Heel to ear
P — Popliteal angle
S — Scarf sign

Components of Physical Maturity

- Lanugo
- Skin
- Plantar surface
- Breast
- Ear
- Genitals: Male, female

LS PE BG

GROWTH CHARTS

If the growth measurements are recorded in a child over a period of time and are plotted on a graph, the deviation in the growth profile can be easily interpreted. This is a good tool to diagnose deviation of growth from normal. Growth chart is also known as "road to health chart."

Use of Growth Charts

- Growth monitoring
- Diagnostic tool
- Tool for action
- Tool for evaluation
- Tool for teaching.

Figure 1 ■ Growth chart

THEORETICAL FOUNDATIONS OF PERSONALITY DEVELOPMENT

Psychosexual Development (Sigmund Freud)

- Defined the terms Id, Ego and Superego
- Id is pleasure principle, ego is based on reality and superego is based on perfection.
- Freud considered sexual instinct to be significant in personality development.
- During childhood certain regions of the body assume a prominent psychological significance as the source of the pleasure and new conflicts gradually shift from one part of the body to another at particular stage of development
- Birth to 1 year (Oral stage): Infant's pleasure centers on mouth
- 1 to 3 years (Anal stage): Child's pleasure focuses on anus
- 3 to 6 years (Phallic stage): Child's pleasure focuses on genitals
- 6 years to puberty (Latency stage): Child represses sexual interest and develops social and intellectual skills
- Puberty to death (Genital stage): A time of sexual re-awakening; source of sexual pleasure becomes someone outside of the family.

Psychosocial Development [Erikson]

- Erikson described eight stages of development
- Each stage is characterized by a psychosocial crisis, representing a conflict between the individual and society
- The progression to the next stage depends on the resolution of these conflicts
- Out of eight stages only five are related to the childhood.

Erikson's Stages of Personality Development

For details of Erikson's stages of personality development please "Refer Synopsis of Psychiatric Nursing" (Page No 562)

Moral Development (Lawrence Kohlberg)

- Moral development is based on cognitive development theory.
- It consists of three major levels (preconventional, conventional and postconventional) each with two distinct stages.
- Kohlberg's theory allows for prediction of behavior, but pays little attention to individual differences.

Scanned with CamScanner

Spiritual Development (James W Fowler)

- Related to the moral and ethical portion of children's self-concepts.
- Fowler (1974) has identified 7 stages in development of faith, five of which are parallel and closely associated with cognitive and psychosocial development in childhood.

Stages

- Stage 0: Undifferentiated
- Stage 1: Intuitive—projective faith
- Stage 2: Mythical—literal faith
- Stage 3: Synthetic—convention
- Stage 4: Individuating—reflective
- Stage 5: Conjunctine
- Stage 6: Universalizing

Development of Logical Thinking (Jean Piaget)

Piaget believed that there are four stages in the development of logical thinking.

- **Birth to 2 years of age (Sensorimotor stage):** The infant constructs an understanding of the world by coordinating sensory experiences with physical actions: progressing from reflexive, instinctual action at birth to the beginning of symbolic thought towards end of the stage.
- **2–7 years of age (Preoperational stage):** The child begins to represent the world with words and images. These words and images reflect increased symbolic thinking and go beyond the connection of sensory information and physical action.
- **7–11 years of age (Concrete operational stage):** The child can now reason logically about concrete events and classify objects into different sets.
- **11–15 years of age through adulthood (Formal operational stage):** The adolescent reasons in more abstract idealistic and logical ways.

NEONATAL REFLEXES

Table 7 Reflexes of a normal neonate

Reflexes	Stimulation	Response	Duration
Blinking	Flash of light or puff of air	Closes eyes	Permanent
Rooting	Cheek stroked or side of mouth touched	Turns toward source, opens mouth and sucks	Disappears at 3–4 months
Sucking	Mouth touched by object	Sucks on object	Disappears at three to four months (3-4)
Grasping	Palms touched	Grasps tightly	Weakens at 3 months; disappears at a year palmar grasp disappeared by 3–4 months and plantar grasp by 8 months
Tonic neck	Placed on back	Makes fists and turns head to the right	Appear at 2 months and disappear at 3–4 months
Stepping	Infant held upright with feet touching ground	Moves feet as if to walk	Disappears at 3–4 months
Swimming	Placed face down in water	Makes coordinated swimming movements	Disappears at 6–7 months
Babinski	Sole of foot stroked	Fans out toes and twists foot in this is known as positive Babinski which is considered as normal in children and abnormal in adult	Disappears at 9 months to 1 year
Moro	Sudden move; loud noise	Startles; throws out arms and legs and then pulls them toward body	Disappears at 3–4 months
Startle	Sudden loud noise or trapping the sternum	Elbow flexed, hand remains closed	Disappears at 4-6 months
Magnet	Child is supine examiners finger pushed against sole of foot, and the knee and hip flex and finger is withdrawn	Follows the finger	
Parachute	While on ventral suspension with sudden change of equilibrium	Causes extension of hands and legs	Disappears by 6-9 months
Landau	While in prone position, trunk is being supported	Baby exhibit some muscle tone	Disappears by 6-9 months
Trunk incurvation (Galant reflex)	In prone position and the paravertebral area is stimulated	It causes flexion of the trunk and swing his pelvis toward the touch	Disappears by 4 months

Apgar Scoring

Table 8

Features	0	1	2
Activity (Muscle tone)	Flaccid	Some flexion of extremities	Active body movement
Pulse (Heart rate)	Absent	Below 100	More than 100
Grimace (Reflex response)	No response	Grimace	Cry
Appearance (Skin color)	Blue, pale	Body pink, extremities blue	Completely pink
Respiration	Absent	Slow, irregular	Good, crying

Total Score 10

- Apgar score between 8 and 10 indicates no depression
- Apgar score between 4 and 7 indicates mild depression
- Apgar score between 0 and 3 indicates severe depression

IMMUNIZATION SCHEDULE

Table 9

Vaccine	Age	Dose	Route	Site
For Pregnant Women				
TT-1	Early in pregnancy	0.5 mL	Intramuscular	Upper arm
TT-2	4 weeks after TT-1*	0.5 mL	Intramuscular	Upper arm
TT- Booster	If received 2 TT doses in a pregnancy within the last 3 years	0.5 mL	Intramuscular	Upper arm
For Infants				
BCG	At birth or as early as possible till one year of age	0.1 mL (0.05 mL until 1 month age)	Intradermal	Left upper arm
Hepatitis B - Birth	At birth or as early as possible within 24 hours	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
Hepatitis-B 1, 2 and 4	At 6 weeks, 10 weeks and 14 weeks	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
OPV-0	At birth or as early as possible within the first 15 days	2 drops	Oral	Oral
OPV 1, 2 and 3	At 6 weeks, 10 weeks and 14 weeks (OPV can be given till 5 years of age)	2 drops	Oral	Oral
Pentavalent 1, 2 and 3	At 6 weeks, 10 weeks and 14 weeks (can be given till one year of age)	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
Rotavirus#	At 6 weeks, 10 weeks and 14 weeks (can be given till one year of age)	5 drops	Oral	Oral
IPV	Two fractional dose at 6 and 14 weeks of age	0.1 mL	Intradermal two fractional dose	Intradermal right upper arm
Measles /MR 1st Dose	9 completed months-12 months. (can be given till 5 years of age)	0.5 mL	Subcutaneous	Right upper arm
JE - 1**	9 completed months-12 months.	0.5 mL	Subcutaneous	Left upper arm
Vitamin A (1st dose)	At 9 completed months with measles-Rubella	1 mL (1 lakh IU)	Oral	Oral
For Children				
DPT booster-1	16–24 months	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
Measles/ MR 2nd dose$	16–24 months	0.5 mL	Subcutaneous	Right upper arm
OPV Booster	16–24 months	2 drops	Oral	Oral

Contd..

Scanned with CamScanner

Vaccine	Age	Dose	Route	Site
JE-2	16–24 months	0.5 mL	Subcutaneous	Left upper arm
Vitamin A*** (2nd to 9th dose)	16–18 months. Then one dose every 6 months up to the age of 5 years.	2 mL (2 lakh IU)	Oral	Oral
DPT Booster-2nd	5–6 years	0.5 mL	Intramuscular	Upper arm
TT	10 years and 16 years	0.5 mL	Intramuscular	Upper arm

*Give TT-2 Booster doses before 36 weeks of pregnancy. However, give these even if more than 36 weeks have passed. Give TT to a woman in labor, if she has not previously received TT

**JE Vaccine is introduced in select endemic districts after the campaign.

***The 2nd to 9th doses of Vitamin A can be administered to children 1–5 years old during biannual rounds, in collaboration with ICDS.

#Phased introduction, at present in Andhra Pradesh, Haryana, Himachal Pradesh and Orissa from 2016 and expanded in Madhya Pradesh, Assam, Rajasthan, and Tripura in February 2017 and planned in Tamil Nadu and Uttar Pradesh in 2017.

$Phased introduction, at present in five states namely Karnataka, Tamil Nadu, Goa, Lakshadweep and Puducherry (As of Feb' 2017)

FEEDING IN CHILDREN

Nutritional management influences immediate survival of as well as subsequent growth and development of low birth weight (LBW) infants.

Table 10

Birth weight	Preferred method of feeding
<1250 g	Baby may need I/V fluids initially, then initiate orogastric feeding gradually
1250–1500 g	Most would need spoon/paladai while some need orogastric feeding
1501–2000 g	Most babies would accept breastfeeding while some might need paladai feeding
>2000 g	Breastfeed in normal birth weight baby, but with monitoring

Breastfeeding

Frequency of Feeds

- First few weeks: 8–12 times a day during first few weeks
- Demand feeding: 1–4 hours as per demand
- By 9–12 months: 3–5 meals

Composition of Breast Milk

Table 11

Types of breast milk	Time	Appearance
Colostrum	3-4 days after birth	Yellowish and thick
Transitional milk	4 days to 10–14 days	Thinner, lighter in color
Mature milk	2 weeks after baby is delivered	Thinner
Preterm milk	When a preterm baby is delivered	
Foremilk	At the start of the feed	Watery
Hind milk	At the end of the feed	Thick

Nutrients in Breast Milk

Table 12

Component	Content/100 mL
Calories	71 kcal
Carbohydrates	7 g
Proteins	1.1 g
Fat	3.8–4.2 g
Lactose	7.0 g
Sodium Na	0.9 mEq/L
Potassium K	1.4 mEq/L
Calcium Ca	34 mg
Phosphorous	15 mg
Iron	0.05–0.1 mg/L
Zinc	120 microgram
Vitamin A	170–670 IU
Vitamin C	5.2–10 mg
Vitamin D	0.5-10 IU
Vitamin E	0.56 microgram
Vitamin K	1.5 microgram
Water	88%
Protective factors	IgA, IgG, IgM, Bifidius factor, Lactoferrin, Lysozyme, Para-aminobenzoic acid

Kangaroo Mother Care (KMC) Procedure

Positioning

- Place the baby between mothers breast in upright position
- Head turned to one side and slightly extended
- Hip flexed and abducted in frog position
- Baby's abdomen in mother's epigastrium
- Support baby's bottom

Purpose

- It is very useful for low birth weight babies.
- It helps them to gain weight, increase feeding, reduce incidence of infection and respiratory complications.
- It promotes breastfeeding and mother-baby bonding.

Scanned with CamScanner

Target High - Fifth Premium Edition

Key Points

- KMC can be done by any family member who is free from infection.
- Each session should last for at least one hour.

Figure 2 ■ Kangaroo mother care

BABY FRIENDLY HOSPITAL INITIATIVE (BFHI)

Baby friendly hospital initiative (BFHI) was launched by WHO and UNICEF in 1991, following innocenti declaration of 1990.

Ten steps to successful breastfeeding:

1. Have a written breastfeeding policy that is routinely communicated to all health care staff
2. Train all health care staff in skills necessary to implement this policy
3. Inform all pregnant women about benefits and management of Breastfeeding
4. Help mothers initiate breastfeeding with in one and half hour of birth
5. Show mothers how to breastfeed and maintain lactation, even if they should be separated from their infants
6. Give newborn no food or drink other than breast milk unless medically indicated
7. Practice rooming in that is allow mothers and infants to remain together 24 hours a day
8. Encourage breastfeeding on demand
9. Giving no artificial teats or pacifiers to breastfeeding infants
10. Foster establishment of breastfeeding support groups and refer mothers to them on a discharge from hospital or clinic.

BEHAVIORAL PROBLEMS IN CHILDREN

Behavioral disorders are conditions in which an individual experiences alterations in thinking and emotions that result in challenging behaviors.

Breath Holding Spells

- Breath holding spells are brief periods when the young children stop breathing for up to 1 minute. Commonly observed in 4-5%.
- It usually occurs when a young child is angry, frustrated, in pain or afraid
- It is child's attempt to control environment, parents/caregivers
- Provocative event—starts crying
- Cyanotic or pale
- Sometimes loss of consciousness or even seizure can occur
- Rare before 6 months, peak at 2 years and abate by 5 years
- These children require iron supplement (3 mg/kg/day) to treat anemia, because it can worsen the condition, moreover, it helps in decreasing the spell itself.

Evening Colic

- Intermittent episode of abdominal pain and severe crying in young infants who are otherwise well. It usually begins at 1-2 weeks of age, peak in 4–6 weeks and persists up to 3–4 months of age.
- Crying occur in the evening or in the afternoon.
- Diagnosis: cry >3 hours, >3 days a week, >3 weeks.

Clinical Features

- Sudden and loud cry
- Face becomes red and legs are drawn up on the abdomen
- The abdomen becomes tense
- Attack ceases when the infant becomes completely exhausted or after passage of flatus or feces.

Management

- During episode hold the child erect or prone position in the lap or on the hot water bottle
- Avoid drugs, enemas, carminatives, suppositories, etc.
- Explain the parents that child is not sick and unburden them
- They should be told that all infants are irritable, fussy and cry 2-3 hours/day
- Discourage feeding with each cry.

Thumb Sucking and Nail Biting (Onychophagy or Onychophagia)

- Repetitive ritual to cope with stress situations—infants and toddler
- Reinforced by attention from parents
- Most give up by 2 years
- If resumed at 7–8 years: Sign of stress/anxiety.

Predisposing Factors

- Developmental delay
- Neglect

Non-nutritive sucking occurs in children up to age of 3–4 years of age but if ignored children can relinquish it up to age of 4–5 years of age and even more.

It can lead to dental problem such as anterior open bite, decreased alveolar bone growth, mucosal trauma, altered growth of facial bones, etc.

Adverse Effect

- Malocclusion
- Mastication difficulty
- Speech difficulty (*D and T*)
- Paronychia and digital abnormalities.

Temper Tantrum

- It is a condition of prolonged anger reaction in a child characterized by screaming, kicking, noisy behavior or throwing himself on the ground to get his/her way from a parent or caretaker.

Scanned with CamScanner

- 18 months to 3 years
- Due to development of sense of autonomy
- Child displays defiance, or physical aggression, negativism
- Normal part of child development
- Gets reinforced when parents respond to it by punitive anger
- Child wrongly learns that temper tantrums are a reasonable response to frustration.

Management

- During the attack protect child from an injury by deviating his mind
- Tell parents to be calm, loving, firm and consistent
- Some tantrums are the result of failing to master the task. In such condition, help the child to master in simple task
- Time out.

Stranger Anxiety

- By 6–7 months, a child develops stranger anxiety
- This may last for a few months to peak around 13–15 months
- It might be an indication for later development of behavioral problem as separation anxiety.

Management

- Relaxation technique
- Slowly exposing them to stranger
  - Initially from a distance
  - Asking them to greet and slowly advance
- Reassure the parents that the behavior gradually declines
- But if persists, refer to child psychiatrist.

Stuttering/Stammering

- Defect in speech characterized by spasmodic repetition of some syllables with pauses and difficulty in pronouncing consonants
- Caused by spasm of lingual and palatal muscles.

Management

- Reassure parents that this is normal in this age group and will pass off and the IQ level of these children is normal
- They should not show undue concern and accept his speech without pressurizing him to repeat or making him conscious of his disability
- Children should be given emotional support
- Do not remind a child for the mistake and ridicule him as it will increases the stress and further aggravates the condition
- The conflict occurs between child's achievement and the parent's expectation and the child loses his confidence
- Older children with secondary stuttering should be referred to speech therapist.

PICA

- Repeated or chronic ingestion of non-nutritive substances
- Examples: Mud, paint, clay, plaster, charcoal and soil.

Management

- Screening indicated for:
  - Iron deficiency anemia
  - Worm infestations
  - Lead poisoning
  - Family dysfunction
- Treat cause accordingly
- Usually remits in childhood but can continue into adolescence.

Sleep Disturbances

Sleep Terrors

- Reassure parents about common occurrence with preschoolers
- Be with child until child is calm without interfering.

Nightmares

- Accept dream as real fear
- Sit with child, offer comfort, assurance, sense of protection
- If recurring, professional's help to be sought.

Sleep Walking (Somnambulism)

- Stay with child
- If night walking is there, do not leave child alone
- Consult physician.

Sibling Rivalry and Aggression

- Sibling rivalry is a type of competition or animosity among children, blood-related or not
- Behavior that attempts to hurt a person or destroy property
- Not similar to anger, but anger may be expressed as aggression
- Unprovoked physical attacks on children and adults, destruction of others property, frequent intense temper tantrums, extreme impulsivity, noncompliance.

Enuresis

Primary: It is the inability to control urine from infancy.
Secondary: It relapses after control has been achieved.

- Treatment options with high success rates
  - Waiting
  - Bedwetting alarm
  - Desmopressin
  - Tricyclic antidepressants
  - Oxybutynin chloride.

Encopresis

- Repeated passage of feces on inappropriate places (e.g. clothing or floor) whether voluntary or unintentional at chronological age of at least 4 years
- With constipation and overflow incontinence
- Without constipation and overflow incontinence

Learning Disability

- **Dyslexia:** Problem in reading, spelling and written expression.
- **Dysgraphia:** Inability to hold pen or pencil while writing
- **Dyspraxia:** Difficulties in activities requiring coordination and movement
- **Dyscalculia:** Difficulty in learning fundamentals of one or more basic numerical skills
- **Cluttering:** A speech fluency disorder where rate and rhythm is affected

Scanned with CamScanner

ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD)/HYPERKINETIC DISORDERS

- Affects normal behavior and impairs the ability to concentrate.
  - Inattention
  - Hyperactivity
  - Impulsivity.
- A group of disorders include lack of persistence in activities that require cognitive involvement and a tendency to move from one activity to another without completing any one together with disorganized.

Pharmacotherapy

- Stimulants used in hyperkinetic disorder
  - **Methylphenidate:** 5–40 mg daily (up to 60 mg in older adolescents).
  - **Pemoline:** 20–60 mg daily (up to 120 mg in older adolescents).
  - **Dexamphetamine:** 5–20 mg daily (up to 40 mg in older adolescents).

Conduct Disorder

- It is a psychological disorder diagnosed in childhood that presents itself through a repetitive and persistent pattern of behavior in which the basic rights of others or major age—appropriate societal norms or rules are violated.
- This behavior is often referred as antisocial behavior.

Juvenile Delinquency

A juvenile delinquent is a person who is typically under the age of 18 and commits an act that otherwise would have been charged as a crime if he/she was an adult.

Oppositional Defiant Disorder

- Oppositional defiant disorder is a pattern of disobedient, hostile, and defiant behavior toward authority figures.
- Symptoms
  - Actively does not follow adults requests
  - Angry and resentful of others
  - Argues with adults
  - Blames others for own mistakes
  - Has few or no friends or has lost friends
  - Loses temper
  - Spiteful or seeks revenge
  - Touchy or easily annoyed.

Treatment

The best treatment for the child is to talk with a mental health professional in individual and possibly family therapy. The parents should also learn how to manage the child's behavior.

NURSING CARE OF CHILDREN WITH BLOOD DISORDERS

Anemia

A condition characterized by decreased RBC or hemoglobin in the blood.

Etiology

- Decreased production of erythrocytes
- Hemolysis
- Blood loss

Classification

- Microcytic
- Normocytic
- Macrocytic

Clinical Features

- Tiredness
- Lassitude
- Easy fatigability
- Muscle weakness
- Poor feeding
- Tinnitus
- Irritability
- Lack of concentration
- Poor school performance
- Dyspnea on exertion
- Palpitations
- Pallor seen in skin, oral mucosa, palmar creases, nails, skin and conjunctiva

Complication

- Angina
- Delayed wound healing
- Loss of libido
- CCF
- Menstrual disturbances

Iron Deficiency Anemia

Most common cause of anemia in children.

Clinical Features

- Hemic murmur present
- Koilonychias (spoon shaped nails)
- Platonychia (flat nails)
- Hepatosplenomegaly
- Pica

Treatment

- Elemental iron 1–2 mg/kg thrice daily for 3–6 months
- **Parenteral iron therapy:** Iron dextran, ferric gluconate (used for dialysis patients)

Megaloblastic Anemia (Macrocytic Anemia)

Characterized by presence of large RBC with nuclear dysmaturity in the blood.

Clinical Features

- Early sign of neurological manifestations; Loss of position and vibration sense
- Paresthesia
- Shiny, glazy, beefy red tongue
- Memory changes
- Depression

Scanned with CamScanner

Treatment

100 microgram of cyanocobalamin or hydroxocobalamin is given three times a week till Hb is normal followed by 100 microgram IM weekly and then monthly

Pernicious Anemia (Biermer Anemia/ Addison Anemia, Addison-Biermer Anemia)

- First described by Thomas Addison
- It is caused due to lack of intrinsic factor

Treatment

- Lifelong vitamin B_{12} replacement
- Oral vitamin B_{12} supplements are given in large doses (1–2 mg/day) at about 200 times more than daily requirement.

Aplastic Anemia

Suppression of one or more blood cell lines along with hypoplastic bone marrow.

Clinical Features

- Increased risk of cardiac failure
- Infections
- Bleeding
- Red spots

Treatment

- Supportive care
- Specific treatment
- *Bone marrow transplantation*
- *Methyl prednisolone 5 mg/kg/day for 1–8 days followed by 1mg/kg/day for 9–14 days*
- *Antilympholytic globulin 40 mg/kg/day in single dose for 4 days*
- *Cyclosporine A 8 mg/kg/day for 14 days*
- *Tacrolimus for those who do not tolerate cyclosporine.*

Hemolytic Anemia

It occurs due to increased destruction or shortened life span of erythrocytes.

Table 13 Thalassemia

Features	Thalassemia major	Thalassemia intermedia	Thalassemia minor
Genetics	Homozygous forms-two mutated gene	Homozygous or Heterozygous forms; two mutated gene	Homozygous forms-one normal and one mutated gene
Age of Presentation	Early infancy	Presents by second year of life	Adolescence
Clinical features	• Pallor • Hepatosplenomegaly • Bony changes	• Anemia • Hepatosplenomegaly • Bony changes	Mild persistent anemia
Requirements of blood transfusion	By 6 months of age	Rarely needed	By adolescence
Complications	Hypersplenism, Iron overload	Iron overload cholelithiasis	Iron overload
Prognosis	Fatal in first few years of life	Normal life span	Normal life span

Table 14 Types of hemolytic anemia

Features	β-Thalassemia/Cooley's anemia	Hereditary spherocytosis/Acholuric jaundice	Sickle cell anemia/sickle cell disease
Age at onset	Around 6 months of life due to presence of fetal hemoglobin	In infancy, newborns can present with jaundice and kernicterus	Presents at birth but usually presents by 2–4 months of age.
Clinical features	• Progressive pallor • Jaundice • Irregular fever • Hemolytic facies • Skeletal changes • Hepatosplenomegaly	• Jaundice • Anemia • Splenomegaly	• Fatigue • Abdominal pain • Bone pain • Jaundice • Splenomegaly in early stages • Clubbing
Treatment	Blood transfusion Stem cell transplantation	Splenectomy	Packed cell transfusion for aplastic crisis Prevention of complications

Immune Thrombocytopenic Purpura (ITP)

Definition

It is a bleeding disorder. Immune thrombocytopenia is a type of thrombocytopenic purpura defined as isolated low platelet count with normal bone marrow and the absence of other causes of thrombocytopenia. It causes a characteristic purpuric rash and an increased tendency to bleed.

Scanned with CamScanner

Clinical Features

- Sudden onset of petechiae or purpura
- Early manifestation is menorrhagia at menarche
- Bleeding from mucus membranes

Treatment

- Prednisolone 1-4 mg/kg/day for 2–3 weeks
- In severe cases methylprednisolone 30 mg/kg/day for 3 days
- IVIG 1 g/kg/day for 5 days
- Splenectomy

Hemophilia

It is also an inherited bleeding disorder.

Types

- Hemophilia A (factor VIII deficiency)
- Hemophilia B (factor IX deficiency)
- Hemophilia C (factor XI deficiency)

Clinical Features

- Hemarthrosis
- Hematuria
- Gastrointestinal bleeding
- Easy bruising

Treatment

- Factor therapy

NURSING CARE OF CHILDREN WITH GASTROINTESTINAL DISORDERS

Diarrhea

It is a symptom that results from disorder involving digestive, absorptive, and secretary function.

- **Viral:** Rotavirus
- **Bacteria:** *E. coli*
- Cholera 5–10%
- Shigella and Salmonella 3–7%
- *C. jejuni, Y. enterocolitica, E. histolytica, Giardia lamblia* rarely.

Table 15 Nature of stools and causes of Diarrhea

Nature of stools	Possible causes of diarrhea
Watery stools	Secretory diarrhea Rota virus infection
Rice water stools	Cholera
Foul smelling stools	Fat malabsorption
Blood stained stools	Dysentery due to Shigella, *E-coli*

- *Complications:* Dehydration and metabolic acidosis.
- *Management:* Rehydration therapy with ORS and IV fluids.

Table 16 Composition of ORS

Contents	Grams/liter
Sodium chloride	2.6
Glucose anhydrous	13.5
Potassium chloride	1.5
Trisodium citrate dihydrate	2.9

Constipation

- It may also be defined as painful bowel movements, which are often blood streaked, or include the retention of stool, with or without soiling, even with a stool frequency of more than three stools per week
- Obstipation: Having extremely long intervals between defecation
- Encopresis: Constipation with fecal soiling.

Treatment

Digital evacuation, Irrigation with hypertonic solution. Early surgical intervention in case of meconium ileus.

Hirschsprung's Disease (Congenital Aganglionic Megacolon)

Congenital disorder of nerve cells in lower colon. In this condition ganglionic cells are absent because of that peristaltic movement will be absent and leads to large intestinal obstruction that cause difficulty while passing stool.

Diagnosis

- History and physical examination
- Barium enema (X-ray)
- Rectal biopsy—absence of ganglionic cells in bowel mucosa.

Management

- Surgical intervention: Colostomy, pull-through procedure and resection

Gastroesophageal Reflux Disease (GERD)

- The cardiac sphincter and lower portion of the esophagus are weak, allowing regurgitation of gastric contents back into the esophagus.

Diagnosis

- Assess pH of secretions in esophagus if <7.0 indicates presence of acid
- Also diagnosed using barium swallow and visualization of esophageal abnormalities
- Scintigraphy (to assess gastric emptying)
- Management is Nissen Fundoplication
- The stomach fundus is wrapped around the distal end of the esophagus
- Complications include breakdown of the wrap, small bowel obstruction, gas bloat syndrome, infection, retching (peristalsis is reversed) and dumping syndrome.

Scanned with CamScanner

Medications

- **H_2 histamine receptor antagonists (decrease acidity)—reduce gastric acidity:** Zantac and Pepcid
- **Proton pump inhibitors (decrease acidity and increase in lower esophageal sphincter tone):** Prevacid, Prilosec, omez.
- **Gastric emptying, prokinetic agents:** Reglan.

Irritable Bowel Syndrome

- Irritable bowel syndrome is a symptom based diagnosis characterized by chronic abdominal pain, discomfort, bloating and alteration of bowel habits
- Fiber supplements
- **Laxatives:** Constipation can be treated with laxative medications
- **Antispasmodics:** Hyoscine, cimetropium and pinaverium
- **Antidepressants:** Tricyclic antidepressants and selective serotonin reuptake inhibitors (SSRI)
- Probiotic.

Necrotizing Enterocolitis (NEC)

- An acute inflammatory disease with a multifactorial etiology, characterized by variable damage to the intestinal tract ranging from mucosal injury to full-thickness necrosis and perforation
- Bacterial infections of injured gut with *E. coli, Klebsiella, Pseudomonas or Salmonella*
- Preterm babies are predominantly affected in the 1st week of life.

Risk Factors

- Prematurity.
- Xanthine derivatives, such as theophylline and aminophylline, slows gut motility and produce oxygen free radicals during their metabolism to uric acid
- Indomethacin is used to treat PDA, it may cause splanchnic vasoconstriction leading to impaired intestinal integrity
- Vitamin E is used to treat retinopathy of prematurity, is known to impair leukocyte function and has been associated with NEC.

Appendicitis

- Inflammation of the lumen of the appendix which becomes quickly obstructed causing edema, necrosis and pain
  - **Positive Rovsing's sign:** Palpation of left lower quadrant of abdomen increases pain in the right lower quadrant. This indicates appendicitis.
  - **Pain at McBurney's point:** Finger pressure on McBurney's point (midway between superior iliac spine and umbilicus) elicits a major pain response from patients with acute appendicitis.

Inflammatory Bowel Disease (IBD)

- IBD refers to two forms of chronic intestinal inflammation: Ulcerative colitis (UC) and Crohn's disease (CD).
- CD is more disabling, has more serious complications and less effective medical and surgical treatment than UC.
- UC can be cured with a colectomy.

Crohn's Disease/Regional Enteritis

- Chronic inflammatory process of any part of GI from the mouth to anus but most often affects the terminal ileum.

Ulcerative Colitis

- UC is a disease characterized by remitting and relapsing inflammation of the large intestine. Inflammation affects the mucosa and submucosa and involves continuous segments along the length of the bowel.

Pyloric Stenosis

- The pylorus muscle which is at the distal end of the stomach becomes thickened causing constriction of the pyloric canal between the stomach and the duodenum and obstruction of the gastric outlet of the stomach.
- **4 Ps of Pyloric stenosis**
  - Punny infant
  - Projectile vomiting
  - Palpable olive shaped mass
  - Peristaltic movement highly invisible.
- **Surgery:** The definitive treatment of pyloric stenosis is with surgical pyloromyotomy known as Ramstedt's procedure (dividing the muscle of the pylorus to open up the gastric outlet).
- Bowel "telescopes" within itself.

Intussusception

Three types intussusception are:

- Colocolic
- Ileocolic
- Ileo-Ileo

Clinical Features

- Failure to pass meconium within 48 hours of delivery
- Green or brown vomitus
- Ribbon like stools

Diagnosis

- Suction rectal biopsy is current international gold standard diagnosis
- Collapsible telescopes sign seen USG

Treatment

- Colostomy

Lactose Intolerance

Inability to tolerate the sugar found in dairy products as a result of an absence or deficiency of enzyme lactase.

Management

- Lactose intolerance can be diagnosed by eliminating lactose from the diet, milk challenge, breath test, blood glucose test, stool acidity test, and intestinal biopsy
- Reducing the amount of lactose in the diet
- Capsule or tablets of lactase are available to take with milk-containing foods
- Calcium and vitamin D supplements.

Celiac Disease

- It is an autoimmune disease
- Inability to fully digest gliadin, which is a by-product of the protein gluten. Also called as *gluten induced enteropathy, gluten-sensitive enteropathy, celiac sprue*

Scanned with CamScanner

Treatment

- Lifelong gluten free diet is advised
- Rice can be used instead of wheat, barley and rye

Short Bowel Syndrome

- Short bowel syndrome is the result of the alteration of intestinal digestion and absorption that occurs following extensive bowel resection.
- The primary symptom is diarrhea.

Cleft Lip and Cleft Palate

- CL—Failure of maxillary and median nasal processes to fuse during embryonic development
- CP—Midline fissure of the palate—failure of the two sides to fuse
- Cleft lip is also known as cheiloschisis
- Cleft palate also known as palatoschisis
- Surgical repair of cleft lip is known as cheiloplasty
- Surgical repair of cleft palate is known as palatoplasty.

Management

- All these measures focus on ways to decrease aspiration.
- Prevent trauma to suture line
  - Logan's bow to protect site
  - Do not allow to suck
  - Maintain upper arm restraints
  - Position supine
  - No hard objects in mouth
- Reduce pain
- Prevent infection
  - Cleanse suture lines as ordered—rinse with water after each feeding
  - Call doctor for any swelling or redness.

Diaphragmatic Hernia

- A defect or hole in the diaphragm allows the intestine to push through the muscle, squeezing the lungs and preventing them from developing properly
- Holes can develop on either side of the diaphragm, but they are most common on left side.

Omphalocele and Gastroschisis

Herniation of abdominal viscera outside the abdominal cavity through a defect in the abdominal wall to the side of the umbilicus.

Umbilical Hernia

- It is an outward bulging (protrusion) of the abdominal lining or part of the abdominal organ through the area around the belly button.

LYMPHOMA

Hodgkin's Lymphoma (HL)

- It is a type of blood cancer which starts from cells in the lymphatic system
- Characterized by progressive enlargement of lymph nodes
- Disease is considered as unicentric in origin and has predictable pattern of spread by extension to contiguous nodes.

Clinical Features

- Painless cervical/supracervical lymphadenopathy (80%)
- Mediastinal lymphadenopathy (50%)
- Axillary/inguinal lymphadenopathy—less common
- At onset in children—ANC is normal
- Anemia—presence of advanced disease
- B symptoms
  - Unexplained loss of >10% of body weight within 6 months before diagnosis
  - Unexplained fever >38°C × 3 consecutive days
  - Drenching night sweats
- Nonspecific changes in the peripheral blood
- Neutrophilic leukocytosis
- Lymphopenia
- Eosinophilia
- Monocytosis.

Non-Hodgkin's Lymphoma (NHL)

Etiology

- Previous chemotherapy of HL
- Associated immunodeficiency and DNA repair deficiency
- X-linked lymphoproliferative disorder (Ataxia telangiectasia)
- AIDS, organ transplantation
- Infection with malaria and Epstein-Barr virus.

Burkitt's Lymphoma

- B cell lymphoblastic lymphoma which occurs in endemic and sporadic forms.

CARE OF A CHILD WITH RESPIRATORY DISORDERS

Nasopharyngitis/Common Cold

- **Agents:** Adenovirus, influenza, rhinovirus, Para influenza, respiratory syncytial virus (RSV)
- **Mode of transmission:** Droplet infection
- **Predisposing factors:** Chilling, exposure to cold air, overcrowding, allergy.

Clinical Features

Fever, thin nasal discharge and irritability, cervical lymph node enlargement, nasal obstruction and respiratory distress. Serous otitis media and congestion of tympanic membrane, dry hacking cough, excessive lacrimation. Lasts for 3 days up to 2 weeks.

Acute Tonsillopharyngitis/Sore Throat

Causative agents: Viruses—Adenovirus, influenza, parainfluenza, enterovirus, EBV, prodrome of rubella and measles, group A Beta Hemolytic Streptococci, *Mycoplasma pneumonia* and *Candida albicans*.

Clinical Features

- Fever, malaise, headache, nausea, edematous, red tonsils and uvula, sore throat/refusal to feed, hoarseness, cough, rhinitis and less toxemic
- Streptococcal—cervical lymph node enlargement
- Tonsils become swollen and covered with exudates
- Acute, high fever lasting for 4–5 days.

Scanned with CamScanner

Diagnosis

- Cervical lymph node enlargement
- Absence of nasal/conjunctival congestion
- Throat swab culture and sensitivity
- Neutrophil count elevated—streptococcal infections.

Acute Lower Respiratory Tract Infections

Croup

- It is a inflammation of larynx and trachea.
- Peculiar brassy cough—main presenting symptom
- With or without (inspiratory stridor, hoarseness or respiratory distress).

Etiology

Parainfluenza, human metapneumovirus, influenza A and B, adenovirus and measles.

Acute Epiglottitis

- Supraglottitis includes both epiglottitis and inflammatory edema of the hypopharynx.
- It is considered to be a medical emergency that may result in death if not treated quickly.

Signs and Symptoms

- Trouble in swallowing
- Change in voice
- Fever
- Tachypnea

Laryngitis and Laryngotracheobronchitis

Stage I

- Ambulatory care and symptomatic Rx
- Humidity, hydration and nourishment
- Comforting measures
- Explain about signs of progression of disease.

Stage II

- Humidified cool mist
- Hospitalization and O_2 administration
- Nebulized (racemic) epinephrine (2.25%)
- Corticosteroids
- Dexa (0.3–0.6 mg/kg, single IM), then oral
- Nebulized budesonide
- Heliox.

Stage III and IV

- May require short-term ventilation

Pneumonia

Condition typically associated with fever and respiratory symptoms evidence of parenchymal involvement.

Classification

- **Lobar:** Large areas (segments) of one or both lungs are involved.
- **Broncho:** Bronchioles become clogged with thick mucopurulent mucus consolidates into patches in nearby lobes.
- **Interstitial:** Primarily occurs within the alveolar wall and interlobular tissues.

Primary Atypical Pneumonia

- Mycoplasma pneumonia and Chlamydia pneumonia
- Pneumocystis jirovecii—immunocompromised children
- Recovery from acute illness in 7–10 days.

Interstitial

- Increased bronchovascular markings
- Peribronchial cuffing and over aeration
- Patchy consolidation due to atelectasis.

Bronchopneumonia

- Diffuse bilateral pattern with increased peribronchial markings
- Small fluffy infiltrates extending into periphery
- Antibiotic is the treatment of choice.

Bronchial Asthma

Asthma is a chronic inflammatory disease characterized by paroxysmal or persistent symptoms, such as dyspnea, chest tightness, wheezing, sputum production and cough associated with variable airflow limitation and airway hyper-responsiveness to endogenous or exogenous stimuli. (Canadian asthma consensus).

Clinical Features

- Simple recurrent cough to severe wheezing.

Severe Cases

- Cyanosis
- Respiratory distress
- Hyper-resonant chest (excessive air trapping)
- Wheezing diminishes—Ominous sign
- Pulsus paradoxus
- Cardiac arrhythmias
- Severe persistent chronic case
- Barrel-shaped chest
- Elevated shoulders
- Use of accessory muscles
- Facial appearance: Flattened malar bones, circles beneath the eyes, narrow nose and prominent upper teeth.

Management Goals

- Maintenance of near normal pulmonary function
- Prevention of night time cough or wheeze with minimal chronic symptoms
- Prevention of exacerbations
- Avoiding adverse effects of medication
- Identification and elimination of exacerbating factors
- Clean and dust free bedroom
- Wet mopping of floors instead of dry dusting
- Use plain cloth sheets for curtain. Avoid heavy tapestry
- Regular/periodic cleaning of carpets, stuffed furniture, loose clothing, wall hangings and calendar

Scanned with CamScanner

- Identification and elimination of exacerbating factors
- Discourage pet animals- especially with fur
- Adolescent's—refrain from smoking
- No diet restrictions
- Avoid letting child go to attics and basements
- Avoid contact plants inside home.

Pharmacotherapy

- Bronchodilators
- **Short acting:** Adrenaline, terbutaline and salbutamol
- **Long acting:** Salmeterol, formoterol.
- Corticosteroids
- **Systemic:** Acute exacerbations.
- **Inhaled:** Budesonide, fluticasone, beclomethasone
- Mast cell stabilizers
- Nedocromil, cromolyn sodium and ketotifen
- Leukotriene modifiers
- Montelukast and zafirlukast
- Methylxanthines
- Theophylline.

Immunotherapy

- Gradual exposure to increasing quantity of allergen extract to clinically sensitive subject
- Only for those with specific allergies. For example, Grass and pollen.

Drug Delivery Devices

- Metered dose inhaler (MDI)
- Children <4 years—MDI + spacer + facemask
- Children 4–12 years—MDI + spacer
- Children >12 years—MDI directly
- Dry powder inhaler (DPI)
- Nebulizer

Status Asthmaticus—Goals

- Improve ventilation
- Decreasing airway resistance
- Relieving bronchospasm
- Correcting dehydration and acidosis
- Allaying anxiety
- Treating concurrent infections

Cystic Fibrosis (CF)-(Autosomal Recessive Disorder)

- Inherited disease that affects the cells that produce mucus, sweat and digestive juices.
- CF causes severe damage to the lungs, digestive system and other organs
- Faulty gene (CFTR) is recessive and must be inherited from both parents
- Most children of an affected women will be carriers of the disease putting their children at a higher risk of getting the disease
- Factor responsible for manifestations of the disease is mechanical obstruction caused by increased viscosity of mucous gland secretions
- Mucous glands produce a thick protein that accumulates and dilates them
- Passages in organs such as the pancreas become obstructed

- **First manifestation is meconium ileus in newborn**
- Physical findings of the CF patient
  - Clubbing of the fingers
  - Increased respirations
  - Cyanosis
  - Productive moist cough
  - Barrel chest.

Treatment

- Prevention and treatment of pulmonary infections with antibiotics
- Chest physiotherapy at least twice a day to increase sputum expectoration
- Physical exercise important adjunct
- Management of dietary supplements (enzymes with meals and snacks)
- Chest physiotherapy cupping and clapping
- Congenital noninfectious disorder of the respiratory tract.

Choanal Atresia

- Congenital failure of the nasal cavities to open posteriorly into the nasopharynx (choanae) is called choanal atresia
- Unilateral or bilateral bony (90%) or membranous (10%) septum between the nose and the pharynx
- Atresia typically becomes—Apparent when the opposite nasal passage becomes blocked due to rhinitis or adenoid hypertrophy.

Diagnosis Confirmation

- Flexible nasal endoscopy confirms the diagnosis.
- A CT scan will demonstrate the thickness of the atretic plate and whether it is a bony or membranous atresia.

Management

- Immediate management of infants with choanal atresia includes placement of an oral airway and initiation of gavage feedings.
- Surgery indicated when conservative management is ineffective in sustaining adequate respiration and nutrition.
- Definitive repair involves transnasal puncture and stenting or endoscopic resection of the posterior nasal septum through a transnasal approach with or without stenting.
- Transnasal puncture not favored due to high rate of recurrence.
- Classic, transpalatal approach is reserved for difficult or recurrent cases.
- Recurrent stenosis may occur even after successful surgery.

CARE OF CHILD WITH TRAUMA

Airway Obstruction

It is a blockage in any part of the airway

Child Breathing Spontaneously

- Open airway either by chin lift or jaw thrust maneuver with cervical spine control. If cervical spine injury is suspected then jaw thrust method is the most appropriate method.
- Clear secretions and debris from oropharynx.
- Supplemental oxygen.

Not Breathing Spontaneously

- Oropharyngeal airway—Prevents collapse of tongue posteriorly
- Endotracheal intubation

Scanned with CamScanner

- Uncuffed endotracheal tubes should be used
- Formula for Endotracheal tube size:
  - Age Based Formula = age (years)/4 + 4 mm
  - Weight Based Formula = weight (kg)/10 + 3.5 mm
- Confirm its location by auscultation and by imaging technique
- Surgical cricothyroidotomy (generally avoided in children below 12 years).

Tension Pneumothorax

- Air is drawn into the pleural space compressing the mediastinum and compromising venous return to the heart.

Treatment

- In case of respiratory or cardiac insufficiency.
- Emergent needle decompression large caliber needle into second intercostal space in the midclavicular line on the affected side.
- Definitive management is by chest tube insertion.

Open Pneumothorax

- There will be reduced chest movements, breath sounds and hyper resonance on the affected side "Sucking Chest Wound"
- Normal ventilation requires negative intrathoracic pressure
- Large open chest—wall defects immediate equilibration of intra-thoracic and atmospheric pressures.

Treatment

- Creation of a flap valve using a air tight dressing
- Chest drain is required
- Surgical exploration, debridement and repair.

Major Hemothorax

- Bleeding into the pleural space from damage to the lung vessels or chest wall
- Reduction in lung volume
- Shock and hypoxia
- Reduced chest movements
- Reduced air entry
- Reduced resonance to percussion on the side of hemothorax

Treatment

- Volume replacement
- Insertion of a large bore chest tube.

Cardiac Tamponade

- Compression of heart caused by increased intrapericardial pressure due to collection of blood or fluid in the pericardium
- Most commonly caused by penetrating trauma

Signs and Symptoms

- Diminished heart sounds
- Increased central venous pressure
- Decreased arterial blood pressure
- Narrowed pulse pressure
- Pulsus paradoxus
- Distended neck veins (when hypovolemia absent).

Treatment

- Thoracotomy
- Pericardiotomy
- Pericardiocentesis.

Pulmonary Contusion

- Injury to alveolar capillary walls cause alveolar epithelial cells to swell and slough into alveolar spaces—desquamative alveolitis
- Swollen endothelium widens the canal between capillaries, allowing for plasma to pass into alveolar spaces.

Treatment

- Early recognition
- O_2 therapy, elevation of head on bed
- Careful limitation of IV fluids
- Analgesics, chest physiotherapy
- Intubation, mechanical ventilation.

Myocardial Contusion

- Mechanism of injury-combination of deceleration forces and compression between sternum and vertebral bodies.

Treatment

- EKG and vitals monitoring
- Antiarrhythmic drugs
- Heart block-pacemaker.

BURNS

Damage to the skin that is caused by sun, heat, fire, acid, electricity or a corrosive material is called burns.

Types of Burn Injuries

- Thermal: Direct contact with heat (flame, scald and contact).
- Electrical
  - AC—Alternating current (residential)
  - DC—Direct current (industrial/lightening).
- Chemical

Classification of Burns

- Burns are classified by depth, type and extent of injury
- Every aspect of burn treatment depends on assessment of the depth and extent.

Classification of Burn Based upon Depth

- Superficial partial thickness: Only epidermis and sometimes upper portion of the dermis will be affected
- Deep partial thickness: Epidermis and upper and deeper portion of the dermis will be affected
- Full thickness burn: Epidermis, dermis and even subcutaneous tissue will be affected. These type of burns are painless because most of the time nerves are damaged.

Measurement Charts

- Rule of Nines:
  - Quick estimate of percent of burn

Scanned with CamScanner

- Lund and Browder:
  - In this method body is divided into small body areas and each area is assigned with a particular percentage and total burn percentage will be calculated
    - More accurate assessment tool
    - Useful chart for children—takes into account the head size proportion.
- Rule of Palms:
  - Good for estimating small patches of burn wound.
  - In this patient's own palm is considered as 1%. It is useful for estimating percentage of burn in scatter burn injury.

Rule of Nines

Figure 3 ■ Rule of Nines in an adult and a child

- **Lund and Browder Method (chart) for calculation of Burned Area:** Age of the child or person is taken in to consideration in this method of calculation. More useful method in pediatric burns.

Fluid Resuscitation

- **Consensus formula:**
  - **Ringer lactate (RL) or other balanced saline solution:** 2–4 mL × kg body weight × % total body surface area burned.
  - Half of the fluid need to be given in 8 hours and remaining half over next 16 hours.
- **Evans formula**
  - **Colloids:** 1 mL × kg body weight × % total body surface area burned.
  - **Electrolyte (saline):** 1 mL × kg body weight × % total body surface area burned.
  - Glucose (5% D): 2000 mL for insensible water loss.
    Day 1: Half of the fluid need to be given in 8 hours and remaining half over next 16 hours.
    Day 2: Half of the previous day's colloids and electrolyte; all insensible water loss.
- Brooke Army Formula
  - Colloids: 0.5 mL × kg body weight × % total body surface area burned
  - Electrolyte (RL): 1.5 mL × kg body weight × % total body surface area burned
  - Glucose (5%D): 2000 mL for insensible water loss.
    Day 1: Half of the fluid need to be given in 8 hours and remaining half over next 16 hours
    Day 2: Half of the previous day's colloids and electrolyte; all insensible water loss
- Parkland/Baxter Formula
  - RL: 4 mL × kg body weight × % total body surface area burned
    Day 1: Half of the fluid need to be given in 8 hours and remaining half over next 16 hours
    Day 2: Varies; colloids are added.

CHILDHOOD POISONING

Kerosene Poisoning

- A serious pediatric problem in India and other developing countries
- Most common factor affecting poisoning: Storage of kerosene in soft drink and beer bottles
- Most cases occur between 1–3 years of age
- 70% children develop symptoms
- Within 10 hours of kerosene ingestion.
- Mortality range from 2 to 10%.

Management

- O_2 therapy
- Antibiotics
- Observation for at least 24 hours till normal vital parameters.

CHILD ABUSE

- For all pediatric trauma patients
- Do a thorough examination
- Make sure they are undressed
- Gather a careful history if possible
- Ask who lives with the child
- Gather every detail about the event
- History of other injuries
- Be alarmed if story is inconsistent
- Multicountry survey to assess reasons for men committing sexual violence.

Scanned with CamScanner

CONGENITAL CARDIAC DISEASES

Pulmonary stenosis
Right ventricular hypertrophy
- ventricular septal defect
- overriding of Aorta.

CONGENITAL ANOMALIES OF NERVOUS SYSTEM

Spina Bifida (Split Spine)

Most common group of birth defects called neural tube defects (NTD). Spina bifida is a variable congenital defect in which the vertebral arch of the spinal column is either incompletely formed or absent.

It is classified as:

- Spina bifida occulta
- Spina bifida cystica
  - Meningocele
  - Myelomeningocele.

Spina Bifida Occulta

- Spina bifida occulta is the most common and mildest form of spina bifida.
- There is overlying skin covering the vertebral defect.

Spina Bifida Cystica

In this type vertebral defect is not covered and is exposed to outside environment. It has mainly two types. They are meningocele and myelomeningocele.

Meningocele

There are three main types:

- Spina bifida occulta
- Meningocele
- Myelomeningocele.

The sac is composed only of meninges and is filled with CSF. The cord and nerve roots are usually normal. There is seldom evidence of weakness of the legs or lack of sphincter control.

Myelomeningocele

- In this condition meninges, CSF and nerve roots are also involved.
- Provision of folic acid during pregnancy will help to prevent the occurrence of this condition.

Hydrocephalus

Dilatation of the cerebral ventricle or ventricles due to accumulation of fluid under pressure caused by an imbalance of CSF production and absorption.

Types of Hydrocephalus

- Obstructive or noncommunicating: Obstruction within the ventricular system
- Nonobstructive or communicating: Malfunction of the ventricular system.

Clinical Manifestation

- Large head with bulging fontanel
- Poor feeding and lethargy
- Sutural diastasis, thin and visible scalp veins
- Sun set sign (Parinaud's phenomenon)
- Crack pot resonance (Macewen's sign)
- Delayed milestones
- Cranial nerve palsies
- HC and CC discrepancies (head growth velocity >2 cm/month)
- Clinical presentation—older children
- Triad of symptoms—headache, vomiting and visual disturbances and papilledema
- Delayed motor and cognitive development
- Memory loss and decreased school performance
- Seizure with increased ICP
- Endocrine effects—Obesity, small stature and prepuberty

Medical Management

- Isosorbide 2 g/kg/6 hourly (absorption)
- Diuretic: Frusemide 1 mg/kg/day
- Mannitol
- Acetazolamide: Decrease CSF secretion
- Dose: 25–100 mg/kg/day, 2–3 divided dose.

Definitive Management

- Shunts
- Lateral ventricle to peritoneal cavity (ventriculoperitoneal shunt), pleural cavity (ventriculopleural shunt), right atrium (ventriculoatrial shunt)
- Lumboperitoneal

Scanned with CamScanner

- Ventriculostomy—3rd ventricle
- Removal by lumbar puncture
- Ventricular tapping
- External ventricular shunt.

PITUITARY GLAND

- The pituitary gland is a pea-sized gland that sits in a protective bony enclosure called the sella turcica
- Two basic divisions of the pituitary gland
  - Adenohypophysis (anterior lobe)
  - Neurohypophysis (posterior lobe)
- One more lobe is there in pituitary which is known as intermediate lobe.

Diabetes Insipidus

Clinical Manifestations

- Due to lack of ADH hormone
- Cardinal signs— polyuria (>2 L/day or >5 mL/kg/hour), polydipsia
- Infant-initial symptom-irritability that is relieved with feedings of water not milk.
- Polyuria (sleep, play, schooling), polydipsia
- Symptoms of chronic dehydration—irritability, high fever, poor feeding, growth failure
- Hypernatremia—mental function impairment.

Diagnostic Tests

- Restriction of oral fluids and observation of consequent changes in urine volume and concentration
- In DI fluid restriction will have no effect on urine formation but causes weight loss from dehydration
- If this test is positive, child should be given a test dose of injected aqueous vasopressin which should alleviate polyuria and polydipsia
- Subjective estimates of urine output and nocturia
- Measurement of 24 hours urine output
- Urine specific gravity value will be low because of diluted urine.

Management

- Central DI-Vasopressin analogues.
  - Nephrogenic di-hydrochlorothiazide–amiloride combination (1–2 mg/kg/day).

Hyperpituitarism

- Overproduction of pituitary hormones.
- Primaryhyperpituitarism—rare in children
  - Tumors- corticotropin, GH and prolactin
  - Hypothalamic hamartomas—Precocious puberty
- Secondary
  - Systemic tumors—ectopic production of releasing hormones
  - Pituitary tumors resulting from stimulation with releasing hormones or gene mutation (McCune-Albright).

Manifestations

Growth Hormone

- Prepubertal gigantism
- Acromegaly
- Diabetes mellitus
- Postpubertal hypoproteinemia.

Thyrotropin

- Hyperthyroidism
- Thyrotoxicosis
- Graves' disease.

Adrenocorticotropic Hormone (ACTH)

- Cushing's syndrome (↑ ACTH) obesity, ↑ BP
  Addison ↓ ACTH

Gonadotropins

- Precocious puberty
- Early epiphyseal closure.

Follicle-stimulating Hormone (FSH)

- Precocious puberty
- Primary gonadal failure
- Hirsutism — abnormal growth of hair on women face
- Polycystic ovary
- Early epiphyseal closure.

Prolactin

- Galactorrhea
- Functional hypogonadism.

Melanocyte-Stimulating Hormone

- Increased skin pigmentation.

Gigantism and Acromegaly

- Tumor of pituitary

Over production of GH

- Gigantism—in open epiphyses
- Acromegaly—in closed epiphyses.

Clinical Features

- Rapid linear growth—taller than peers at puberty
- Large peripheral parts of body—hands and feet
- Increased head circumference—preceding linear growth in young children
- Prominent jaw, broad nose and bushy eyebrows
- Enlarged tongue, separated teeth due to mandible growth.
- Thick skin and subcutaneous tissue
- Dorsal kyphosis
- Increased appetite
- Delayed sexual maturation
- Visual field defects and neurologic abnormalities.

Diagnostic Findings

- Elevated GH levels
- IGF-I and IGFBP-3 elevated
- CT-MRI—extent of tumor
- X-ray
  - Enlarged sellaturcica with eroded margins
  - Tufting of phalanges
  - Increased heel-pad thickness.

Scanned with CamScanner

Cretinism (child) → Hypothyrodism
Myxedema (Adult)

Management

- Partial or complete resection of pituitary
- Radiotherapy
- Bromocriptine (dopamine agonist)—10–20 mg/day
- Octreotide (long acting somatostatin analogue).

THYROID GLAND

- Secretes 2 types of hormones—Thyroid hormone T3 and T4 thyrocalcitonin
- Synthesis of thyroid gland depends on available sources of dietary iodine and tyrosine
- Main physiologic action of TH is to regulate the basal metabolic rate and thereby control the processes of growth and tissue differentiation
  - The thyroid gland is the first of the body's endocrine glands to develop, on approximately the 24th day of gestation. The gland originates as a proliferation of endodermal epithelial cells on the median surface of the developing pharyngeal floor.

Congenital Hypothyroidism

Clinical Features

- Coarse facial features (depressed nasal bridge, short forehead, puffy eyelids and large tongue) dry skin, prolonged jaundice, large fontanels, wide patent cranial sutures coarse dry, lusterless hair, cutis marmorata, bradycardia, hypothermia, hoarse cry and cold extremities
- Hypotonia, hyporeflexia, lethargy, poor feeding, constipation macroglossia, umbilical hernia and edema
- The brain is extremely sensitive to the presence of thyroid hormones from end of pregnancy until the 1st weeks of life, and if left untreated may result in irreversible mental retardation.

Management

- Thyroid replacement therapy—gradual thyroxine
- Recommended dose schedule.

Goiter

- Enlargement or hypertrophy of thyroid gland.
- May occur with deficient (hypothyroid), excessive (hyperthyroid), or normal (euthyroid).
- With Hypothyroidism
  - Fetal thyroxine synthetic defect
  - Antithyroid drug and iodides during pregnancy
  - Iodine deficiency.
  - Autosomal recessive conditions—genetic counseling-Future.
- With Hyperthyroidism
  - Endemic goiter
  - Moderate iodine deficiency—compensatory hypertrophy and hyperplasia
- Mild—noticeable with rapid growth periods and pregnancy
- Severe-decompensation—endemic cretinism
- Girls > boys
- Endemic cretinism.

Nursing Alert

- If an infant is born with a goiter, immediate precautions are instituted for emergency ventilation, such as supplemental oxygen and a tracheostomy set.
- Hyperextension of neck always facilitates breathing.

Lymphocytic Thyroiditis

- Also known as Hashimoto's disease, juvenile autoimmune thyroiditis and adolescent goiter
- Most common cause of thyroid disease in children and adolescents
- Account for largest percentage of juvenile hypothyroidism
- Disease is 4–7 times more common in girls than in boys
- It is an autoimmune disease in which the immune system reacts against a variety of thyroid antigens

Diagnosis

- Diagnosis is made by detecting elevated levels of anti-thyroid peroxidase antibodies in the serum

Treatment

- Thyroid hormone replacement.

DISORDERS OF THE PARATHYROID GLANDS

Functions- ↑ calcium level

Hypoparathyroidism

- Aplasia or hypoplasia of parathyroid gland.

Clinical Features

- Dry scaly skin
- Brittle hair
- Thin and brittle nails
- Dental and enamel hypoplasia
- Tetany
- Convulsions
- Carpopedal spasm
- Muscle cramps
- Twitching
- Paresthesia
- Laryngeal stridor
- Swings of emotions, loss of memory
- Latent tetany (↓ calcium)
  - Chvostek sign
  - Trousseau sign.

Management

- IV Ca gluconate (80 mg/kg/day)
- Adequate dietary intake of calcium (800 nmg elemental calcium).
- Vitamin D (20–40 ng/kg/day in three divided doses for 2 days).

THE ADRENAL GLANDS

- Located on the superior surface of the kidneys
- Two endocrine glands in one
  - Adrenal cortex—bulk of the adrenal gland
  - Adrenal medulla—a knot of nervous tissue within the gland.

Addison's Disease (Adrenal Cortex Destruction)

- Adrenocortical insufficiency-etiology
- Adrenoleukodystrophy (with CNS demyelination) X-linked or autosomal recessive)
- Drugs—ketoconazole, mitotane, rifampicin, phenytoin, etc.
- Acquired immunodeficiency syndrome.

(AIDS)

Scanned with CamScanner

Acute Adrenocortical Insufficiency

Etiology

- Hemorrhage into gland from trauma
- Fulminating infections
- Abrupt withdrawal of exogenous sources of cortisone
- Failure to increase exogenous supplies during stress
- Congenital adrenogenital hyperplasia of salt losing type.

Clinical Manifestation

Early Symptoms

- Increased irritability
- Headache
- Diffuse abdominal pain
- Weakness
- Nausea
- Vomiting
- Diarrhea
- Generalized hemorrhagic manifestations
- Fever
- CNS signs—nuchal rigidity
  - Seizures
  - Stupor
  - Coma
- Shock like state
- Weak, rapid pulse
- Decreased blood pressure
- Shallow respirations
- Cold, clammy skin
- Cyanosis
- Circulatory collapse.

In Newborn

- Hyperpyrexia
- Tachypnea
- Cyanosis
- Seizures
- Gland evident as retroperitoneal, palpable mass (hemorrhagic).

Diagnostic Tests

- Serum electrolyte and blood sugar test
- Plasma renin activity
- ACTH stimulation test
- Serum cortisol levels
- Estimation of ACTH levels
- Abdominal CT scan
- Estimation of antiadrenal antibodies.

Management

- Replacement of cortisol
- Replacement of body fluids to combat dehydration and hypovolemia
- Specific antibiotic therapy in presence of infection.

Chronic Adrenocortical Insufficiency

- Rare in children.

Causes

- Destructive lesion of adrenal gland or neoplasms
- Idiopathic.

Clinical Manifestations

- Neurologic symptoms
  - Muscular weakness
  - Mental fatigue
  - Irritability
  - Apathy
  - Negativism
  - Increased sleeping
  - Listlessness
- Pigmentary Changes
  - Hyperpigmentation over pressure points (elbows, knees, waist)
  - Less frequently vitiligo (loss of pigmentation)
- Gastrointestinal Symptoms
  - Dehydration
  - Anorexia
  - Weight loss
- Circulatory Symptoms
  - Hypotension
  - Small heart size
  - Dizziness
  - Syncope
  - Hypoglycemia
  - Headache
  - Hunger
  - Weakness
  - Trembling
  - Sweating

Management

- Replacement of glucocorticoids and mineralocorticoids
- Oral supplements of cortisol or monthly injections of deoxycorticosterone acetate or implantation of deoxycorticosterone acetate pellets subcutaneously every 9–12 months
- Correction of shock by fluid boluses
- Hydrocortisone at a dose of 50 mg/m² followed by 100 mg/m²/day
- Frequent monitoring of hemodynamic parameters, urine output and serum electrolytes
- Hemodynamically stable-hydrocortisone can be tapered to physiological dose 10 mg/m²/day.

Cushing's Syndrome

- A characteristic pattern of obesity with associated hypertension, as the result of abnormally high levels of serum cortisol.

ACTH Independent

- Functioning adrenocortical tumor (infants, 85% in <7 years, girls: boys—3:1)
- Primary pigmented nodular adrenocortical disease
- Nodular hyperplasia, adenoma (McCune-Albright syndrome).

ACTH Dependent

- B/L adrenal hyperplasia (older children, boys = girls).
  - Pituitary adenoma (Cushing's disease)
  - Ectopic ACTH production—rare in children.
- Cushingoid syndrome—Prolonged corticosteroids.

Scanned with CamScanner

Clinical Features

- Infants: More flagrant > older children
  - Moon facies: Round, flushed and prominent cheeks
  - Double chin, buffalo hump, generalized obesity
  - Signs of abnormal musculation
  - Hypertrichosis of face and trunk, pubic hair, deepening of voice, acne and enlargement of clitoris in girls
  - Impaired growth—ht< 3rd percentile except in virilization
  - Hypertension—May lead to heart failure
  - Increased susceptibility to infection
- Older children
  - Gradual onset of obesity
  - Deceleration or cessation of growth—short stature
  - Purplish striae on hips, abdomen, thighs
  - Delayed pubertal development amenorrhea
  - Weakness, headache
  - Deterioration in school work
  - Emotional liability
  - Hypertension
  - Renal stones

Diagnosis

- Elevated serum cortisol levels
- Elevated urinary free cortisol (>20–90 mcg/day)
- Elevated urinary 17 hydroxysteroids (>5 mg/m²/day)
- Overnight dexamethasone suppression test
- Polycythemia, lymphopenia and eosinophilia
- Serum ACTH levels
- Bone scan—osteoporosis, pathological fractures, retarded, advanced if virilization
- Absent thymic shadow—involution if excess cortisol
- Increased adipose tissue in extremities and decreased muscle mass
- MRI—pituitary tumors
- CRH stimulation test.

Management

- Unilateral adrenalectomy—benign cortical adenoma
- Subtotal adrenalectomy—bilateral adenoma
- Cushing's disease—transsphenoidal surgical removal of pituitary microadenoma
- Replacement of corticosteroid post operatively

Pheochromocytoma

- Catecholamine secreting tumor—Chromaffin cell of adrenal medulla.

Clinical Features

- Hypertension
- Headache
- Palpitation
- Pallor
- Sweating
- Nausea
- Vomiting
- Visual disturbances
- Polyuria
- Polydipsia
- Convulsions.

Diagnosis

- Increased urinary catecholamine excretion, >300 mcg/24 hours
- Elevated urinary VMA (vanillylmandelic acid)
- Increased plasma renin
- CT scan, MRI scan and arteriography.

Management

- Avoid stimuli which precipitate hypertensive crisis (preoperative palpation of mass)
- Alpha adrenergic blocking agents (prazosin, phenoxybenzamine)
- Calcium channel blockers
- Rest, nonstressful environment
- High calorie diet
- Adrenalectomy.

Congenital Adrenal Hyperplasia

- Group of autosomal recessive defects in steroid synthesis, which is characterized by deficiency of adrenocortical hormones and excess of steroid precursors on the other hand
- Most common adrenal disorder in childhood
- Most common defect is 21-hydroxylase deficiency
- **Diagnosis:** Elevated levels of 17-OHP (10,000–20,000 ng/dL, normal <90 ng/dL).
- **Treatment:** Hydrocortisone 10–15 mg/m²/day.
- Fludrocortisone—0.1 mg/day.

GONADAL HORMONE DISORDERS

Precocious Puberty

- Pubertal onset before 8 years in girls and 9 years in boys
- Development may involve all aspects pubertal development or restricted to one component of premature development (thelarche, adrenarche or menarche).

Management

- Precocious puberty in girls
  - Gonadotropin dependent precocious puberty medroxy-progestrone acetate, cyproterone and GnRH analogues
  - Gonadotropin independent precocious puberty and thyroxin replacement
  - Treatment of McCune-Albright syndrome.
- Precocious puberty in boys
  - Treatment of underlying CNS pathology and GnRH analog therapy.
- Delayed Puberty
  - Lack of secondary sexual characters by the age of 17
  - More common in boys than in girls.

Hypogonadotropic Hypogonadism

- Transient-systemic disorders such as nutritional disorders, endocrine disorders
- Permanent: Genetic, multiple pituitary hormone deficiency.

Hypergonadotropic Hypogonadism

- Gonadal dysgenesis
- Steroidogenic defects
- Ovarian insults
- Autoimmune ovarian failure

Scanned with CamScanner

- Gonadotropin resistance
- Isolated amenorrhea
- Structural malformations
- Inefficient androgen action.

Investigations

- Measurement of FSH, LH and testosterone level
- Karyotype
- Pelvic ultrasound
- Neuroimaging
- Pituitary function tests
- Prolactin level
- Thyroid profile.

Management

- Hormone replacement therapy
- Girls deferred till 12 years of age
- Boys till 14 years of age
- One of the regimen is conjugated estrogen starting at doses as low as 0.15 mg daily and titrating upwards in 6–12 month intervals to typically 0.625 mg daily
- Medroxyprogesterone acetate should be added 2 years after initiation of treatment or when withdrawal bleeding has started
- Testosterone
- Parenteral preparations are preferred over oral preparation
- CDPG–3 monthly injections of testosterone enanthate (100 mg).

DIABETES MELLITUS

Metabolic disorder that is characterized by hyperglycemia and glycosuria.

Type 1 Diabetes

- It was previously called insulin-dependent diabetes mellitus (IDDM) or juvenile-onset diabetes
- Develops when body's immune system destroys pancreatic beta cells
- This form of diabetes usually strikes children and young adults, although disease onset can occur at any age
- Risk factors for type 1 diabetes may include autoimmune, genetic, and environmental factors.

Type 2 Diabetes

- It was previously called non-insulin-dependent diabetes mellitus (NIDDM) or adult-onset diabetes
- Type 2 diabetes may account for about 90%–95% of all diagnosed cases of diabetes
- Usually begins as insulin resistance
- Type 2 diabetes is associated with older age, obesity, family history of diabetes, history of gestational diabetes, impaired glucose metabolism, physical inactivity, and race/ethnicity.

Clinical Manifestations

- Polyphagia, polydipsia and polyuria ("3 Ps")
- Unexplained weight loss
- Blurred vision, dry skin
- Lack of energy
- Diminished reflexes
- Irritability, shortened attention span
- Nausea and vomiting
- Poor wound healing
- Ketoacidosis (initially in 25%)
  - Mild-polyuria, vomiting, dehydration
  - Severe-Kussmaul's respiration, acetone breath, abdominal pain, rigidity
  - Cerebral obtundation-coma
  - Acidosis, electrolyte imbalance.

WHO-Diagnostic Criteria-DM

- Symptoms of DM plus random plasma glucose ≥200 mg/dL
- Fasting plasma glucose ≥126 mg/dL
- 2 hours plasma glucose during GTT ≥200 mg/dL
- Detection of islet cell antibodies, insulin autoantibodies.

Principles of Therapy and Monitoring

- Elimination of clinical features of uncontrolled diabetes
- Prevention of Diabetic Ketoacidosis (DKA)
- Avoidance of hypoglycemia
- Maintenance of normal growth and maturation
- Early detection of associated diseases
- Prevention of emotional disorders
- Prevention of chronic vascular complications of diabetes.

Insulin Therapy

- A combination of intermediate and short acting (2/3rd intermediate and 1/3rd short acting)
- Initially 1–1.75 units/kg/day
- 0.5 units/kg/day
- 0.8 units/kg/day.

Nutrition

- Carbohydrates: 55–60%
- Fiber: 20–35 g/day
- Protein: 15%
- Fats: 30–35%
- Micronutrients: Mg and Zn.

Sick Day Care

- Monitor blood sugar and urine ketone at every 4 hours
- Do not omit insulin even if oral intake is less
- If blood sugar >250 mg/dL—20% insulin of daily requirement as plain insulin in addition to usual insulin dose is to be given
- Ensure meal intake
- Refer to hospital if
  - Altered sensorium
  - Rapid breathing
  - Decreased urine output, excessive vomiting or anorexia
  - Persistent ketosis.

Acute Complications of Diabetes

- Diabetic ketoacidosis (DKA)
- Hyperglycemic-hyperosmolar state (HHS)—was called Hyperglycemic hyperosmolar nonketotic, syndrome (HHNS) in the past
- Hypoglycemia from too much insulin or too little glucose.

Complications of Insulin Therapy

- Lipoatrophy
- Lipohypertrophy

Scanned with CamScanner

- Dawn phenomenon
- Somogyi's phenomenon.

CARE OF CHALLENGED CHILD

Mental Retardation

Normal IQ - 91 to 110

Mild Mental Retardation

(Educable → 6th std

- IQ range from 50 to 75
- Children with mild mental retardation are not identified until after first or second grade, when academic demands increase
- By late adolescence, they often acquire academic skills at approximately a sixth grade level
- Many adults with mild mental retardation can live independently with appropriate support and raise their own families.

Moderate Mental Retardation

(Trainable edu - 2nd

- IQ range, between 35 and 50
- Most children with moderate mental retardation acquire language and communicate adequately during early childhood
- They are challenged academically and often are unable to achieve academically above second to third grade level
- During adolescence, socialization difficulties often set these persons apart, and great deal of social and vocational support is beneficial
- Can lead relatively normal lives provided they receive some level of supervision, can live in group homes with other mentally retarded people.

Severe Mental Retardation

Dependable
Don't self care

- IQ range is between 20 and 35.
- They may be able to develop communication skills in childhood and often learn to count as well as recognize words that are critical to functioning.

Profound Mental Retardation

(custody)
(injury to others)

- IQ scores of <20.
- Most individuals with profound mental retardation may be taught some self-care skills and learn to communicate their needs given if appropriate training.

DISORDERS OF RENAL SYSTEM

Nephrotic Syndrome

- It is characterized by heavy proteinuria (more than 1 g/m²/day), hypoalbuminemia (serum albumin <2.5 mg/dL) edema and hyperlipidemia.

Accompanied by

- Hyperlipidemia
- Lipiduria
- Hypercoagulability
- Sometimes hematuria.

Idiopathic NS

Classification of Idiopathic NS

- Minimal change: Steroid responsive.
- Significant: Glomerular lesions.

Causes

- Idiopathic
- Genetic
- Hepatitis B and Hepatitis C
- Penicillamine, gold, NSAIDs and heroin
- HIV, TB and malaria
- SLE
- Malignancies.

Clinical Picture

- Proteinuria
  - Proteinuria exceeding 3.5 g/24 hours
  - Albumin sensitive dip-stick reading 3+, 4+
- Nephrotic edema
- Serum albumin levels below 2.5 g/dL
- Puffiness of the face (eyes), decreases during day time but appears at abdomen and extremities
- Anasarca
- Edema of the scrotum and labia
- Weight gain
- Decreased urine output

Hypoalbuminemia

- In nephrotic syndrome, the serum concentration of albumin often is significantly low.
- When albumin appears in the urine, the patient may complain of urine frothiness.

Hyperlipidemia

- The hyperlipidemia associated with the syndrome is primarily due to abnormal lipoprotein homeostasis that results in an increase in synthesis and decrease in catabolism
- Patients usually have elevations of total plasma cholesterol, triglyceride, very-low-density lipoprotein (VLDL), and low-density lipoprotein (LDL).

Lipiduria

Excretion of lipids in the urine due to elevated lipid levels in the blood.

Hypercoagulability

- Caused by an increased urinary loss of antithrombin III, increased hepatic synthesis of fibrinogen and increased platelet aggregation
- Present with sudden onset of, flank or abdominal pain, gross hematuria, and an acute decline in renal function, but most patients are asymptomatic
- Anemia
- With progressive renal failure, anemia may result from decreased renal synthesis of erythropoietin
- Weight gain
- Puffiness of face (facial edema)
- Ascites
- Pleural effusion
- Labial or scrotal swelling
- Edema of intestinal mucosal possibly causing diarrhea, anorexia, poor intestinal absorption
- Ankle or leg swelling
- Irritability
- Easily fatigued

Scanned with CamScanner

- Lethargic
- Blood pressure normal or slightly decreased
- Susceptibility to infections
- Urine alteration (frothy, decreased volume).

Lab Findings

- Urine examination shows heavy (3 + or 4+) proteinuria
- Gross hematuria
- Hyaline and granular casts may be present
- Hypoalbuminemia
- Hypercholesterolemia
- Blood level of IgG and IgM↑
- Renal biopsy.

Management

- Prednisolone—2 mg/kg/day (maximum 60 mg) in single or divided doses for 6 weeks, followed by 1.5 mg/kg maximum 40 mg as a single morning dose on alternative days for the next 6 weeks
- Therapy with corticosteroid is then stopped.

Therapy for Relapse

Prednisolone

- Prednisolone—2 mg/kg/day until urine protein is trace or nil for 3 consecutive days (remission)
- Subsequently as a single morning dose of 1.5 mg/kg on alternate days for 4 weeks
- Treatment for a relapse usually lasts for 5–6 weeks.

Infrequent Relapse

- Three or fewer relapses a year–prednisolone at 2 mg/kg/day (single or divided doses) until remission.
- Followed by the same agent given in single morning dose of 1.5 mg/kg on alternates days for 4 weeks.
- Therapy is then discontinued.

Frequent Relapses and Steroid Dependence

- Long-term, alternate day steroids.
- Following treatment of a relapse, prednisolone is tapered to a dose of 0.3–0.7 mg/kg on alternate days, which is given for 9–18 months.
- Steroid sparing agents.
- Alternate agents are recommended if prednisolone threshold more than 0.5–0.7 mg/kg on alternate days.
- Features of corticosteroid toxicity (growth failure, hypertension and cataract appear).
- Steroid sparing agents.

Levamisole

- Dose and duration: 2–2.5 mg/kg on alternate days for 12–24 months
- Adverse effect: Flue like symptoms, neutropenia, hepatotoxicity, convulsions, skin rash.
- Monitoring: Monitor total and differential leukocyte count at every 3–4 months.
- Concomitant steroid therapy: Dose of prednisolone is tapered to 0.25 – 0.5 mg/kg on alternate days.
- Steroid sparing agents.

Cyclophosphamide

- Dose and duration: 2–2.5 mg/kg/day for 8–12 weeks
- Adverse effect: Leukopenia, alopecia, vomiting hemorrhagic cystitis, gonadal toxicity, malignancies.
- Monitoring: Cumulative dose should not exceed 168 mg/kg, repeat courses are avoided.
- Leukocyte counts should be monitored every 2 weeks.
- Cyclophosphamide is stopped if less than 4000/cu mm.
- Fluid intake should be increased and patients are encouraged to void frequently.

Cyclosporine

- A calcineurin inhibitor, is used in patients who are not benefited significantly from levamisole or cyclophosphamide, continue to relapse and show significant signs of toxicity
- The drug is administered daily along with small dose of predinosolone
- Side effects: Hirsutism, gum hyperplasia and hypertension, nephrotoxicity
- A renal biopsy is advisable before commencing treatment with these agents.

Glomerulonephritis

- Refers to disorders in which an immunologic insult triggers inflammation and proliferation of glomerular tissue with damage to glomerular basement membrane, mesangium or capillary endothelium.

Classification

- Primary— Confined to kidney
- Secondary— Part of a systemic disorder.

Depending on duration of disease onset rate of progression: Acute and chronic.

Acute Glomerulonephritis

- Characterized by relatively abrupt onset of hematuria, oliguria and edema and hypertension.
- Acute GN following streptococcal infection is the most common type in children
- Conditions presenting as acute glomerulonephritis
- Postinfectious: Streptococci, staphylococci, Hep. B, endocarditis, infected ventriculoatrial shunts
- Systemic vasculitis: SLE, polyarteritis
- Membranoproliferative glomerulonephritis
- Familial nephropathy—Alport syndrome.

Poststreptococcal Glomerulonephritis

- Caused by group A beta hemolytic streptococci
- Commonly involves school age children
- Asymptomatic cases are frequent
- Immune complexes deposited in glomerular basement membrane
- Glomerular become edematous, infiltrated with PMN leukocytes
- Occludes the capillary lumen
- Leads to decrease in plasma filtration which results in an excessive accumulation of water, sodium retention, circulatory congestion and edema.

Scanned with CamScanner

Clinical Manifestations

- Acute fluid overload
- Peripheral edema
- Pulmonary edema
- Congestive cardiac failure
- Hypertension
- Hematuria
- Proteinuria(<3 g/day)
- Renal function impairment (oliguria, elevated plasma creatinine).
- Cola Colored urine

Investigation

- Urinalysis (urine microscopy, proteinuria)
- Bacteriology (throat swab, streptozyme assay)
- Immunology (C3, C4, anti-double stranded DNA antibodies, ASO titer)
- **Renal function:** Creatinine, acid base balance, plasma proteins, calcium phosphate
- **Hematology:** Full blood count, peripheral blood film
- **Renal biopsy:** Indicated in those with heavy proteinuria, suspected crescentic GN or significant deviation from the natural course of the disease.

Treatment

Pharmacological Therapy

- **Antibiotics:** Penicillin are used to control local symptoms and to prevent spread of infection to close contacts
- **Loop diuretic:** For edema and hypertension
- **Vasodilator drugs:** Nitroprusside, nifedipine, hydralazine, diazoxide may be used if severe hypertension or encephalopathy is present
- Glucocorticoids and cytotoxic agents are of no value, except in severe cases of PSGN.

Rapid Progressive Glomerulonephritis

- Rapid progression of acute GN characterized by hematuria, edema, hypertension, oliguria, anuria and azotemia
- Extensive crescents on renal biopsy—hallmark
- Rare in children
- Treatment-corticosteroids and plasmapheresis

Management

- Regular measurement of vital signs, body weight and intake and output
- Diet: Restriction of protein, sodium, potassium
- Fluid restriction: Amount equal to insensible losses and 24 hours urine output
- Weight: Daily weight monitoring
- Diuretics: Modest edema, oral furosemide at a dose of 1–3 mg/kg, in pulmonary edema-IV furosemide—2–4 mg/kg
- Hypertension-mild HTN: Restriction of salt and water, oral antihypertensive, in severe hypertensive emergency IV nitroprusside/labetalol.

Chronic Glomerulonephritis

Clinical Features

- Persistent anemia
- Moderate to severe hypertension, edema and nocturia
- Microscopic or gross hematuria
- Bone pains and deformities.

Management

- No specific treatment
- Steroids, other immunosuppressive drugs—no benefit
- Antiproteinuric treatment with ACE inhibitors/angiotensin receptor blocker may be used to reduce heavy proteinuria and retard disease
- If renal function is severely compromised the treatment is that of chronic renal failure (CRF).

HUS

- Hemolytic-Uremic Syndrome (HUS) is a disorder that usually occurs when an infection in the digestive system produces toxic substances that destroy red blood cells, causing kidney injury
- Triad of microangiopathic hemolytic anemia (MHA), thrombocytopenia and renal failure.

D+ HUS

- Diarrheal illness that precedes HUS is caused by *E. coli* and Shigella dysenteriae.
- Cytotoxin mediated injury to the endothelium in the renal microvasculature leads to localized coagulation and fibrin deposition, finally causing damage to the endothelium.

D– HUS

- Seen at any age
- Lacks prodromal history of diarrhea or dysentery
- Predisposing factors: Drugs, cobalamin deficiency, pneumococcus or HIV virus, inherited abnormalities in the complement regulatory pathways
- Microangiopathic lesions chiefly affects interlobular arteries and results in severe HTN and progressive renal insufficiency.

Clinical Features

- Petechiae, purpura, and fever are common
- GI bleeding GI involvement may lead to symptoms of an acute abdomen with occasional perforation
- Cardiac involvement may leads to congestive heart failure (CHF) and arrhythmias
- Microinfarcts in the pancreas may cause pancreatitis or, rarely, insulin–dependent diabetes mellitus
- Ocular involvement may lead to retinal or vitreous hemorrhage.

Investigations

- Peripheral blood smears fragmented RBCs (schistocytes, burr cells and helmet cells)
- Complete blood count—(leukocytosis, ↑reticulocytes, mild fibrinolysis with slight elevation in fibrin degradation products)
- Lactate dehydrogenase (elevated) (cell necrosis)
- Unconjugated hyperbilirubinemia (platelet breakdown)
- Serum haptoglobin (decreased) (Hb binding protein)
- Urinalysis
- Coombs' test (mostly negative)
- Blood urea and creatinine (elevated)
- Stool testing
- Renal biopsy-rarely required.

Scanned with CamScanner

Imaging Studies

- Chest radiography
- Renal ultrasound
- Abdominal ultrasonography or CT scanning
- Noncontrast CT scanning or MRI of the head.

Urinary Tract Infections

- Common medical problem affecting 6–8% girls and 1.5–2% boys
- **Definitions:** Significant bacteriuria-colony count of more than 10^5 CFU/mL of a single bacterial species in a midstream clean catch sample
- **Asymptomatic bacteriuria:** Significant bacteriuria without symptoms of UTI
- **Complicated UTI:** Fever >39°, systemic toxicity, persistent vomiting, dehydration, renal angle tenderness and serum creatinine↑.

Etiology

- *E. coli*
- Klebseilla
- Enterobacter
- Proteus
- Pseudomonas
- Enterococcus
- *Candida*

Predisposing Factors

- Vesicourethral Reflex (VUR)
- Obstructive uropathy
- Neurogenic bladder
- Malnutrition
- Immunosuppressive recipient.

Clinical Features

- Neonates: Sepsis with fever, vomiting, diarrhea, jaundice, poor weight gain and lethargy
- Older infants: Unexplained fever, frequent micturition and occasionally convulsion
- Older children: Dysuria, hypogastric pain, frequency and urgency.

Diagnosis

- Urine culture
- Midstream clean catch specimen ↑10^5 CFU/mL
- Sample collected by suprapubic aspiration—any number of pathogen
- Sample collected by urethral catheterization—count of more than 5×10^4 CFU/mL.

Treatment

- General measures: Encourage child to take large amount of fluids and empty the bladder
- UTI in early infancy: Combination of ampicillin and an aminoglycoside (gentamycin, amikacin) or 3rd generation cephalosporins for 14 days.
- USG of abdomen to rule out other major anomalies
- Further imaging is usually done 4 weeks following recovery.

UTI in Older Children

- In case of pyelonephritis—Antibiotics are administered parenterally
- In nonsevere cases—Oral amoxicillin, cephalexin and cefixime for 7 to 10 days.
- Short term therapy—Not recommended in children

Hydronephrosis

Dilatation of renal pelvis with or without calyceal distension due to obstruction of urine outflow.

Clinical Features

Detected antenatally by USG

If not detected

- Pain in the lumbar area
- Asymptomatic abdominal mass
- Recurrent UTI
- Hematuria, specially following minor trauma
- Recurrent abdominal pain, nausea without vomiting
- Failure to thrive, anemia and Hypertension.

Investigations

- Excretory vesico urethrogram (EVU)—to assess renal function
- USG—Antenatally and postnatally
- Doppler sonography
- Nuclear scintigraphy
- CT scan
- MR imaging.

Treatment

- Nephrectomy
- Dismembered pyeloplasty
- Percutaneous nephrostomy
- Pyeloplasty—In bilateral hydronephrosis.

Nephrolithiasis

- Stones in the kidneys and urinary tract are not common in childhood
- Children are at a high risk for recurrent stone formation and underlying metabolic disorder may be in 50–75% cases.

Pathogenesis

Crystal may form due to:

- Supersaturation of urine with solutes due to their excessive excretion (calcium oxalate, cystine)
- ↓ in urinary volume (↓ water intake, excessive intestinal/renal loss)
- ↓ in urinary inhibitors of crystallization (citrate magnesium pyrophosphate)
- Pediatric urolithiasis: 4 major patterns:
  - Metabolic calculi—most common in children
  - Infective stones—
    - Stones composed of organic matrix and struvite
    - Most cases associated with Proteus infection.
  - **Endemic calculi:**
    - Bladder calculi composed of ammonium acid urate and oxalate

Scanned with CamScanner

- Dietary factors, increased intake of rice/cereal and lack of inhibitors in diet
- "Stone belt"—Idiopathic hypercalciuria.

Clinical Features

- Classical/Typical features: 50% cases
  - Abdominal colicky pain
  - Recurrent dysuria
  - Painful or painless hematuria
- Uncommon features: 30% cases
  - Urinary tract infection
  - Recurrent microscopic hematuria
  - Failure to thrive, polyuria, polydipsia
  - Anuric acute renal failure
  - Asymptomatic in ~20%
- Often silent and detected incidentally
- Gross hematuria, complications such as UTI or obstruction
- Pain—feature of ureteric calculi, may radiate from loin to groin or mimic appendicitis/diverticulitis
- Bladder stones—dysuria, urgency, incontinence, interrupted stream and rarely acute renal failure (ARF).

Special Tests

- Stone chemical analysis
- 24 hours urine for cystine, oxalate metabolites, sodium, etc.
- Eye examination for oxalate crystals
- Liver biopsy (Primary hyperoxalurias).

Pediatric Urolithiasis: Principles of Medical Therapy

- Water intake—decreases concentration of solutes
- Low salt diet—decreases urinary calcium excretion
- Increased intake of fruits—source of citrate (chelator of Ca)
- Reduction in meat intake—decrease purine load and also, acid load
- Reduction in oxalate rich diet
- Oral alkalinizer
- Dietary modification has to be for the entire family and not for the child alone.

Surgical Therapy

- Extra corporal short wave lithotripsy (ESWL)
- Percutaneous nephrostolithotomy (PCNL)
- Ureteric stenting
- Pyelolithotomy.

Indications

- Obstructing calculus
- Renal calculi >8 mm
- Calculi associated with pyonephrosis/pyelonephritis
- Anuric/oliguric acute renal failure.

Wilms' Tumor

- Most common primary malignant renal tumor of childhood
- 80% of patients with Wilms' tumor are aged below 5 years.

Clinical Features

- Asymptomatic abdominal mass detected during routine physical examination
- Abdominal pain, hematuria and fever
- Hypertension—Renin release
- Anorexia, vomiting and constipation
- Presence of varicocele—Obstruction of IVC
- Acute abdominal emergency—Tumor rupture and hemorrhage
- Polycythemia—increased erythropoietic.

Diagnosis

- History, physical examination
- CBC, differential count, LFT, RFT, serum calcium and urinalysis
- Imaging studies—USG, CT and MRI
- Magnetic resonance imaging (MRI) of Wilms' Tumor on right kidney.

Treatment

- Based on stage of the disease and histology
  - Surgery
  - Chemotherapy and
  - Radiation
- Immediate therapy for unilateral disease is removal of the affected kidney
- Preoperative chemotherapy to reduce the tumor size— Actinomycin D and vincristine × 4 weeks
- Postoperative Rx of Stage I and II with favorable histology – vincristine and Actinomycin D
- Drugs for advanced Wilms' tumor—Vincristine, actinomycin and adriamycin + abdominal radiation.

Chronic Renal Failure

- Chronic kidney disease is characterized by an irreversible deterioration of renal function that gradually progresses to end-stage renal disease.

Causes

- Genetic
  - Hereditary disorders including juvenile nephronophthisis
  - Autosomal recessive polycystic kidney disease
  - Congenital nephrotic syndrome
  - Laurence-Moon-Biedl syndrome
- Chronic glomerulonephritis (focal segmental, membrane proliferative glomerulonephritis
- Reflux nephropathy
- Obstructive uropathy
- Neurogenic bladder
- HUS
- Renal dysplasia/hypoplasia
- Hereditary nephropathy
- Miscellaneous (cortical necrosis)
- Chronic pyelonephritis.

Clinical Features

- Polydipsia and nocturia (secondary to a reduced capacity to concentrate the urine)
- The signs and symptoms in advanced chronic kidney disease may include:
  - Volume overload
  - Hyperkalemia
  - Metabolic acidosis
  - Cardiac abnormalities (e.g., Left ventricular hypertrophy [LVH], pericarditis)

Scanned with CamScanner

- Hypertension
- Anemia
- Bone disease (termed osteodystrophy)
- Cardiovascular disease
- Anorexia, nausea, vomiting.

Management

- Close monitoring of a patient's clinical and laboratory status
- Blood studies: Hemoglobin level and serum electrolytes, blood urea nitrogen, creatinine, calcium, phosphorus, albumin and alkaline phosphatase
- Intact parathyroid hormone (PTH) levels and roentgen graphic studies
- Echocardiography
- Strict blood pressure control
- Angiotensin-converting enzyme (ACE) inhibitor
- Angiotensin II receptor-blocker (ARB) therapy
- Lipid lowering therapy
- Correction of anemia
- Management of proteinuria and blood pressure
- Antihypertensive therapy for both renal protection and cardiovascular protection
- Whose renal failure is a consequence of renal dysplasia may be polyuric with significant urinary sodium losses
- Sodium restriction and diuretic therapy
- Fluid restriction is rarely necessary until the development
- ESRD requires the initiation of dialysis.

Hemodialysis

- Performed in a hospital setting
- 3–4 hours sessions with frequency of 3 sessions per week.
- Access-surgically created arteriovenous fistula, graft, or indwelling subclavian or internal jugular catheter.
- Blood is circulated through an extracorporeal circuit that includes a hollow dialyzer (artificial kidney).
- Anticoagulation of the circuit is done through systemic heparinization.

Table 17 Formulas used in pediatric setting

Weight calculation:	
Age less than 1 year	(Age in months + 9)/2
1–6 years	2 (age in years) + 8
7–12 year	[7 (age in years) – 5]/2
Height in children	(6 × age in years) + 77
Blood pressure:	
1–7 years	
Systolic BP	Age in years + 90
Diastolic BP	Age in years + 56
7–12 years	
Systolic BP	2 (Age in years) + 82
Diastolic	Age in years + 52
Fluid calculation (24 hours)	
Up to 10 kg	100 mL/kg weight
11–20 kg	1000 + 50 mL/kg weight
21–30 kg	1500 + 20 mL/kg

Table 18 Blood pressure cuff size used for various age groups

Age	Cuff size (cm)
Newborn	2.5
<2 years	5
3–4 years	7.5
5–9 years	10
10–14 years	12.5

Table 19 Heart disease and murmurs

Murmurs	Conditions
Mid diastolic murmurs	Mitral stenosis
Ejection systolic murmur	Aortic stenosis
Pan systolic murmur	Mitral regurgitation Tricuspid regurgitation VSD
Ejection systolic murmur	Pulmonary hypertension ASD TOF Pulmonary stenosis
Early diastolic murmurs	Aortic regurgitation
Continuous murmur	PDA

- Teratology of Fallot = Pulmonary stenosis, Right Ventricular Hypertrophy, Ventricular Septal Defect, Overriding of Aorta
- Pentalogy of Fallot–TOF+ASD

Rheumatic Fever

Causative agent; Group A β hemolytic streptococci

Clinical features

Jones criteria

- Major Criteria
  - Carditis
  - Polyarthritis
  - Subcutaneous nodules
  - Chorea (Sydenham Chorea, St Vitus' dance)
  - Erythema Marginatum
- Minor criteria
  - Fever
  - Arthralgia
  - Increased ASO titer
  - Prolonged PR interval

Congestive Cardiac Failure

Table 20 Features of left and right sided heart failure

Left sided heart failure	Right sided heart failure
Tachypnea	Elevated JVP
Tachycardia	Tachycardia
Cough	Edema
Wheeze	Liver enlargement
Rales (basal)	Ascites
Dyspnea on exertion	–

Scanned with CamScanner

INTEGRATED MANAGEMENT OF CHILDHOOD ILLNESS

- Case Management Process
  - Assess the child
  - Classify illness
  - Identify Treatment
  - Treat the child
  - Counsel the mother
  - Give follow up care.

Table 21 Classification (Color coding system)

Pink	Yellow	Green
• Patient requires urgent hospitalization • Give pre-referral treatment • Refer urgently to hospital	• Specific medical treatment or advice, as you do in OPD, clinic	• Simple advice on home management. May require some home made safe remedy

Table 22 Play therapy in children

Unoccupied behavior	Solitary play	Onlooker play	Parallel play	Associative play	Cooperative play
• No play activities in usual sense of the world • Child moves randomly, crawl randomly and crawl under a table, climb on and off a chair	• Child plays alone and independent • Concentration on Play only • Pre-toddlers and toddlers engage in this play only.	• Child observes others and don't engage in play • He/she sits or stands near other children to hear or see what is going on	• Children 2–3 years play in this manner • Independent activity in which child plays with toys of either similar or identical or to those used by another children	• Common among children of 3–4 years of age • Social interaction occurs between or among children	• Found in children after preschool years • It is organized and children play in group with other children.

Hyperbilirubinemia in Newborn

Table 23 Kramer's criteria to assess clinical jaundice

Body part	Level of bilirubin (mg/dl)
Head and neck	4-8
Chest	5-12
Lower trunk and thighs	12-15
Palms and soles	>15

Table 24 Major types of jaundice

Physiological jaundice	Pathological jaundice	Breast milk jaundice
• Appears after 24 hours • Total bilirubin raises by less than 5 mg/dL/day • Maximum intensity by • 4th to 5th day in term and 7th day in preterm • Serum level less than 15 mg/dL • Not detectable after 14 days clinically	• Appears within 24 hours of age • Increase of bilirubin >5 mg/dL/day • Serum bilirubin >15 mg/dL • Jaundice persisting after 14 days • Stool clay/white coloured • Direct bilirubin >2 mg/dL	• Prolonged increased enterohepatic circulation of bilirubin • Bilirubin peaks at 10-15 days of age • Level of unconjugated bilirubin is at 10-30 mg/dL

Phototherapy

- Perform hand wash
- Cover the eyes and genitals
- Start phototherapy
- Turn baby after each feed
- Monitor bilirubin and urine frequency
- Place baby naked in incubator
- Keep at least 45 cm from lights
- Breastfeeding every 2 hours
- Record temperature 2 to 4 hourly
- Weigh daily.

Scanned with CamScanner

Side Effects

- Increased insensible water loss
- Loose stools
- Skin rash
- Bronze baby syndrome
- Hypocalcemia
- Hyperthermia.

Malnutrition

Classification of Malnutrition

Table 25 IAP classification(1972)

Nutritional status	Weight for age (%) of 50th percentile of Harvard standard
Normal	>80
Grade I Protein Energy Malnutrition (PEM)	71–80
Grade II PEM	61–70
Grade III PEM	51–60
Grade IV PEM	<50

Table 26 Wellcome trust classification (1970)

Weight for age	Edema present	Edema absent
60–80% of standard	Kwashiorkor	Undernutrition
<60% of standard	Marasmic kwashiorkor	Marasmus

Table 27 JELLIFE classification (1965)

Nutritional status	Weight for age (%) of 50th percentile of Harvard standard
Normal	>90
I degree PEM	80-90
II degree PEM	70-79
III degree PEM	60-69
IV degree PEM	<60

Table 28 GOMEZ classification (1956)

Nutritional status	Weight for age (%)
Normal	>90
I degree PEM	76-90
II degree PEM	60-75
III degree PEM	<60

Table 29 McLaren classification

Classification	Height for age (%)
Normal	93–105
Short	80–93
Dwarf	<80

PEM can be classified according on the basis of Mid-arm circumference as follows:

Table 30 Arnold's classification

Grades	Mid arm circumference (cm)
Normal	16
Mild PEM	Between 13.5 and 16
Moderate PEM	Between 12.5 and 13.5
Severe PEM	<12.4

Shakirs Tape

Table 31 Color coding

MAC	Color	Inference
>13.5	Green	Normal
12.5-13.5	Yellow	Borderline
<12.5	Red	Wasted

Table 32 Kanawati index

$$Kanawati\ index = \frac{MAC\ (cm)}{Head\ circumference\ (cm)}$$

Grades of malnutrition	Kanawati index
Mild	0.28-0.32
Moderate	0.25-0.28
Severe	<0.25

Rao and Singh's Index

$$Rao\ and\ Singh's\ Index = \frac{Weight\ in\ kg}{\{Height\ (cm)\}^2}$$

- Normal —0.15–0.16
- PEM —0.12–0.14

Ponderal Index

$$Ponderal\ Index = \frac{Weight\ (g) \times 100}{Height\ (cm)^3}$$

Table 33

Ponderal Index	Significance
>2.5	Normal
2-2.5	Borderline PEM
<2	Severe PEM

Scanned with CamScanner

Table 34 Difference between kwashiorkor and marasmus

Features	Marasmus	Kwashiorkor
Etiology	Decreased intake of both proteins and calories and other nutrients	Decreased protein intake
Age	Common below 1 year (0-3 years)	1-4 years
Appearance	Old man appearance	Moon face
Weight	Less than 60%	60-80%
Edema	Absent	Present
Mood	Normal	Irritable
Hair changes	Absent	Present (flag sign)
Skin changes	Absent	Present
Muscle wasting	More	Less
Anemia	Moderate	More severe
Subcutaneous fat	Grossly reduced	Less reduced

Golden points to remember

- Growth and development in children are the continuous orderly processes.
- The sequence of attainment of milestone is same in all children.
- The process of development progresses in cephalocaudal direction and proximodistal direction.
- The baby attains three times of its birth weight by one year of age.
- The baby attains four times of its birth weight by two years and 5 times by three years of age.
- The Chest Circumference (31 cm approx) is about 3 cm less than the Head Circumference at the time of birth.
- Head Circumference (HC) and Chest Circumference (CC) are almost equal by 1 year of age and after that CC exceeds the HC.
- The arm span is 1-2 cm less than height of children below 5 years and by 10-12 years both will be equal. Then arm span exceeds the height.
- In children, arm span is greater than height in Marfan syndrome, Klinefelter syndrome and Homocystinuria.
- Arm span is less than height in Achondroplasia, cretinism.
- Instrument used for measurement of skin fold thickness is Lange's or Harpenden's skin fold callipers.
- The first two teeth to erupt are the two bottom central incisors.
- New Ballard Scale is frequently used scale for assessment of the gestational age. It assesses six external physical and six neuromuscular characteristics.
- Sigmund Freud's psychosexual development defined the terms Id, Ego and Superego.
- Id is pleasure principle; ego is based on reality and superego is based on perfection.
- In oral stage (0-1 year), infant's pleasure centers around mouth.
- Child's pleasure focuses on anus during anal stage (1-3 years).
- Child's pleasure focuses on genitals during phallic stage (3-6 years).
- Loving, consistent care, including playing by parents help in infant's cognitive and psychosocial development.
- Negativism is commonly seen in young children (Toddlers). It is a behavior characterized by the tendency to resist direction from others, and refusal to comply with requests.
- Appearance, Pulse, Grimace, Activity, and Respiration (APGAR) score is considered excellent if the score is 7-10.
- A newborn's temperature on an average ranges from 36.5 to 37.5°C.
- Newborns lose 10% of their birth weight by 3-4 days of age. Newborns gain the lost birth weight by 10th day of life.
- The normal newborn hemoglobin level is 17-20 g/dl.
- Normal birth weight of an Indian child is 2.5-3.5 kg.
- Baby's birth weight doubles at 5-6 months of age.
- Baby's birth weight triples at 1 year of age.

Contd...

Scanned with CamScanner

- Drug of choice for neonatal seizure: Phenobarbitone.
- Vitamin deficiency responsible for neonatal seizure: Pyridoxine (Vitamin B_6).
- In Neural Tube Defect, the following markers increase in the amniotic fluid:
  - Alpha feto protein
  - Ach esterase
- Descending motor paralysis is seen in:
  - Botulinum
  - Polio
  - Diphtheria
- Peri conceptional use of folic acid decreases the incidence of NTD by: 50-70%.
- **Dose of folic acid for:**
  - Primary prevention of NTD: 0.4 mg/day.
  - Secondary prevention of NTD: 5 mg/day.
- If a newborn's head and trunk are allowed to fall backward it elicits more reflex.
- Plantar grasp disappears in infant around 9 to 12 months of age. It is the last neonatal reflex to disappear.
- Neonatal reflex elicited by touching the cheeks of the baby is rooting reflex.
- The last neonatal reflex to emerge is rooting reflex. It develops at around 28 to 30 weeks of gestational age.
- Rooting reflex in infant disappears at 3 to 4 months.
- Asymmetric Moro's reflex at birth is indicative of Kernicterus:
  - Most common seizure disorder during childhood: Febrile seizure.
  - Most common cause of neonatal seizure: Hypoxia.
  - Most common presentation of neonatal seizure: subtle type.
  - Most common cause of neonatal meningitis: GP B strep > *E.coli*.
  - Most common cause of meningitis in the age group of 3months-3 years: H. Influenza.
  - Most common site of Neural Tube Defect: Lumbosacral region.
- The most common form of childhood brain tumor is Medulloblastoma.
- Phototherapy is indicated for children with hyperbilirubinemia.
- Artificially acquired immunity is obtained by immunization with antibody response. Antibodies are administered, not produced by the body.
- Breastfeeding is natural passive immunity which is obtained by immunoglobins in mothers breast milk.
- In children, currant jelly-like stools containing and mucus is associated with intussusception.
- Meckel's diverticulum is an outpouching or bulge in the lower part of the small intestine. The bulge is congenital (present at birth) and is a leftover of the umbilical cord.
- Cheiloplasty is the surgical management of Cleft lip.
- Cleft lip is usually repaired at four to six months of age and a cleft palate is usually repaired around 12 months of age.
- BCG vaccine is given Intradermally. In intradermal injection, needle is placed almost flat against patient's skin (15°).
- Anthropometry is the index for nutritional status in children.
- Sunset sign is seen in Hydrocephalus. In this, eyes are often rolled downward so that the white part of the eyes (sclera) is visible below the upper eyelid.
- Tetralogy of Fallot (TOF) is a combination of four heart defects present at the time of birth. It includes Ventricular Septal Defect (VSD), Pulmonary Valve Stenosis (PVS), overriding of aorta, Right Ventricular Hypertrophy (RVH).
- Immediate action by the nurse after the birth of a baby is to clear the mucus in nose and mouth that will help the baby to breathe.
- While assessing APGAR, pulse or heart rate has to be assessed first and then the respirations.
- Most infants born before 27 weeks of gestation develop respiratory distress syndrome which is associated with surfactant deficiency.
- **Lack of stridor and adventitious breath sounds are the signs of shaken baby syndrome.**
- Human milk contains little iron, so infants who are exclusively breastfed are at increased risk of iron deficiency after four months of age. This is more common among preterm infants as they are born with lower iron stores.
- A complication of erythroblastosis fetalis is kernicterus, which is caused by deposition of bilirubin in the brain. Exchange transfusion is needed to prevent the complication.
- The earliest and most frequent manifestation of digoxin toxicity in infants and children is the appearance of cardiac arrhythmias, including sinus bradycardia.
- Drug used to keep Patent Ductus Arteriosus (PDA) open is **PGE1 (Misoprost).**
- Drug used to treat PDA is Indomethacin.
- Most common heart abnormality in children is Ventricular Septal Defect.
- In infants, brachial pulse is used to detect the presence or absence of pulse rate during cardiac arrest (Source: ACLS Guidelines).
- In an infant with ventro-peritoneal shunt, the nurse needs to measure head and abdominal circumference since there is chance of shunt malfunction in order to monitor the early sign of intra-cranial pressure and abdominal distension.
- Projectile vomiting is a classic symptom of hypertrophic pyloric stenosis.

Contd...

Scanned with CamScanner

- Color-coded treatment under *Integrated Management of Neonatal and Childhood Illness* (IMNCI):
  - **Green:** Home care
  - **Yellow:** Treatment at Outpatient Department (OPD)
  - **Pink:** Urgent referral after treatment at OPD (for stabilization)
- Bulging sack-like lesion filled with spinal fluid and spinal cord element is known as myelomeningocele.
- Spina bifida occulta is a malformation of one or more vertebrae, it is also called closed or hidden spina bifida.
- Reye's syndrome is associated with the use of aspirin with viral illness. Reye's syndrome most often affects children. It causes swelling in the liver and brain.
- The ratio of lung inflation to chest compression in cardio pulmonary resuscitation is 1:3.
- The sequence of vital signs assessment in newborn is Respiratory Rate, Pulse and Temperature. (RPT)
- **Injection vitamin K** is routinely administered to a newborn to prevent bleeding.
- **Foramen ovale is a** structure with functional closure immediately after birth.
- Failure of the foramen ovale closure will lead to atrial septal defect.
- Patent ductus venouse results in irregular transmission of blood between **left umbilical vein and inferior vena cava.**
- Patent ductus arteiousus results in irregular transmission of blood between pulmonary artery and aorta.
- After the closure ductus venosus is known as **ligamentum venosum.**
- After the closure ductus arteriosus is known as **ligamentum arteriosum.**
- After the closure foramen ovale is known as **fossa ovalis.**
- Both Indomethacin and Iboprufen are equally effective in closing Patent Ductus Arteriosus.
- Commonly occurring accident among newborn babies is falling from bed.
- **Myoclonic seizure is the most common type of seizure occurring in newborn.**
- Sternum is the best site to demonstrate capillary refilling in infants.
- Surfactant production in fetus begins at 20 to 24 weeks of gestation.
- Total lung capacity in newborn is 150 ml.
- Sponge bath the baby until stump falls off because moisture will delay the stump to fall off.
- Immediately after the delivery baby should be placed on mother's chest.
- Exchange transfusion is needed in a neonate with erythroblastosis fetalis to prevent kernicterus that is caused by the deposition of bilirubin in brain cells.
- A newborn who adequately breastfed will sleep at least 2 hours, pass urine 8 to 10 times a day and will gain weight.
- Baby Friendly Hospital Initiative (BFHI) was launched by WHO in the year of 1991.
- The first milk produced after delivery is known as Colustrum. It appears thick and yellow coloured.
- Milk secreted following colostrum is transition milk.
- Foremilk (milk secreted at the start of feed) is rich in proteins, sugar and minerals whereas hindmilk is rich in fat and provides more energy.
- Immunoglobulin present in breast milk is IgA.
- Most abundant immunoglobulin of human body is IgG.
- Only class of immunogolobulin which is transported across the placenta is IgG.
- Exclusive breastfeed should be provided to the baby up to 6 months.
- The extra calories needed by mother during breast feeding is 500 calories.
- Expressed breast milk can be stored at room temperature for up to 4 hours.
- Cow's milk is deficient of iron.
- Bottle-fed babies are more prone to develop diarrhea
- Feeding a child with choanal atresia can cause chokes on feeding.
- According to the WHO report, malnutrition contributes to 45 percent of deaths of children aged under 5 years (worldwide).
- Diarrheal disease is the most common cause of under-five mortality rate in India.
- According to WHO childhood Severe Acute Malnutrition (SAM) is diagnosed when the weight-for-height .
- Wasting (low weight for height) indicates acute malnutrition. Sukhmari
- Chronic malnutrition is measured by height for age.
- Stunting (low height for age) indicates chronic malnutrition. Shreya
- Vaccine of Diptheria, Tetanus Toxoids and Pertussis (DTP) is contraindicated in **progressive neurological illness.**
- Vastus lateralis is the best choice for IM injection in infants and younger children.
- Oral Poliovirus (OPV) and measles are sensitive to heat and can be frozen without harm.
- DTP vaccine should be stored at **4-8°C.**
- Method used for the transportation of vaccine from the site of production to the vaccination site is Cold Chain.
- Bacillus Calmette–Guérin (BCG) vaccine is administered through intradermal route.
- Measles, Mumps, and Rubella (MMR) is a live vaccine and route of administration Is subcutaneous.
- Varicella vaccine provides protection against chicken pox.
- Subacute sclerosing panencephalitis may occur years after measles vaccination as a complication.
- Diaper rashes most commonly caused by *Staphylococcus aureus.*

Contd...

Scanned with CamScanner

- Site of lesion in polio is **ventral horn of spinal cord.**
- Parenteral polio vaccine is also known as Salk.
- Oral Polio Vaccine is also known as Sabin.
- Intelligence quotient (IQ) is the index of intellectual brightness of the child and is calculated as:
- IQ = Mental age/Chronological age × 100
- The new terminology for mental retardation is intellectual disability.
- The type of play commonly exhibited by toddlers where they play by themselves in the presence of other children is called parallel play.
- The child plays intently with available materials but remains totally alone is known as solitary play.
- Burns are the most common documented cause of accidents in toddlers followed by choking, toxic ingestions and drowning.
- Passage of feces in inappropriate places after bowel control would be expected is known as Encopresis.
- Child's participation in decision making process about health care is termed as Assent.
- **Normal adult hemoglobin contains two alpha chains and two beta chains.**
- Neonatal anemia is defined as haemoglobin less than 13 g/dl.
- Anemia in children is defined as haemoglobin less than 11 g/dl.
- Treatment of choice for thalassemia major is **blood transfusion and desferrioxamine.**
- Haemophillia affects only male.
- A female who inherits one affected X chromosome becomes a 'carrier' of haemophilia.
- Vitamin 'A' deficiency leads to diarrhea and hyperkeratosis in children.
- Most common bacterial cause of diarrhea in children is *Enterotoxic E. coli.*
- Neonatal physiological jaundice appears after 24 hours of life due to breakdown of Red Blood Cells.
- Neonatal pathological jaundice appears within first 24 hours after birth.
- Drug used in the treatment of neonatal jaundice is phenobarbitone
- Eyes and genitalia need to be covered during phototherapy.
- Cleft palate is usually repaired around 12 months of age.
- Cleft lip is usually repaired at four to six months of age.
- Double bubble sign in the X-ray is suggestive of **duodenal atresia.**
- Continuous drooling immediately after birth indicates tracheo-esophageal fistula.
- Congenital absence of ganglion cells in the submucosal and myenteric plexus of the distal intestine is known as **Hirschsprung's disease.**
- Hypokalemic metabolic alkalosis is the classic electrolyte and acid-base imbalance of pyloric stenosis.
- Projective vomiting is a feature of **hypertrophic pyloric stenosis.**
- Drug of choice to treat scabies in younger children is 5% permethrin cream.
- Frequent swallowing is a sign of haemorrhage in child who underwent tonsillectomy.
- Drug of choice in trachoma for children is oral tetracycline.
- Tetracycline is contraindicated in infants and young children.
- To administer eardrop in children below age 3, pull the pinna downward and backward. In adult the pinna will be hold upward and backward.
- Other name of mucocutaneous lymph node syndrome is Kawasaki Disease.
- Toddler and preschooler are more prone to accidental poisoning due to their curiosity and desire to explore the world.
- Damage caused by lead poisoning is irreversible in CNS, but in all other body system the damage is reversible.
- Folic acid helps in prevention of neural tube defect in fetus.
- Nurse needs to measure head and abdominal circumference in a newborn with non-communicating hydrocephalus and has a ventro peritoneal shunt inserted to monitor the function of the shunt.
- Most common type of meningitis that affects children less than 5 years is bacterial meningitis.
- Meningomyelocele is a sac-like protrusion containing meninges, *Cerebrospinal Fluid* (CSF) and neural elements.
- Immediate nursing care for a child with meningomyelocele is applying sterile moist non-adherent dressing to the sac to prevent the breakage and dryness of the sac.
- Police man tip hand condition is known as Erb's palsy.
- Excess or deficiency of vitamin pyridoxine leads to peripheral neuropathy.
- Positive Kernig's sign, Brudzinski's sign and nuchal rigidity are signs of meningitis.
- **Brudzinski's sign: Hips and knees to flex when the neck is flexed.**
- **Kernig's sign: Inability to straighten the leg when the hip is flexed to 90°.**
- Tetralogy of Fallot is a cyanotic heart disease.
- Tetralogy of Fallot is congenital heart disease which includes four heart defects, namely:
  - Overriding aorta
  - Pulmonic stenosis
  - Ventricular septal defect
  - Right ventricular hypertrophy

Scanned with CamScanner

- In X-ray, the heart of a child with tetralogy of Fallot appears boot-shaped.
- A child who is suffering from cyanotic heart diseases is more comfortable in knee-chest position.
- **Group A β-hemolytic streptococcus is the** causative organisms for rheumatic fever.
- Drug of choice for rheumatic fever prophylaxis in penicillin allergic patient is Erythromycin.
- The heart disease most commonly associated with rubella infection is Patent Ductus Arteriosus.
- Common symptom of TOF is **clubbing of fingers.**
- Deficiency of growth hormone leads to **proportionate dwarfism.**
- Hyper secretion of growth hormone before the closure of epiphyseal plates can cause **Gigantism.**
- Hyper secretion of growth hormone after the closure of epiphyseal plates can cause **Acromegaly.**
- Adrenocorticotropic hormone (ACTH) secretion is highest in **morning.**
- Term used for undescended testis is **Cryptorchidism.**
- Unilateral renal agenesis is associated with **single umbilical artery.**
- Wilm's Tumor is commonly present as **abdominal mass.**
- In Acute Renal Failure (ARF), hyperkalemia is treated with **calcium gluconate.**
- Red urine without RBC is seen in **Rhabdomyolysis.**
- Color codes used in IMNCI are **Pink, Green and Yellow.**
- Most common form of childhood cancer is Leukemia.
- The Human Genome Project was completed in 2003.
- The first human gene therapy was instituted in 1990.
- The science of betterment of human race by application of the law of inheritance is called Eugenics.
- Triple screen test involves Alpha-fetoprotein, Human chorionic gonadotropin, and Estriol.
- X-linked recessive disorders are more common among males as compared to females.
- Trisomy 13 is identified as **Pataus' syndrome.**
- **Trisomy 18 is identified as Edward's syndrome.**
- **Trisomy 21 is identified as Down's syndrome.**
- A chromosomal disorder in which a female is born with only one X chromosome is known as Turner's syndrome.
- Deficiency of vitamin-D in children may cause Rickets.
- Chvostek sign and trousseau signs are seen in **Hypocalcemia.**
- Restraints used during upper chest/abdominal procedure which immobilize all the extremities is **Mummy restraints.**
- An axillary temperature should be taken for 3 minutes.
- The rectal temperature should be taken in 1 minute.

Image-Based Questions

1. Instrument shown in photograph is used in public health for

a. Birth weight
b. Birth length
c. Mid arm circumference
d. Abdominal circumference

2. Monitor shown in photograph is a marker of

a. Efficacy of vaccine
b. Expiry of vaccine
c. Cold chain maintenance
d. Number of doses in vaccine vial

3. Suture (Arrow) shown in the photograph closes by the age of *[Recent Question 2012]*

a. 6 months
b. 2 years
c. 3 years
d. 6 years

4. Urine sample collection method shown in photograph is preferred in

a. Infants
b. Adolescents
c. Adults
d. Older persons

5. Which of the following vaccines is given by route shown in photograph? *[Recent Question 2012]*

a. DPT
b. Hepatitis B
c. MMR
d. BCG

6. Vaccine administered by following route is

a. Typhoral live
b. H1N1 killed
c. H1N1 live
d. Yellow fever live

7. Identify the Reflex shown (First stage) in the photograph *[Recent Question 2014]*

a. Tonic neck reflex
b. Moro's reflex
c. Parachute reflex
d. Rooting reflex

8. Identify the therapy

a. Phototherapy
b. Radiant warmer
c. Heater
d. IR therapy

Ans.

1. b
2. c
3. a
4. a
5. d
6. c
7. b
8. a

Scanned with CamScanner

9. **Cut-section of Structure shown in the photograph contains**

a. 1 artery, 2 veins
b. 2 arteries, 2 veins
c. 2 arteries, 1 vein
d. 1 artery, 1 vein

10. **In the given image, which of the following breast feeding practice for good attachment is not complied?**

a. Wide open mouth
b. Most nipple and areola in mouth
c. Chin touching breast
d. Lower lip turned outwards

11. **Disorder based on line (arrow) shown in photograph**

a. Hyperthyroidism
b. Bronchogenic carcinoma
c. PDA
d. Down's syndrome

12. **Identify the instrument shown in the photograph:**

a. Salter scale
b. Spring balance
c. Electronic weighing scale
d. Beam balance

13. **Milestone shown in photograph appears at age of .....**

a. 3 months
b. 5 months
c. 7 months
d. 10 months

14. **Milestone shown in photograph appears at age of .....**

a. 6 months
b. 9 months
c. 12 months
d. 18 months

15. **Milestone shown in photograph appears at age of .....**

a. 2 months
b. 4 months
c. 6 months
d. 12 months

16. **Identify the apparatus used in pediatrics as shown in photograph:**

a. Radiant warmer
b. Infantometer
c. Electronic weighing scale
d. Salter weighing scale

Ans.

9.	c
10.	c
11.	d

17. The item shown in the figure is:

a. Shakir's tape
b. Triage tape
c. Multi purpose tape
d. Wrist tape

18. The condition depicted in figure is:

a. Kwashiorkor
b. Marasmus
c. Nephrotic syndrome
d. Epidemic dropsy

19. Injection technique shown in figure is used to administer?

a. BCG
b. Measles
c. Hepatitis B
d. Japanese Encephalitis

20. Identify the scheme/program/plan launched by Government of India *(Refer explanation at the end)*

a. Mission Indradhanush
b. Kangaroo Mother Care
c. BFHI
d. India Newborn Action Plan

21. What is the target year for the mission depicted in the symbol? *(Refer explanation at the end)*

a. 2017
b. 2020
c. 2025
d. 2030

22. Identify the scheme/program/plan launched by WHO/UNICEF *(Refer explanation at the end)*

a. Janani Shishu Suraksha Karyakram
b. Kangaroo Mother Care
c. BFHI
d. RCH Program

23. True about instrument shown in photograph is *(Refer explanation at the end)*

a. Filled with tap water
b. Salt is added
c. Filled up to brim
d. Holes used to hold when taking out of Freezer

24. What of the following can be monitored using this tape? *(Refer explanation at the end)*

a. Nutritional status
b. Ascites
c. Skull growth
d. Height

25. The following test is useful in identification of:
(Refer explanation at the end)

a. Poliomyelitis
b. Rickets
c. Hip dislocation
d. Scoliosis

26. In the picture which area is being auscultated?
(Refer explanation at the end)

a. Tricuspid area
b. Pulmonic area
c. Aortic area
d. Mitral area

27. The following auscultation is done for diagnosis of?
(Refer explanation at the end)

a. Radiation of aortic regurgitation murmur
b. Carotid artery bruit
c. Carotid artery dissection
d. Venous hum

28. The device being used by the child is:
(Refer explanation at the end)

a. Spirometer
b. Metered dose inhaler
c. Peak expiratory flow rate meter
d. Nebuliser

29. Which among the following depicts the correct fitting of face mask used during neonatal resuscitation?
(Refer explanation at the end)

a.

b.

c.

d.

Ans.

Explanations of Image-Based Questions

20. Ans. (d) India Newborn Action Plan

[Ref. Park, 23/e p467]

India Newborn Action Plan (INAP) (Photograph)

- India Newborn Action Plan (INAP) was launched in September 2014 with the aim of ending preventable newborn deaths and stillbirths by 2030
  - **Goal 1:** Ending Preventable Newborn Deaths to achieve "Single Digit NMR" by 2030, with all the states to individually achieve this target by 2035
  - **Goal 2:** Ending Preventable Stillbirths to achieve "Single Digit SBR" by 2030, with all the states to individually achieve this target by 2035

21. Ans. (b) 2020

[Ref. Park, 23/e p442]

Mission Indradhanush 2014 (Photograph)

- **Launch:** 25 December 2014
- **Description:** Indradhanush depicting seven colors of the rainbow, aims to cover all those children by 2020 who are either unvaccinated, or are partially vaccinated against 7 vaccine preventable diseases (7 VPD's)
  - Diphtheria
  - Pertussis
  - Tetanus
  - Childhood Tuberculosis
  - Poliomyelitis
  - Hepatitis B
  - Measles
- **Strategy:**
  - **Focused and systematic immunization drive:** "Catch-up" campaign mode to cover all the children who have been left/ missed out
  - **Four special vaccination campaigns:** January-June 2015 with intensive planning and monitoring

22. Ans. (c) BFHI

[Ref. Park, 23/e p540]

WHO-UNICEF and BFHI 1991 Baby Friendly Hospital Initiative (Photograph)

- Ten Steps to Successful Breast Feeding
- Every facility providing maternity services and care to the newborn infants should,
  - Have a written breast feeding Policy that is routinely communicated to all health care staff
  - Train all health care staff in skills necessary to implement this policy
  - Inform all pregnant women about benefits and management of breast feeding
  - Help mother Initiate breast feeding 'within half hour of birth'
  - Show mothers how to breast feed, and how to maintain lactation even if they are separated from their infants
  - Give newborn infants no food or drink other than breast milk, unless medically indicated
  - Practice Rooming-in: Allow mothers and infants to remain together 24 hours a day
  - Encourage 'breast feeding on Demand'
  - Foster Establishment of breast feeding support groups and refer mothers to them on discharge from the hospital or clinic:
    - Eliminate any support by the manufacturers of infant-formula/infant-food or feeding bottles
    - Prohibit distribution of free and low-cost supplies of breast milk supplies
    - Provide additional lactation assistance to mothers of special cases, i.e. low birth weight, caesarean section
    - Assure a safe and, healthy and positive birthing experience for mother and Infant

23. Ans. (a) Filled with tap water

[Ref. Park, 23/e p109]

ICE-PACK (Photograph)

- Is prepared by keeping in a Deep freezer
- Is used for:
  - Temperature maintenance during vaccine transportation, in a vaccine carrier
  - Temperature maintenance during an immunization session
- Is of total 320 – 340 ml capacity
- Has a 'horizontal mark' – water fill level (as water expands on freezing)
  - NOTHING should be added to water for freezing in an ice-pack
- Has generally 2 holes – MEANT FOR keeping vaccines

24. Ans. (a) Nutritional status

Ref: OP Ghai Textbook of Pediatrics, 8th Ed, page 97

Shakir tape has colored zones: red, yellow and green – corresponding to <12.5 cm (wasted),12.5 to 13.5 cm (borderline) and over 13.5 cm (normal) MUAC (Mid-upper-arm circumference) respectively.

Interpretation of measurements:

- *Red colour:* The child should be immediately referred
- *Yellow colour:* Child is at risk for acute malnutrition and should be counselled and followed-up
- *Green Colour:* The child is well nourished.

25. Ans. (c) Hip dislocation

- The picture depicts Ortolani's sign useful in screening for congenital hip dislocation or developmental dysplasia of hip.
- This test helps to judge if the hip has already been dislocated.
- Baby is placed supine with knees fully flexed and the hips flexed to a right angle.
- Pelvis is stabilized with one hand and with the other hand opposite thigh is abducted and the femoral head is pushed anteriorly.
- In dislocated hip, the femoral head suddenly slips into the acetabulum with a distinctly palpable **"clunk"**.

Scanned with CamScanner

26. Ans. (c) Aortic area

- The stethoscope has been put on right second intercostal area just lateral to sternal border and this represents aortic area.
- The auscultation should proceed in a logical manner over 4 general areas on the anterior chest, beginning with the patient in the supine position. The 4 precordial areas are examined with diaphragm, including:
  - Aortic region (between the 2nd and 3rd intercostal spaces at the right sternal border) (RUSB – right upper sternal border).
  - Pulmonic region (between the 2nd and 3rd intercostal spaces at the left sternal border) (LUSB – left upper sternal border).
  - Tricuspid region (between the 3rd, 4th, 5th, and 6th intercostal spaces at the left sternal border) (LLSB – Left Lower Sternal Border).
  - Mitral region (near the apex of the heard between the 5th and 6th intercostal spaces in the mid-clavicular line) (apex of the heart).

27. Ans. (b) Carotid artery bruit

- The stethoscope over the carotid artery indicates attempt to evaluate for carotid artery bruit.

28. Ans. (b) Metered dose inhaler

The image shows a child blowing into the mouth piece of a peak expiratory flow rate meter. It is Shown next

- PEFR is the maximum flow rate generated during a forceful exhalation, starting from full lung inflation. Peak flow rate primarily reflects large airway flow and depends on the voluntary effort and muscular strength of the patient.
- Maximal airflow occurs during the effort-dependent portion of the expiratory maneuver, so low values may be caused by a less than maximal effort rather than by airway obstruction.
- Nevertheless, the ease of measuring peak flow rate with an inexpensive small portable device has made it popular as a means of following the degree of airway obstruction in patients with asthma and other pulmonary conditions.

29. Ans. (a)

- Using an appropriately sized mask will reduce leakage and is vital for successful effective resuscitation
- The mask or facemask is connected to the bag and covers the mouth and nose of the newborn during resuscitation.
- A correctly sized **mask** should **cover the mouth and nose,** *but not the eyes, and should not extend beyond the chin.*

"A good laugh and a long sleep are the best cures in the doctor's book."

—Irish Proverb

MULTIPLE CHOICE QUESTIONS (Including Explained and Practice Questions)

INTRODUCTION TO PEDIATRIC NURSING

1. The modern concept of pediatrics means: *(Safdarjung NO 2018)*

a. Short term care of the child
b. Basic care of the child
c. Continuous and preventive care of whole child
d. Terminally ill care of the child

Explanation: Paediatrics is defined as the branch of medical science that deals with child development and care during illnesses. As the major causes leading to under five mortality and morbidity are preventable in nature, the modern concept of paediatrics focuses on prevention of illness and promotion of health rather than treatment of illnesses alone.

2. What is the best and most accurate method of measuring the medication dosage for infants and children: *(Safdarjung NO 2018)*

a. Weight
b. Height
c. Nomogram
d. Weight and Height

Explanation:

- Most drugs in children are dosed according to body weight (mg/kg). Doses are often expressed as mg/kg/day or mg/kg/dose. Chemotherapeutic drugs are commonly dosed according to body surface area
  - Clarke's Formula = $\frac{\text{Weight (Pounds)}}{150} \times \text{Adult dose}$
  - Fried Formula = $\frac{\text{Age (month)}}{150} \times \text{Adult dose}$
  - Young's Formula = Adult dose $\times \frac{\text{Age (Years)}}{\text{Age} + 12}$
- Nomogram is a graphical calculating device used to calculate Body surface area.

GROWTH AND DEVELOPMENT

3. At what age does a child normally develop 'social smile' milestone? *(AIIMS Bhopal Nursing Officer, 2018)*

a. 12 weeks
b. 4 weeks
c. 16 weeks
d. 8 weeks

Explanation: By 2 months of age child develops social smile. At this age, the baby also look at parent, coos, makes gurgling sounds and turns head toward sounds.

4. Brain growth is at its maximum during ...

a. 1st trimester of pregnancy
b. Infancy
c. Toddler
d. School going

Explanation: The last 3 months of pregnancy and first 3 years of post-natal life are most crucial for brain development.

5. Crawling of an Infant occurs at: *(DSSSB PHN, 2015)*

a. 8 to 9 months
b. 2 to 3 months
c. 4 to 5 months
d. 6 to 8 months

6. An infant sits alone momentarily by about.....month of age.

a. 2
b. 3
c. 4
d. 6

7. A male baby will be having an optimal (50th percentile) head circumference of 45 cm at ..... age

a. 5 months
b. 7 months
c. 9 months
d. 12 months

Explanation: As per the WHO growth chart for boys, head circumference is 45 cm at 9 months and 46 cm at 12 months (50th percentile).

8. Taste perception of a baby develops at .....

a. Birth
b. 3 months
c. 6 months
d. 9 months

9. Closure of anterior fontanel takes place by:

a. 6 weeks
b. 6 months
c. 1½ year
d. 2 years

10. Anterior fontanelle is closed at:

a. <3 months
b. 12 months
c. 12–18 months
d. >3 years

Ref: Nelson 20th ed. p 297

Explanation: The average time of closure is 18 months but the fontanel may normally close as early as 9 months. The fontanelle is normally slightly depressed and pulsatile and is best evaluated when an infant is held upright while asleep or feeding.

11. 1-year-old child comes to well-baby clinic and nurse noticed the child's anterior fontanel is still open. What is the appropriate nursing intervention?

a. Report to doctor
b. Normal findings
c. Measure head circumference
d. Look for sign and symptoms of infection

Explanation: Anterior fontanel close by 18 months of age, so in a 1-year-old child this is a normal finding.

12. A child likes to look at self in a mirror at age of ____ months?

a. 1 month
b. 2 months
c. 4 months
d. 6 months

Ref: OP Ghai 8th ed. p 5

Ans.

1.	c
2.	a
3.	d
4.	b
5.	a
6.	d
7.	c
8.	a
9.	c
10.	c
11.	b
12.	d

Scanned with CamScanner

Explanation: Milestones achieved at age of 6 months:

Social and Emotional
- Knows familiar faces and begins to know if someone is a stranger
- Likes to play with others, especially parents
- Likes to look at self in a mirror

Language/Communication
- Responds to sounds by making sounds
- Strings vowels together when babbling ("ah," "eh," "oh") and likes taking turns with parent while making sounds
- Responds to own name
- Makes sounds to show joy and displeasure

Cognitive (learning, thinking, problem-solving)
- Looks around at things nearby
- Brings things to mouth
- Shows curiosity about things and tries to get things that are out of reach
- Begins to pass things from one hand to the other

Movement/Physical Development
- Rolls over in both directions (front to back, back to front)
- Begins to sit without support
- When standing, supports weight on legs and might bounce
- Rocks back and forth, sometimes crawling backward before moving forward

13. A 3-year-old child cannot
a. Draw a square
b. Draw a circle
c. Knows gender
d. Ride a tricycle

Ref: OP Ghai 8th Ed, p 51

Explanation: A child is able to draw a square at approximately 4 ½ years of age

Important developmental milestones at 3 years of age
- Rides tricycle
- Draw a circle
- Can dress or undress completely
- Build a tower of 10 cubes
- Knows gender and age
- Counts 3 objects correctly

14. A 3-year-old child is said to have delayed milestone if he fails to:
a. Use spoon
b. Draw a square
c. Skip
d. Climb with alternating foot downwards in the steps

Ref: Nelson 20th ed. p 75

Explanation: A child is expected to use a spoon by 18 months of age, hence not attaining it at 3 years is definitely developmental delay.

All other milestones in the question, namely drawing a square, skipping and climbing with alternating foot downwards are achieved at 4 years of age or afterwards.

15. During the first year after birth an infant's birth weight normally:
a. Quadruples
b. Doubles
c. Remain stable
d. Triples

16. Expected weight of one-year old child, when the birth weight is 3.5 kg: *(RAK MSc 2018)*
a. 7 kg
b. 6 kg
c. 9.5 kg
d. 10.5 kg

Explanation: As the child ages the weight increase is as follows:
- X Weight at Birth
- 2x 5 months
- 3x 1 year
- 4x 2 years
- 5x 3 years
- 6x 5 years
- 7x 7 years
- 10x 10 years

So, Birth weight triples (3x) at one year.
Therefore, the correct answer is 3.5 × 3 = 10.5 in a year

17. Which part of the brain controls and integrates activities of the autonomic nervous system?
a. Hypothalamus
b. Epithalamus
c. Midbrain
d. Thalamus

18. Which of the following best describes typical annual growth during the school age years?
a. Few physical differences are noticeable between age mates throughout this period
b. Fat pads increase in number and add to the normal "chubby" appearance of the child
c. Child grows an average of 2 inches (5.2 cm) per year
d. Child gain an average of 3 pounds (1.4 kg) per year

19. Popcorn and nuts should not be given to a toddler primarily because they:
a. Will spoil the child's appetite
b. Can cause tooth decay
c. Are easily aspirated
d. Have very little food value

20. First appearing teeth in a child is.....
a. Premolar
b. Incisors
c. Canines
d. Third molar

Explanation: The bottom incisors are the first teeth that tend to erupt in children at 6-8 months of age.

21. The child has a complete set of deciduous teeth at the age of .....years.
a. 1 ½ year
b. 2 years
c. 1 year
d. 2 ½ years

22. A nurse is assessing a one-month-old infant. Which of the following findings should be reported by the nurse immediately?
a. Heart rate of 140 beats per minute
b. Respiratory rate of 40 breaths per minute
c. Inspiratory grunt
d. Abdominal respirations

23. A 3-year-old male child is likely to perform which of the following act
a. Tie the shoelaces
b. Pedaling a tricycle
c. Threading beads
d. Write letters

Ans.

13.	a
14.	a
15.	d
16.	d
17.	a
18.	c
19.	c
20.	b
21.	d
22.	c
23.	b

Scanned with CamScanner

24. The prime principles of growth and development include all except?
a. Growth is a continuous process
b. Development occurs in orderly manner and follows a certain sequence
c. Growth and development go hand in hand
d. Development occurs in a Caudocephalad fashion

25. Identify the correct statement related to growth and development among the following
a. Size and mass of child's body is increasing is called as growth
b. Specific maturations of functions in a child is known as development
c. In a child during initial period of growth and development brain growth is faster, then it became almost static
d. All of the above

26. Growth chart is used for
a. Growth monitoring
b. Diagnostic tool
c. Tool for action
d. All of the above

27. Growth chart is also known as .....
a. New Ballard scale
b. Road to health chart
c. Apgar Score
d. GCS score

28. Identify the correct statement among the following related to weight of the child
a. Normal birth weight of an Indian child is 2.5–3.5 kg
b. Baby's birth weight doubles at 5-6 months of age
c. Baby's birth weight triples at 1 year of age
d. All of the above

29. Birth weight of a newborn baby is 3kg. What is the expected weight of the baby at 1 year of age?
a. 6 kg
b. 9 kg
c. 12 kg
d. 15 kg

Explanation: Weight of a child triples at 1 year of age. So, weight is $3 \times 3 = 9$ kg. Birth weight doubles at 5 months of age.

30. Which of the following is NOT true regarding the birth weight of a newborn? *(AIIMS-BBS SNO 2019)*
a. Birth weight less than 5% of normal on the day of birth requires further investigation
b. Typical birth weight of newborn is between 2.7 kg and 4.0 kg
c. Newborn lose 10% of their birth weight by 3-4 days of age
d. Newborn gain the lost birth weight by 10th day of life

Explanation: Normal birth weight of the baby is between 2.5 kg and 4.5 kg. Newborns often lose around 10% in the first 4 to 5 days after birth but regain it by about 10 to 12 days of age. So, 5% loss on day of birth is considered normal and requires no further investigation.

31. Identify the incorrect statement related to height/length of a child
a. Length of the baby at the time of birth is approximately 45-51 cm
b. Length of the baby doubles at 4 years of age
c. Height of a child will increase till the closure of epiphyseal plate
d. Rate of growth in height is highest during toddler

32. Identify the correct statement related to head circumference/chest circumference
a. At the time of birth, head circumference is about 33-35 cm
b. At the time of birth chest circumference is about 30-33 cm
c. In a healthy child, the head and chest circumference will become equal at around 12 months
d. All of the above

33. In a healthy child, the head and chest circumference equal each other around the age of?
a. 3-6 months
b. 6-9 months
c. 9-12 months
d. 15-18 months

Ref: OP Ghai 8th ed. p 13

Explanation: In a healthy child, the circumference of the chest is about 2-3 cm less than head circumference at birth.

The circumference of head and chest are almost equally by the age of 1 year. Thereafter, the chest circumference exceeds the head circumference.

34. What is the relationship between head circumference (HC) and chest circumference (CC) in a new born baby?
a. Both are equal at the time of birth
b. HC more at the time of birth and both become equal by 1 year and then CC exceeds
c. CC is more at the time of birth and then both become equal by 1 year and then HC exceeds
d. None of the above

35. When preparing a 4-year-old child for a procedure, which method is developmentally most appropriate for the nurse to use?
a. Allowing the child to watch another child undergoing the same procedure
b. Showing the child pictures of what he or she will experience
c. Talking to the child in simple terms about what will happen
d. Preparing the child through play with a doll and toy or a medical equipment

36. Which age group identified illness as a punishment for misdeeds?
a. Infant
b. Toddler
c. Preschool
d. School going

37. Identify the correct statement related to teeth development in children
a. First erupted teeth in a newborn baby is Lower central incisor
b. First teeth erupted in a baby at 4-6 months of age
c. Number of milk teeth in children are 20 in number
d. All of the above

38. At what age do first permanent teeth appear?
a. 5 years
b. 6 years
c. 7 years
d. 8 years

39. Delayed dentition is most characteristics of --
a. Mongolism
b. Milia
c. Cretinism
d. Malnutrition

40. A mature Pincer grasp is attained by_____months:
a. 8
b. 10
c. 12
d. 18

Ref: OP Ghai 8th ed. p 50

Explanation: Development of pincer grasp

- 9 months radial digital grasp
- 10 months inferior pincer grasp
- 10–12 months mature pincer grasp

Ans.

24.	d
25.	d
26.	d
27.	b
28.	d
29.	b
30.	a
31.	d
32.	d
33.	c
34.	b
35.	d
36.	c
37.	d
38.	b
39.	c
40.	c

Scanned with CamScanner

1. **Voluntary palmar grasp appears at what age?**
   a. 28 weeks
   b. 20 weeks
   c. 12 weeks
   d. At birth

2. **Identify the correct statement related to mile stones achievement in child**
   a. Running seen at the age of 15 months
   b. 1-year-old child speaks two words with meaning
   c. Recognizing mother is seen at 3 months of age
   d. All of the above

43. **When Rajan was 3 months old, he had a toy train; when his view of the train was blocked, he did not search for it. Now that he is 9 months, old, he looks for it, reflecting the presence of:**
   a. Object permanence b. Sensorimotor play
   c. Schemata d. Magical thinking

44. **A baby with tripod position, bi dextrous approach, recognizes strangers and can spell out mono syllable by what age?**
   a. 7 months b. 12 months
   c. 9 months d. 10 months

45. **Identify the correct statement related to mile stones achievement in child**
   a. Sit without support seen at 8 months of age
   b. Developmental milestone achieved by a 9 months old child is creeping
   c. Stand without support seen at 12 months of age
   d. All of the above

46. **At what age child can eat food without spilling, identify her gender, say her full name, can dress self with supervision?**
   a. 2 yrs b. 3 yrs
   c. 4 yrs d. 5 yrs

47. **When assessing physical development of the five years old, you would find it abnormal if he____** *(ESIC 2019)*
   a. Needed to go up a stairway one step at a time.
   a. Could catch a large rubber ball
   b. Could stack up pile of six blocks.
   c. Could jumps on one foot a few times.

Explanation: A 3-year-old child should be able to walk up the stairs using a reciprocal pattern, placing only one foot on each step, without requiring the use of a railing for support. Four-year-old child should be able to go both up and down stairs using a reciprocal pattern and no rail.

Other mentioned milestones are expected in a 5-year-old child.

48. **Asperger's syndrome is a**
   a. Neuromuscular disease b. Degenerative disorder
   c. Developmental delay d. Metabolic disorder

49. **Toilet training need to be initiated at ..... of age**
   a. 15 months b. 18 months
   c. 20 months d. 24 months

50. **A child can withhold and postpone his bowel movements at age of?**
   a. 1 years b. 2 years
   c. 3 years d. 4 years

51. **The nurse is aware that preschoolers often display a developmental characteristic that makes them treat dolls or stuffed animals as if they have thoughts and feelings. This is an example of:**
   a. Logical reasoning b. Egocentrism
   c. Concrete thinking d. Animism

52. **The following are features of premature thelarche?**
   a. Association with Turner Syndrome
   b. Asymmetrical breast enlargement
   c. Associated growth spurt
   d. Areola pigmentation

53. **First sign of puberty in boys is?**
   a. Testis enlargement b. Breast enlargement
   c. Penis enlargement d. Scrotum enlargement

54. **According to Denver Development Screening Test (DDST) an infant normally starts standing with support in**
   a. 6 months b. 9 months
   c. 12 months d. 15 months

55. **In Babinski's reflex the movement of great toe undergoes:**
   a. Dorsi extension
   b. Dorsiflexion
   c. Plantar flexion
   d. Plantar adduction

56. **A mature Pincer grasp is attained by_____months:**
   a. 8 b. 10
   c. 12 d. 18

Ref: OP Ghai 8th ed. p 50

Explanation: Development of pincer grasp
- 9 months radial digital grasp
- 10 months inferior pincer grasp
- 10–12 months mature pincer grasp

57. **Normal head circumference of a newborn is:** *(Staff Nurse G II 2014)*
   a. 30-32 cm b. 35-37 cm
   c. 31-33 cm d. 33-35 cm

58. **Follow up care is required for the new born with.....**
   a. Mongolian spots are present
   b. Head circumference 39 cm
   c. Milia is present
   d. Umbilical cord has 2 artery and 1 vein

Explanation: Normal head circumference is 33-35 cm in a new born baby. 39 cm is abnormally large head circumference which is suggestive of hydrocephalus. So, this child require follow up care.

59. **Normal mid upper arm circumference (MUAC) at birth is about**
   a. 6–8 cm
   b. 9–11 cm
   c. 12–14 cm
   d. 14–16 cm

60. **The best method to perform physical examination on a 2-year-old child is**
   a. Proximally to distal
   b. From Head to toe
   c. From least to most intrusive
   d. Abdomen to head

61. **The nurses assess a six months old child during well-baby-clinic. Nurse makes all the following observations. Which of the following assessments made by the nurse is an area of concern indicating a need for further evaluation?** *(RAK MSc 2018)*
   a. Absence of Moro reflex
   b. Closed posterior fontanel
   c. Three pounds weight gain in two months
   d. Moderate head lag when pulled to sitting position

Ans.

57.	d
58.	b
59.	b
60.	c
61.	d

Scanned with CamScanner

Explanation: Head control is expected at the age of 3 months in a baby. Starting at 6 weeks head control develops and there is only a slight lag at 12 weeks of age. Infant lifts head from supine position when to pulled up at 5 months of age. So, head lagging in 6 months old infant requires attention.
All other findings are normal for a 6 months old infant.

62. All of the following informations are sought in the well-baby clinic except: *(Banaras HU 2015)*
a. Schooling
b. Breastfeeding
c. Sleep pattern
d. Child growth and development

63. Importance of play therapy during infancy is.....
a. Physical development
b. Social development
c. Psychological development
d. Emotional development

Explanation: Play during infancy promotes physical development through the use of different kind of toys. All others are also the functions of play therapy but during infancy its main importance is physical development of the child.

64. Maximum absolute growth is seen at: *(AIIMS 2001)*
a. 0–3 years
b. 3–5 years
c. 5–10 years
d. 14–16 years

Explanation: Maximum growth can be seen in Girls by 10 years (8–13) and in boys 12 years (10–15). This growth spurt is because of puberty attainment.

Ans.

62.	a
63.	a
64.	d
65.	a
66.	d
67.	d
68.	c
69.	a
70.	d
71.	a
72.	a

THEORIES OF GROWTH AND DEVELOPMENT

65. When considering the principle of growth and development, remember that *(ESIC 2019)*
a. Although development occurs in an orderly sequence, the rate may vary between individuals.
b. Most children can run before they walk
c. Development occurs evenly, with periods of no growth occurring every third year.
d. All children should grow in the same rate, all four years old should weight within 4 kg of each other.

Explanation: Although development of child follows an orderly sequence, it is not necessary that the rate of growth and development is similar in all individuals. It is subject to individual variations. Statements given in option B, C, D are incorrect as per the principles of Growth and Development. [*Refer Principles of Growth and Development in Synopsis of Pediatric Nursing (Page no. 737)*]

66. The prime principles of growth and development include all except? *(Recent Question 2015)*
a. Growth is a continuous process
b. It follows the same pattern in all human beings
c. Growth and development go hand in hand
d. Development occurs in a Caudocephalad fashion

Ref: OP Ghai 8th ed. p 10

Explanation: Order of growth in human beings is cephalocaudal and distal to proximal.

67. All among the following indicate principles of normal growth and development EXCEPT:
a. Proximal to distal
b. Cephalocaudal
c. General to specific
d. Physical to psychological

Explanation: Physical to psychological not used to describe normal growth and development. All others are the characteristics of normal growth and development.

68. In the stages of growth and development, the infancy extends from: *(AIIMS Raipur Grade II 2017)*
a. Birth to 4 weeks
b. Birth to 1 year
c. 4 weeks to 1 year
d. 1 to 3 years

Explanation:
0–28 days - newborn
1 month-year: Infant
1–3 years: Toddlers
3–6 years: Preschoolers
6–12 years: Schoolers
12–18 years: Adolescents

69. Psychosocial development of children is proposed by
a. Erikson
b. Freud
c. Piaget
d. Kohlberg

Explanation: Psychosocial development proposed by Erikson.
Psychosexual development - Freud
Cognitive development - Piaget's
Moral development - Kohlberg

70. According to Piaget's theory 6 months old infant will demonstrate:
a. Negativism
b. Transductive reasoning
c. Imitation
d. Beginning of object permanence

Explanation: The beginning of object permanence will start by around 6 months of age. Object permanence is the understanding that objects continue to exist even when they cannot be observed (seen, heard, touched, smelled or sensed in any way)

71. A per Erik Erikson's stages of development child take decision at the age of..... *(Kerala PSE 1991)*
a. 3 years
b. 5 years
c. 7 years
d. 9 years

Explanation: From 1–3 years child develops autonomy and reaches peak at 3 year.

72. According to Erickson's psychosocial theory, what is the developmental task of a toddler? *(AIIMS Bhopal Grade-I 2018)*
a. Autonomy/shame and doubt
b. Trust/Mistrust
c. Industry/Inferiority
d. Initiative/Guilt

Explanation: Toddlers are 1–3 years old children. In this age group the child is developing physically and become more mobile and discovering that he/she has many skills or abilities like putting on clothes and shoes etc. If children in this stage are supported in their increased independence, they develop a sense of autonomy and if they are criticized or not giving opportunity to assert themselves then they feel a sense of shame and doubt in their abilities.

Scanned with CamScanner

73. Psychosexual development stage of a toddler?
a. Phallic stage
b. Anal stage
c. Genital stage
d. Oral stage

Explanation: As per the psychosexual development theory proposed by Freud, toddler belongs to anal stage of development.

74. Guidelines for assessing toilet training readiness are.....
a. Parental readiness
b. Psychological readiness
c. Mental readiness
d. All of the above

Explanation: Guideline for assessing readiness for toilet training includes Parental readiness, psychological readiness, mental readiness and physical readiness.

75. Occurrence of 'Oedipus complex' is commonly seen in:
a. Girls between 1–3 years of age
b. Girls between 3–5 years of age
c. Boys between 1–3 years of age
d. Boys between 3–5 years of age

Ref: Textbook of Developmental Pediatrics by John E. Williams, p 266

Explanation: In Freudian psychoanalytical theory, 'Oedipus complex' the complex of emotions aroused in a young child, typically around the age of four, by an unconscious sexual desire for the parent of the opposite sex and wish to exclude the parent of the same sex.

- The term was originally applied to *boys*, the equivalent in girls being called the Electra complex

76. The parents of a child aged 6 years who will begin school ask the nurse for anticipatory guidance. The nurse should explain that a child of this age: *(DSSSB 2010)*
a. Still depends on the parents
b. Rebels against scheduled activities
c. Is highly sensitive to criticism
d. Loves to battle

Explanation: 6-year-old child is independent in most of his activities and highly sensitive to criticism.

77. Eight-year-old Suman has difficult time making friends at school and being chosen to play on the team. He also has trouble completing his homework and, as a result, receives little positive feedback from his parents or teachers. According to Erickson's theory, Failure at this stage of development results in:
a. A sense of guilt
b. A sense of Shame
c. Feelings of inferiority
d. A poor sense of self

78. To encourage an infant's cognitive and psychosocial development parents and other caregivers should____ *(ESIC 2019)*
a. Allow the baby to play alone several hours each day.
b. Firmly explain the rules of acceptable behavior
c. Give loving consistent care, including playing
d. Keep the baby with them at all times so he or she is safe.

Explanation: Giving a loving consistent care, including playing helps in the development of higher mental functions and the behavior related development of the child.

- Allow the baby to play alone several hours each day does not help in behavioral development.
- Firmly explaining the rules increases the discipline in child.
- Keep the baby with them at all times increases the dependency in child.

79. WHO defines adolescent age group between:
a. 10-19 years
b. 9-14 years
c. 10-25 years
d. 10-14 years

Ref: OP Ghai 8th ed. p 63

Explanation: As per WHO, adolescents are person between the age group of 10 and 19 years.

80. The primary psychosocial task during adolescence is to establish
a. Identity
b. Intimacy
c. Autonomy
d. None of the above

81. The nurse teaches parents how to have their children learn impulse control and cooperative behaviours. This would be during which of Erickson's stages of development?
a. Trust versus mistrust
b. Initiative versus guilt
c. Industry versus inferiority
d. Autonomy versus sense of shame and doubt

82. During adolescence, psychosocial development focuses on .....
a. Becoming independent
b. Establishing an identity
c. Peer group relationship
d. Developing initiative

NEONATAL ASSESSMENT

83. All are the characteristics of term baby EXCEPT
a. Well curved pinna reaching up to the periphery
b. No deep creases in the soles
c. Pigmented and pendulous scrotal sac
d. Silky hair individual hair strands can be made out

Explanation: In term baby deep creases will be present in the palms and soles of the baby. All others are the characteristic of term baby.

84. Babinski sign is considered as normal in *(AIIMS Raipur NO 2019)*
a. Newborn
b. Adolescents
c. Youth
d. Older adults

Explanation: Babinski sign is considered as normal in Newborns and infants. Positive Babinski reflex in adults is indicative of abnormalities in the motor control pathways leading from the cerebral cortex.

85. What is the most common complication for which a nurse must monitor preterm infant? *(NCFL 2019)*
a. Hemorrhage
b. Brain damage
c. Respiratory distress
d. Aspiration of mucus

Explanation: Respiratory Distress Syndrome (RDS) occurs most often in newborns born preterm, affecting nearly all newborns who are born before 28 weeks of pregnancy. Less often, RDS can affect full term newborns. Since the exact period of preterm (gestational age) is not given, Respiratory distress is the most likely answer.

Ans.

73.	b
74.	d
75.	d
76.	c
77.	c
78.	c
79.	a
80.	a
81.	d
82.	b
83.	b
84.	a
85.	c

Scanned with CamScanner

86. The Apgar score should be assessed: *(Safdarjung NO 2018)*
a. Immediately after birth and at 30 minutes after birth
b. At 5 minutes after birth and at 30 minutes after birth
c. At 1 minute after birth and at 5 minutes after birth
d. Immediately after birth and at 5 minutes after birth

Explanation: APGAR scoring is useful quantitative Assessment of Newborn for Respiratory, Circulatory and neurologic status. APGAR is assessed at 1 minute and 5 minutes of Birth. Usually newborn have lower score at Birth due to depression than the score after 5 minutes of birth. The 1 minute's score determines how well the baby tolerated the process of birth. The 5-minute score determines how well the baby is doing in the outside environment (outside womb).

87. What is nurse's primary critical observation when performing an assessment for determining an Apgar score? *(NCFL 2019)*
a. Heart rate
b. Respiratory rate
c. Presence of meconium
d. Evaluation of Moro reflex

Explanation: Pulse or heart rate has to be assessed first and then the respirations.

88. Which is the indicator of immediate estimate of the physical condition of the baby?
a. New Ballard scale
b. Apgar score
c. Growth chart
d. Health assessment

89. In the term APGAR 'G 'stands for_____
a. Grunting b. Growth
c. Gross d. Grimace

90. Apgar score system contains all of the following criteria EXCEPT
a. Respiratory rate b. Color
c. Motor tone d. Heart rate

91. Which of the following is not a component of Apgar score? *(Recent Question 2015)*
a. Color of the body
b. Muscle tone
c. Heart rate/min
d. Respiratory rate per minute

Ref: OP Ghai 8th ed. p 126

Explanation: It is respiratory efforts and not respiratory rate per minute that is taken into consideration in Apgar score.

Apgar scale (evaluate @ 1 and 5 minutes postpartum)

Sign		2	1	0
A	Activity (muscle tone)	Active/fully flexed	Arms and legs flexed	Absent
P	Pulse	>100 bpm	<100 bpm	Absent
G	Grimace (reflex irritability)	Sneezes, coughs, pulls away	Grimaces	Cyanotic or pale all over
A	Appearance (Skin color)	Normal over entire body	Normal except extremities	Cyanotic or pale all over
R	Respirations	Good, crying	Show, irregular	Absent

92. Which of the following are components of Apgar score?
a. Activity, heart rate, grimace, respiratory rate
b. Apnea, heart rate, grimace, tone
c. Activity, color, tone, respiratory effort
d. Appearance, tone, heart rate, respiratory rate

Ref: Nelson 20th Ed, p 798

Explanation: Components of Apgar score:
- Heart rate
- Respiratory effort
- Tone
- Response to catheter in nose
- Color

93. Initial nursing action after the birth of a preterm baby with Apgar score 8 is.....
a. Weight the baby
b. Do suction
c. Inform the family members about the birth and sex of the baby
d. Receive the baby in a pre-warmed towel and dry the baby

Explanation: Preterm babies are more prone to develop hypothermia which cause hypoxia and academia. Because of physiological factors, such as lack of brown fat, the preterm infant is more vulnerable to cool temperatures.

94. A new born of one minute after vaginal delivery is pink with blue hands and feet. Has a lusty cry, having heart rate of 140. Prompt response to stimulation with crying and maintains minimal flexion with sluggish movement. The nurse should know that this newborn's Apgar score is:
a. 10 b. 8
c. 9 d. 7

95. Identify the high-risk infant among the following
a. Infant with birth weight 2.5 kg
b. Infant on artificial feeding
c. Infant with birth weight 2 kg
d. Infant with Apgar score 8

96. The normal axillary temperature of a newborn is between which of the following ranges? *(AIIMS Bhopal Nursing Officer, 2018)*
a. 40 to 42°C
b. 30 to 32°C
c. 32.5 to 34°C
d. 36.5 to 37.4°C

Explanation: 36.5 to 37.4°C is the normal axillary temperature of a newborn baby. If temperature less than 36.5°C it is called as hypothermia.

97. Which of the following is NOT a nursing intervention to maintain the temperature of a newborn? *(AIIMS-BBS SNO 2018)*
a. Dry the newborn immediately after birth
b. Wrap the newborn in warmed blankets
c. Use a warmed cloth for weighing the unclothed newborn
d. Place the newborn near draughts or air vents.

Explanation: One of the basic needs of newborn is "warmth". Placing the newborn near air vents will put the newborn at risk of hypothermia due to convection heat loss.

Ans.

86.	c
87.	a
88.	b
89.	d
90.	a
91.	d
92.	c
93.	d

95.	c
96.	d
97.	d

Scanned with CamScanner

98. **For assessing the gestational age of preterm infant the nurse should use.....?**
   a. Palmar creases
   b. Reflex stability
   c. Breast bud size
   d. Head to toe length

Explanation: The size of breast bud is an indication of gestational age. Small under developed nipple indicate prematurity.

99. **All the following reflexes are present in the newborn baby EXCEPT**
   a. Sucking
   b. Rooting
   c. Mature pincer grasp
   d. Pupillary reflex

Explanation: Mature pincer grasp will be developing by 9 months of age. All the other reflexes are present in a newborn baby

100. **The last neonatal reflex to emerge is?**
   a. Rooting reflex
   b. Grasp reflex
   c. Babinski reflex
   d. Moro's reflex

Ref: Illingworth 10th ed,p 72; Achar Textbook of Pediatrics 4th ed, p 70, Table 6.2

Explanation:

Reflex	Emerges at gestational age
Palmar grasp	11 weeks
Babinski reflex	18 weeks
Moro reflex	8-9 weeks
Rooting reflex	28-30 weeks

101. **If a newborn's head and trunk is allowed to fall backward it elicits:**
   a. Step in reflex
   b. Plantar reflex
   c. Startled reflex
   d. Moro reflex

102. **Reflex response to a sudden loss of support, when the infant feels as if it is falling is known as .....**
   a. Startle reflex
   b. Glabella reflex
   c. Moro reflex
   d. Tonic neck reflex

103. **The last neonatal reflex to disappear is .....**
   a. Rooting reflex
   b. Grasp reflex
   c. Plantar grasp
   d. Moro's reflex

104. **Rooting reflex in infant disappears at**
   a. 1 month
   b. 3 to 4 months
   c. 6 to 8 months
   d. 9 to 12 months

Explanation:

Reflex	Age when reflex appears	Age when reflex disappears
More reflex	Birth	2 months
Walking/stepping	Birth	2 months
Rooting	Birth	4 months
Tonic neck reflex	Birth	5-7 months
Palmar grasp	Birth	5-6 months
Plantar grasp	Birth	9-12 months

Source: Caring for Your Baby and Young Child: Birth to Age 5 (Copyright © 2009 American Academy of Pediatrics

105. **Newborn reflexes which are present at birth and remain unchanged throughout adulthood:** *(Safdarjung NO 2018)*
   a. Blinking, coughing, rooting and gag reflex
   b. Blinking, coughing, sneezing and gag reflex
   c. Rooting, sneezing, swallowing and coughing
   d. Stepping, blinking, coughing and sneezing

Explanation: Blinking, coughing, sneezing and gag reflexes are mature reflexes and as we grow, they do not disappear as they are needed for normal survival. They are known as protective reflexes.

106. **Neonatal reflex elicited by touching the cheeks of the baby is:**
   a. Moro reflex
   b. Rooting reflex
   c. Startle reflex
   d. Sucking reflex

107. **Asymmetric Moro's reflex at birth is indicative of:**
   a. Hypoxic ischemic encephalopathy
   b. Brain damage
   c. Erb's palsy
   d. Kernicterus

108. **Which assessment data alert the nurse to suspect shaken baby syndrome?**
   a. Preterm baby
   b. Lack of stridor and adventitious breath sounds
   c. Previous episode of apnea which last for 10–15 seconds
   d. Previous episode of seizure

Explanation: Lack of stridor and adventitious breath sounds is the most common sign which occurs in shaken baby syndrome following CNS trauma.

109. **Among the following identify the feature that is not expected in a full term new born baby?**
   a. Creases cover sole
   b. Well pigmented pendulous scrotum
   c. Pinna firm, stand errect from head
   d. Breast nodule 1-2 mm

Explanation: Breast nodule is small with size less than 5 mm in a preterm child. Average breast diameter at term birth is 8 mm. So breast nodule 1-2 mm is not a feature of full term baby. All other given features are characteristics of a term baby.

110. **Which of the following is NOT a common problem of infants born to diabetic mothers?** *(AIIMS-BBS SNO 2019)*
   a. Hyperglycemia
   b. Hypocalcaemia
   c. Polycythemia
   d. Macrosomia

Explanation: Gestational diabetes results in neonatal problems like hypoglycemia, polycythemia (venous hematocrit greater than equal to 65), macrosomia (newborn larger than average), and respiratory distress syndrome (breathing disorder).

NEONATAL RESUSCITATION

111. **The ratio of lung inflation to chest compression in cardio pulmonary resuscitation is:** *(UP 2010)*
   a. 1:5
   b. 2:5
   c. 1:3
   d. 3:1

Ref: OP Ghai 8th ed. p 131

Explanation: Provider should perform chest compressions while the other maintains the air way and performs **Ventilations:** Compressions at a ratio of 1:3 with as short a pause in compression as possible..

Ans.

110.	a
111.	c

Scanned with CamScanner

112. Expanded form of TABC used in neonatal resuscitation is ----
a. Thermometer, airway, Breathing, circulation
b. Temperature, atmosphere, breathing, compression
c. Temperament, airway, breathing, circulation
d. Temperature, airway, breathing, circulation

113. What is the ideal temperature of the newborn resuscitation room? *(AIIMS Nov 2016)*
a. 37–39°C
b. 32–34°C
c. 28–30°C
d. 25–27°C

Ref: O.P Ghai 8th Ed, pg 133

Explanation: Immediately after birth the newborn is at high risk for hypothermia. The temperature of delivery room should be 25 degree Celsius and it should be free from draft of air.

114. While suctioning newborn babie's mouth and nose which part need to suction first?
a. Mouth
b. Nose
c. There is no order
d. Based upon the amount of secretions present

115. When caring for an infant during cardiac arrest, which pulse must be palpated to determine cardiac function? *(NCFL 2019)*
a. Carotid
b. Brachial
c. Pedal
d. Radial

116. The first medication that may be required in the resuscitation of baby with prolonged birth asphyxia is
a. Sodium bicarbonate
b. Adrenalin in 1:10000 dilution
c. Calcium gluconate
d. 25% dextrose

117. Size of suction catheter used in neonate for oral and nasal suction is .....
a. 8 Fr
b. 12 Fr
c. 14 Fr
d. 16 Fr

118. In Neonatal Resuscitation _____ are seldom needed to stimulate the heart, increase tissue perfusion, and restore acid base balance.
a. Medication
b. Chest Compression.
c. Bag and mask ventilation
d. Tactile stimulation.

119. Bag and mask ventilation is contraindicated in newborn resuscitation with clinical suspicion of: *(Recent Question 2016-17)*
a. Diaphragmatic hernia
b. Intracranial haemorrhage
c. Born to diabetic mother
d. Pneumothorax

Ref: O.P Ghai 8th Ed., pg 129

Explanation: Two situations where Bag and mask ventilation is contraindicated in newborn resuscitation:
- Congenital diaphragmatic hernia. Diaphragmatic hernia is the contraindication for BMV, because it further increases the intrathoracic pressure and respirator compromise will be there.
- Infants born through meconium stained liquor

Ans.

112.	d
113.	d
114.	a
115.	b
116.	b
117.	a
118.	a
119.	a
120.	d
121.	a
122.	a
123.	c
124.	d

120. Bag and mask ventilation is contraindicated in newborn resuscitation with clinical suspicion of all of the following conditions, EXCEPT?
a. Diaphragmatic hernia
b. Tracheoesophageal fistula
c. Meconium aspiration
d. Lung malformation

Explanation: In diaphragmatic hernia, bag and mask ventilation (BMV) lead to further distension of bowel.

Air through Tracheoesophageal fistula can result in increased gastric pressure.

In meconium aspiration, BMV will further increase the risk of aspiration.

121. During resuscitation shoulder roll is placed under baby's shoulder to slightly extent the neck. This is because .....
a. It brings posterior pharynx, larynx and trachea in a line
b. Facilitate drainage from the mouth
c. More amount of air will pass
d. It promote inspiration and expiration

Explanation: Shoulder roll brings posterior pharynx, larynx and trachea in a line and it will facilitate breathing in new-born baby and will also help in easy intubation.

122. During neonatal resuscitation, what is the order of clearance of secretions?
a. Mouth first followed by nasal cavity
b. Nasal cavity followed by mouth
c. Pharynx followed by mouth
d. None of above

Ref: OP Ghai 8th Ed, p 128

Explanation: During neonatal resuscitation, secretion may be removed from the airway by wiping the nose and mouth with a clean cloth or by suctioning with a bulb syringe or suction catheter.

The mouth is suctioned before nose (*remember, 'M' before 'N'*) to ensure the infant does not aspirate, if she should gasp when the nose is suctioned.

123. Which is the ideal route for administration of drugs during newborn resuscitation? *(AIIMS Nov 2016)*
a. Endotracheal
b. Umbilical artery
c. Umbilical vein
d. Intraosseous

Ref: Cloherty 7th Ed., pg 56

Explanation: "The most accessible intravenous (IV) route for neonatal administration of medications is catheterization of the umbilical vein, which can be done rapidly and aseptically"

The most commonly used medication is epinephrine (as 1:10,000 solution). Intravenous fluids and naloxone can also be given.

124. What should be the size of the endotracheal tube for a newborn weighing 2,000 to 3,000 gms? *(AIIMS Bhopal Nursing Officer, 2018)*
a. 4.0
b. 3.0
c. 2.5
d. 3.5

Scanned with CamScanner

Explanation:

Tube size	Birth weight	Gestational age
4.0	>3 kg	Term
3.5	2–3 kg	34–38 weeks
3.0	1–2 kg	28–34 weeks
2.5	<1 kg	≤28 weeks

CARE OF NEWBORN

125. An infant is born precipitously outside the labor room. What should the nurse do first? *(NCFL 2019)*

a. Tie and cut the umbilical cord
b. Establish an airway for the newborn
c. Ascertain the condition of the uterine fundus
d. Arrange transport for mother and infant to the birthing unit

Explanation: Immediate action by the nurse after the birth of a baby is to establish an airway by clearing the mucus in nose and mouth. This will help the newborn to breathe. Other actions can be followed after that.

126. The premature closure of the sagittal suture is called: *(AIIMS Raipur Grade II 2017)*

a. Scaphocephaly
b. Oxycephaly
c. Acrocephaly
d. Anencephaly

Explanation: Scaphocephaly is a type of cephalic disorder which occurs when there is a premature fusion of the sagittal suture.

- **Oxycephaly:** Premature closure of coronal suture.
- **Acrocephaly:** Premature closure of the lambdoid and coronal sutures.
- **Plagocephaly:** Asymmetrical distortion (flattening of one side) of the skull.
- **Anencephaly:** Absence of major portion of brain.

127. Identify the correct statement regarding caput succedaneum

a. Maximum size and firmness at birth
b. Occur between skull and periosteum
c. Increases size for 12–24 hours then stable
d. Does not cross the suture line

Explanation: Option A is the correct statement regarding caput succedaneum all other statements are related to cephalohematoma

128. Premature closure of coronal suture is known as.....

a. Albert syndrome
b. Apert syndrome
c. Neurofibromatosis
d. Trachoma

Explanation: Apert syndrome is a genetic disorder characterized by the premature closure of the bones of the skull (craniosynostosis)

129. Anterior fontanel corresponds to all structures EXCEPT:

a. Frontal suture
b. Coronal suture
c. Lambdoid suture
d. Sagittal suture

130. Craniopagus refers to:

a. Fusion at head and spine
b. Fusion at head only
c. Fusion at head and legs
d. None of above

Ref: Cloherty Neonatology manual, 7th Ed, p 129

Explanation: Craniopagus refers to conjoined twins with partially fused skulls; the union may be frontal occipital or parietal

- They can share scalp, calvarium, dural sinuses and surface of the brain, but the face foramen magnum and the spine remain separate.
- Conjoined twins result when incomplete embryonic division occurs late, after day 14 postconception.
- **Illustration of a craniopagus twin is shown below**

131. Sunset sign is seen in the following condition. *(AIIMS Raipur NO 2019)*

a. Pyloric Stenosis
b. Hydrocephalus
c. Tetralogy of Fallot
d. Seizures

Explanation: Sunset sign phenomenon is an ophthalmologic sign seen in children with Hydrocephalus due to increased ICP. In this, eyes are often rolled downward so that the white part of the eyes (sclera) is visible below the upper eyelid.

132. The average length of a normal newborn baby is

a. 45 cm
b. 43 cm
c. 50 cm
d. 35 cm

133. Which of the following is true about Mongolian Spots?

a. Disappears in about a year
b. It will persist throughout life time
c. Can be treated with emollient
d. Are indicative of parental abuse

134. Identify the incorrect statement related to Mongolian spot in newborn baby.

a. Disappears in about a year
b. Are indicative of parental abuse
c. They are flat, gray-blue in color
d. Any part of the body of dark-skinned babies

Explanation: Mongolian spots are very common in any part of the body of dark-skinned babies. They are flat, gray-blue in color (almost looking like a bruise), and can be small or large. They are caused by some pigment that did not make it to the top layer when baby's skin was being formed. Most of the time it will disappear by 1 year of age.

135. In preterm labour, medication given to the mother to establish fetal lung maturity is .....

a. Prostaglandin
b. Betamethasone
c. Oxytocin
d. Adrenaline

136. Lecithin/Sphingomyelin ratio is done to assess the maturity of: *(JIPMER 2014)*

a. Lung
b. Fetal circulation
c. Brain
d. Gonad

Ref: OP Ghai 8th ed. p 169

Ans.

125. b
126. a
127. a
128. b
129. c
130. b
131. b
132. c
133. a
134. b
135. b
136. a

Scanned with CamScanner

Explanation: The Lecithin-Sphingomyelin (L/S) Ratio

- Assessment of fetal lung maturity (FLM) prenatally by testing amniotic fluid obtained by amniocentesis.
- It is performed by thin-layer chromatography.
- The risk of RDS is very low if the L/S ratio is >2.
- Exceptions to L/S ratio >2 are:
- Infants of diabetic mothers (IDMs).
- Intrapartum asphyxia.
- Erythroblastosis fetalis.

137. In the antenatal period there is a history of exposure to morphine in pregnant mother. After the delivery which among the following drug is most likely ordered by the doctor?

a. Naloxone
b. N-acetyl cysteine
c. Acetazolamide
d. Sodium bicarbonate

Explanation: Morphine is narcotics and its antidote is naloxone which is essential to prevent respiratory depression in new born child.

138. Clinical manifestation of fetal alcohol syndrome includes .....

a. Anencephaly, hydrocephalus and microglossia.
b. Hepatomegaly, hypotonia, and microphthalmia.
c. Hyperbilirubinemia, jaundice, and failure to thrive.
d. Microcephaly, short philtrum, and prenatal growth retardation

139. All are seen in fetal alcohol syndrome except:

a. Microcephaly
b. Poor coordination
c. Overgrowth of body
d. Flat face

140. Which of the following action would the nurse anticipate using while caring for a term neonate diagnosed with transient tachypnea at 2 hours after birth? *(RAK MSc 2018)*

a. Monitoring the neonates color and cry every four hours
b. Feeding the neonate with a bottle every three hours
c. Obtaining extra corporeal membrane oxygenation equipment
d. Providing warm, humidified oxygen in a warm environment

Ans.

137.	a
138.	d
139.	c
140.	d
141.	a
142.	d
143.	c
144.	a
145.	d
146.	c
147.	d
148.	a
149.	d

Explanation: Transient Tachypnea of newborn (TTN) is a self-limiting disease occur especially among term neonate & due to delayed clearance of lung field. These babies have tachypnea with minimal or no respiratory distress. Oxygen treatment is adequate to treat this condition.

141. Which of the following vaccine can be given to severely immunosuppressed HIV positive child

a. DPT
b. BCG
c. Measles
d. OPV

142. Which of the following vaccine can be given to HIV positive child

a. DPT
b. Hepatitis B vaccine
c. IPV
d. All of the above

143. Which of the following immunization should be given to a client who is HIV positive and immune compromised?

a. MMR
b. OPV
c. IPV
d. Rotavirus

144. Which drug is given to prevent HIV transmission from mother to child?

a. Nevirapine
b. Lamivudine
c. Stavudine
d. Abacavir

145. All are the correct nursing interventions while caring for new-born baby affected with HIV except

a. Follow standard precautions
b. Educate the family regarding the disease transmission process
c. Educate them that vaccination need to be done after consultation with doctors only
d. If baby is not satisfied with breast milk then provide formula feed

Explanation: Mixed feeding is never recommended in HIV positive child because it will increase the risk of infection. Vaccination need to be done after consultation with doctors, because live vaccines need to be avoided in these patients.

146. A nurse is performing as assessment on a 10-year-old suspected of having Hodgkin's disease. The nurse understand that which data are most characteristics of this disease? *(RAK MSc 2018)*

a. Painful, enlarged inguinal lymph nodes
b. Fever and malaise
c. Painless, firm, movable adenopathy in cervical area
d. Anorexia and weight loss

Explanation: Hodgkin's disease is a neoplasm of lymphatic tissue. The presence of Reed-Sternberg cells (giant multinucleated cells) is the hallmark sign of Hodgkin's disease. Specific clinical manifestations associated with Hodgkin's disease include painless, firm, and movable adenopathy in the cervical, supraclavicular, and mediastinal areas. Mediastinal presentation is common in adolescents and young adults. Hepatosplenomegaly also is seen in this condition.

Other given symptoms are present with many other disorders while Painless, firm and movable adenopathy is associated with Hodgkin's disease only.

147. Out come on fetus if the mother is suffering from serious conditions like cyanotic heart disease is .....

a. Macrosomia
b. Acromegaly
c. VSD
d. IUGR

148. Most common cause of neonatal death in India: *(AIIMS Nov 2010)*

a. Prematurity
b. Infection
c. RDS
d. HIE

Ref: Lancet 2010 November 27; 376(9755): 1853-1860

Explanation: The major causes of newborn deaths in India are:

- Prematurity/preterm - 35%
- Neonatal infections - 33%
- Intrapartum related complications/birth asphyxia - 20% and
- Congenital malformations - 9%

Source: UNICEF

149. Which of the following is a major risk factor for having a low birth weight baby? *(RAK MSc 2018)*

a. Heredity
b. Smoking
c. Drugs use during pregnancy
d. Poor nutrition

Scanned with CamScanner

Explanation:

- **Poor nutrition** is a major risk factor for having a low-birth-weight-baby. Nutritional status of the mother is extremely important for the growth of the fetus.
- Other primary factors associated with low birth weight baby includes genetics, age of the mother, smoking status of mother and prenatal care.

150. According to World Health Organization, "low birth weight" means a weight of less than: *(SSNE 2015)*

a. 2.8 kg b. 2.7 kg
c. 2.5 kg d. 2.3 kg

151. 'Extremely low birth weight' babies have a birth weight of *(AIIMS Bhopal Nursing Officer, 2018)*

a. 1000 to 1,500 g b. Less than 1000 g
c. 3000 to 2,500 g d. 2,500 to 1,500 g

Explanation:

1500 g - 2500 g	Low birth weight
1000 g to 1500 g	Very low birth weight
Less than 1000 g	Extremely low birth weight

152. Antenatal smoking by the pregnant women may leads to .....

a. Coarctation of aorta b. Low birth weight
c. Macrosomia d. Acromegaly

153. Which babies are at higher risk to have hypothermia?

a. Baby with any congenital abnormality
b. Low birth weight babies
c. Healthy baby
d. One year old child.

154. The most common complication in low birth weight infant is: *(RAK MSc 2018)*

a. Respiratory distress b. Mucus damage
c. Brain damage d. Hemorrhage

Explanation: Low birth weight is most often caused by premature birth. Respiratory distress is the most common complication in preterm babies as their lungs are not mature at the time of delivery. Other complications of LBW babies includes hypothermia, perinatal asphyxia, bacterial sepsis apnea of prematurity etc.

155. The best method to prevent hypothermia in LBW babies is:

a. Temperature recording
b. Hot sponging
c. Warm chain
d. Keep baby in cradle

156. Kangaroo mother care is necessary till baby attains a weight of: *(J&K PG 2011)*

a. 1500 g b. 2000 g
c. 2500 g d. 3000 g

Ref: OP Ghai 8th ed. p 148

Explanation: WHO recommends that KMC to be continued till baby attains a weight of 2.5 kg or till babies wriggle out, indicating that they do not need kangaroo mother care any further.

157. How to keep a LBW baby warm:

a. Keeping the room warm
b. Kangaroo mother care (KMC)
c. Adequate breast feeding
d. All of the above

158. KMC is mostly applicable to which women:

a. All pregnant women
b. Only women who are at high risk of delivering a pre- term/ LBW babies
c. Only women who are booked to deliver in hospital
d. Only primigravid women

159. The position of the baby during KMC should be:

a. A special garment is needed
b. A blanket is used to keep the infant on the mothers back
c. Keep baby in mother chest, head turned to one side and support bottom with belt or hand
d. Baby should be kept on mother's lateral side

160. Who should take the infant out of the incubator for KMC?

a. Only the doctor
b. The nurse
c. Either the doctor or the nurse
d. The mother

161. How baby should be monitored during KMC?

a. With an apnea alarm.
b. A nurse must observe the infant while the mother is giving KMC.
c. Usually no monitoring is needed.
d. The baby vital signs must be recorded every 30 minutes.

162. Which baby should not be given KMC?

a. Baby in incubators.
b. Baby who are having recurrent apnea.
c. Baby who are not breast feeding yet.
d. Baby whose weight is less than 1200 gram

163. The duration of providing KMC should be:

a. ½ hour b. 1 hour
c. 2 hours d. 3 hours

164. Key features of kangaroo mother care are all the following, except? *(AP PG 2014)*

a. Skin to skin contact between mother and baby
b. Exclusive breast feeding
c. Initiated in a facility and continued at home
d. Done for babies with cyanosis

Ref: OP Ghai 8th ed. p 150

Explanation: Kangaroo care is a technique practiced on newborn, usually preterm, infants wherein the infant is held, skin-to-skin, with an adult.

- The kangaroo position provided ready access to nourishment.
- The parent's stable body temperature helps to regulate the neonate's temperature more smoothly than an incubator, and allows for readily accessible breastfeeding.
- Babies who are eligible for kangaroo care include pre-term infants, weighing less than 1,500 grams, and breathing independently.
- Cardiopulmonary monitoring, oximetry, supplemental oxygen or nasal continuous positive airway pressure ventilation, intravenous infusion, and monitor leads do not prevent kangaroo care.
- Babies who are in kangaroo care tend to be less prone to apnea and bradycardia and have stabilization of oxygen needs.

165. The LBW baby get discharged to home:

a. When the baby weight reaches to 1800 gram
b. When the baby weight is 2000 gram
c. When the baby reaches to term period
d. When the baby is feeding well & gaining weight

166. The calories needed in LBW infant is:

a. 50-60 kcal/kg/day b. 70-110 kcal/kg/day
c. 120 - 140 kcal/kg/day d. 150-200 kcal/kg/day

Ans.

150.	c
151.	b
152.	b
153.	b
154.	a
155.	c
156.	c
157.	d
158.	b
159.	c
160.	c
161.	d
162.	b
163.	b
164.	d
165.	d
166.	c

Scanned with CamScanner

167. All are the characteristic of neonatal asphyxia EXCEPT
a. Hypoxia
b. Hypoperfusion
c. Hypocapnia
d. Acidosis

168. The nurse would expect to find in a newborn with birth asphyxia: *(Safdarjung NO 2018)*
a. Hyperoxia
b. Acidosis
c. Hypocapnia
d. Ketosis

Explanation: In birth asphyxia, there is accumulation of carbon-dioxide in the blood resulting in respiratory acidosis.

169. In full term newborns, functional closure of ductus arteriosus occurs _____ after birth
a. Within 3 weeks
b. Within 2 weeks
c. Within 1 week
d. Within 24-72 hours

Explanation: Normally, the ductus arteriosus closes within 24–72 hours after a full-term birth; if after 72 hours the ductus fails to close, a diagnosis of persistent PDA may be made. This is known as functional closure. Permanent or anatomic closure is complete within 2 to 3 weeks.

170. Which drug is used to treat PDA?
a. Oxaceprol
b. Morphine
c. Dopamine
d. Indomethacin

171. Drug used for closure of patent ductus areteriosus?
a. Paracetamol
b. Ibuprofen
c. Indomethacin
d. All of the above

172. Drug of choice to keep ductus arteriosus patent is .....
a. Paracetamol
b. Ibuprofen
c. Indomethacin
d. Prostaglandin

Explanation: Prostaglandin [PGE1 (Misoprost)] is the drug of choice to keep PDA open.

173. Sequence of taking vital sign in a newborn infant is:
a. TPR
b. PRT
c. RPT
d. RTP

Explanation: Respiratory Rate should be assessed first before touching or handling the newborn because the newborn may cry while touching for temperature or pulse assessment that results in increased respiratory rate. So the sequence is respiratory rate, pulse and temperature.

174. Numerator for neonatal mortality rate is calculated by newborn death within:
a. 28 days
b. One year
c. 24 hours
d. One week

175. While assisting delivery, which of the following intervention by the nurse will prevent heat loss in the newborn due to evaporation?
a. Pre-warming the crib pad
b. Turn on overhead radiant warmer
c. Drying the newborn in a warm blanket
d. Closing the doors of the room

176. Which of the following complication is expected in a neonate of a diabetic mother?
a. Thrombocytopenia
b. Anemia
c. Hypoglycemia
d. Oliguria

177. Which of the following assessment findings is most suggestive of hypothermia in a neonate?
a. Perspiration
b. Tachycardia
c. Bradycardia
d. Metabolic alkalosis

Explanation: Bradycardia proportional to the degree of core temperature is seen in neonates with hypothermia. Perspiration and tachycardia is seen in hypothermic neonates. Metabolic acidosis is seen in hypoglycemia.

178. Cessation of breathing for 20 seconds is known as
a. Respiratory arrest
b. Respiratory distress syndrome
c. Apnoea
d. Transient tachypnea

179. Cannula size used in new-born baby is .....
a. 24 size
b. 22 size
c. 20 size
d. 18 size

180. The fluid requirements per kg of body weight for new born is
a. 60-80 ml
b. 80-100 ml
c. 100-140 ml
d. 120-140 ml

181. All the following are causes of neonatal jaundice except?
a. Hyperthyroidism
b. α-Thalassemia
c. G6PD deficiency
d. Rh incompatibility

182. The normal resting heart rate for a newborn is?
a. 75 to 115 bpm
b. 85 to 125 bpm
c. 110 to 150 bpm
d. 140 to 200 bpm

183. Which of the following injections is routinely administered to a newborn to prevent bleeding? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Injection vitamin K
b. Soda bicarbonate
c. Calcium gluconate
d. Methylergometrine

Explanation: Immediately after the birth of newborn inj. Vit K will be administered to newborn in order to prevent bleeding. Neonate have low plasma concentrations and low levels of vitamin K dependent clotting factors.

184. The purpose of Vitamin K injection in newborn is:
a. For thermogenesis
b. To establish intestinal flora
c. Stimulate vitamin K production in the body
d. Provide protection against bleeding until intestinal flora is established

Explanation: In the newborn baby gut is sterile, so until intestinal flora is established to provide protection against bleeding vitamin K is given to newborn baby. It helps to prevent bleeding problems in the new born baby. A baby who is less than 1 kg 0. 5 mg I/M is the dose a baby who is more than 1 kg 1 mg I/M is the dose.

185. Dose of Vitamin K in pre-term baby is .....
a. 0.5 mg
b. 1 mg
c. 1.5 mg
d. 2 mg

186. Dose of Vitamin K in term baby is .....
a. 0.5mg
b. 1 mg
c. 1.5mg
d. 2 mg

187. Route of administering Vitamin K in newborn baby is
a. IV
b. IM
c. SC
d. ID

188. Structure with functional closure immediately after birth? *(Recent Question 2016)*
a. Foramen Ovale
b. Ductus venosus
c. Ductus arteriosus
d. Umbilical artery

Ans.

167.	c
168.	b
169.	d
170.	d
171.	d
172.	d
173.	c
174.	a
175.	c
176.	c
177.	c
178.	c
179.	a
180.	c
181.	a
182.	c
183.	a
184.	d
185.	a
186.	b
187.	b
188.	a

Scanned with CamScanner

Explanation: Ductus venosus is open until day 7 of life. The functional closure of foramen ovale occurs soon after birth, whereas anatomical closure takes weeks to months.

Key Functional Changes after Birth

1 and 2–Umbilical cord clamped (closure of umbilical arteries and vein),
3–Foramen ovale closed,
4–Ductus arteriosus closed,
5–Ductus venosus closed

189. Not true about fetal circulation is
a. Maternal blood enters fetus through umbilical vein
b. Fetal hemoglobin has higher affinity for O_2 than adult hemoglobin
c. Pulmonary blood has low O2
d. All of the above

190. Closure of the Foramen ovale occur after birth because of...
a. Decreased blood flow across foramen ovale
b. Shifting of pressures from right side to the left side of the heart
c. Increased oxygen tension in the blood
d. Placental circulation close

Explanation: During fetoplacental circulation, the pressure in the heart is much higher in the right side, but once breathing/crying is established, the pressure will shift from the R to the L side, and will facilitate the closure of foramen ovale. The remaining of foramen ovale is known as fossa ovalis. If this opening fail to close then atrial septal defect can occur.

191. Failure of the Foramen Ovale to close will lead to .....
a. Atrial Septal defect
b. Ventricular septal defect
c. Patent ductus arteriosus
d. Transposition of great arteries

Explanation: Foramen ovale is present between two atriums. The abnormal connection between two atria in the postnatal life can lead to atrial septal defect.

192. Patent ductus venosus results in irregular transmission of blood between
a. Pulmonary vein and superior vena cava
b. Left umbilical vein and pulmonic vein
c. Left umbilical vein and inferior vena cava
d. Umbilical vein and superior vena cava

193. Patent ductus arteriosus results in irregular transmission of blood between
a. Umbilical artery and inferior aorta
b. Umbilical artery and pulmonic artery
c. Pulmonary artery and aorta
d. Atrium and aorta

194. After the closure ductus venosus is known as
a. Ligamentum arteriosum
b. Ligamentum venosum
c. Fossa ovalis
d. Bregma

195. After the closure ductus arteriosus is known as
a. Ligamentum arteriosum
b. Ligamentum venosum
c. Fossa ovalis
d. Bregma

196. After the closure foramen ovale is known as
a. Ligamentum arteriosum
b. Ligamentum venosum
c. Fossa ovalis
d. Bregma

197. Connection between right atrium and left atrium in fetal life is known as
a. Foramen ovale
b. Ductus arteriosus
c. Ductus venosus
d. Atrial septal defect

198. Post-natal life closure of Foramen ovale occur because of ....
a. Decreased blood flow
b. Shifting of pressures from right side to the left side of the heart
c. Increased PO_2
d. Increased in oxygen saturation

199. Drug of choice for closing Patent ductus arteriosus in a newborn is: *(West Bengal PG 2015)*
a. Paracetamol
b. Ibuprofen
c. Mefenamic acid
d. Prostaglandins

Ref: Nelson 20the, p 2198

Explanation:
- Both Indomethacin and Ibuprofen are equally effective in closing PDA with closure rate of 70-80%.
- Ibuprofen appears to be a better option with its better safety profile and reduced NEC rates.

200. After birth of a baby, breastfeeding should be started
a. Within 2 hours
b. Within ½ hours
c. On second day
d. After 1 week

Ans.

189.	c
190.	b
191.	a
192.	c
193.	c
194.	b
195.	a
196.	c
197.	a
198.	b
199.	b
200.	b

Scanned with CamScanner

201. Commonest type of seizure in newborn
a. Atonic b. Tonic
c. Subtle d. Myoclonic

202. Commonly occurring accident among newborn babies?
a. Road traffic accidents b. Falls
c. Burns d. Poisoning

203. Which of the following is not a component of Kangaroo mother care (KMC)?
a. Skin to skin contact
b. Supplementary nutrition
c. Exclusive breastfeeding
d. Early discharge and follow-up

204. Which of the following babies is at lowest risk of developing hypoglycemia?
a. Appropriate for gestational age babies
b. Infant of diabetic mothers
c. A baby born to mother on beta blockers
d. IUGR babies

205. Which one of the following includes the immediate step in resuscitation of the new born?
a. Squeezing the chest to remove secretions from the airway
b. Routinely giving sodium bicarbonate
c. Clearing the oral and nasal airway
d. Suction of the baby's stomach

206. Neonate with retrolental fibroplasia is associated with?
a. Hypoxia
b. Hypocapnea
c. Hypoxemia
d. Hyperoxemia

207. Surfactant inactivation occurs in
a. Infant of diabetic mother
b. Meconium aspiration syndrome
c. Transient tachypnea of newborn
d. Bronchopulmonary dysplasia

208. The neonatal feature of cystic fibrosis is?
a. Bronchitis
b. Bronchiolitis
c. Meconium ileus
d. Bronchiectasis

209. Which of the following is NOT true regarding meconium aspiration syndrome? *(AIIMS-BBS SNO 2019)*
a. It is common cause of respiratory distress
b. It occurs when a newborn inhales particulate meconium mixed with amniotic fluid in utero
c. It does not progress to persistent pulmonary hypertension in severe cases
d. Chest X-ray shows fluffy infiltrates with areas of atelectasis.

Explanation: Features of meconium aspiration syndrome include
- Asphyxiated at birth
- Develops progressive respiratory distress soon after birth
- **Life threatening persistent pulmonary hypertension**
- Chest X-ray shows bilateral coarse irregular densities with patches of obstructive emphysema.

So, the option (c) which states that "it does not progress to persistent pulmonary hypertension" is incorrect.

210. Newborn with neonatal tetanus shows?
a. Risus Sardonicus
b. Opisthotonus
c. Poor feeding and rigidity
d. Trismus and lockjaw

211. All the following are normal manifestation in a newborn baby EXCEPT
a. Uneven head shape
b. Respirations are irregular, abdominal, 30-60 bpm
c. Positive moro reflex
d. Heart rate is 80 bpm

212. Best site to demonstrate capillary filling in infants?
a. Nail bed b. Sternum
c. Ear lobule d. Great toe

213. Hypothermia is characterized by all except
a. Poor feeding
b. Metabolic acidosis
c. Increased peripheral perfusion
d. Respiratory distress

214. Which one of the following is considered abnormal in a neonate?
a. Erythema Toxicum
b. Mongolian spot
c. Caput succedaneum
d. Jaundice within the first 24 hours

215. Surfactant production in fetus begins at the age of
a. 16-20 weeks b. 20-24 weeks
c. 26-30 weeks d. 30-34 weeks

216. Total lung capacity in a newborn is: *(Safdarjung NO 201)*
a. 100 mL b. 350 mL
c. 500 mL d. 150 mL

Explanation:
- Total lung capacity in a newborn is 150 mL. The estimate of total lung volume of infant is 44±9 mL/kg. An average newborn weighs approximately 3 kg. Therefore, lung capacity is 50 × 3 = 150 mL.
- The average total lung capacity of an adult human male is about 6 liters of air.

217. If a mother had measles during pregnancy, her newborn baby would be immunized to this disease for –
a. 4 to 6 months b. 6 to 12 months
c. 1 to 3 years d. 3 to 6 years

218. Bronze-baby syndrome is characterized by
a. Decreased urine output and macroglossia
b. Bow like legs and curved legs
c. Brownish black colour of skin, serum and urine
d. Yellowish discoloration of skin

219. All interventions prevent hypothermia in preterm babies except?
a. Use of polyethylene plastic wraps
b. Using double layered incubators
c. Using woolen caps to cover head
d. Keeping the delivery room temperature at 22 degree Celsius

220. All of the following are features of prematurity in a neonate except.
a. No creases on sole b. Abundant lanugo
c. Thick ear cartilage d. Empty scrotum

221. Gestational age of a newborn baby can be assessed by which one of the following scoring system
a. Sarnat and Sarnat b. Downeys
c. Silvermans d. New Ballard

222. Macrosomia means .....
a. Baby with large tongue b. Baby with large head
c. Large size baby
d. Baby whose birthweight is not adequate to the length

Ans.

201.	d
202.	b
203.	b
204.	a
205.	c
206.	d
207.	b
208.	c
209.	c
210.	d
211.	d
212.	b
213.	c
214.	d

216.	d
217.	a
218.	c
219.	d
220.	c
221.	d
222.	c

Scanned with CamScanner

223. Iron supplementation in a healthy term breast fed baby should be started at the age of
a. 2 weeks b. 4 weeks
c. 8 weeks d. 6 weeks

224. Medication given to the new born baby to prevent bleeding is .....
a. Normal saline b. Dextrose
c. Adrenaline d. Vitamin -K

225. A new born baby' skin covered with white sticky material which is known as
a. Mongolian spot b. Lanugo
c. Milia d. Vernix

226. Neonate born to a mother with DM is at risk for developing .....
a. Hypoglycemia
b. Hyperglycemia
c. Anemia
d. Thrombosis

227. Swelling of tissue over the presenting part of the fetal scalp due to sustained pressure; it resolves in 3-4 days is known as.....
a. Caput succedaneum
b. Cephalohematoma
c. Mongolian spot
d. Anasarca

228. Identify the correct among the following related to umbilical cord care
a. Apply peroxide to the cord with each diaper change
b. Cover the cord with petroleum jelly after bathing
c. Keep the cord dry and open to air
d. Wash the cord with soap and water each day during a tub bath

229. What all are the advantages of delayed cord clamping?
a. Improved hematologic status
b. Improved iron status
c. Reduced risk of IVH I preterm babies
d. All of the above

Explanation: All the above mentioned are the clinical advantage of delayed cord clamping. It will also decrease the incidence of anemia.

230. While teaching a primi mother about the care of umbilical cord, nurse should teach:
a. Apply lotions over the umbilical cord to keep it as moist
b. Cover the stump tightly
c. Drainage from the umbilical cord is the normal finding
d. Sponge bath the baby until the cord stump fall off

Explanation: Moisture will delay the stump to fall off. So sponge bath the baby until stump fall off. Nothing is supposed to apply in the stump and it should be exposed to air. Cord will fall of itself within a week.

231. Correct regarding Rh isoimmunization is
a. It is also known as Erythroblastosis fetalis
b. Anti-D gamma globulin are given to mother to prevent Rh isoimmunization
c. It is a cause for pathological jaundice
d. All of the above

232. Correct regarding fontanelle is
a. Anterior fontanel closed at 18 months of age
b. Posterior fontanel closed at 6-8 weeks of age
c. Anterior fontanel known as bregma and posterior is lambda
d. All of the above

233. Cleaning of eyes need to be done in ..... Direction
a. Middle to outer side
b. Middle to inner side
c. Inner canthus to outer canthus
d. Outer canthus to inner canthus

234. Moderate hypothermia in neonate is defined as an axillary temperature of
a. <32°C b. <34°C
c. 35 to 36.9°C d. 32 to 35.9°C

235. Immediately after the delivery baby should be placed .....
a. Mother's breast
b. Mother's abdomen
c. Side of the mother
d. Radiant warmer

236. Important sign of cold stress is .....
a. Irritability
b. Fever
c. Increased Respiratory rate
d. Shaking

237. Neonatal period is considered from
a. Birth to 15 days b. Birth to 21 days
c. Birth to 28 days d. Birth to 1 month

238. Normal axillary body temperature is:
a. 35.6-36.2°C b. 36.5- 37.5°C
c. 37.2- 38.2°C d. Above 38.5°C

239. Hypothermia is stated as a body temperature:
a. Equal to 35°C b. Below 36.5°C
c. Between 36.5 to 37.5°C d. Above 38°C

240. Moderate hypothermia in a neonate is:
a. Below 32°C b. 32-35.9°C
c. 33.6-36.2°C d. 36.4-37.2°C

241. Severe hypothermia in a neonate is:
a. When the body temperature is below 30°C.
b. When the body temperature is below 32°C.
c. When the body temperature is above 34°C.
d. When the body temperature is above 36°C.

242. Hypothermia in neonate is characterized by all of the following EXCEPT: *(PGI Dec 2002)*
a. Hyperactivity
b. Respiratory distress
c. Apnea
d. Tachypnea

Explanation: Signs and symptoms of hypothermia in neonate includes
- Peripheral vasoconstriction
- Acrocyanosis, cold extremities
- Decreased peripheral perfusion
- CNS depression
- Lethargy, bradycardia, apnea, poor feeding
- Increased pulmonary artery pressure
- Respiratory distress, tachypnea
- Chronic signs
- Weight loss, failure to thrive

243. Signs and symptoms of Hypothermia are all except? *(Recent Question 2015)*
a. Poor feeding
b. Apnea
c. Central cyanosis
d. Cool extremities

Ref: CPDT 22nd e, p 352

Ans.

223.	b
224.	d
225.	d
226.	a
227.	a
228.	c
229.	d
230.	d

240.	b
241.	b
242.	a
243.	c

Scanned with CamScanner

Explanation:

Signs and symptom of hypothermia:

- Acrocyanosis (peripheral cyanosis)
- Cool extremities
- Decreased peripheral perfusion
- Lethargy, bradycardia, apnea, poor feeding
- Hypoglycemia, hypoxia, metabolic acidosis
- Respiratory distress, Tachypnea
- Weight loss

244. Which amongst the following is the most common cause of neonatal death?

a. Mothers lack of knowledge
b. Improper care or due to infections
c. Low family income
d. Any congenital disease

245. What are the causes of hypothermia:

a. Congenital disorders.
b. Trauma, dehydration and diarrhea
c. Birth asphyxia, infections and prematurity
d. Atresia, spina bifida

246. The early symptoms occur in hypothermia:

a. Weight loss, pale body, hypoglycemia
b. Edema and central cyanosis, sclerema
c. Respiratory distress and bradycardia
d. Feet and hand are cold and body becomes blue, weak suckling, lethargy and weak cry

247. Which of the measures should be chosen to prevent hypothermia after delivery:

a. Drying, bathing, weighing and vital recording
b. Wrapping, vital recording, bathing and breastfeeding
c. Drying, wrapping, weighing, and breastfeeding
d. Wrapping, bathing, vital recording, bottle feeding

248. Treatment used to provide standard thermal care to prevent neonatal hypothermia in NICU is:

a. Use of phototherapy
b. Incubator/radiant warmer
c. Bathing & weighing
d. Oxygen support

249. The most prone period of neonatal death due to hypothermia is:

a. First 24 hours/first week
b. 2 months
c. 6 months
d. 8- 12 months

250. What should be the temperature of delivery room to maintain warmth for neonate?

a. 21-24°C
b. 25-28°C
c. 28-30°C
d. Above 30°C

251. When should the normal baby take bath?

a. After 1 hour of delivery
b. After 24 hours
c. On 3rd day
d. On 5th day

252. KMC means

a. Skin to skin contact
b. Back to back contact
c. Hand to hand contact
d. Contact of baby with mother clothe

253. How much a neonate should gain weight after a successful feeding?

a. 3-8 g/day
b. 10-15 g/day
c. 15-20 g/day
d. 25-30 g/day

254. Rh negative mother delivered a baby. Which among the following test is more likely to be ordered for the baby?

a. Direct Coomb's
b. Indirect Coomb's
c. Blood cultured
d. Platelet count

Ans.

244.	b
245.	c
246.	d
247.	c
248.	b
249.	a
250.	b
251.	b
252.	a
253.	d
254.	a
255.	d
256.	b
257.	b
258.	d
259.	d
260.	c

Explanation: Coomb's test is the test to determine if RH antibodies are present. Indirect Coomb's is done to the mother and Direct Coomb's is done to the baby. Blood culture and Platelet count does not help detect Rh antibodies.

Direct Coombs test is used to detect antibodies that are stuck to the surface of red blood cells. Many diseases and drugs can cause this. These antibodies sometimes destroy red blood cells and cause anemia. A normal result means there was no clumping of cells (agglutination). This means there is no antibodies to red blood cells.

255. A newborn with Rh positive group born to a mother with Rh negative blood, during exchange transfusion blood of choice is Rh negative. This is because .....

a. To give same blood of mother
b. It is neutral and will not react with baby's blood
c. Can easily obtain from mother
d. To prevent RBC destruction because of maternal anti Rh antibodies

Explanation: Giving Rh positive blood will lead to further hemolysis. Rh negative cells are not attacked by maternal antibodies which are present in infant's blood. So Rh negative blood is the choice.

256. Which one of the following is most suggestive of neonatal small bowel obstruction

a. Generalized abdominal distension
b. Failure to pass meconium in the first 24 hours
c. Bilious vomiting
d. Refusal of feeds

257. Sudden infant death syndrome (SIDS) is most likely to occur at what age?

a. 1 to 6 weeks of age, peaking at 3 weeks
b. 1 week to 1 year of age, peaking at 2-4 months
c. 1 week to 1 year of age, peaking at 8-12 months
d. 1 to 3 years of age, peaking at 12-18 months

258. In following which is not a preventive measure for tetanus neonatorum

a. T.T. vaccination
b. Follow five clean rule
c. T.T. immunization during reproductive age
d. Penicillin antibiotic

259. The nurse explains to the mother of a neonate diagnosed with erythroblastosis fetalis, that the exchange transfusion is necessary to prevent damage to: *(NCFL 2019)*

a. Liver
b. Lungs
c. Kidneys
d. Brain

Explanation Erythroblastosis fetalis is a hemolytic anemia caused by transplacental transmission of maternal antibodies to fetal RBCs. The disorder usually results from incompatibility between maternal and fetal blood groups, often RhO(D) antigens.

Exchange transfusion is needed to prevent kernicterus that is caused by the deposition of bilirubin in brain cells.

260. Amount of blood used for single volume exchange transfusion in full term newborn is:

a. 50 ml/kg body weight
b. 65 ml/kg body weight
c. 80 ml/kg body weight
d. 100 ml/kg body weight

Explanation: Estimating the blood volume of newborn as 80 ml/kg, exchange involving replacement of 80 ml/kg has been termed as single volume exchange transfusion (SVET) and that involving 160 ml/kg is termed as double volume exchange transfusion (DVET)

Scanned with CamScanner

261. The expected respiratory rate of a neonate within 3 minutes of birth is
a. 20-40 breaths per minute b. 40-60 breaths per minute
c. 60-80 breaths per minute d. >80 breaths per minutes

262. The expected heart rate of a neonate within 3 minutes of birth is
a. 90 to 120 b. 100 to 180
c. 100 to 130 d. 120 to 160

263. For accurate measurement of axillary temperature in newborn, thermometer is kept for how many minutes?
a. 30 sec b. 1 min
c. 2 min d. 5 min

264. In twin to twin transfusion syndrome in donor twin all the signs and symptoms are present EXCEPT
a. Oligohydramnios b. Anemia
c. Hypovolemia d. Plethora

Explanation: Donor twin is likely to have oligohydramnios, anemia, and hypovolemia and the recipient twin is likely to have polyhydroamniosis and plethora (abundance or excess) and to be larger than the donor twin

NUTRITION/FEEDING IN CHILDREN

265. Adequate breastfeeding in baby indicates: *(MP PG 2008)*
a. Baby sleeps 2 hour after feeds
b. Does not cry frequently
c. Urine 5-7 times/day
d. Stool 4 times/day

Ref: OP Ghai 8th ed. p 151; 7th e, p 452

Explanation: A newborn who adequately breastfed will sleep at least 2 hours, pass urine 8 to 10 times a day and will gain weight.

266. Ultimate aim of baby friendly hospital initiative was to promote
a. Immunization b. Hospital deliveries
c. Breastfeeding d. Family planning

267. Baby Friendly Hospital Initiative (BFHI) was launched by WHO in the year of
a. 1990 b. 1991
c. 1992 b. 1993

268. The first milk produced after delivery is known as:
a. Colostrum b. Lactose
c. Hind milk d. Pseudo milk

269. The thick yellow colour breast milk secreted initially is .....
a. Colostrums
b. Fore milk
c. Hind milk
d. Mature milk

270. Milk secreted following colostrum is .....
a. Fore milk
b. Hind milk
c. Transition Milk
d. Mature milk

271. What is correct about breast milk?
a. Hind milk is rich in proteins
b. Fat in breast milk is rich in iron
c. Colostrum must be discarded
d. Feeding in supine position increases risk of otitis media

Ref: O.P Ghai 8th Ed., pg 151

Explanation: Fat content in breast milk and cow's milk is similar. However, the amount of PUFA (Polyunsaturated) is significantly higher in breast milk which helps in the myelination of nervous system.

Foremilk (milk secreted at the start of feed) is rich in proteins, sugar and minerals whereas hindmilk is rich in fat and provides more energy.

Colostrum is the milk that is secreted during initial during first 3–4 days after delivery which should not be discarded

Improper breastfeeding techniques like supine feeding significantly associated with occurrence of acute otitis media in infants.

272. Exclusive breastfeeding is advised in all EXCEPT
a. Diarrhea b. Evening colic
c. Jaundice d. Typhoid

273. Immunoglobulin present in breast milk is:
a. IgA b. IgD
c. IgG d. IgM

274. Exclusive breastfeed should be provided to the baby:
a. Up to 2 months b. Up to 6 months
c. Up to 1 year d. More than 1 year

275. The extra calories needed by mother during breastfeeding is:
a. 100 Calories b. 300 calories
c. 500 calories d. 1000 calories

276. After normal delivery breast feeding should be initiated within:
a. ½–1 hour b. 2–4 hours
c. 6-8 hours d. After 12 hours

277. Initially the mother should feed the baby at least:
a. 3 times a day b. 5-6 times a day
c. 8-12 times a day d. 10-16 times a day

278. The initial feeding should last for:
a. 1–2 min on each breast
b. 2–4 min on each breast
c. 5–10 min on each breast
d. 10–15 min on each breast

279. Which of the statements is true about breastfeeding?
a. It promotes infections in the baby
b. It reduces risk of developing breast cancer in mother
c. It worsens the baby's digestive system
d. It makes the mother susceptible to infections

280. The benefit of breastfeeding is:
a. To strengthens the bond between the mother and the baby
b. To helps the uterus contract after delivery
c. To reduces the risk of breast cancer
d. All of the above

281. Which of these medications should be avoided while breast-feeding?
a. Birth control pills b. Iodine
c. Antibiotics d. All of the above

Ans.

261.	b
262.	d
263.	d
264.	d

281.	d

Scanned with CamScanner

282. When the burping should be done:
a. Before each feed
b. Middle and at the end of each feed
c. Only at the end of each feed
d. After 1 hour of feed

283. The symptoms of adequate feeding in baby is:
a. Baby stools are yellow & loose.
b. Baby empties his bladder often.
c. Baby steadily gains weight.
d. All of the above.

284. At what interval the mother should feed the baby:
a. 1/2 – 1 hour
b. 2-3 hours
c. 3-4 hours
d. 4-5 hours

285. Breast milk storage in a refrigerator is up to?
a. 4 hours
b. 8 hours
c. 12 hours
d. 24 hours

286. Expressed breast milk can be stored at room temperature for how many hours? *(Recent Question 2015)*
a. 4
b. 8
c. 16
d. 24

Ref: OP Ghai 8th ed. p 155

Ans.

282.	b
283.	d
284.	b
285.	d
286.	a

295.	a
296.	a
297.	d
298.	d

Explanation:

Human Milk Storage Guidelines

Storage Locations and Temperatures

Type of Breast Milk	Countertop 77°F or colder (25°C) (room temperature)	Refrigerator 40°F (4°C)	Freezer 0°F or colder (-18°C)
Freshly Expressed or Pumped	Up to 4 hours	Up to 4 days	Within 6 months is best Up to 12 months is acceptable
Thawed, Previously Frozen	1-2 hours	Up to 1 day (24 hours)	Never refreeze human milk after it has been thawed
Left Over from a Feeding (baby did not finish the bottle)	Use within 2 hours after the baby is finished feeding		

Source: Centre for Disease Control and Prevention. Revised 2017.

287. Cow's milk is deficient of.....
a. Calcium
b. Fat
c. Iron
d. Lactose

288. What is the sign of good attachment?
a. Baby's chin touches the breast.
b. Baby's mouth is wide open with the lower lip curled out.
c. Baby suckles with slow, deep sucks and pauses sometimes.
d. All of the above.

289. Nipple confusion means? *(AP PG 2014)*
a. Baby fed with a bottle finding it difficult and confusing to suckle at breast
b. Baby not able to suckle with bottle
c. Baby not able to feed with spoon
d. Baby not able to feed with paladin

290. Breastfeeding is contraindicated if the mother is receiving
a. Aspirin
b. Prednisone
c. Amiodarone
d. Erythromycin

291. Breastfeeding is contraindicated in .....
a. Hepatitis C
b. Cardiomyopathy
c. Tuberculosis
d. Typhoid

292. Food item need to be introduced following weaning is .....
a. Solid diet
b. Semi solid diet
c. Liquid diet
d. Spicy food

293. Which is the best solid food that can be used during the process of weaning?
a. Fruits
b. Vegetables
c. Egg white
d. Rice cereals

294. Age at which weaning need to be initiated is .....
a. 4 to 6 months
b. 6 to 8 months
c. 8 to 10 months
d. 10 to 12 months

295. The major cause for childhood illness is: *(AIIMS BPL NO 2018)*
a. Malnutrition
b. Accidents
c. Infestation
d. Infection

Explanation: According to the World Health Organization (WHO), malnutrition is the gravest single threat to global public health. Globally, it contributes to 45% of deaths of children aged under 5 years.

296. 'Edema' is a sign in which of the following nutritional disorders? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Kwashiorkor
b. Marasmus
c. Underweight
d. Nutritional dwarfism

Explanation: Kwashiorkor, also known as "edematous malnutrition" because of its association with edema (fluid retention). It occurs due to protein deficiency.

297. As per Gomez classification, which of the following 'weight per age' comes under 'IIIrd degree malnutrition' when compared with the Harvard growth standard? *(AIIMS Bhopal Nursing Officer, 2018)*
a. 75–90% of the standard
b. 60–74% of the standard
c. 90–110% of the standard
d. Less than 60% of the standard

Explanation: Gomez classification: One of the earliest systems for classifying protein-energy malnutrition in children, based on percentage of expected weight for age: over 90% is normal, 76–90% is mild (first degree) malnutrition, 61–75% is moderate (second degree) malnutrition and less than 60% is severe (third degree) malnutrition.

298. Which of the following is seen in marasmus, but not in kwashiorkor?
a. Edema
b. Fatty change in liver
c. Hypoalbuminemia
d. Good appetite

Ref: OP Ghai 8th ed. p 98

Scanned with CamScanner

Explanation: Children with marasmus have voracious appetite versus kwashiorkor child exhibiting poor appetite and apathy.

Clinical finding	Marasmus	Kwashiorkor
Oedema	Absent	Present
Activity	Active	Lethargic
Appetite	Voracious (Eager to eat)	Poor
Liver size	Normal	Enlarged (Fatty liver)
Infection	Less prone	More prone
Prognosis	Less than kwashiorkor	-

299. Which is the best parameter for acute severe malnutrition?

a. Weight/height
b. Height/age
c. Weight/age
d. Mid arm circumference

Ref: Nelson 20the, p 297

Explanation: Weight for height is the most reliable long-term indicator regarding the growth status of the child.

300. All are seen in marasmus EXCEPT: *(Recent Question 2014)*

a. Muscle wasting
b. Hepatomegaly
c. Low insulin
d. Muscle wasting

Ref: OP Ghai 8th ed. p 99

Explanation:

- **Marasmus:** is characterized by failure to gain weight and irritability, followed by weight loss and listlessness until emaciation results. *The skin loses turgor and becomes wrinkled and loose as subcutaneous fat disappears. Loss of fat* from the sucking pads of the cheeks often occurs late in the course of the disease; thus, the infant's face may retain a relatively normal appearance compared with the rest of the body, but this, too, eventually becomes shrunken and wizened.
- *The abdomen may be distended or flat,* with the intestinal pattern readily visible. There is muscle atrophy and resultant hypotonia.
- **Kwashiorkor:** is characterized by development of pedal edema which can mask weight loss. Dietary protein deficiency leads to brain damage and apathy, and/or irritability. When advanced, there is lack of growth, lack of stamina, loss of muscle tissue, increased susceptibility to infections, vomiting, diarrhea, anorexia, flabby subcutaneous tissues, and edema. It is often present in internal organs before it is recognized in the face and limbs.
- ***Hepatomegaly due to fatty liver is seen with flag sign on hair*** and Skin showing ***FLAKY PAINT DERMATOSIS***

301. All are seen in Kwashiorkor, except: *(Recent Question 2014)*

a. Increase appetite
b. Flag sign on hair
c. Hepatomegaly
d. Apathy

Ref: Nelson 20th ed. p 3239-40

Explanation:

- Kwashiorkor is protein and calorie deficiency and hence the serum albumin of the child is very low. This causes the child to develop pedal edema and generalized anasarca later.
- Since the child is not eating proteins, essential amino acids like phenylalanine is deficient and therefore the child forms less of melanin. *This results in hair of the child being reddish in color. This color change of hair strand is seen as FLAG sign.*
- The children with kwashiorkor have a FATTY liver and thereby a hepatomegaly.
- Apathy means lack of interest in surroundings and therefore this child is not interested in playing with the mother or toys. This occurs due to brain damage secondary to chronic protein deprivation.

Increased appetite can be seen in patients with marasmus.

302. In children which disease occur due to protein deficiency

a. Marasmus
b. Kwashiorkor
c. Beriberi
d. Scurvy

303. "Flag sign" is a characteristic feature of which disease? *(Staff Nurse G II 2014)*

a. Poliomyelitis
b. Kwashiorkor
c. Rickets
d. Marasmus

304. Essential clinical features of kwashiorkor are.....

a. Baggy pants
b. Muscle wasting, and skin and bone appearance
c. Markedly retarded growth, mental changes and edema
d. Low weight and no edema

305. Identify correct statement in relation to marasmus/ kwashiorkor

a. In kwashiorkor child edema is present because of Hypoalbuminemia
b. Monkey face, baggy pants, skin and bone appearance are the clinical features of marasmus
c. Marasmus is an energy deficiency disorder
d. All of the above

306. All are seen in Kwashiorkor EXCEPT?

a. Increase appetite
b. Flag sign on hair
c. Hepatomegaly
d. Apathy

307. Following are the clinical manifestations of marasmus except

a. Sugar baby
b. Monkey face
c. Baggy pants
d. Skin and bone appearance

308. All are seen in Marasmus EXCEPT:

a. Muscle wasting
b. Hepatomegaly
c. Low insulin
d. Decreased mid arm circumference

309. Best indicator for nutritional status for a child is: *(Recent Question 2014)*

a. Mid arm circumference
b. Head circumference
c. Rate of increase of height and weight
d. Chest circumference

Ref: Nelson 20th ed. p 297, OP Ghai 8th ed. p 18

Explanation: "Rate of increase of anthropomorphic features as shown by growth charts is the most reliable method of assessment": WHO Handbook

Ans.

299.	a

Scanned with CamScanner

310. Chronic malnutrition is measured by:
a. Weight/height
b. Height/age
c. Weight/age
d. Mid arm circumference

311. Which of the following is the best indicator of long-term nutritional status? *(UP 2010)*
a. Mid arm circumference
b. Height for age
c. Weight for age
d. Weight for height

Explanation:

Weight for height	Acute under nutrition generally characterized by low weight for height has been termed wasting. Conversely, over-nutrition or obesity is characterized by high weight for height.
Height for age	This is a measure of linear growth. Frequent periods of acute food deprivation or infection or prolonged period of inadequate food intake — especially during the rapid growing years (esp. first 2 years of life) may cause measurable growth retardation—the result is a child who is low in height for age—called stunting. This is an indicator of long-term nutritional adequacy.
Weight for age	Does NOT distinguish between present and long-term malnutrition. Useful in children under 1 year of age in whom length measurement may not be accurate

Ans.

310.	b
311.	b
312.	b
313.	b

319.	b
320.	d
321.	d
322.	c
323.	b

312. According to IAP classification if weight for age is 61–70% which grade of malnutrition it is?
a. Grade 1
b. Grade 2
c. Grade 3
d. Grade 4

Explanation:

Grade	Weight for age
Grade 1	71–80%
Grade 2	61–70%
Grade 3	51–60%
Grade 4	<50%

313. According to GOMEZ classification, II-degree Protein Energy Malnutrition refers to weight for age (%) of
a. <60%
b. 60-75%
c. 76-85%
d. 86-90%

314. Identify the age independent indicators of malnutrition among the following
a. Mid upper arm circumference
b. Shakir tape method
c. Bangle test
d. All of the above

Explanation: All the above are age independent indicators of malnutrition. Any MUAC below 13.5 is abnormal. In Shakir tape method also mid upper arm circumference which is less than 13.5 is abnormal. In bangle test if 4cm diameter bangle freely passes the elbow that suggestive of malnutrition. All these parameters, do not require age of the baby to calculate the level of malnutrition so it is called as age independent indicators of malnutrition.

315. Excess vitamin A cause all among the following sign EXCEPT
a. Increased appetite
b. Blurred vision
c. Bone pain or swelling
d. Dryness in the skin

Explanation: Signs and symptoms of Hypervitaminosis A include decreased appetite. Blurred vision, bone pain or swelling, dryness in the skin, bulging fontanelle, changes in consciousness, dizziness, drowsiness, double vision, hypercalcemia, heart valve calcification and hair loss are some of the side effects of excessive intake of vitamin A.

316. Feeding a child with choanal atresia can cause.....
a. Chokes on feeding
b. Lack of swallowing reflexes
c. Does not appear to be hungry
d. Takes about half of the feeding

Explanation: There is no opening between nasal passage and nasopharynx, so infant can breathe only through mouth, it will lead to choking during feeding.

317. All are the signs of good attachment EXCEPT
a. Wide open mouth
b. More areola is visible above than below
c. Baby's chin touching the breast
d. Baby's lower lip inverted

Explanation: In good attachment baby's lower lip everted not inverted. All others are the correct signs and symptoms of attachment.

318. Nutritional advice given to the mother of a 5-month-old non-breast feeding child is.....
a. Cow's milk
b. Formula feeds available
c. Skim milk and baby food
d. Iron-rich formula only

Explanation: At the age of 5 months a child should receive iron rich formula and that they should not receive solid food even baby food until age of 6 months. Iron rich feed is essential because baby depending upon the stored iron in the initial months, so depletion stored iron will be there. So to replenish, the source iron should supplied to the baby.

319. Identify the management of breast engorgement among the following
a. Wear a tight-fitting bra or breast binder
b. Apply warm, moist heat to the breasts
c. Contact the nurse midwife for a lactation suppressant
d. Restrict fluid intake to 1000 ml. daily

320. In malnourished children the following parameters are reliable indicators of dehydration except?
a. Skin turgor
b. Dry buccal mucosa
c. Oliguria
d. Thirst

321. A child who is on vegetarian diet only. The pediatric nurse alert to the child's potential deficiency of:
a. Niacin
b. Thiamin
c. Vitamin B6
d. Vitamin B12

322. Which of the following vitamins deficiency leads to diarrhea and, renal stone formation?
a. Vitamin A
b. Vitamin C
c. Vitamin D
d. Vitamin K

323. Mid upper arm circumference value in a moderately malnourished child is
a. <11.5 cm
b. <12.5 cm
c. <13.5 cm
d. <14.5 cm

Scanned with CamScanner

324. Calcium absorption is aided by all of the following, except?
a. Vitamin D
b. Vitamin C
c. Lactose
d. Fat

325. Identify correct statement in relation to vitamin A
a. Recommended dose of vitamin A at 9 months of age is 1,00,000 IU
b. Vitamin A administered via oral route
c. After the first dose of Vit. A dose need to be repeated every 6 months till 5 years of age
d. All of the above

326. Agent used for iron chelation is
a. Deferoxamine
b. Iron sulphate
c. Calcium gluconate
d. Calcium sulphate

327. In children, rickets is occurred because of the deficiency of
a. Vitamin A
b. Vitamin B
c. Vitamin D
d. Vitamin E

328. Anti-infective vitamin is .....
a. Vitamin- A
b. Vitamin- B
c. Vitamin- C
d. Vitamin- D

IMMUNIZATION/VACCINATION

329. Artificially acquired immunity is obtained by *(ESIC 2019)*
a. Recovering from a disease.
b. Exposure to a disease.
c. Being breast fed
d. Immunization with antibody response.

Explanation: Recovering from a disease, exposure to a disease (natural active) and breast feeding (natural passive) are example of natural immunity. Immunization with antibody response is an artificial immunity. Antibodies are administered from outside, not prepared by body.

330. What are the vaccines recommended at birth as per the universal immunizations program? *(Recent Question 2015)*
a. BCG
b. BCG and Hepatitis B
c. BCG and DPT
d. DT and oral Polio-vaccine

Explanation: OP Ghai 8th ed. p 203

331. DPT is contraindicated in? *(UP 2009)*
a. Family history of convulsions
b. Acute respiratory tract infections
c. Progressive neurological illness
d. Mild diarrhea

Ref: OP Ghai 8th ed. p 193, 194

Explanation: Following are NOT contraindication for administration of DPT vaccine.
- Mild acute illness
- Low grade fever
- Mild diarrhea
- Current antibiotic therapy
- Prematurity
- Recent exposure to an infectious disease
- History of allergies
- Allergy to penicillin
- Malnutrition

332. An 18-month-old child was brought to the well-baby clinic for booster dose of DPT vaccine. Which among the following muscle is preferred by the nurse to administer vaccine? *(AIIMS Bhopal Grade-I 2018)*
a. Dorsogluteal
b. Ventrogluteal
c. Deltoid
d. Vastus lateralis

Explanation: Vastus lateralis is the best choice for IM injection because in infants or younger children this muscle has an adequate amount of muscle mass. If another muscle is used the delivery of vaccine could be compromised or needle may hit the bone which may cause severe pain.

333. Which vaccine stored at the Freezer compartment of refrigerator? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. OPV
b. Hep B vaccine
c. DTwP-hepatitis B-Hib (pentavalent)
d. HPV

Explanation: Vaccines such as OPV, measles, MMR, BCG and Rabies vaccine are most sensitive to heat and can be frozen without harm. Hepatitis B vaccine, Hepatitis A vaccine, DTwP-hepatitis B-Hib (pentavalent), DTaP-hepatitis B-Hib-IPV (hexavalent), DTaP, meningitis C, Pneumoccal vaccine, T, DT, dT and Human papillomavirus (HPV) vaccine are freeze senstive. Never expose these vaccines to zero or subzero temperatures. *(Ref: WHO).*

334. The route of administration of BCG vaccine is: *(AIIMS Bhopal Nursing Officer, 2018)*
a. Intramuscular
b. Intradermal
c. Intrathecal
d. Subcutaneous

Explanation: BCG vaccine is administered via intra dermal route. DPT, DT, TT, Pentavalent vaccines, hep B etc. are administered via intramuscular route. MMR, Measles etc. administered via sub cutaneous route.

335. What is the route of administration of MMR vaccine? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Subcutaneous
b. Oral
c. Nasal
d. Intradermal

Explanation: MMR is a live vaccine and route of administration is subcutaneous. OPV is administered via oral route and BCG administered via intra dermal route.

336. Which of the following is a viral vaccine? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Oral polio vaccine
b. Cholera
c. Bacilli calmette guerin
d. Tetanus toxoid

Explanation: OPV is viral vaccine, cholera is inactivated vaccine, BCG is live bacterial vaccine and tetanus is toxoid.

337. Which of the following vaccines is administered to the newborn within 12 hours of birth?
a. Rubella
b. Hepatitis B
c. Rotavirus
d. Measles

Explanation: The World Health Organization recommends all infants receive the first dose of the hepatitis B vaccine within 24 hours of birth. According to Centre for Disease Control (CDC), Hepatitis B vaccination works best when the baby gets it within the first 12 hours of his life. Rubella, Rotavirus vaccine is given at 6 weeks. Measles and Rubella vaccine are given at 9 months.

Ans.

324.	d
325.	d
326.	a
327.	c
328.	a

334.	b
335.	a
336.	a
337.	b

Scanned with CamScanner

338. A 13-month-old child who has never been immunized now comes to the hospital. What will your advice regarding immunization according to National immunization schedule?

a. 1 dose BCG, 3 doses OPV, 3 doses DPT
b. 1 dose IPV, 3 doses OPV, 3 doses Pentavalent
c. 3 doses OPV, 3 doses DTP
d. 3 doses Hib, 3 doses Hep B

Explanation: "As per the latest immunization schedule, BCG can be given till 1 year of age. Since this child is now 13 months old, BCG need not be given. Also, in the latest schedule, pentavalent vaccines are included in the schedule instead of DPT. Hence this child requires 1 dose IPV, 3 doses OPV, 3 doses of pentavalent vaccine"

339. Which vaccine is contraindicated in child with history of convulsions? *(AIIMS June 2008)*

a. DPT
b. Measles
c. Typhoid
d. BCG

Ref: OP Ghai 8th ed. p 205; IAP Guide Book on Immunization, 3/e p14

Explanation: Pertussis component of DPT vaccine is contraindicated in children with neurological problems such as convulsion.

340. Varicella vaccine provide protection against .....

a. Chicken pox
b. Dengue
c. Encephalitis
d. Meningitis

Explanation: Varicella vaccine provide protection against chicken pox.

341. What is the Percentage of polio infections that is asymptomatic: *(PGI 2008)*

a. 1%
b. 20%
c. 30%
d. 90%

Explanation: 90% of polio infection are asymptomatic.

342. All are true about killed vaccine EXCEPT

a. Prepared by growing bacteria/virus in a media followed by inactivation with heat/chemical
b. Do not cause infection but elicit immune response
c. Multiple dose is required
d. Between two killed vaccines minimum 4 weeks gap is required.

Explanation: Between two killed vaccines there is no recommended duration. All other statements are true in relation with killed vaccines

343. Identify the incorrect pair among the following:

a. BCG- TB- Intradermal
b. DPT - Pertussis - SC
c. MMR- Rubella-S/C
d. OPV-Polio- Oral

Explanation: DPT stands for Diphtheria, Pertussis and Tetanus. But the route of administration of DPT vaccine is Intramuscular (IM).

344. Subacute sclerosing panencephalitis is a complication associated with .....vaccine

a. BCG
b. Measles
c. MMR
d. OPV

Explanation: Subacute sclerosing panencephalitis may occur years after measles vaccination. In this condition progressive, debilitating, and deadly brain disorder related to measles (Rubeola) infection.

345. Small baby with intrauterine growth retardation, cataracts, microphthalmia, myocarditis, and a red or purple macular rash ("blueberry muffin" rash) are the characteristic of .....

a. Congenital rubella
b. Congenital syphilis
c. Congenital varicella
d. Congenital herpes

346. A newborn with acquired herpes simplex type 2 infection often exhibits deficit in:

a. GI function
b. Renal function
c. GU function
d. Skeletal function

Explanation: These infants may have renal dysplasia so impaired renal function will be there.

347. Diaper rashes most commonly caused by .....

a. Streptococci
b. Staphylococcus aureus
c. E-coli
d. Diphtheria

Explanation: Culture of rashes at diaper area will show the growth of Staphylococcus aureus

348. Identify the correct statement related to late onset neonatal sepsis?

a. Organism responsible are present in maternal genital tract
b. Foul smelling liquor and multiple vaginal examination are the risk factors
c. Most commonly manifest as pneumonia
d. Infection is transmitted through the hands of care provider

Explanation: Option d is the correct statement related to late onset neonatal sepsis which occur after 72 hours, all other statements indicate early onset neonatal sepsis

349. Which one of the following statements is most appropriate to convince a mother for immunization of her child? *(Banaras HU 20..)*

a. Immunization is okay for your baby
b. Vaccines are expensive and you are getting it free
c. Vaccines will prevent the occurrence of that disease in future for which it is meant
d. Government will take care of all post-immunization complications

350. The route of administration of MMR Vaccine is

a. Intradermal
b. Subcutaneous
c. Intramuscular
d. Intravenous

351. The process administering the vaccine/antigen is known .....

a. Immunization
b. Seroconversion
c. Herd effect
d. Inactivation

352. Polio vaccination in children is an example of

a. Primary prevention
b. Secondary prevention
c. Tertiary prevention
d. Rehabilitation

353. Site of lesion in polio is .....

a. Dorsal horn of spinal cord
b. Ventral horn of spinal cord
c. Spinal canal
d. All muscles

354. Which vaccine is NOT administered to an HIV-positive child?

a. OPV
b. MMR
c. Hepatitis B
d. DPT

Scanned with CamScanner

355. Following DPT immunization a child developed swelling and tenderness at the injection site, a low-grade fever, and malaise. What is the appropriate nursing reaction?
a. Ask the parents to take the child to emergency
b. Educate them that this is occurring because of allergy to the vaccine
c. This is the expected reaction and teach them how to manage
d. In future avoid DPT injections to the child

356. Identify correct statement related to measles vaccine
a. Measles vaccine is stored at 2-8°C
b. Measles vaccine is a live vaccine
c. Immediately after administration of measles vaccine, immunity develops
d. All of the above

357. Contraindicated vaccine in child with history of convulsions is .....
a. Diphtheria b. pertussis
c. Tetanus d. BCG

358. 4 weeks old infant who never immunized earlier needs to be immunized with the following vaccines.....
a. BCG, OPV, Measles.
b. BCG, OPV, DPT
c. BCG, DPT, Measles
d. BCG, OPV, Vitamin a.

359. True statement about DPT vaccine is
a. Route of administration of DPT vaccine is IM
b. DPT booster is given at 16-24 month
c. It is a killed vaccine
d. All of the above

360. Identify correct statement related to BCG vaccination
a. Dose of BCG at birth is 0.05 mL
b. Dose of BCG if not given at birth is 0.1 mL
c. BCG protects against Tuberculosis
d. All of the above

361. Site for BCG vaccination is
a. Left upper arm
b. Right upper arm
c. Lateral aspect of mid-thigh
d. Anterior aspect of hand

362. Route of administration of MMR vaccine is
a. IM b. IV
c. SC d. ID

363. A child is vaccinated for MMR at what age?
a. At birth b. 3 month
c. 6 months d. 15 months

364. All are true about BCG except
a. It is a live vaccine
b. Route of administration is intradermal
c. It is available in powder form and need to dilute before administration
d. It provides protection against MMR

365. Correct regarding polio is
a. Paralytic polio is caused by Polio virus type - 1
b. Polio is most commonly affecting 6 months to 3 years
c. Flaccid paralysis, tripod sign, fever, nausea and vomiting are the clinical features
d. All of the above

366. Oral polio vaccine is also known as
a. Sabin b. Salk
c. Pentavalent d. Easy

367. Parenteral polio vaccine is also known as
a. Sabin b. Salk
c. Pentavalant d. Easy

368. Pentavalent vaccine provide protection against
a. Diphtheria, pertusis, tetanus, hepatitis-B, hemophilus B
b. polio, TB, Measles, Mumps, hemophilus B
c. Measles, mumps, rubella, TB, hemophilus B
d. Measles, mumps, rubella, hepatitis B and hemophilus B

369. What all are the six killer diseases against which immunization provide protection?
a. Polio, Diphtheria, pertussis, tetanus, TB, measles
b. Measles, mumps, rubella, TB, polio, hepatitis B
c. Diphtheria, pertussis, tetanus, Hepatitis B, Hemophilus B, polio
d. Polio, Diphtheria, pertussis, tetanus, Hepatitis B mumps

370. Neonatal tetanus can be prevented through
a. Conducing deliveries under hygienic conditions
b. Proper cord care practices
c. Maternal immunization with TT in the antenatal period
d. All of the above

Explanation: Maternal and neonatal tetanus (MNT) have been among the most common lethal consequences of unclean deliveries and umbilical cord care practices. When tetanus develops, mortality rates are extremely high, especially when appropriate medical care is not available. Immunizing pregnant mother with TT also help us to prevent neonatal tetanus.

371. All are live vaccine EXCEPT
a. OPV b. BCG
c. Measles d. TT

372. Expanded Programme of Immunization (EPI) launched in India
a. 1974 b. 1978
c. 1980 d. 1982

373. WHO launched expanded program of immunization in the year of
a. 1974 b. 1978
c. 1980 d. 1982

374. In India, last case of smallpox was reported in the year
a. 1970 b. 1975
c. 1978 d. 1980

375. India was declared smallpox free in the year
a. 1970 b. 1977
c. 1980 d. 1982

376. World declared smallpox free in the year
a. 1977 b. 1980
c. 1982 d. 1985

377. Go through the following statements related to vaccination and identify the false statement
a. Administration of 2 live antigens- a minimum interval of 4 weeks is recommended, if not administered simultaneously.
b. Two or more killed antigens may be administered simultaneously or at any interval between the doses
c. There is no minimum recommended time interval between two types of vaccines
d. If not sure about the immunization status of the child all the vaccine recommended in the immunization schedule need to give from the beginning

378. DPT vaccine should be stored
a. -20°C b. 0°C
c. 4-8°C d. 20°C

379. Method used for the transportation of vaccine from the site of production to the vaccination site by protecting its potential to provide immunity is known as

a. Cold chain
b. Vaccine carrier
c. Transportation
d. Cold box storage

380. For children IM injection need to be administered at

a. Middle aspect of mid-thigh
b. Lateral aspect of mid-thigh
c. Lateral aspect of upper arm
d. Anterior aspect of mid-thigh

BEHAVIORAL DISORDERS IN CHILDREN

381. Formula to calculate intelligence quotient (IQ):

a. Chronological age/Mental age*100
b. Mental age-Chronological age *100
c. Mental age/Chronological age*100
d. Mental age + Chronological Age *100

Ref: Achar's Textbook of Pediatrics, 3rd ed, p 31

Explanation: Intelligence quotient (IQ) is the index of intellectual brightness of the child and is calculated as

IQ = Mental age/Chronological age × 100

- The new terminology for mental retardation is intellectual disability

IQ classification	Level of intellectual disability
50–70	Mild intellectual disability
35–49	Moderate intellectual disability
20–34	Severe intellectual disability
0–19	Profound intellectual disability

382. A mother asks her two-year child, "Do you want to eat now?" The child responds "No". Which of the following behavioral characteristics does the child elicit? *(AIIMS Bhopal Grade-I 2018)*

a. Egocentrism
b. Negativism
c. Egomania
d. Ritualism

Explanation: Negativism is a behavior characterized by the tendency to resist direction from others, and refusal to comply with requests. This behavior is commonly encountered with young children (toddlers).

383. Toddler have a tendency to say NO to everything. This feature is known as .....

a. Imitation
b. Ritualism
c. Negativism
d. Autonomy

Explanation: A tendency to say no to everything is known as negativism. Imitation means mimicking someone else's behavior. Ritualism means toddlers try to adhere to a specific type of behavior.

384. Which of the following best describes the language of a 24-month-old: *(Safdarjung NO 2018)*

a. Doesn't understand yes and no
b. Understands the meaning of words
c. Able to verbalize needs
d. Continuously asks "Why?" to most of the topics

Explanation: By 2 years of age, child will be able to understand the meaning of words. Between 8 to 12 months babies start to understand simple requests such as yes or no. At the age of one year babies begin to communicate beyond crying and are able to verbalize needs in one word. At the age 2 to 3 years a child will ask why to most of the topics.

385. The type of play exhibited by toddlers where they play by themselves in the presence of other children is called: *(AIIMS BPL NO 2018)*

a. Passive play
b. Cooperative play
c. Solitary play
d. Parallel play

Explanation: Parallel play can be defined as children playing side by side from one another. Parallel play is most common among toddlers and can take place at any age. Cooperative play begins in the late preschool period. The play is organized by group goals.

Solitary play - the child plays intently with available materials but remains totally alone.

386. Which among the following statement describe the parallel play between two toddlers?

a. Sharing crayons to color two different pictures
b. Playing a board game with nurse
c. Sitting near to each other and playing with own toys
d. Sharing their toys with two different nurses

387. Typical type of play in a toddler is: *(Staff Nurse G II 2014)*

a. Parallel play
b. Cooperative play
c. Associative play
d. Onlooker play

Explanation:

Infant-onlooker play,
Toddler-parallel play,
Preschool – associative play,
School going –cooperative play

388. Which of the following examples represents parallel play *(Safdarjung NO 2011)*

a. Ajay and Arun share their toys
b. Ajay plays with his car beside Merin, who is playing with her doll
c. Kavin plays a game of Scrabble with Subash and Sathish
d. Kavya plays with a handheld game while sitting in her mother's lap

Explanation: Parallel play can be defined as children play side by side from one another. Parallel play is most common among toddlers and can take place at any age.

389. Terrible twos the term used to describe ..... Age group of children

a. Infant
b. Toddler
c. Pre School
d. School going

Explanation: The term terrible twos used to describe the toddler years, the period ranging from 1 to 3 year of age. It is the challenging time for parents and child as each learn to know the other better. It is an extremely important period for developmental achievement and intellectual growth.

390. Which among the following represents the most common type of accidents found in case of toddlers? *(AIIMS BPL NO 2011)*

a. Toxic ingestions
b. Choking
c. Drowning
d. Burns

Ans.

379. a
380. b
381. c
382. b
383. c
384. b
385. d
386. c
387. a
388. b
389. b
390. d

Scanned with CamScanner

Explanation: Burns are the most common documented cause of accidents in toddlers followed by choking, toxic ingestions and drowning. Toddlers uses their newly acquired motor skills in an autonomous manner (lack of supervision).

391. Among the following which is best for a better hospital experience in a 3.5-year-old child?
a. Tricycle
b. Clay modeling
c. Building blocks
d. Doll and syringe play

Explanation: Therapeutic play allows the child to manipulate unfamiliar equipment and thereby reduces the tension of hospitalization. So, by providing syringe and doll we can make the unfamiliar situation to a familiar one.

392. Concept regarding death among preschool children is.....
a. Not a permanent condition
b. Permanent and irreversible
c. It is because of some bad doing
d. An event that eventually happens to everyone

Explanation: Preschoolers are having no cognitive ability to understand that death is not reversible. So, they think that it is a reversible condition

393. Passage of feces in inappropriate places after bowel control would be expected is known as .....
a. Encopresis
b. Enuresis
c. Pica
d. Dyslexia

Explanation: Passage of fecal matter in inappropriate locations after bowel control would be expected is known as encopresis or paradoxical diarrhoea. It is voluntary or involuntary faecal soiling in children who have already been toilet trained.

Enuresis: Refers to a repeated inability to control urination

Pica: eating non-nutritive substances

Dyslexia: Dyslexia, also known as reading disorder, is characterized by trouble with reading

394. A person has not yet fully realized their social identity or defined their personality traits - and they are not actively seeking to is known as.....
a. Role identification
b. Delinquency
c. Negativism
d. Role diffusion

Explanation: According to Erikson, role diffusion develops when the adolescent does not develops a sense of identity and a sense or where he fits in.

395. Failure to thrive is
a. Child is unable to stand
b. Child is unable to sit
c. Child is not gaining weight adequately
d. Child is unable to speak

396. Short stature is a type of _____ disorder
a. Orthopedic
b. Cardiac
c. Metabolic
d. Psychiatric

397. Failure to thrive include all among the following except
a. Growth is lagging behind
b. Infant not gaining weight adequately
c. Infant looks small for age
d. Poor response to social stimuli

398. An 18-month-old child is noted by the parents to be 'anger' about any change in routine. This child's temperament is most likely to be described as:
a. Slow to warm up
b. Difficult
c. Hyperactive
d. Easy

399. The term educable is used for which category of mental retardation?
a. Mild mental retardation
b. Moderate mental retardation
c. Severe mental retardation
d. Profound mental retardation

400. The term trainable is used for which category of mental retardation?
a. Mild mental retardation
b. Moderate mental retardation
c. Severe mental retardation
d. Profound mental retardation

401. The term custodian is used for which category of mental retardation?
a. Moderate mental retardation
b. Severe mental retardation
c. Profound mental retardation
d. Both B and C

402. Identify the correct statement related to mental retardation
a. In mild MR IQ range is 51–70
b. In moderate MR IQ range is 36–50
c. In sever MR IQ range is 20–35
d. All of the above

403. Long-term thumb sucking may cause.....in the child
a. Dental problems
b. Worm infestation
c. Decreased nutritional intake
d. All of the above

404. Bedwetting is considered normal in girls and boys till the age of?
a. 3 and 4 years respectively
b. 4 and 5 years respectively
c. 5 and 4 years respectively
d. 4 and 3 years respectively

405. Which is true concerning attention deficit hyperactivity disorder?
a. Impulsive behavior is a feature
b. Higher incidence in tic disorders
c. May respond to treatment with stimulants such as amphetamine
d. All of the above

406. What is the condition in which children is pulling out hair?
a. Trichotellomania
b. Acrophobia
c. Enuresis
d. Encopresis

407. Nocturnal Enuresis is occurrence of involuntary voiding at night in a child more than?
a. 2 ½ yrs
b. 3 ½ yrs
c. 4 yrs
d. 5 yrs

408. Drug of choice to treat Enuresis
a. Clozapine
b. Diazepam
c. Imipramine
d. Olanzapine

409. Identify the effective nasal spray to control enuresis?
a. Pitressin
b. Desmopressin
c. Lypressin
d. Oxytocin

410. All of the following are common problems of pre-school children except?
a. Temper tantrums
b. Sleep problems
c. Truancy
d. Pica

Ans.

391.	d
392.	a
393.	a
394.	d
395.	c
396.	a
397.	d
398.	c
399.	a
400.	b
401.	d
402.	d
403.	a
404.	b
405.	d
406.	a
407.	d
408.	c
409.	b
410.	c

Scanned with CamScanner

411. What is the term used for sudden abnormal involuntary repetitive purposeless movement?
a. Obsession
b. Tic
c. Compulsion
d. ADHD

412. Management of attention deficit hyperactivity disorders (ADHD) child is .....
a. Calm approach
b. Use simple instructions with the child
c. Reward the child for acceptable behavior
d. All of above

413. Temper Tantrum is the normal behaviour of ..... group
a. Infancy
b. Toddlers
c. Preschool age
d. School age

414. Which of the following is not found in cerebral palsy?
a. Hypotonia
b. Symmetrical
c. Ataxia
d. Flaccid paralysis

415. Child's participation in decision making process about health care is termed as: *(AIIMS BBS NO 2018)*
a. Assent
b. Collegiality
c. Ethics
d. Advocacy

Explanation: For child less than 18 year of age, assent is taken, procedure is explained to the child in the simpler form while informed written consent is taken from adult (age more than 18 years). This is known as Assent.

BLOOD DISORDERS

416. In a child with mild hemophilia A, the factor VIII level is: *(AIIMS Bhopal Grade-I 2018)*
a. 5–50%
b. <1%
c. 50–60%
d. 1–5%

Explanation: The severity of Hemophilia has been defined by a traditional classification into three forms: Mild form in which factor VIII level is more than 5 to 40 % of normal (factor level: >0. 05 to 0. 40 IU/mL), Moderate form in which factor VIII level is 1 to 5% of the normal (factor level: 0.01 to 0.05 IU/mL) and Severe form in which factor VIII level is <1% of the normal (factor level is <0.01 IU/mL).

417. Vector of dengue fever is: *(BHU 2001)*
a. Aedes
b. Anopheles
c. Culex
d. None

Explanation: Dengue is spread through the bite of the female mosquito (Aedes aegypti). This also can spread dengue fever, chikungunya, Zika fever, Mayaro and yellow fever viruses, and other diseases.

418. Go through the following statements related to hemophilia and identify the incorrect statement
a. Hemophilia B are inherited in an X-linked recessive pattern
b. Most of the time females are affected with this condition
c. Fathers cannot pass X-linked traits to their sons
d. In hemophilia B factor 9 is absent

Explanation: Hemophilia is affecting males and most of the time females are the carrier because it is unlikely that females will have two altered copies of this gene.

419. Normal adult hemoglobin contains: *(Safdarjung NO 2018)*
a. Two alpha chain and one beta chain
b. One alpha chain and two beta chains
c. One beta chain and two alpha chains
d. Two alpha chains and two beta chains

Explanation: Hemoglobin is the protein that makes blood red. It is composed of four protein chains, two alpha chains and two beta chains, each with a ring-like heme group containing an iron atom. Oxygen binds reversibly to these iron atoms and is transported through blood.

420. Signs and symptoms of sickle cell anemia are most often appear by 4 months of age. This is because.....
a. Breastfeeding provides protection against the condition
b. IgG act as a protective factor
c. Fetal hemoglobin act as a protective factor
d. Immunization given at birth provides protection against the condition

Explanation: In new born baby fetal hemoglobin act as a protective factor. Fetal hemoglobin is replaced with adult hemoglobin by the age of 3-4 months, so till that time child remains asymptomatic.

421. A hereditary hemolytic anemia is..... *(Safdarjung NO 2018)*
a. Aplastic anemia
b. Thalassemia
c. Megaloblastic anemia
d. All of the above

Explanation: Inherited hemolytic anemia (also known as called intrinsic hemolytic anemia) is caused by a defect in the RBC themselves and result when one or more genes that control red blood cell production malfunctions. Types of inherited hemolytic anemia include: Thalassemia, Sickle cell anemia, Hereditary Spherocytosis, Pyruvate Kinase Deficiency (PKD), Glucose-6-Phosphate Dehydrogenase (G6PD) Deficiency

422. Inherited pattern of thalassemia is .....
a. Autosomal recessive pattern
b. Autosomal dominant
c. X-linked recessive
d. X-linked dominant

Explanation: Autosomal recessive is one of several ways that a trait, disorder, or disease can be passed down through families. An autosomal recessive disorder means two copies of an abnormal gene must be present in order for the disease or trait to develop.

423. Repeated urination while sleeping, even after five years of age is called:
a. Enuresis
b. Tic
c. Stuttering
d. Encopresis

424. In a pregnant woman with raised phenylalanine in blood offspring is most likely to have
a. Mental retardation
b. Lighter complexion
c. Microcephaly
d. Reduction of limb growth

Ans.

411.	b
412.	d
413.	b
414.	b
415.	a
416.	a
417.	a
418.	b
419.	d
420.	c
421.	b
422.	a
423.	a
424.	a

Scanned with CamScanner

425. Neonatal anemia is defined as hemoglobin
a. <13 g/dL b. <12 g/ dL
c. <11 g/ dL d. <10 g/ dL

426. According to WHO cut off level for haemoglobin in child anemia is?
a. 10 gm b. 11 gm
c. 12 gm d. 13 gm

427. Which among the following food items need to be included in the diet plan of a child with iron deficiency anemia?
a. Rice, cereals and milk
b. Green leafy vegetables and jaggery
c. Bread, jam and cheese
d. Pudding potato and rice

428. In a child with iron deficiency anemia, which among the following activity will be helpful to decreases the oxygen demand?
a. Dancing b. Playing video games
c. Reading a book d. Riding bicycle

429. Most commonly seen anemia in children is
a. Hemolytic anemia b. Iron deficiency anaemia
c. Sickle cell anemia d. Beta thalassemia

430. Vitamin-B12 deficiency anaemia also known as .....
a. Macrocytic normochromic
b. Microcytic hypochromic anaemia
c. Megaloblastic anaemia
d. Microcytic normochromic

431. Characteristic of iron deficiency anaemia is .....
a. Macrocytic normochromic
b. Megaloblastic anemia
c. Microcytic hypochromic anaemia
d. Microcytic normochromic

432. Which of the following is a hereditary hemolytic anemia
a. Aplastic anaemia
b. Iron deficiency anemia
c. Vitamin B12 deficiency anemia
d. All of the above

433. Thrombocytopnea, increased hematocrit value and positive tourniquet test are seen in
a. Cholera b. Dengue
c. Mumps d. Measles

434. Bilirubin is the by-product occurred after the metabolism of
a. Albumin b. Hemoglobin
c. Calcium d. Globulin

435. Hemoglobin level in neonate is .....
a. 10-12 gm% b. 12-14 gm%
c. 14-16 gm% d. 16-18 gm%

436. In a child with haemophilia swollen knees occur after falling from bicycle, which among the following is the first nursing intervention?
a. Put an IV cannula and start blood transfusion
b. Monitor client's vital sign
c. Apply ice pack and compressions
d. Provide health education

437. The most common site of bleeding in children with hemophilia is: *(Kerala PSC, Nov 2014)*
a. Joints b. Stomach
c. Gum d. Nose

438. Haemophillia commonly affects.....
a. Males
b. Females
c. Transgenders
b. Both males and females equally

439. Which among the following condition required repeated blood transfusion?
a. Iron deficiency anaemia
b. Pernicious anemia
c. Thalassemia
d. Vitamin B12 deficiency anemia

440. Hemophilia-A is due to deficiency of
a. Coagulation factor-VIII
b. Coagulation factor -IX
c. Coagulation factor -X
d. Coagulation factor –XI

441. Hemophilia-B is due to deficiency of
a. Coagulation factor-VIII
b. Coagulation factor -IX
c. Coagulation factor -X
d. Coagulation factor -XI

442. Hallmark of the haemophilia is?
a. Epistaxis b. Hemarthrosis
c. Abdominal pain d. Anaemia

443. The Best screening test in hemophilia is?
a. Bleeding time
b. Clotting time
c. Partial thromboplastin time
d. Thrombin time

444. Which of the following would be least likely to result in a prolonged bleeding time?
a. Thrombocytopenia
b. Von Willebrand disease
c. Hemophilia A
d. Scurvy

445. Treatment of choice for thalassemia major is
a. Blood transfusion and iron therapy
b. Folic acid and desferrioxamine
c. Blood transfusion and desferrioxamine
d. Iron, blood transfusion and desferrioxamine

446. Uncontrolled proliferation of immature WBCs known as.....
a. Leukemia b. Anemia
c. Thrombocytopenia d. Leukocytosis

447. All are the diagnostic test for iron deficiency anemia EXCEPT
a. Total iron-binding capacity
b. haemoglobin
c. Serum transferrin levels
d. Total protein

448. Laboratory results of a patient who is suffering from disseminated intravascular coagulation (DIC) shows
a. Decreased prothrombin time
b. Decreased partial thromboplastin times
c. Increased platelet counts
d. Prolonged prothrombin and partial thromboplastin times

GASTROINTESTINAL DISORDERS

449. What is main reason for under five morbidity and mortality? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Malnutrition b. Diarrheal disease
c. Asphyxia d. Leukemia

Explanation: Diarrheal disease is the most common cause of under-five mortality rate in India. Malnutrition is the factor which is making children more vulnerable to other disease condition

Ans.

425.	a
426.	b
427.	b
428.	c
429.	b
430.	c
431.	c
432.	a
433.	b
434.	b
435.	d
436.	c
437.	a
438.	a
439.	c
440.	a
441.	b
442.	b
443.	c
444.	d
445.	c
446.	a
447.	d
448.	d
449.	b

Scanned with CamScanner

450. A 2-day-old neonate underwent corrective surgery for tracheoesophageal fistula two days back. Which of the following needs to be reported by the nurse?
(AIIMS Bhopal Grade-I 2018)

a. Diminished bowel sounds
b. Excessive crying, irritability
c. Pulse rate 130 beats/min
d. Dislodgement of orogastric tube

Explanation: Esophageal atresia with or without tracheoesophageal fistula is the most common congenital anomaly of the esophagus. The primary surgical correction is the best option in the absence of severe malformation. But the primary complications during postoperative period are leak and stenosis of the anastomosis, gastroesophageal reflux and respiratory disorders. The dislodgement of the orogastric tube increases the risk for developing the complications. So, this should be reported to the Physician immediately.

451. Projectile vomiting is a characteristic of which of the following conditions?
(AIIMS Bhopal Grade-I 2018; Safdarjung NO 2018)

a. Pyloric stenosis
b. Hernia
c. Imperforate anus
d. Appendicitis

Explanation: Pyloric stenosis is a narrowing of the opening from the stomach to the first part of the small intestine characterized by projectile vomiting (Ejection of gastric content up to 3 feet) without the presence of bile. This occurs due to the hypertrophic pylorus muscles which obstructs the gastric pathway.

Ans.

450.	d
451.	a
452.	d
453.	b
454.	d
455.	d
456.	c
457.	b
458.	c

452. Identify the food items need to be avoided in a child with celiac disease? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Wheat
b. Rye
c. Oats
d. All of these

Explanation: Celiac disease is an auto immune disease and child with celiac disease need to avoid food items contain gluten protein. This protein is present in food items such as wheat, barley, oats and rye.

453. As per the recent WHO classification of dehydration in children, all of the following are type of dehydration, EXCEPT

a. No dehydration
b. Moderate dehydration
c. Severe dehydration
d. Some dehydration

Explanation:

Table WHO guideline for the classification of dehydration

Parameters	No dehydration	Some dehydration	Severe dehydration
Appearane	Well, alert	Restless, irritable	Lethargic or unconscious; floppy
Eyes	Normal	Sunken	Very sunken
Thirst	Drinks nomally, not thirsty	Thirsty, drinks eagerly	Drinks poorly or not able to drink
Skin pinch	Goes back quickly (< 1 second)	Goes back slowly (1 second)	Goes back very slowly (≥2 second)

454. Which of the following symptoms suggest that the child has severe dehydration: *(AIIMS Bhopal Nursing Officer, 2018)*

a. Irritable
b. Restless
c. Who drinks water eagerly
d. Lethargic or unconscious

Explanation: Lethargic and unconsciousness is the sign of severe dehydration in child. It requires immediate IV fluid replacement. Irritability, restlessness and drinking water eagerly are symptoms of mild to moderate dehydration.
Children with severe dehydration may also have:

- Excessive sleepiness
- Sunken eyes
- Discolored hands and feet
- Persistent wrinkling of the skin
- Faster heart rate
- Extreme thirst

455. A clinic nurse is assessing a child for dehydration. The nurse determines that the child is moderately dehydrated if which symptom is noted on assessment: *(RAK MSc 2018)*

a. Flat fontanels
b. Moist mucous membranes
c. Pale skin color
d. Oliguria

Explanation:

- Oliguria is a sign of dehydration. It is defined as a urine output that is less than 1 mL/kg/hr in infants, less than 0.5 mL/kg/h in children, and less than 400 mL or 500 mL per 24 hours in adults - this equals 17 or 21 mL/hr.
- Sunken or depressed fontanels are seen in dehydration.
- Mucus membrane would be dry in dehydration.
- Skin can be cold or turgor, not pale.

456. While administering IV fluid for the management of dehydration, among the following is the most important nursing intervention?

a. Change the IV set 24 hourly
b. Maintain I/O chart
c. Continuing the prescribed rate of flow
d. Maintaining the fluid at body temperature

Explanation: Prescribed flow rate need to be followed, otherwise it can lead to fluid overload and further problems in children.

457. When administering Total Parenteral Nutrition (TPN) through a peripheral IV line to a school age child, What is the lowest glucose concentration that is considered safe to small veins that will also provide adequate TPN?

a. 5% glucose
b. 10% glucose
c. 15% glucose
d. 20% glucose

Explanation: Any amount above 10% glucose must be administered via central venous access. Glucose 5% is not sufficient concentration to provide sufficient TPN.

458. A child suffering from acute diarrhea is brought to the emergency room and is diagnosed as having severe dehydration with pH of 7.25- Serum Sodium-126 mEq/L, Serum Potassium-3.0 mEq/L, HCO_3-16. The best IV fluid of choice in this condition is

a. Half normal saline
b. N/3 Saline+ 5% dextrose
c. Normal Saline
d. N/3 saline + 10% dextrose

Scanned with CamScanner

459. Parents brought a 4-month-old to OPD with lethargy and poor feeding. Which among the following finding suggestive of fluid volume deficit in child?

a. A sunken fontanel
b. Drinking water
c. Increased blood pressure
d. Enough tears

Explanation: A noticeable sunken fontanel, lethargy, poor feeding and decreased skin turgor suggestive of fluid volume deficit.

460. In a child with lactose intolerance and absent lactase activity, which of the following foods is least likely to cause symptoms?

a. Ice cream
b. Skimmed milk
c. Condensed milk
d. Yoghurt

Ref: Nelson 20th Ed, p 289

Explanation: Lactose intolerance is a clinical syndrome of 1 or more of the following; abdominal pain, diarrhea, nausea, flatulence and/or bloating after the ingestion of lactose or lactose containing food substances

- Avoidance of milk and other dairy product will relieve symptoms in these children.

Among the given options, yogurt is least likely to cause symptoms due to following reasons:

- Yogurt contains inactive lactase enzyme, which is activated by the temperature and pH of the duodenum; this lactase activity in the yogurt substitutes for the lack of endogenous lactase
- Bacteria in yogurt partially digest lactose into glucose and galactose before consumption
- Yogurt's semisolid state slows gastric emptying and gastrointestinal transit resulting in fewer symptoms of lactose intolerance

461. Which of the following is true about measurement of nasogastric tube in infants?

a. From the tip of head to middle of sternum
b. From the nostril to the end of sternum
c. From the nostril to ear lobe, then to a point midway between the xiphoid process and umbilicus
d. Any of the above measurements can be used

Ref: Primary Care of the Premature Infant by Dara Brodsky, p 111

Explanation: The approximate length of nasogastric tube to be inserted is calculated as "the length from the nostril to the base of the ear lobe, then to a point midway between the xiphoid process and umbilicus"

462. Which of the following vitamins deficiency leads to diarrhea and hyperkeratosis?

a. Vitamin A
b. Vitamin C
c. Vitamin D
d. Vitamin K

Ref: Nelson 20th ed. p 319, 3240, 18th ed. Ch 45

Explanation: The disturbance of the integrity of the intestinal epithelium with an increased risk for bacterial translocation is one of the suggested factors underlying the increased incidence of infections and sepsis during vitamin A deficiency.

- Squamous metaplasia of the renal pelvis, ureters, vaginal epithelium, and the pancreatic and salivary ducts may lead to increased infections in these areas. In the urinary bladder, loss of epithelial integrity may result in pyuria and hematuria.
- Similarly, in the respiratory tract, mucus-secreting epithelium is essential for the disposal of inhaled pathogens and toxicants. Epithelial changes in the respiratory system can result in *bronchial obstruction.*
- Epithelial changes in the skin due to vitamin A deficiency are manifested as dry, scaly, *hyperkeratotic patches,* commonly on the arms, legs, shoulders, and buttocks.

463. Most common bacterial cause of diarrhea in children is? *(Recent Question 2014)*

a. E. coli
b. Salmonella
c. Staphylococcus
d. Shigella

Ref: CPDT 22nd e, p 1353

Explanation: Most common bacterial cause of diarrhea is ETEC (Enterotoxic E. coli).

464. Prepared ORS solution is stable for a period of: *(Recent Question 2016-17)*

a. 24 hours
b. 48 hours
c. 72 hours
d. 7 days

Ref: Ghai 8th/e/p 293

Explanation: "Generally, a prepared ORS solution should be covered and not kept for more than 24 hours, due to the risk of bacteriological contamination. Packets of ORS should be stored carefully and not kept in temperatures of over 30 degree C or in conditions of high humidity"

465. Initial fluid of choice for diarrhea in an infant: *(AIIMS May 2015)*

a. ORS
b. Salt water
c. Sugar water
d. Dextrose

Ref: Nelson 20th ed. p 882t

Explanation: Compared with standard ORS, lower sodium and glucose ORS (containing 75 mEq of sodium and 75 mmol of glucose per liter, with total osmolarity of 245 mOsm per liter) reduces stool output, vomiting, and the need for intravenous fluids without substantially increasing the risk of hyponatremia.

466. A 4-week-old male infant is brought to the emergency department because of persistent vomiting. Examination shows infant with dry mucus membranes and an olive-shaped mass is palpated in the right upper quadrant of the abdomen. Which of the following acid-base abnormalities is most likely in this patient? *(Recent Question 2015)*

pH, $PaCO_2$ (mm Hg), HCO_3 (mEq/L)

a. 7.10, 80, 24
b. 7.40, 40, 24
c. 7.55, 46, 42
d. 7.62, 21, 21

Ref: Nelson 20th ed. p 1797

Ans.

459. a
460. d
461. c
462. a
463. a
464. a
465. a
466. c

Scanned with CamScanner

Explanation:

- This patient has congenital hypertrophic pyloric stenosis.
- The loss of acidic gastric fluid via vomiting causes a metabolic alkalosis. Additionally, the loss of large volumes of fluid via vomiting leads to contraction alkalosis due to the action of aldosterone.
- In order to compensate for the metabolic alkalosis, the respiratory system responds via hypoventilation to create a secondary respiratory acidosis. The patient described is expected to have a primary metabolic alkalosis with respiratory compensation.
- This is characterized by a plasma pH greater than 7.45, $PaCO_2$ greater than 40 mm Hg and HCO_3^- greater than 24 mEq/L.
- Choice A is ruled out as it has acidosis. Choice B has normal pH and is ruled out. Choice D has alkalosis but HCO_3 is reduced (normal HCO_3= 22-26 mEq) and is hence ruled out.

467. All are true regarding cystic fibrosis EXCEPT:

a. Secretions to become thick and sticky. Instead of acting as a lubricant
b. It is an inherited disorder
c. Sweat chloride test is used to diagnose the condition
d. Digestion and absorption of nutrients are least likely to be affected

Explanation: Thick mucus can block the tubes that carry digestive enzymes from pancreas to intestines. Without these enzymes, body cannot absorb proteins, fats or fat-soluble vitamins. So there will be nutritional deficiency.

Ans.

467. d
468. b
469. d
470. a
471. a
472. b
473. a
474. b
475. b
476. d
477. c

468. Immediate postoperative care following tracheoesophageal repair surgery is .....

a. Administer pain killers
b. Maintain patent airway
c. Maintain parenteral fluid infusion
d. Do careful oral suction

Explanation: Airway maintenance is the highest priority after surgery. So maintain a patent airway play an important role in the immediate post-operative period.

469. All of the following statements about colic in a baby is correct EXCEPT

a. Repeated bouts of excessive crying in a baby is observed.
b. Colic is common and can affect up to 3 out of 10 babies.
c. Colic is more common in babies who are born prematurely.
d. All the babies with colic have an intolerance to cow's milk.

Explanation: Colic is a condition where there are repeated bouts of excessive crying in a baby who is otherwise healthy. Colic is common and can affect up to 3 out of 10 babies. It is more common among babies who are prematurely. Some babies with colic have an intolerance to cow's milk but certainly not majority or all the babies with colic have intolerance to cow's milk.

470. Invertogram is used for the diagnosis of ..... condition

a. Anorectal malformations
b. Tracheoesophageal fistula
c. Cleft lip and palate
d. Hirschprungs disease

Explanation: Invertogram is a specific diagnostic test done to find out anorectal malformations. Skiagram is used for the diagnosis of tracheoesophageal fistula.

471. Important complication of mumps in postpubertal male is:

a. Sterility
b. Cryptorchidism
c. Decrease in libido
d. Decrease in androgen

Explanation: Mumps cause orchitis in male and can cause sterility.

472. What is persistent diarrhea?

a. Diarrhea last > 1 week
b. Diarrhea last > 2 weeks
c. Diarrhea last > 3 weeks
d. Diarrhea last > 4 weeks

Explanation: Diarrhea lasts, more than 2 weeks is persistent diarrhea.

473. In a child with the diagnosis of hyperpyloric stenosis nurse should look for the possible sign of:

a. Dehydration
b. Diarrhea
c. Cyanosisd
d. Malena

Explanation: A child with HPS will develop projectile vomiting and can lead to dehydration. Dehydration occurs as a complication of vomiting. So nursing responsibility include assessment for dehydration

474. Confirmatory diagnostic test for Hirschsprung's disease is...

a. Invertogram
b. Suction biopsy
c. Abdominal CT
d. Fiber optic nasoenteric tube

Explanation: Suction biopsy removes some rectal tissues which will be observed under microscope for ganglionic cells.

475. What is the most important nursing intervention while caring an infant with diarrhea?

a. Maintain Inatke Output chart
b. Take daily weight at same time and in same scale
c. Teach family how to prepare ORS
d. Promote hand hygiene

Explanation: Weight is the best indicator of fluid loss or gain if measured daily at same time and in same scale. During infancy, mild dehydration is indicated by a loss of weight up to 5%, moderate dehydration by 5-10%, and severe dehydration by more than 10%. The infant's life is threatened if there is greater than 15% weight loss.

476. Nurse was going through the file of a child who is admitted with hyper pyloric stenosis. All among the following except one can be seen in the file

a. Olive like mass
b. Projectile vomiting
c. String sign in the X-ray
d. Radiating pain towards left shoulder

Explanation: Except D all are the manifestation related to hyper pyloric stenosis. Projectile vomiting leads to dehydration among children. The definitive treatment of pyloric stenosis is with surgical pyloromyotomy known as Ramstedt's procedure (dividing the muscle of the pylorus to open up the gastric outlet).

477. Which among the following indicate parent have adequate knowledge regarding the dietary management of cystic fibrosis?

a. There is no need for any enzyme supply
b. Low salt food need to be given
c. Provide high calorie food between the meals
d. Eliminate milk and milk products from meal

Explanation: High calorie food need to be given, because absorption of fats and nutrients are compromised by disease process.

Scanned with CamScanner

478. Father of a child with cystic fibrosis is concerned about the low weight of his child. The most appropriate nursing education is.....
a. Digestive enzymes will be given to help your child digest food
b. Weight gain is not possible for the child
c. In cystic fibrosis demand for energy is more and intake is less
d. Prepare tasty food and encourage the child to have it

Explanation: In CF pancreatic ducts are blocked and pancreatic enzymes are not available for digestion process. So supplying pancreatic enzyme will help in digestion process. Enzymatic supplementation helps in proper digestion as well as absorption of nutrient and fat-soluble vitamin

479. Following Albendazole therapy nurse need to educate the parents to observe stool for.....
a. Malena
b. Hematochezia
c. Passage of worm
d. Clay colored stool

Explanation: Albendazole is a deworming medications its administration leads to killing and passage of worms in the stool

480. Rice water stools are observed in:
a. Typhoid
b. Cholera
c. Food poisoning
d. Amebic dysentery

481. All are essential requirements of nursing care of a child admitted with severe diarrhea, except
a. Administration of fluids orally/parentally
b. Restrict oral feeding
c. Assess daily weight
d. Maintaining normal body temperature

482. Which vitamin in Excess may lead to necrotizing entero-colitis?
a. Vitamin A
b. Vitamin E
c. Pyridoxine
d. Vitamin C

483. Initial Fluid of choice for diarrhea in an infant?
a. ORS
b. Salt water
c. Sugar water
d. Dextrose

484. Infant who all are recovering from diarrhoea often fed with soya based formula because milk based formula cause .....
a. GI bleeding
b. Soya milk is rich in electrolyte
c. Intestine is unable to digest normal fat
d. Lactase activity is decreased

485. The most important cause of diarrhea in infants and children is: *(Kerala PSC, Nov 2014)*
a. Escherichia coli
b. Rota virus
c. Salmonella
d. Vibrio cholera

486. Skin turgor in children is assessed at
a. Dorsum of hand
b. Chest
c. Forehead
d. Abdomen

487. Diarrhea is caused by.....
a. E-coli
b. Shigella
c. Salmonella
d. All

488. Electrolyte is present in ORS is .....
a. Calcium carbonate
b. Calcium gluconate
c. Potassium sulfate
d. Sodium chloride

489. A child had repeated vomiting and developed metabolic alkalosis. The appropriate treatment in this condition is
a. ORS
b. IV normal saline
c. Ringer lactate
d. IV normal saline and potassium

490. Soy-based formulas are given to a child who is suffering from diarrhoea because '.....
a. Milk-based formulas may cause gastrointestinal irritation and bleeding
b. Supply deficient electrolytes needed for the child
c. Their intestines are unable to digest normal fats
d. Their lactase activity is decreased

491. The common pathogen causing diarrhoea in infancy is .....
a. Rotavirus
b. E. coli
c. Klebsiella
d. Shigella

492. Bottle fed babies are more prone to develop .....
a. Fever
b. Diarrhea
c. Typhoid
d. Malaria

493. In a 3-year-old child, most common cause of hepatitis B is?
a. Pin prick
b. Saliva exchange
c. Perinatal
d. Blood transfusion

494. A tracheoesophageal fistula should be suspected in a neonate immediately after birth if one of the following is present? *(Banaras HU 2015)*
a. Jaundice
b. Bile-stained vomitus
c. Absence of sucking
d. Excessive amount of frothy saliva in the mouth

495. Three days after the birth newborn appears slightly jaundiced. Nurse need to understand that this is due to:
a. Immature liver function
b. Prolonged RBC life span
c. Maternal antibody reaction
d. High hemoglobin with low hematocrit value

Explanation: Physiological jaundice occur because of the short life span of RBCs and inability of the immature newborn liver to conjugate them.

496. All are features indicative of physiological jaundice of a newborn except: *(AIIMS BBS NO 2018)*
a. It appears before attaining 24 hours of age
b. It fades by 7th day of life
c. It peaks by 3rd day of life
d. It appears after attaining 24 hours of age

Explanation: Neonatal physiological jaundice appears after 24 hours of life due to breakdown of Red Blood Cells. Jaundice in the first 24 hours after birth is often considered pathologic.

497. Pathological jaundice criteria, all are included except:
a. 24 hours later but within 72 hours
b. >14 days persistence
c. >2 mg/dL conjugated bilirubin
d. Clay colored stool

498. Identify the characteristic of pathological jaundice among the following
a. It appears in between 24-72 hours of age
b. It occurs because of the physical immaturity of the baby
c. Prematurity, asphyxia and infections may aggravate it
d. It appears within 24 hours

499. All are the characteristic of pathological jaundice EXCEPT
a. It appears within 24 hours of birth
b. Total bilirubin level is more than 15 mg/dL
c. Serum bilirubin level does not exceed 15 mg/dL
d. Direct bilirubin level more than 2 mg/dL

Ans.

478.	a
479.	c
480.	b
481.	b
482.	b
483.	a
484.	d
485.	b
486.	d
487.	d
488.	d
489.	c
490.	d
491.	a
492.	b
493.	c
494.	d
495.	a
496.	a
497.	a
498.	d
499.	c

Scanned with CamScanner

500. Kernicterus, which may occur as a complication of jaundice, is a pathological condition of the: *(Safdarjung NO 2018)*
a. Liver
b. Brain
c. Kidney
d. Heart

Explanation: Indirect Bilirubin more than 20 mg/dl can cause a condition called kernicterus in which bilirubin deposition occurs in Brain. It can cause athetoid cerebral palsy and hearing loss.

Pathological condition of liver may cause jaundice (hyperbilirubinemia). Here, the question is complication of jaundice. Kernicterus is a complication due to hyperbilirubinemia.

501. Kramer's rule used for.....
a. Jaundice
b. Necrotizing enterocolitis
c. Burns
d. Asphyxia

Explanation: Kramer's rule used for the estimation of bilirubin level in jaundice.

502. Drug used in the treatment of neonatal jaundice is .....
a. Phenobarbitone
b. Calcium gluconate
c. Betamethasone
d. Diazepam

Explanation: Phenobarbitone act in the liver and induce glucuronyl transferase. So, it is the drug of choice in neonatal jaundice

503. Correct regarding phototherapy
a. Wavelength of lights used in phototherapy is 500–550 nm
b. 30-45 cm is the distance between light source and baby
c. Biliblanket is used in double surface phototherapy
d. All of the above

504. Phototherapy acts by.....
a. Configurational isomerization
b. Structural isomerization
c. Photooxidation
d. All of the above

Explanation: Configurational isomerization Z isomer are converted to E isomers, in structural isomerization bilirubin converted as lumirubin and in photo oxidation photo products are excreted via urine.

505. In phototherapy unit what is the importance of using white clothes or aluminium foil around the unit?
a. To provide privacy to the child
b. To reflect the light, back on to the baby
c. To avoid exposure to other lights in the unit
d. All of the above

Explanation: The purpose is to reflect back the light on to the baby. While using these make sure that air flow is not impede.

506. Eyes need to be covered during phototherapy section because:
a. To make sure that newborn closed the eyes well
b. To induce sleep in the baby
c. Prevent injury to conjunctiva and retina
d. To minimize repeated blinking of the eyes which causes tiredness to eye muscles

Explanation: Eye patches are applied to prevent dryness of conjunctiva and injury to retina.

507. Pathological jaundice treatment .....
a. Exchange transfusion
b. Phototherapy
c. Administration of phenobarbitone
d. All

508. All are complications of phototherapy except:
a. Passing loose green stools
b. Hypercalcemia
c. Hyperthermia
d. Bronze discoloration of skin

509. Complication of phototherapy is
a. Hyperthermia
b. Retinal damage
c. Bronze-baby syndrome
d. All of the above

510. Which all body parts need to be covered of a child getting phototherapy?
a. Eyes and abdomen
b. Eyes and genitalia
c. Eyes and extremities
d. Genitalia and extremities

511. All of the following are required while caring for a child who is on phototherapy EXCEPT
a. Infant should be fully naked with eyes and genitalia covered
b. breast feeding should be continued unless it is contra-indicated
c. frequent monitoring of infant temperature need to be done
d. Baby should be completely naked

512. Cleft-palate is ideally repaired at
a. Between 6 months and 18 months
b. Between 6 weeks and 8 weeks
c. Between 6 years and 8 years
d. 1st week of birth

513. Double bubble sign in the x-ray suggestive of .....
a. Duodenal atresia
b. Intestinal obstruction
c. Aganglionic megacolon
d. Trachea esophageal fistula

514. Investigation of choice for biliary atresia in a 2 month old baby is?
a. Hepatic scintigraphy
b. ERCP
c. USG
d. MRCP

515. The classical presentation of congenital hypertrophic pyloric stenosis is
a. Non bilious projectile vomiting
b. Fever
c. Constipation
d. Pain abdomen

516. Which of these signs indicates tracheoesophageal fistula immediately after birth? *(Daman & Diu NO 2018)*
a. Passage of frothy meconium
b. Continuous drooling
c. Slow response to stimuli
d. Diaphragmatic breathing

Explanation: Tracheoesophageal fistula is an abnormal connection in one or more places between the Esophagus and the trachea. Symptoms may include frothy, white bubbles, drooling in the mouth, coughing or choking when feeding, vomiting, blue color of the skin especially when the baby is feeding, difficulty breathing, round and full abdomen.

Ans.

500.	b
501.	a
502.	a
503.	d
504.	d
505.	b
506.	c
507.	d
508.	b
509.	d
510.	b
511.	d
512.	a
513.	a
514.	d
515.	a
516.	b

Scanned with CamScanner

517. Surgery of choice for congenital hypertrophic pyloric stenosis is
a. Gastrostomy b. Pyloromyotomy
c. Colostomy d. Gastrectomy

518. Most common biochemical abnormality in congenital hypertrophic pyloric stenosis
a. Hypokalemic metabolic alkalosis
b. Hyperkalemic metabolic acidosis
c. Hypokalemic metabolic acidosis
d. Hyperkalemic metabolic alkalosis

519. Congenital absence of ganglion cells in the submucosal and myenteric plexus of the distal intestine is known as
a. Congenital hypertrophic pyloric stenosis
b. Hirschsprung's disease
c. Intussusception
d. Intestinal obstruction

520. Child is failing to pass meconium and there is protruded abdomen, child is passing ribbon like stool. These are the typical clinical features of .....
a. Necrotizing enterocolitis
b. Intestinal obstruction
c. Anorectal malformations
d. Aganglionic megacolon

521. Projectile vomiting is a feature of
a. Esophageal atresia
b. Hypertrophic pyloric stenosis
c. Cholera
d. Intussusception

522. A congenital condition in which abdominal content protrudes through the defect in the abdominal wall and is not covered with sac is called as .....
a. Gastroschisis b. Omphalocele
c. Umbilical hernia d. Abdominal hernia

523. A congenital condition in which abdominal content protrudes through the defect in the abdominal wall and is covered with sac is called as .....
a. Gastroschisis b. Omphalocele
c. Umbilical hernia d. Abdominal hernia

524. Which among the following activity is compromised in a newborn baby with cleft lip?
(AIIMS Raipur Staff Nurse Grade I-2018)
a. Sucking b. Swallowing
c. Respiration d. Facial expression

Explanation: Sucking is the activity compromised in baby with cleft lip and swallowing will be compromised in baby with cleft palate.

525. Important health teaching regarding feeding practices for a child who is suffering from cleft lip and palate include.....
a. Make the patient lie down and provide feed
b. He should be held in a horizontal position and fed slowly to avoid aspiration
c. Try soft nipple with enlarged opening so he can get the milk through chewing motion
d. Brief rest period and frequent burping during feeding to get rid of swallowed air

Explanation: Provide nutrition and prevent aspiration are the two important nursing responsibility while caring a child with cleft lip and cleft palate. Child should be held in upright position during feeding.

526. The cleft palate usually gets repaired during _____
(ESIC 2019)
a. 6 months b 3 months
c. 12-18 months d. 2-3 years

Explanation: Cleft palate is usually repaired around 12 months of age. Cleft lip is usually repaired at four to six months of age.

527. Position used post operatively while caring for a child with cleft palate is .....
a. Supine b. Prone
c. Sitting d. Left lateral

528. Which condition occurs due to the congenital absence of parasympathetic ganglionic nerve cells in the colon?
a. Meconium ileus b. Volvulus
c. Intestinal obstruction d. Hirschsprung's disease

529. The important aspect to be included in the discharge plan of a child with cleft lip and palate is: *(Daman & Diu NO 2018)*
a. Adherence to antibiotic therapy
b. Application of sterile dressing over the lip
c. Administration of vitamin supplements
d. Administering oxygen

Explanation: Infection is a potential complication of any surgery. The nurse should inform to give the antibiotic medication to child on time, as directed. Logan's Bow (U shaped metal bar) or Steri-Strips is left in place after surgery for a week which need not be changed with any dressing at home.

530. The most common manifestation of ulcerative colitis in children is
a. Anal fissures b. Abdominal distension
c. Abdominal cramps d. Profuse diarrhoea

531. Intense abdominal cramps, anal fissures and abdominal distensions in a child are suggestive of
a. Ulcerative colitis b. Crohn's disease
c. Diverticulosis d. Diverticulitis

532. All of the following are the sign of fluid volume deficit in an infant EXCEPT
a. Low urine specific gravity
b. Increased pulse rate
c. Decreased blood pressure
d. Sunken fontanels

533. Infant with cystic fibrosis (CF) are likely to develop
a. Meconium ileus b. Loose motions
c. Vomiting d. Constipation

534. All are the manifestations of crohn's disease EXCEPT
a. Intense abdominal cramps
b. Profuse diarrhea
c. Anal fissures
d. Abdominal distention

535. In gastroesophageal reflux disease (GERD), the purpose of esophageal pH monitoring is .....
a. Look for esophagitis
b. Assess the frequency of reflex
c. Assess time taken for gastric emptying
d. Identify possible obstruction

536. A child presents with abdominal colic and hematuria. On ultrasonography a stone 2.5 cm in diameter is seen in the renal pelvis. The next step in management of this case is:
a. Pyelolithotomy
b. Nephroureterostomy
c. Conservative d. ESWL

Ans.

517. b
518. a
519. b
520. d
521. b
522. a
523. b
524. a
525. d
526. c
527. b
528. d
529. a
530. d
531. b
532. a
533. a
534. b
535. b
536. a

Scanned with CamScanner

537. Preferred position for nursing babies with GERD?
a. Right lateral
b. Football position
c. Left lateral
d. Head down position

538. Safest position of neonate is on their back or side lying this is because incidence of ..... is very less in these positions.
a. Asphyxia
b. Apnea
c. Sudden infant death syndrome
d. Aspiration

Explanation: Sudden infant death syndrome (SIDS) is the unexplained death, usually during sleep, of a seemingly healthy baby less than a year old. SIDS is sometimes known as crib death because the infants often die in their cribs. Exact cause for this condition is not known. By making them lying down in the back or side lying position will help to reduce the incidence of this condition.

539. Prior to feeding an infant by gastrostomy tube, the nurse should: *(Banaras HU 2015)*
a. Aspirate the tube
b. Slowly instill 5 ml of water
c. Provide the baby with a pacifier
d. Place the baby in Semi-Fowler's position

540. In a child with Hirschsprung's disease nurse noticed fever and explosive diarrhoea, what is the immediate nursing intervention?
a. Notifying the physician immediately
b. Administer ant-diarrhoeal medication
c. Monitor child every 30 minutes
d. Record the findings

Ans.

537. c
538. c
539. d
540. a
541. a
542. d
543. b
544. d
545. a
546. c
547. c

541. Effectiveness of use of thickened formula feed in a client with GERD is evaluated with .....
a. Decrease in regurgitation and vomiting
b. Decrease in frequency of stool
c. Increased urine out put
d. All of the above

542. Reye's syndrome is associated with____ *(ESIC 2019)*
a. Hemolytic transfusion reactions.
b. Biliary colic
c. Sickle cell crisis
d. Use of aspirin with viral illness.

Explanation: Reye's syndrome is associated with the use of aspirin with viral illness. It is a rare but serious condition that causes swelling in the liver and brain. Reye's syndrome most often affects children.

RESPIRATORY DISORDERS

543. A 10-year-old child with asthma is admitted to the ward. Which of the following observations needs immediate action by the nurse? *(AIIMS Bhopal Grade-I 2018)*
a. Breath rate 20/min
b. Sitting upright and refusing to lie down
c. Refusing to eat food
d. Oxygen saturation 96%

Explanation: In children Asthma Attack Scale is used to determine the disease severity and it has four level i.e. Mild (no SOB at rest, mild SOB with walking, can talk normally, can lay down normally, wheezes not heard or mild), Moderate (SOB at rest, speaks in phrases, sitting upright and refusing to lie down, wheezing can be heard), Severe (severe SOB at rest, can talk in single words, wheezing may be loud) and Peak flow rate which tells how well a person can move air out of the lungs. In above scenario nurses need to take immediate action because the child develops a moderate type of asthma attack.

544. A 5-year-old child gets admitted to the hospital with the diagnosis of Bronchopulmonary Dysplasia (BPD). If the child is at the third stage, what would be the clinical symptoms present? *(AIIMS Raipur Grade II 2017)*
a. Profuse hyaline membranes and patchy mucosal cilia loss
b. Interstitial fibrosis and epithelial proliferation
c. Edema of the interstitium and necrosis of alveolar cells
d. Alveolar collapse and difficulty in oxygenation

Explanation:

Table

Stage 1 (1–3 days)	Stage 2 (4–10 days)	Stage 3 (11–20 days)	Stage 4 (>1 month)
Presence of hyaline membranes, atelectasis, vascular hyperemia, and lymphatic dilatation	Lung destruction resulting in ischemic necrosis of airways and bronchiolar obstruction	Hypertrophy of the remaining alveoli, bronchial-wall muscle and glands, Airtrapping, pulmonary hyperinflation, tracheomegaly, tracheomalacia, interstitial edema, and ciliary dysfunction	Emphysematous alveoli are seen. Pulmonary hypertension, cor pulmonale. Fibrosis, atelectasis, a cobblestone appearance due to uneven lung aeration, and pleural pseudofissures are seen.

545. What is the priority need that must include in the care of a child who is having pneumonia? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Rest
b. Respiratory exercises
c. Nutrition
d. Tricycle riding

Explanation: In a child with pneumonia rest is the most priority need. The child is having limited energy and nutritional status will be compromised, so unnecessary energy expenditure need to be avoided in order to spend those energy in the airway need of the patient.

546. Most suitable position for a child who come to OPD with the complaint of epistaxis?
a. Supine
b. Prone
c. Sitting
d. Lithotomy

Explanation: Sitting is the most appropriate position because keep child's heads elevated but not hyperextended because hyperextension may cause bleeding into the pharynx and possible aspiration.

547. The most common indication of respiratory illness in infant is.....
a. Poor feeding
b. Longer period of sleep
c. Rapid grunting respiration
d. Cough

Explanation: Rapid grunting is the most common sign indicating respiratory distress in an infant. It is a mechanism by which infant try to keep alveoli open and to increase arterial oxygenation.

Scanned with CamScanner

548. A newborn is suspected to have respiratory distress if there is.....

a. Flaring of nostrils
b. Acrocyanosis
c. Breath holding spells
d. Irregular respiration

Explanation: According to Silverman-Anderson index for respiratory function, flaring of nostrils indicate respiratory distress.

Table

Feature	Score 0	Score 1	Score 2
Chest movement	Equal	Respiratory lag	Seesaw respiration
Intercostal retraction	None	Minimal	Marked
Xiphoid Retraction	None	Minimal	Marked
Nasal flaring	None	Minimal	Marked
Expiratory grunt	None	Audible with (stethoscope)	Audible

549. Choanal atresia affect.....

a. Nose
b. Nasopharynx
c. Anus
d. Sigmoid colon

Explanation: Congenital failure of the nasal cavities to open posteriorly into the nasopharynx (choanae) is called choanal atresia.

550. Which lobe is most commonly affected in children with pulmonary atelectasis?

a. Right middle lobe
b. Right lower lobe
c. Left upper lobe
d. Left lower lobe

Explanation: Right middle lobe is more prone to atelectasis because It is bronchus has a narrow diameter, acute angle of take-off and a relatively long course.

551. What should be the priority nursing intervention in a child with croup?

a. Pad side rails of the ribs
b. Arrange for a quiet, cool environment
c. Obtain a cot so that a parent can stay
d. Place a tracheostomy set at the bedside

Explanation: Priority is the patent airway and necessary equipment must be immediately available.

552. What is the priority nursing intervention for a child who is admitted with respiratory syncytial virus (RSV)?

a. Administering an antiviral agent
b. Clustering care to conserve energy
c. Send daily blood sample
d. Offering oral fluids to promote hydration

Explanation: Often the infant will have decreased pulmonary reserve and the clustering of care is essential to provide for period of rest.

553. When a small child is shaken by the arms or shoulders in a repetitive, violent manner, this condition is called:

a. Marfan syndrome
b. Munchausen syndrome
c. De Quervain syndrome
d. Shaken baby syndrome

554. What instruction should be included in the nursing care plan of a child with RSV infection?

a. Administering an antiviral agent
b. Allow parents and siblings to visit
c. Maintain standard and contact precautions
d. Administer IV fluids to promote hydration

Explanation: RSV is highly contagious so child need to be isolated and need to maintain standard and contact precautions.

555. All are present in a child with croup EXCEPT

a. Fever
b. Bronchospasm
c. Barking cough
d. Inspiratory stridor

Explanation: Fever, barking cough and inspiratory stridor are the manifestation of croup. Croup is a general term applied to conditions characterized by hoarseness of voice and resonant cough it includes acute epiglottitis, laryngitis, laryngotracheobronchitis, spasmodic laryngitis

556. When assessing a child with chronic hypoxia, nurse has to look for:

a. Clubbing of fingers
b. Decreased RBC count
c. $SPO_2 > 90\%$
d. Fluid intake

Explanation: Hypoxia leads to poor peripheral circulation; clubbing occurs as a result of tissue hypertrophy and additional capillary development in fingers. The nail widening that characterizes clubbing occurs because the tissue under the nail plate becomes thicker. This can be caused by a number of conditions that lead to a decrease in the amount of oxygen in the blood, such as lung disease and heart disease.

557. Beclomethasone helps to .....

a. Bronchodilation
b. Increases cardiac output
c. Increases surfactant production
d. Decreases inflammatory process

Explanation: This drug reduces the inflammation and inflammatory response of the bronchial wall. Beclomethasone is a steroid. It prevents the release of substances in the body that cause inflammation. Beclomethasone inhalation is used to prevent asthma attacks.

558. A nurse caring for a child with spasmodic croup need to understand that immediate nursing care is required for.....

a. Irritability
b. Hoarseness
c. Crocking sound
d. Rapid respiration

Explanation: Rapid respiration indicates impending airway obstruction.

559. What should the nurse emphasize in discharge teaching of a child with persistent asthma?

a. Indoor plants and pet animals helps to increase the activity in asthmatic child
b. Dry dusting of the room need to be done daily.
c. Diminishing signs and symptoms helps to taper the drug
d. Medication must be continued even if the child is asymptomatic

Ans.

548. a
549. b
550. a
551. d
552. b
553. d
554. c
555. b
556. a
557. d
558. d
559. d

Scanned with CamScanner

Explanation: Children who all are suffering from asthma need to continue the medication even if they are asymptomatic and they always need to carry medications with them.

560. In croup humidified oxygen is given to
a. Maintain moist mucosa
b. Provide mode for giving inhaled drugs
c. Decrease tissue inflammation and edema
d. Provide an environment free of pathogenic organisms

Explanation: Cool mist help to reduce inflammation and tissue edema.

561. A 6-year-old child is admitted to the hospital with pneumonia. An immediate priority in this child's nursing care would include all of the following except: *(Banaras HU 2015)*
a. Provide nutrition to the child
b. Assess respiratory status and signs of cyanosis
c. Give fowler position/semi-fowler position
d. Give oxygen according to the program

562. Which among the following respiratory condition is always treated as medical emergency?
a. Pneumonia b. Asthma
c. Epiglottitis d. Cystic fibrosis

563. Bronchiolitis is commonly seen in which age group?
a. 6/12 b. <2 years
c. 2-3 years d. All age group

564. In which of the following condition, the main presenting symptom is peculiar brassy cough (barking cough)?
a. Acute tonsilopharyngitis
b. Croup
c. Pneumonia
d. Cystic fibrosis

565. Failure of distension of alveoli due to loss of elasticity of the lung, is known as
a. Respiratory failure b. Atelectasis
c. Emphysema d. Empyema

566. Which of the following organisms is commonly associated with bacterial tracheitis in children.
a. Haemophilus influenzae
b. Staphylococcus aureus
c. Moraxella catarrhalis
d. Streptococcus pneumonia

567. Myxovirus is responsible for
a. Diphtheria b. Pertussis
c. Mumps d. Tetany

568. Most common cause of Acute Epiglottitis is
a. S. pneumoniae b. Influenza
c. H. influenza d. Meningococci

569. Most common complication of bronchial asthma is.....
a. Hypoxemia b. Atelectasis
c. hypoxemia d. respiratory failure

570. Inhaled corticosteroid used in bronchial asthma are all except
a. Beclomethasone b. Budesonide
c. Fluticasone d. Dexamethasone

571. All the following statements are true related to wheezing EXCEPT
a. It is a high pitch whistling sound
b. It can be auscultated by the stethoscope only
c. It occurs due to partial obstruction of lower airway
d. It is predominantly expiratory in nature

572. Identify the lower respiratory tract infection among the following
a. Coryza b. Common cold
c. Bronchitis d. Rhinitis

573. Which among the following condition is characterized by destruction of bronchial and peribronchial tissues
a. Laryngitis b. COPD
c. Bronchiectasis d. Pneumonia

574. Rubeola is
a. German Measles b. Measles
c. Paratoditis d. Meningitis

575. Commonest complication of Mumps in children is –
a. Orchitis b. Meningitis
c. Myocarditis d. Pancreatitis

576. Mode of Transmission of measles is .....
a. Droplet b. Transplacental
c. Contaminated food d. fomite

577. "German measles" is .....
a. Mumps b. Rubella
c. Rubeola d. Pertusis

578. Diphtheria is characterized by.....
a. Sore throat, dysphasia and low grade fever
b. Sore throat, high grade fever and rash
c. Swelling of parotid gland, earache, fever
d. Sore throat, rash and pain in abdomen

579. Rashes are the clinical manifestation of all the following diseases. EXCEPT
a. Measles b. Mumps
c. Chickenpox d. Diphtheria

580. The clinical manifestation of Measles which appears last is
a. Convulsion b. Fever
c. Rash d. Rhinitis

581. Maximum rate of incidence of pertussis is seen in the age group of .....
a. < 1 year b. 1-5 years
c. 3-6 years years d. 5-10 years

582. Commonly used name for the disease 'hundred-day cough' is.....
a. Rubella b. Rubeola
c. Cholera d. Pertussis

583. Cyanosis in a child can be seen in all the place mentioned below except *(Banaras HU 2015)*
a. Sclera b. Tongue
c. Nail beds d. Lips

584. Noisy breathing due to airway obstruction is known as .....
a. Ronchi b. Stridor
c. Snoring d. Crackles

585. Treatment of choice in Community acquired pneumonia in neonates is?
a. Cefotaxime + Gentamycin
b. Cefotaxime + Amikacin
c. Ampicillin + Amikacin
d. Ampicillin + Gentamycin

586. An acute, severe prolonged asthma attack and is unresponsive to usual treatment is known as
a. Nocturnal asthma b. Intrinsic asthma
c. Extrinsic asthma d. Status asthmaticus

587. Risk factors for persistent asthma in children include All EXCEPT
a. Previous episodes of Bronchiolitis as infant
b. Previous episodes of pneumonia
c. Food allergy.
d. First born infant to asthmatic parents.

Ans.

587.	d

Scanned with CamScanner

588. Best method of oxygen administration to a 2-month-old baby is:
a. Oxyhood
b. Nasal cannula
c. Face mask
d. Oxygen tent

589. A child is suffering from dyspnea, at first what nursing care you would provide to the child
a. Start I.V infusion
b. Provide supine position
c. Start oxygen therapy
d. Start nebulization

590. When the respiratory rate of a 12 months old child is 35 breaths/minute, the most appropriate nursing action is
a. Notify the physician
b. Administer oxygen
c. Reassess respiratory rate in 15 minutes
d. Document the findings

591. Which measure would be most appropriate for the nurse to do to ensure that a child's ET tube is correctly positioned? *(AIIMS Raipur NO 2019)*
a. Auscultate for abdominal breath sounds
b. Mark the tracheal tube at the child's lip
c. Watch for yellow display on CO2 monitor
d. Inspect for water vapor in the tracheal tube

Explanation: Capnography is a noninvasive method for monitoring the level of CO_2 in exhaled breath to assess a patient's ventilatory status. It has become a standard of care. The CO_2 detector should change color from purple to yellow.

Checking for the presence of water vapor is an unreliable method because condensation may be present even if the tube is in esophagus.

SKIN DISORDERS, BURNS, ENT AND OPHTHALMOLOGY

592. In newborn hearing assessment test done is .....
a. BERA (brain stem evoked response audiometry)
b. Tuning fork test
c. Audiometer test
d. Bone conduction test

Explanation: In newborn baby hearing is assessed with the help of BERA test. Brain stem evoked response auditory (BERA) is a test to measure the brain wave activity that occurs in response to clicks or certain tones.

593. Child who is affected with Bell's palsy, moistening of the affected eye has to be done to prevent.....
a. Keratitis
b. Damage to retina due to light
c. Conjunctivitis
d. Drooping of the eye lid

Explanation: Maintaining moisture to the affected eye (especially at night) to prevent keratitis is required in a child who is affected with Bell's palsy

594. The nurse is caring for a 6-year-old client with conjunctivitis. Before administering eye drops, the nurse should recognize that it is essential to consider: *(Safdarjung NO 2018)*
a. The eye should be cleansed with warm water, removing any exudate, before instilling the eye drops.
b. The child should be allowed to instil his own eye drops.
c. The mother should be allowed to instil the eye drops.
d. If the eye is clear of any redness or edema, the eye drops should be withheld.

Explanation: Conjunctivitis can be manifested as exudates, redness, or edema. Before instilling eye drops, cleansing of eye is done with sterile cotton swab soaked in warm saline using strict aseptic technique.

595. Drug of choice in treating scabies among younger children is .....
a. Gamma benzene hexachloride
b. 5% permethrin cream
c. 0.1% Benzoyl peroxide
d. 0.1% Nicotinamide

Explanation: Gamma benzene hexachloride can cause neurotoxicity through subcutaneous absorption especially in younger children, so drug of choice in younger children is 5% permethrin cream

596. Following tonsillectomy appropriate position in the post-operative period is.....
a. Lithotomy
b. Side-lying
c. Fowlers
d. Prone

Explanation: Side lying position helps in the drainage of secretions from oral cavity and reduces the risk of aspiration

597. Which of the following would first alert the nurse that a child is hemorrhaging after tonsillectomy? *(RAK MSc 2018)*
a. Mouth breathing
b. Frequent swallowing
c. Requests for drinks
d. Increased pulse rate

Explanation: Postoperative care for patient with tonsillectomy is to observe for hemorrhage. If Hemorrhage occur patient will show frequent swallowing, pallor, and increase in pulse rate. Hematemesis also can occur.

598. Drug of choice in trachoma for children is: *(SGPGI 2001)*
a. Oral tetracycline
b. Oral penicillin
c. Aminoglycosides
d. None

Explanation: Oral tetracycline (20/mg/kg) is recommended by WHO for the treatment of trachoma in children.

599. Which of the following antibiotics is contraindicated in infants and young children?
a. Amoxicillin
b. Cephalosporins
c. Tetracycline
d. Erythromycin

600. Correct method of holding the pinna in children is .....
a. Upward and backward
b. Downward and backward
c. Backward directly
d. Downward directly

Explanation: By pulling pinna downward and backward it makes the ear canal straight, and promote visibility and easy administration of medication. In adult the pinna will be hold upward and backward.

601. Other name of mucocutaneous lymph node syndrome is:
a. Kawasaki disease
b. Minamata disease
c. Edward syndrome
d. Laughing disease

Explanation: A condition that causes inflammation in the walls of some blood vessels in the body. It is most common in infants and young children. Early stages include a rash and fever. Symptoms include high fever and peeling skin. In late stages, there may be inflammation of medium size blood vessels (vasculitis). It also affects lymph nodes, skin and mucous membranes, such as inside the mouth. Kawasaki disease is usually treatable. Initial treatments include aspirin and IV immunoglobulin therapy given in a hospital

601.	a

Scanned with CamScanner

602. Child who is on cast complaining of itching. Action need to take by the nurse to relieve itching is.....
a. Apply cool air under the cast with a blow-dryer
b. Apply lotions on the body
c. Remove the cast
d. Apply mitten to prevent the child from itching

Explanation: Applying cold air under the cast reduces itching in the child

603. Untreated strabismus can lead to
a. Cataract
b. Glaucoma
c. Amblyopia
d. Loss of vision in the affected eye

Explanation: By not using affected eye vision in that particular eye will be lost and leads to partial blindness

604. Otitis media in children is caused by
a. Streptococcus pneumoniae
b. Hemophilus influenzae
c. E-coli
d. Both (A) and (B)

605. In following which is the first sign of chickenpox in children
a. Fever
b. vesicles
c. Shivering
d. Malaise

606. Varicella zoster cause .....
a. Chicken pox
b. Pertussis
c. Diphtheria
d. Polio

607. A 2-year-old child is admitted to a burn-unit with partial and full thickness burns over 35% of the body. After admission assessment and review of physician's order, the priority intervention focuses on: *(RAK MSc 2018)*
a. Sedating with morphine sulfate
b. Restricting I/V fluids
c. Inserting nasogastric tube
d. Inserting a Foley catheter

Explanation: Fluid resuscitation is the important treatment for a child with burn injury. Assessment of Urine Output is the best guide regarding fluid resuscitation. Insert a Foley catheter in patients with burns >15% TBSA. Adequate urine output is 0.5 mL/kg/h in adults and 1.5 mL/kg/h in children.

POISONING AND CHILD ABUSE

608. Following the poisoning with acetaminophen which among the following sign the nurse needs to expect? *(AIIMS 2004)*
a. Fever
b. Jaundice
c. Right upper quadrant pain
d. Headache

Explanation: Acetaminophen cause hepatic damage because of which child may be complaining of right upper quadrant pain and Jaundice may be a late manifestation.

609. In poisoning the first action expected from a parent is ..... *(RML 2000)*
a. Give ample of water to the child to drink
b. Call an ambulance immediately
c. Call the poison control center
d. Note down the signs and symptoms developed by the child

Explanation: Before doing any Intervention the parents should call the poison control center for specific directions and help.

610. Assuming that all have achieved normal cognitive and emotional development, which of the following children is at greatest risk for accidental poisoning: *(Safdarjung NO 2018)*
a. A 6-month-old
b. A 4-year-old
c. A 10-year-old
d. A 13-year-old

Explanation: Toddler and preschooler are more prone to accidental poisoning due to their curiosity and desire to explore the world. They learn to eat and drink by their own without knowing, whether it's eatable or not making them vulnerable to eat or drink poisonous substances.

611. The most important toxic side effect of NSAIDs is.....
a. Constipation
b. Hyperthermia
c. Hematuria
d. Feed intolerance

Explanation: Long term use of NSAIDs can leads to hematuria because of nephrotoxicity.

612. Lead poisoning most commonly affects ---------- body system with it irreversible side effect
a. Cardiac
b. CNS
c. Gastrointestinal
d. Genitourinary

Explanation: Damage caused by lead is irreversible in CNS, but in all other body system the damage caused by lead is reversible.

613. Oxygen toxicity in pre-term babies causes:
a. Retrolental fibroplasia
b. Respiratory distress syndrome
c. Neonatal sepsis
d. Neonatal hypoglycemia

DISORDERS OF NERVOUS SYSTEM

614. Which of the following helps in prevention of neural tube defect in fetus? *(RAK MSc 2018)*
a. Vitamin A
b. Vitamin C
c. Vitamin E
d. Folic Acid

615. An infant born with non-communicating hydrocephalus has just had a ventro peritoneal shunt inserted. In addition to neuromuscular assessments what measures should the nurse use in child's care plan?
a. Reinforce wet dressings every 2 hourly
b. Position the infant on operative side
c. Place infant in semi fowler position
d. Measure head and abdominal circumference

Explanation: Nurse need to measure head and abdominal circumference since there is chance of shunt malfunction and in order to monitor the early sign of intra-cranial pressure and abdominal distension.

616. Isolation period of a child with bacterial meningitis:
a. 12 hours after starting antibiotics
b. 24 hours after starting antibiotics
c. Till antibiotic course completion
d. Till culture negative

Ans.

602.	a
603.	d
604.	d
605.	a
606.	a
607.	d
608.	c
609.	c
610.	b
611.	c
612.	b
613.	a
614.	d
615.	d
616.	b

Scanned with CamScanner

Explanation:
- Isolation is generally required for bacterial meningitis due to meningococci only; it usually spreads by droplet infection
- The affected children should be placed on droplet precautions (private room, mask for all entering the room) until they have completed 24 hours of appropriate antibiotic therapy.

617. Most common type of meningitis that affects children less than 5 years is: *(AIIMS BPL NO 2018)*
a. Idiopathic meningitis
b. Aseptic meningitis
c. Bacterial meningitis
d. Tuberculous meningitis

Explanation: Bacterial meningitis: Acute bacterial meningitis is a chief cause of high morbidity and mortality among under five children due to H. influenza type b, S. pneumonia and meningitidis. Bacterial meningitis is also known as septic meningitis.

618. Which of the following information obtained from the mother of a child with cerebral palsy most likely correlates to the diagnosis? *(Safdarjung NO 2018)*
a. She was born at 42 weeks gestation
b. She had meningitis when she was 6 months old
c. She had physiologic jaundice after delivery
d. She has frequent sore throats

Explanation: Abnormal brain development, injury or infection to the developing brain can cause Cerebral palsy. Therefore, history of meningitis at the age of 6 months is the correct answer causing cerebral palsy.

619. Meningismus refers to: *(Recent Question 2016-17)*
a. Meningeal irritation sign without meningitis
b. Meningitis without meningeal irritation sign
c. Headache leads to meningitis
d. It occurs commonly in adults.

Ref: Nelson 20th/e/p ch 603

Explanation:
- Meningism, also called meningismus or pseudomeningitis is a set of symptoms similar to those of meningitis but not caused by meningitis.
- Whereas meningitis is inflammation of the meninges, meningism is caused by nonmeningitic irritation of the meninges, usually associated with acute febrile illness, especially in children and adolescents.

  Meningism involves the **triad** of nuchal rigidity (neck stiffness), photophobia and headache.

620. Most common diagnostic test performed in a child who is suspected to be suffering from meningitis is
a. MRI
b. X-ray spine
c. CT scan
d. Lumbar puncture

Explanation: Inflammation of meninges which is covering brain and spinal cord is known as meningitis. LP is the most commonly performed diagnostic test in a child with meningitis.

621. Cerebrospinal fever is well known as.....
a. Meningococcal meningitis
b. Pneumococcal meningitis
c. Staphylococcus meningitis
d. Haemophilus influenzae type B meningitis

Explanation: Meningococcal meningitis is also known as Cerebrospinal fever caused by Neisseria meningitidis. Meningococcal meningitis is a severe bacterial infection of the bloodstream and meninges which is a thin lining covering the brain and spinal cord. Hence it is also called cerebrospinal fever.

622. All among the following are the characteristics of aseptic meningitis EXCEPT
a. Nonbacterial meningitis
b. Meningitis with negative bacterial culture
c. Meningitis with normal CSF glucose, normal to elevated protein
d. Caused by E. coli

Explanation: Option D is the characteristic of bacterial meningitis. All other are the characteristics of aseptic meningitis. Caused by viruses.

623. Which nursing care is to be provided preoperatively to a baby born with exstrophy of bladder?
a. Cover the bladder with sterile petroleum gauze
b. Place the baby in the prone position
c. Immerse the baby in water while bathing
d. Keep the bladder mucosa dry

Explanation: Most children are no longer contagious after beginning the antibiotic therapy.

624. In bacterial meningitis CSF reveals:
a. Decreased cell count
b. Elevated protein level
c. Increased glucose
d. Low spinal fluid pressure

Explanation: Blood brain barrier is impaired which allows the passage of protein into the CSF. Cell count will increase and glucose will decrease.

625. While caring for a child with meningococcal meningitis the nurse should observe for:
a. Presence of dysphagia
b. Identifying purpuric skin rashes
c. Presence of frontal headache
d. Ataxia

Explanation: Meningococcal meningitis is identified by its epidemic nature and purpuric skin rashes.

626. Clinical features of meningitis .....
a. Stiff neck
b. Kernig's sign
c. Brudzinski sign
d. All the above

627. The CSF findings in TB meningitis include
a. High sugar + low protein
b. Low sugar + high protein and Lymphocytosis
c. High sugar + high chloride
d. Low sugar + high protein and Lymphopenia

628. Positive brudzinski sign is suggestive of .....
a. Craniopharyngioma
b. Meningitis
c. Hydrocephalus
d. Glioma

629. In a small child diagnosed with H. influenza meningitis, what investigation must be done before discharging him from the hospital?
a. BERA
b. MBI
c. CT scan
d. X ray skull

Ans.

617.	c
618.	b
619.	a
620.	d
621.	a
622.	d
623.	a
624.	b
625.	b
626.	d
627.	b
628.	b
629.	a

Scanned with CamScanner

630. Most common cause for communicating hydrocephalus?
a. Bacterial meningitis
b. Intraventricular hemorrhage
c. Aqueductal stenosis
d. Bony malformation of skull

631. While caring for a child with ventriculoperitoneal shunt, what observation might alert the nurse that the child is having infected shunt?
a. Lethargy
b. Tachycardia
c. Fever
d. Complaining of stiff neck

Explanation: Shunt infection will result in meningitis and stiff neck is the sign of meningitis.

632. Which among the following anti-seizure medication require ventilator facility to administer?
a. Phenytoin
b. Phenobarbitone
c. Lorazepam
d. Calcium gluconate

Explanation: Lorazepam can cause severe respiratory depression, so this drug will be administered only if ventilator facility is available in the unit.

633. Commonly used shunt in hydrocephalus management: *(AIIMS May 2015)*
a. Ventriculoatrial
b. Ventriculoperitoneal
c. Ventriculo pericardial
d. Ventriculo pleural

Ref: Nelson Textbook of Pediatrics 19th e, p 2008-2011; Bailey and Love Textbook of Surgery 25th e, p 627

Explanation: Cerebrospinal fluid shunting is required for the treatment of many children with hydrocephalus.
- The procedure uses a silicone rubber device with a proximal portion inserted into the ventricle, a unidirectional valve, and a distant segment that diverts the CSF from the ventricles to the peritoneal cavity (ventriculoperitoneal shunt).

634. Bulging fontanelle indicate.....
a. Increased ICP
b. Hydrocephalus
c. Both A and B
d. Dehydration

Explanation: In hydrocephalus and increased ICP bulging of fontanel will be there. In dehydration depressed fontanel will be there.

635. Cracked pot sound on percussion over hydrocephalus baby is called as .....
a. Chadwick's sign
b. Homan sign
c. Kerning's sign
d. Macewen sign

Explanation: Cracked pot sound in hydrocephalus bay is Macewen sign. Chadwick's sign is a bluish discoloration of the cervix, vagina, and labia resulting from increased blood flow. Homans' sign: Pain in the calf of the leg upon dorsiflexion of the foot with the leg extended that is diagnostic of thrombosis in the deep veins of the area. Kerning's sign: Severe stiffness of the hamstrings causes an inability to straighten the leg when the hip is flexed to 90 degrees. It is suggestive of meningitis.

636. Among the following all are the characteristics of seizure EXCEPT
a. Have both fast and slow components
b. Provoked by stimulation
c. Often associated with eye movements
d. Does not stop with restraints

Explanation: Provoked by stimulation is the characteristic of jitteriness, seizure is not provoked by stimulation.

637. Which is the most appropriate diagnostic test to find out identify phrenic nerve paralysis?
a. Fluoroscopy
b. Bronchoscopy
c. Chest X-ray
d. CT

Explanation: An ultrasound or fluoroscopy of the chest would reveal asymmetric diaphragmatic motion in a seesaw manner.

638. Most priority nursing intervention while caring for a child who is suffering from tonic-clonic seizure?
a. Start oxygen by mask
b. Make child sit and provide water
c. Protect child from self-injury
d. Apply restraints

Explanation: Most important nursing intervention during seizure activity is to protect the child from injury.

639. Among the following sign and symptoms which is indicative of increased ICP?
a. Bradycardia
b. Hypertension
c. Tachypnea
d. Decrease in systolic pressure

Explanations: Bradycardia is the classical sign of increased ICP. Vomiting, headache and blurring of vision are also often associated with increased ICP

640. Encephalitis is a complication of:
a. Pertussis
b. Varicella
c. Diphtheria
d. Rubella

Explanation: Varicella is caused by virus and may be followed by encephalitis.

641. Meningomyelocele is .....
a. Herniation of brain, meninges and spinal cord occur through a defect in the base of skull.
b. Protrusion of meninges and spinal fluid but no neural elements
c. Sac like protrusion through the defect in the vertebra but not contain CSF
d. Sac like protrusion contain meninges, CSF and neural elements

Explanation: Meningomyelocele is a condition in which meninges, CSF and neural elements are present in the protruded sac. But in meningocele, meninges and spinal fluid are only involved, but no nerve elements.

642. Immediate nursing care for a child with meningomyelocele is:
a. Maintain perineal hygiene
b. Administer antibiotic as ordered to prevent infection
c. Applying sterile moist non-adherent dressing to the sac
d. Measure head circumference of the child

Explanation: This is to done to prevent the breakage and dryness of sac and also to prevent the infection which can leads to infection in the CNS. All other options are also the management of a child born with meningomyelocele but the immediate management required is covering of the sac to prevent infection and dehydration.

Ans.

630.	a
631.	d
632.	c
633.	b
634.	c
635.	d
636.	b
637.	a
638.	c
639.	a
640.	b
641.	d
642.	c

Scanned with CamScanner

643. Priority nursing intervention for a child who has meningomyelocele is .....?
a. Maintain hydration
b. Antibiotic therapy
c. Measurement in head circumference daily
d. I/O chart maintenance

Explanation: Meningomyelocele predispose the child to develop hydrocephalus. So, it is important for the nurse to recognize signs and symptoms related to hydrocephalus earlier. Increase in head circumference suggestive of hydrocephalus.

644. The earliest congenital anomaly identified by ultrasound is:
a. Hydrocephalus b. Encephalocele
c. Renal agenesis d. Anencephaly

645. Police man tip hand condition is .....
a. Erb's palsy
b. Klumpke's paralysis
c. Median never injury
d. Peroneal nerve injury

Explanation: Erb's palsy or Erb–Duchenne palsy is a paralysis of the arm caused by injury to the upper group of the arm's main nerves, specifically the severing of the upper trunk C5–C6 nerves. These form part of the brachial plexus, comprising the ventral rami of spinal nerves C5–C8 and thoracic nerve T1

Klumpke's paralysis (or Klumpke's palsy or Dejerine-Klumpke palsy) is a variety of partial palsy of the lower roots of the brachial plexus

646. Excess or deficiency of which vitamin leads to peripheral neuropathy?
a. Pyridoxine b. Thiamine
c. Vitamin B 12 d. Niacin

647. Sign of increased intracranial pressure are all except
a. Papilledema b. Eighth nerve palsy
c. Dilated scalp vein d. Diplopia

648. Brudzinski's sign is.....
a. Hips and knees to flex when the neck is flexed.
b. inability to straighten the leg when the hip is flexed to 90 degrees.
c. Palpation of right side of abdomen cause pain and guarding behavior on left side of abdomen
d. The examiner's fingers are extended along the outside of the thighs and a click or a popping sensation may be felt if the joint is unstable

649. Kernig's sign is .....
a. Hips and knees to flex when the neck is flexed.
b. Inability to straighten the leg when the hip is flexed to 90 degrees.
c. Palpation of right side of abdomen cause pain and guarding behavior on left side of abdomen
d. The examiner's fingers are extended along the outside of the thighs and a click or a popping sensation may be felt if the joint is unstable

650. Which neonatal reflex is absent in a child with spastic cerebral palsy?
a. Moro reflex
b. Symmetric tonic neck reflex
c. Asymmetric tonic neck reflex
d. Grasp reflex

651. Increased accumulation of cerebrospinal fluid in brain is:
a. NTD b. Spinal bifida
c. Hydrocephalus d. None

652. A child with Kawasaki disease is likely to develop
a. Meningioma b. Mitral valve prolapsed
c. Aneurysm formation d. Sepsis

653. Commonest cause of obstructive hydrocephalus in children?
a. Aqueductal stenosis
b. Dandy Walker syndrome
c. Subarachnoid hemorrhage
d. Tubercular meningitis

654. Signs and symptoms of increased ICP includes
a. Bulging fontanel b. Headache
c. Vomiting d. All of the above

655. Early signs of ventricular shunt malfunction in a child are:
a. A high-pitched cry, colic, and pupillary changes
b. A tense fontanelle, vomiting, and irritability
c. Anorexia, and changes in pulse and respiration.
d. Headaches, lethargy, and a loss of appetite

656. Position given after lumbar puncture procedure is .....
a. Fowlers b. Supine
c. Prone d. Side lying

657. In an infant the important clinical finding which makes one to suspect increased intracranial tension is
a. Fever
b. Sunken eyes
c. Tachypnea
d. Bulged Anterior Fontanel

658. Absent seizures are characterized by .....
a. Infrequent occurrence
b. Frequent association with vocalization
c. Aura proceeding the incident
d. Induction by hyperventilation

CARDIOVASCULAR DISORDERS

659. The single-most important indicator of cardio-respiratory function in a neonate is: criterion to classify a death as brain death *(AIIMS BPL NO 2018)*
a. Good cry b. Good skin color
c. Good muscle tone d. Good eye contact

Explanation: Good skin color is the most important indicator of cardiopulmonary function in neonate. Adequate oxygenation & good contractibility of heart is necessary to have good skin color. Bluish color (cyanosis) of the skin is an indication of defective cardiac function.

660. Most common heart abnormality in child
a. Tetralogy of Fallot b. Atrial septal defect
c. Total anomalous pulmonary venous connection
d. Ventricular septal defect

661. What is the normal range of pulse rate of a child of 1 to 2 years? *(AIIMS Bhopal Nursing Officer, 2018)*
a. 60 to 100/min b. 76 to 120/min
c. 120 to 160/min d. 80 to 130/min

Explanation: Normal range of pulse rate based upon age of the children is as follows:

Newborns (0 - 3 months)	:	100 - 150 BPM
Infants (3 - 6 months)	:	90 - 120 BPM
Infants (6 - 12 months)	:	100 - 160 BPM
Children (1 - 10 years)	:	70 - 130 BPM
Children over age 10 and adults	:	60 - 100 BPM

In the above given options, 80 to 130 BPM is within the normal range of a child of 1 to 2 years.

Ans.

643.	c
644.	d
645.	a
646.	a
647.	b
648.	a
649.	b
650.	b
651.	c
652.	c
653.	a
654.	d
655.	b
656.	b

658.	d
659.	b
660.	d
661.	d

Scanned with CamScanner

662. All among the following are cyanotic heart disease EXCEPT
a. Tetralogy of Fallot
b. Ebstein's anomaly
c. Transposition of great arteries
d. Patent ductus arteriosus

663. Which of these is a cyanotic heart defect? *(Kerala PSC, Nov 2014; Staff Nurse G II 2014; 2012; AIIMS BPL NO 2018)*
a. Ventricular septal defect
b. Patent ductus arteriosus
c. Tetralogy of Fallot
d. Atrial septal defect

Explanation: Cyanotic heart disease refers to a group of many different heart defects that are present at birth (congenital). They result in a low blood oxygen level. Cyanosis refers to a bluish color of the skin and mucous membranes.

Example of cyanotic heart defect: Tetralogy of Fallot, Tricuspid atresia.

664. Which of the following condition can present with cyanosis at birth?
a. Tetralogy of Fallot
b. ASD
c. PDA
d. VSD

665. Which of the following is not included in tetralogy of Fallot? *(AIIMS Raipur NO 2019)*
a. Pulmonary stenosis
b. RVH
c. ASD
d. VSD

Explanation: TOF is a combination of four heart defects present at birth. Ventricular septal defect (VSD), pulmonary valve stenosis, overriding of aorta, and right ventricular hypertrophy (RVH).

666. Tetralogy of Fallot includes all the following conditions, EXCEPT: *(AIIMS Bhopal Grade-I 2018)*
a. Overriding aorta
b. Pulmonic stenosis
c. Patent ductus arteriosus
d. Ventricular septal defect

Explanation: Tetralogy of Fallot is congenital heart disease which includes four heart defects which are Overriding aorta, Pulmonic stenosis, Ventricular Septal defect and Right ventricular hypertrophy

667. An infant with congestive heart failure (CHF) is admitted to the hospital. Which goal has the highest priority when planning nursing care? *(RAK MSc 2018)*
a. The infant will maintain an adequate fluid balance
b. The infant will have digoxin at the bedside
c. Skin integrity will be assessed
d. Administer medication on time

Explanation: While caring an infant with CHF, the priority is to maintain an adequate fluid balance in the infant. Excessive fluid retention results in symptoms of pulmonary and systemic congestion.

668. In X-ray, the heart of a child with tetralogy of Fallot appears
a. Cone shaped
b. Boot shaped
c. Pea shaped
d. Apple shaped

669. Pulmonary blood flow is decreased in?
a. Ventricular septal defect
b. Atrial septal defect
c. Tetralogy of Fallot
d. Truncus arteriosus

670. A child with tetralogy of Fallot and history of severe hypoxic episodes is to be admitted to pediatric unit. Which of the following would be most important for the nurse to have at the bedside? *(RAK MSc 2018)*
a. Morphine sufate in a syringe ready to administer
b. Oxygen tubing and gauze plugged in
c. Blood pressure cuff and stethoscope
d. Suction tubing and equipment

Explanation: Tetralogy of Fallot is a complex congenital heart disease. In this disease cyanosis is the main symptom and the degree of cyanosis depends upon the size of ventricular septal defect and the severity of the obstruction in the right ventricle. The uncontrolled cyanosis leads to respiratory distress. Therefore, oxygen tubing and gauze should be at bed side to meet the emergency signs of respiratory distress.

671. A six years old child is admitted to the hospital for heart surgery to repair tetralogy of Fallot, the nurse should anticipate, when the child goes home the parents will most likely have a concern about: *(RAK MSc 2018)*
a. Allowing the child to lead a normal active life
b. Persuading the child to get enough rest
c. Having the child develop post-operative complications
d. Having the child out of the school for a month

Explanation: Last phase of treatment is rehabilitation and principle of rehabilitation is to restore optimal level of health. Rest other options are distractors opposite to leading normal life.

672. Peripheral pulmonic stenosis may be seen in all except? *(Recent Question 2014)*
a. Williams syndrome
b. Alagille syndrome
c. Rubella syndrome
d. CMV

Ref: Nelson 20th ed. p 1551

Explanation:
- A familial tendency has been recognized in some patients with peripheral pulmonic stenosis.
- A high incidence is found in infants with congenital rubella syndrome.
- The combination of supravalvular aortic stenosis with pulmonary arterial branch stenosis, idiopathic hypercalcemia of infancy, elfin facies, and mental retardation is known as Williams syndrome, a condition associated with deletion of the elastin gene in region 7q11.23 on chromosome 7.
- Peripheral pulmonary stenosis is also associated with the Alagille syndrome, which may be associated with a mutation in the Jagged 1 gene.

673. The complications for ventricular septal defect are all of the following, Except *(ESIC 2019)*
a. Pulmonary hypertension
b. Cerebral palsy
c. Endocarditis
d. Heart failure.

Explanation: VSD or ventricular septal defect is a cardiac defect in which there is an abnormal communication between two ventricles. Cerebral palsy is neurological disorder that affect balance, movement and muscle tone. All other conditions are complication of VSD

674. A child who is suffering from cyanotic heart diseases is more comfortable in ..... position
a. High Fowler's
b. Knee chest
c. Prone
d. Supine

Explanation: Assuming the knee-chest position is thought to increase peripheral resistance, decreasing the amount of right-to-left shunting and thus increasing pulmonary blood flow

675. The most common symptom in children with symptomatic cardiac malformation is:
a. Poor feeding
b. Hypothermia
c. Delayed physical growth
d. Clubbing of the finger tips

Ans.

662.	d
663.	c
664.	a
665.	c
666.	c
667.	a
668.	b
669.	c
670.	b
671.	a
672.	d
673.	b
674.	b
675.	c

Scanned with CamScanner

Explanation: Children with cardiac malformation often use increased energy in activities of daily living, decreased oxygen utilization and increased energy output in developing child result in slow growth rate.

676. In a child with right to left shunt which finding the nurse should expect?
a. Low BP
b. Peripheral edema
c. Elevated hematocrit
d. Bounding pulse

Explanation: Polycythemia is a common finding in children with right to left shunt and there by increased HCT will be present.

677. Small for gestational age and large for gestational age infants have polycythemia because of: *(AIIMS-BBS SNO 2019)*
a. Hypocalcaemia
b. Hypoglycemia
c. Hypoxia
d. Hypothermia

Explanation: Polycythemia is defined as a venous hematocrit above 65% (too many RBCs in the blood). It can be caused by low oxygen level, chromosomal abnormalities, etc. It affects babies who are small for gestational age or large for gestational age.

678. Signs and symptoms of which of the following would be priority when caring for a newly delivered term neonate diagnosed as small for gestational age? *(RAK MSc 2018)*
a. Iron deficiency anemia
b. Birth asphyxia
c. Persistent pulmonary hypertension
d. Hyperglycemia

Explanation: Birth asphyxia is a major cause of neonatal mortality. Among the given options birth asphyxia in a small for gestational age (SGA) baby needs more concern & priority. Interventions of all other mentioned conditions can be delayed and addressed after managing a newborn for birth asphyxia.

679. In preoperative period of cardiac surgery prophylactic antibiotics are given to prevent:
a. Pericarditis
b. Myocarditis
c. Sub-acute bacterial endocarditis
d. Upper respiratory tract infection

Explanation: Antibiotics are given to prevent sub-acute bacterial endocarditis which is most commonly present in children with cardiac malformation.

680. While taking vital signs of a child with coarctation of aorta (CoA) nurse should suspect:
a. A weak radial pulse
b. A strong pedal pulse
c. A decreased blood pressure in the arm
d. An elevated blood pressure in the arm

Explanation: CoA is narrowing of aorta usually thoracic segment which cause accumulation of blood above the constriction and increased blood volume and pressure in the arm.

681. Which of the following nursing intervention is a priority after cardiac catheterization?
a. Provide hydration
b. Monitor site for bleeding
c. Check for gag reflex
d. Administer antibiotics as ordered.

Explanation: Hemorrhage is a life-threatening complication following catheterization, because catheter is inserted into the artery during the procedure. So, monitor the catheter insertion site for bleeding is the important nursing intervention.

682. Identify the most frequent complication for a child with congenital cardiac disease?
a. Frequent chest infection
b. Malnutrition
c. Activity intolerance
d. Prolonged bleeding

Explanation: Children with congenital heart disease are more prone to chest infections. Most of the time these children will be presented with the sign and symptoms related to chest infection.

683. All among the following signs and symptoms are related to increase ICP EXCEPT:
a. Irritability
b. Bradycardia
c. Decreased alertness
d. Decreased pulse pressure

Explanation: Increased pulse pressure is evident in increased ICP. So option D is not manifest in case of increased ICP.

684. In cyanotic heart disease polycythemia is a compensatory mechanism for:
a. Tissue oxygen need
b. Decreased blood volume
c. More capillary refill time
d. Hypertrophy of cardiac muscles

Explanation: Decreased oxygenation stimulate erythropoiesis, resulting in excessive production of RBCs, so polycythemia will be there.

685. In postoperative period following repair of TOF important nursing intervention is to prevent:
a. Diarrhea
b. Sneezing
c. Hard stool
d. Unnecessary movement

Explanation: Forceful evacuation resulting in taking deep breath and holding it. This will cause increase in intra-abdominal pressure, which put excessive strain on heart structure.

686. The parents of a 2 days old girl baby are concerned because her feet and hands are slightly blue. How should the nurse respond? *(AIIMS Raipur NO 2019)*
a. "Your daughter has acrocyanosis; this is causing her blue hands and feet"
b. "Let's watch her carefully to make sure she does not have a circulatory problem"
c. "This is normal; her circulatory system will take a few days to adjust"
d. "This is vasomotor response caused by cooling or warming"

Explanation: In a 2-day-old newborn, slightly blue hands and feet are not an abnormality, but rather a minor immaturity of the circulatory system, which will be resolved after some time. So the reassurance by the nurse is the correct response.

687. In rheumatic fever sydenham's chorea occur because of the involvement of .....
a. CNS
b. Cardiovascular
c. Gastrointestinal
d. Genitourinary

688. Most common cause of sore throat in children is
a. RSV
b. Rhinovirus
c. Influenza
d. Allergic

Ans.

676.	c
677.	c
678.	b
679.	c
680.	d
681.	b
682.	a
683.	d
684.	a
685.	c
686.	c
687.	a
688.	b

Scanned with CamScanner

689. Name the causative organisms responsible for rheumatic fever?
a. Klebsiella
b. Monococcus
c. Group A β-hemolytic streptococcus
d. Staphylococcus aureus

Explanation: Rheumatic fever results as a delayed reaction to inadequately treated group A β-hemolytic streptococcal infection. Poverty, poor hygiene, lack of access to medical care are the risk factors for the development of rheumatic fever. Jones criteria is used to diagnose this condition.

690. A nurse was collecting history from a child who was admitted with suspected rheumatic fever. Which of the following information is specific to rheumatic fever?
a. A fever that started 2 days back
b. Vomiting for last two days
c. Loss of appetite
d. A recent episode of pharyngitis

691. Drug of choice for Rheumatic fever prophylaxis in penicillin allergic patient:
a. Erythromycin
b. Clindamycin
c. Vancomycin
d. Gentamycin

692. Identify the correct statement related to rheumatic fever
a. Most common causative organism responsible for rheumatic fever is Group a beta hemolytic streptococci
b. 5-15 years children are most commonly affected with rheumatic fever
c. Jones criteria is the diagnostic criteria used for diagnosing rheumatic fever
d. All of the above

693. Nurse has collected history from a child who is suffering from rheumatic fever. Which among the following is most important?
a. Recent history of tooth extraction
b. Recent pharyngitis
c. Staying in rural slum area
d. All of the above

694. Clinical criteria for diagnosing rheumatic fever is developed by
a. Karl Landsteiner
b. Alexander flaming
c. Leewanhook
d. T. Duckett Jones

695. All among the following are major criteria for diagnosing rheumatic fever as per Jones criteria EXCEPT
a. Erythema marginatum
b. Carditis
c. Arthralgia
d. Polyarthritis

696. All among the following are minor criteria for diagnosing rheumatic fever as per Jones criteria EXCEPT
a. Fever
b. Arthralgia
c. Chorea
d. Prolonged PR interval

697. Most commonly affected valve in rheumatic heart disease is
a. Tricuspid
b. Aortic
c. Mitral
d. Pulmonic

698. As per Jones criteria for diagnosis of rheumatic fever, what is the minimum recommended criteria need to be present to diagnose acute rheumatic fever
a. Presence of one major or two minor sings in the presence of essential criteria
b. Presence of two major signs and no minor signs in the presence of essential criteria
c. Both A and B
d. Presence of one major and one minor sign

699. A classic characteristic of coarctation of aorta includes
a. Cyanotic episodes
b. Clubbed fingers
c. Absent of diminished femoral pulses
d. Squatting posture of the child

700. In transposition of the great arteries, which of the following procedure is performed to shift the high pressure from the right ventricle to the left ventricle?
a. Rastelli procedure
b. Jatene procedure
c. Nikaidoh procedure
d. Richmond procedure

701. Ductus arteriosus refers to
a. Communication between pulmonary vein and inferior vena cava
b. A small hole located in the septum between atria
c. Communication between Pulmonary vein and aorta
d. Communication between Pulmonary artery and aorta

702. A child with cyanotic heart disease brought to emergency with cyanotic spell, most important nursing management is .....
a. Place the child in high Fowler's position
b. Start IV fluid
c. Decrease hypoxic spells
d. Minimize activity

703. Which heart disease is most commonly associated with rubella infection?
a. Patent ductus arteriosus
b. Ventricular septal defect
c. Atrial septal defect
d. Eisenmenger's syndrome

704. The best position for examination of cardiac murmurs in a child is:
a. Sitting
b. Standing
c. Right lateral
d. Recumbent

705. As a management of congenital heart disorders one child is posted for the anastomosis of the subclavian artery to the pulmonary artery. This procedure is known as .....
a. Glenn shunt
b. Raskkind Procedure
c. Ross procedure
d. Blalock-Taussig

706. Common symptom of TOF is.....
a. Diarrhea
b. Bradycardia
c. Clubbing of fingers
d. Fever

707. Most common acyanotic congenital heart disease
a. Pulmonic stenosis
b. Atrial septal defect
c. Patent ducts arteriosus
d. Tricuspid atresis

708. Drug of choice to close patent ductus arteriosus?
a. Indomethacin
b. Corticosteroids
c. Adrenaline
d. Prostaglandin

709. Drug of choice to keep patency of ductus arteriouses?
a. Prostaglandin
b. Paracetamol
c. Ibuprofen
d. Corticosteroids

710. Drug used for closing patent ductus arteriosus in a newborn is
a. Paracetamol
b. Ibuprofen
c. Both A and B
d. Prostaglandins

711. Most sensitive indicator of intravascular volume depletion in infant is:
a. Stroke volume
b. Heart rate
c. Cardiac output
d. Blood pressure

Ans.

689.	c
690.	d
691.	a
692.	d
693.	d
694.	d
695.	c
696.	c
697.	c
698.	c
699.	c
700.	b
701.	d
702.	c
703.	a
704.	b
705.	d
706.	c
707.	c
708.	a
709.	a
710.	c
711.	d

Scanned with CamScanner

712. What is the ratio of chest compressions to ventilations when two rescuer performs cardiopulmonary resuscitation (CPR) on a child?

a. 30:1 b. 30:2
c. 15:1 d. 15:2

713. While performing cardiopulmonary resuscitation (CPR) on a 5-year-old, the nurse palpates for a pulse. Which of the following sites is best for checking the pulse during CPR in a 5-year-old child? *(RAK MSC 2018)*

a. Femoral b. Carotid
c. Radial d. Brachial

Explanation: Carotid artery is the best for checking the pulse during CPR in a 5-year-old child. The pulse is located most easily by checking carotid artery on the neck just below the jaw using two fingers. Brachial artery is assessed to locate the pulse in infants.

714. Which among the following nursing intervention expected to perform by the nurse to decrease the joint pain associated with rheumatic fever?

a. Maintaining the joints in a neutral position
b. Do ice compression
c. Apply traction to the joint
d. Use bed cradle to avoid weight of the linen

715. A physician orders I/V potassium for a child with hypertonic dehydration. A nurse performs which of the following highest priority assessment before administering the potassium? *(RAK MSC 2018)*

a. Taking temperature b. Taking blood pressure
c. Obtaining a weight d. Checking urine output

Explanation: Before administering potassium to the child, urine output needs to be monitored because main route of excretion of potassium is renal system. If urine output is less than 30ml/hour the patient is at risk for developing hyperkalemia.

ENDOCRINE DISORDERS

716. Clinical features of "hypothyroidism" in a newborn are all, except: *(Recent Question 2014)*

a. Sluggishness b. Large tongue
c. Large posterior fontanel d. Mental retardation

Ref: Nelson 20th ed. p 2668-69

Explanation: Clinical Features of Hypothyroidism in a Newborn

- Birth weight more than average
- Prolongation of physiological jaundice
- Feeding difficulties
- *Respiratory difficulties – large tongue*
- *Sluggishness, poor activities, somnolence*
- Obstinate constipation
- Cold and mottled extremities
- *Umbilical hernia*
- Large posterior fontanelle
- Mental Retardation cannot be seen at birth.

717. Identify the correct statement in relation to congenital hypothyroidism

a. Oral levothyroxine sodium is used for treatment
b. Periodic measurement of T3, T4, and TSH is necessary
c. Monitoring bone age is essential.
d. All of the above

Explanation: All the above statements are correct in relation to the management of a child with congenital hypothyroidism

718. Hormone responsible for the onset and progression of puberty is .....

a. Estrogen b. Testosterone
c. Progesterone d. GnRH

Explanation: GnRH is a hypothalamic gonadotropin-releasing hormone. Which responsible for the onset and progression of puberty.

719. Hormone responsible for milk secretion is .....

a. Prolactin b. Oxytocin
c. Estrogen d. Progesterone

Explanation: Prolactin stimulates milk production/secretion by inducing the enzyme that synthesizes the constituents of milk, such as lactose, casein, and lipids. The release of the hormone oxytocin leads to the milk ejection or let-down reflex.

720. In a full term newborn, operational threshold for hypoglycemia is defined as plasma glucose level less than.....

a. 30 mg/dL b. 45 mg/dL
c. 55 mg/dL d. 65 mg/dL

Explanation: The operational threshold for hypoglycemia is defined as that concentration of plasma or whole blood glucose at which clinicians should consider intervention, based on the evidence currently available in literature. Operational threshold has been defined as BGL of less than 40 mg/dL (plasma glucose level less than 45 mg/dL)

721. Prolonged steroid use can cause all EXCEPT .....

a. Buffalo's hump b. Moon faces
c. Thin extremity d. Loss of hair in the body

Explanation: Hirsutism (abnormal hair growth in the body) is the side effect of steroid use.

722. Thelarche is.....

a. It is the onset of secondary breast development, usually occurring at the beginning of puberty in girls.
b. First menstrual bleeding, in female humans.
c. The adrenal cortex secretes increased levels of androgens but without increased cortisol levels
d. The first pregnancy occurs in female human being

Explanation: Option A is the correct answer. Option B indicate menarche option C indicate adrenarche

723. Deficiency of Growth Hormone leads to

a. Delayed union of epiphysis
b. Proportionate dwarfism
c. Acromegaly
d. Mental retardation

724. ACTH secretion is highest during?

a. Noon b. Evening
c. Morning d. Night

725. Gigantism is caused by abnormality in the secretion of ...

a. Growth hormone b. Thyroxin
c. Adrenaline d. Vasopressin

726. Identify the false statement among the following

a. Acromegaly and gigantism occur due to the problem with growth hormone secretions
b. Gigantism occur in adult and acromegaly occur in children
c. Both are growth defect
d. In gigantism linear growth is more while in acromegaly it occur after the closure of epiphyseal plate

Ans.

712. d
713. b
714. d
715. d
716. d
717. d
718. d
719. a
720. b
721. d
722. a
723. b
724. c
725. a
726. b

Scanned with CamScanner

727. Hyper secretion of growth hormone after the closure of epiphyseal plates can cause .....
a. Gigantism
b. Acromegaly
c. Myxedema
d. Cretinism

728. Hyper secretion of growth hormone before the closure of epiphyseal plates can cause .....
a. Gigantism
b. Acromegaly
c. Myxedema
d. Cretinism

729. Which among the following hormone helps in skeletal maturation of fetus?
a. Testosterone
b. Oxytocin
c. Thyroxin
d. Prolactin

Explanation: Hormone thyroxin play an important role in the intrauterine growth and development. This hormone will help in the skeletal maturation of fetus

730. Thyroxine secretions starts in the fetal life from ..... POG on wards
a. 6th week POG
b. 10th week POG
c. 12th week POG
d. 14th week POG

731. In the antenatal period if the mother is suffering from myxedema, then her unborn new born is at risk for developing .....
a. Hyperthyroidism
b. Hypothyroidism
c. Both a and b
d. Myxedema

732. All are the signs and symptoms of congenital hypothyroidism except
a. Large fontanels
b. Large protruding tongue
c. Umbilical hernia
d. Tachycardia

733. Congenital hypothyroidism resulting in .....
a. Myxedema
b. Cretinism
c. Gigantism
d. Acromegaly

734. Hirsutism is seen in all except?
a. Testicular feminization
b. Polycystic ovary syndrome
c. Cushing's syndrome
d. Congenital adrenal hyperplasia

735. Glycated haemoglobin is a form of hemoglobin that is measured primarily to identify
a. Oxygen carrying capacity of hemoglobin
b. Glucose absorbing capacity of haemoglobin
c. 3 months average plasma glucose concentration
d. Life span of haemoglobin

736. All are the features of hyperthyroidism EXCEPT
a. High amounts of T4, T3
b. High metabolic rate
c. Hand tremors
d. Bradycardia

737. Complications of hypothyroidism include all except?
a. Coagulopathy
b. SIADH
c. Muscle weakness
d. Hypokalemia

738. TYPE I Diabetes in children is most commonly associated with?
a. Obesity
b. Celiac disease
c. Downs syndrome
d. Hypothyroidism

739. One of the leading causes of hyperthyroidism is .....
a. Graves' disease
b. Exophthalmos
c. Hashimoto's disease
d. Congenital hypothyroidism

740. All are the features of type 1 DM except
a. Age of onset early
b. Human leukocyte antigen present
c. Can manage with nutritional management
d. Complete absence of insulin

741. All are the features of type 2 DM except
a. Late onset
b. Family history
c. Tissue resistance is less
d. Manage with diet and exercises

RENAL DISORDERS

742. The nurse is planning care for a 2-year-old who has nephrotic syndrome and is in remission. What type of diet would the nurse plan to feed this child? *(RAK MSc 2018)*
a. High protein low caloric
b. High caloric low proteins
c. Low sodium, low fat
d. Regular diet no added sugar

Explanation:
- As child is in remission state, i.e. the protein in the urine disappears and the swelling in the tissues goes away, regular diet with adequate proteins and calories is to be given.
- High protein diet is not given due to compromised kidney function.
- Low calorie diet is not given as the energy requirements of the body are to be met.
- Low sodium and low-fat diet are given only when proteinuria is significantly present.
- High calorie diet is restricted as metabolic functions of the body are altered.

743. The clinical manifestation of nephrotic syndrome includes which of the following: *(RAK MSc 2018)*
a. Hematuria
b. Massive proteinuria
c. Increased serum albumin
d. Weight loss

Explanation: Nephrotic syndrome is a kidney disorder that causes the body to excrete protein (albumin) in the urine more than the normal value due to which urine appears foamy. Nephrotic syndrome is caused by the damage to the glomeruli. Nephrotic syndrome causes edema particularly in the feet and ankles.

Weight gain occurs due to excess fluid retention in the body.

Serum albumin levels are decreased.

Haematuria is also a clinical manifestation of nephrotic syndrome, but it is not always present.

744. A 6-year-old child is admitted with nephrotic syndrome. Which is the significant nursing intervention to be done daily by a nurse? *(AIIMS Bhopal Grade-I 2018)*
a. Checking temperature
b. Measuring mid arm circumference
c. Checking capillary refill
d. Monitoring intake output

Explanation: Nephrotic syndrome is defined as a group of symptoms characterized by number of renal or extra renal features most prominent of which are proteinuria (>3.5 gm/24 hrs), hypoalbuminemia, edema, hyperlipidemia and hypercoagulability. So, it is very important to maintain intake output chart to maintain fluid and electrolyte balance and prevent dehydration

Ans.

727.	b
728.	a
729.	c
730.	c
731.	b
732.	d
733.	b
734.	a
735.	c
736.	d
737.	b
738.	d
739.	a
740.	c
741.	c
742.	d
743.	b
744.	d

Scanned with CamScanner

745. A child is diagnosed with Wilms' tumor. During assessment, the nurse expects to detect:
a. Gross hematuria
b. Dysuria
c. Oliguria
d. Abdominal mass

Explanation: The most common sign of Wilms' tumor is a painless, palpable abdominal mass, sometimes accompanied by an increase in abdominal girth. Gross hematuria is uncommon, although microscopic hematuria may be present. Usually abdominal palpation is contraindicated in these group of patients

746. A pediatric nurse is assigned to care for a child with a diagnosis of Wilms' tumor. In planning care for the child, the nurse understands that this tumor is: *(RAK MSC 2018)*
a. An abdominal tumor
b. A renal tumor
c. A brain tumor
d. A bone tumor

Explanation: Wilms' tumor or nephroblastoma is one of the common malignant diseases of children. It is a renal tumor originates from embryonic tissue. Abdominal palpation is contra indicated in this condition.

747. In a child with exstrophy bladder, what covering should the nurse use to protect the exposed area?
a. Loose diaper
b. Moist dressing
c. Dry gauze dressing
d. Petroleum jelly gauze pad

Explanation: Exposed area should be moistened and cover well.

748. Additional defect associated with exstrophy bladder is:
a. Separation of the pubic bones
b. Puborectal slings
c. Abdominal wall defect
d. All of the above

Explanation: All the above-mentioned defects are associated with exstrophy bladder. Bladder exstrophy is a rare genitourinary malformation that, when simply defined, refers to the eversion of the bladder to the outside of the body. It is a rare genitourinary malformation for which the management still challenges the field of pediatric urology.

749. Following circumcision, discharge teaching include.....
a. Apply diaper loosely
b. Clean the site with alcohol and betadine
c. Perform intermittent catheterization
d. Perform Kegel exercises

Explanation: Apply diaper loosely for 2–3 days to lessen the pressure on the penis.

750. Nursing care of a child with acute streptococcal glomerulonephritis is:
a. Monitor I/O chart
b. Monitoring for convulsions
c. Monitor BP
d. All of the above

751. All the following are the expected diagnostic test for Wilms' tumor EXCEPT
a. Abdominal CT
b. Abdominal MRI
c. Abdominal USG
d. Renal biopsy

Explanation: Abdominal palpation and renal biopsy are contra-indicated in a child with Wilms' tumor because it may break the encapsulated tumor and may cause spreading of the disease.

752. During the assessment of fluid and electrolyte status in a child, the nurse need to keep in mind that .....
a. Kidney is as mature as adult's kidney
b. Intake of fluid will be less
c. Infant body has less percentage of water as compared to an adult
d. Children are having large body surface area

753. Post streptococcal glomerulonephritis in children is diagnosed by?
a. Heavy proteinuria, high cholesterol, high ASO titre
b. Heavy proteinuria, hematuria, low ASO titre
c. Mild proteinuria, high hematuria, high ASO titre
d. Mild proteinuria, high cholesterol, normal ASO titre

754. Which among the following signs in a child who is suffering from acute post streptococcal glomerulonephritis indicate early signs of improvement?
a. Weight gain
b. Increased urine out put
c. Have good appetite
d. Decreased incidence of fever

755. The child with acute glomerulonephritis is under treatment in a ward. The nurse should look for following as an indicator for acute renal failure *(Banaras HU 2015)*
a. Polyuria
b. Oliguria
c. Hematuria
d. Glycosuria

756. Condition in which the foreskin is narrowed and cannot be retracted over the glans is known as
a. Phimosis
b. Cryptorchidism
c. Exstrophy bladder
d. Anorectal malformation

757. Circumcision is used for the treatment of
a. Epispadia
b. Hypospadia
c. Cleft palate
d. Phimosis

758. Complications of cryptorchidism includes .....
a. Atrophy of testes
b. Strangulated hernia
c. Sterility
d. All

759. Orchidopexy is the treatment of choice for .....
a. Cryptorchidism
b. Phimosis
c. Exstrophy bladder
d. Anorectal malformation

760. Term used for undescended testis is
a. Cryptorchidism
b. Omphalocele
c. Hypospadiasis
d. Epispadiasis

761. Management of cryptorchidism is.....
a. Testosterone
b. Aldosterone
c. Mineralocorticoids
d. Estrogen and progesterone

762. Unilateral renal agenesis is associated with
a. Polycystic disease of pancreas
b. Hiatus hernia
c. Single umbilical artery
d. Hypogonadism

763. The primary purpose of administering corticosteroids to a child with nephrotic syndrome is to
a. Prevent infection
b. Control edema
c. Decrease proteinuria
d. Increase blood pressure

Explanation: The primary purpose of administering corticosteroids to a child with nephritic syndrome is to achieve complete remission (absence of proteinuria). Corticosteroids have no effect on blood pressure. Steroids may predispose a patient to infection. Diuretics are used to reduce edema.

Scanned with CamScanner

764. **Wilms' tumor commonly presents as?**
   a. Pain in the abdomen
   b. Abdominal mass
   c. Fever
   d. Hematuria

765. **All are the clinical features of Wilms' tumor EXCEPT**
   a. Microscopic hematuria
   b. Painless, palpable abdominal mass
   c. Increase in abdominal girth.
   d. Dysuria

766. **Wilms' tumor affect .....**
   a. Kidney
   b. Abdominal muscles
   c. Uterus
   d. Liver

767. **Estimation of GFR includes all except?**
   a. Serum creatinine
   b. Age of child
   c. Weight of child
   d. Height of child

768. **Renal artery stenosis can result in**
   a. Persistent hypertension
   b. Chronic glomerulonephritis
   c. Renal failure
   d. Nephrotic syndrome

769. **Acute glomerulonephritis is most often occur because of ...**
   a. Streptococci
   b. Diphtheria
   c. Pneumococci
   d. Salmonella

770. **Edema is first noticed ..... in nephrotic syndrome**
   a. On the legs
   b. Around the eyes
   c. All over the body
   d. On extremities

771. **In an edematous child 1 kg increase in weight indicate approximately how much fluid retention?**
   a. 100 mL
   b. 450 mL
   c. 750 mL
   d. 1000 mL

772. **The main indication for giving corticosteroids in nephrotic syndrome is to manage .....**
   a. Proteinuria
   b. Edema
   c. Hyperlipidemia
   d. Hypertension

773. **All are the treatment of nephrotic syndrome EXCEPT**
   a. Corticosteroids
   b. Daily weight check and urine protein monitoring
   c. High protein diet
   d. Extra added salt in the food

774. **All serum proteins are reduced in nephrotic syndrome except:**
   a. Fibrinogen
   b. Ceruloplasmin
   c. Transferrin
   d. Albumin

775. **In ARF hyperkalemia is treated with .....**
   a. Normal saline
   b. Calcium gluconate
   c. Corticosteroids
   d. 50%dextrose

776. **Which nursing care is to be provided pre-operatively to a baby born with exstrophy of bladder?**
   a. Initially cover the bladder with a thin dressing or clear plastic wrap
   b. Cover the bladder with petroleum gauze
   c. Immerse the baby in water while bathing
   d. Cover with adhesive tape

Explanation: Cover with petroleum jelly causes dryness and damage to mucosa. Thin film dressing without adhesive is preferred.

777. **Causes of painless hematuria in children include all except?**
   a. Acute glomerulonephritis
   b. Renal calculus
   c. IgA nephropathy
   d. Wilms' tumor

Ans.

784. a
785. d

778. **Red urine without RBC is seen in:**
   a. Lupus nephritis
   b. Pyelonephritis
   c. Hemolytic uremic syndrome
   d. Rhabdomyolysis

779. **Which of the following is the most appropriate method for obtaining a urine specimen for culture in an 8-month-old girl:**
   a. Suprapubic aspiration
   b. Indwelling catheter sample
   c. Clean catch void
   d. Urinary bag sample

POLICY AND PROGRAMS

780. **Supplementary Nursing, Immunisation, Health check-up and referral services under Integrated child developmental services re applicable to which of the following age groups?**
   (AIIMS Bhopal Nursing Oficer, 2018)
   a. 12 to 14 years
   b. 3 to 6 years
   c. 8 to 10 years
   d. 7 to 9 years

Explanation: Supplementary Nursing, Immunization, Health check-up and referral services' under Integrated child developmental services re applicable to 3–6 years of age group

781. **Among the following all are the components of GOBI F3 Except:**
   a. Global warming
   b. Female education
   c. Immunization
   d. Food supplementation

Explanation: UNICEF'S GOBI F3 contain the following components such as Growth monitoring, oral rehydration, breast feeding, immunization, female education, family spacing and food supplements.

782. **Mission Indradhanush programme is related to.....**
   a. Immunization
   b. Breast feeding
   c. Female education
   d. Nutritional supplementation

Explanation: Mission Indradhanush was launched by Ministry of Health and Family Welfare (MOHFW) Government of India on 25th December, 2014. The objective of this mission is to ensure that all children under the age of two years as well as pregnant women are fully immunized with seven vaccine preventable diseases. The diseases are Diphtheria, Pertussis (Whooping Cough), Tetanus, Tuberculosis, Polio, Hepatitis B, Measles.

783. **Child Survival and Safe Motherhood programme was replaced by .....**
   a. MCH
   b. JSY
   c. RCH
   d. KSY

784. **Midday meal programme is also known as**
   a. Nutrition supplement programme
   b. Beti bacho beti padhao
   c. Iodine deficiency control programme
   d. Surva Shiksha Abhiyan

785. **Color codes used in IMNCI are.....**
   a. Green, Black, and Red
   b. Black, Ash & Orange
   c. Blue, black & green
   d. Pink, Green & Yellow

Scanned with CamScanner

786. Correct regarding IMNCI is
a. It aims to reduce under five morbidity and mortality
b. It means integrated management of neonatal and childhood illness
c. Pink, yellow and green are the color codes used in IMNCI
d. All of the above

ONCOLOGY AND LYMPHATIC SYSTEM DISORDERS

787. What is the most common form of childhood cancer?
a. Lymphoma
b. Leukemia
c. Brain tumor
d. Osteosarcoma

788. A 6-year-old is newly diagnosed with acute lymphoid leukemia (ALL). During assessment, which of the following signs and symptoms would you except? *(RAK MSc 2018)*
a. Fever, pallor, bone and joint pain
b. Fever, ruddy complexion, petechiae
c. Abdominal pain, cystitis, swollen joint
d. Enlarged lymph nodes, low-grade fever, night sweat

Explanation: Acute lymphoid leukemia is also known as acute lymphocytic leukemia (ALL). It is a type of blood and bone marrow cancer, in which immature lymphocytes (WBC) are formed. Patients commonly present with pallor caused by anemia and petechiae and bruising secondary to thrombocytopenia. Other signs and symptoms include Bleeding gums, bone pain, fever, frequent infections, frequent or severe nosebleeds, lumps caused by swollen lymph nodes in and around the neck, underarm, abdomen or groin, pale skin and shortness of breath.

789. A malignant tumor of childhood, which metastasizes to bones most often, is
a. Wilms' tumor
b. Neuroblastoma
c. Adrenal gland tumors
d. Granulose cell tumor of ovary

790. Which is the most common intra-abdominal tumor in children
a. Wilms' tumor
b. Rhabdomyosarcoma
c. Hepatocellular carcinoma
d. Osteosarcoma

791. What is the most common malignancy of childhood?
a. Medulloblastoma
b. Wilms' tumor
c. Leukemia
d. Neuroblastoma

792. Identify an early symptom of spinal cord tumor from the options.
a. Pain worsens with activity, straining and lying down
b. Position changes leading to complete anesthesia
c. Impaired sensation of temperature, touch pain
d. Clumsiness, weakness, spasticity

GENETICS

793. All of the following are true about Phenylketonuria, except: *(Safdarjung NO 2018)*
a. Deficiency of Phenylalanine Hydroxylase
b. Mental retardation
c. Increased urinary excretion of 4-hydroxy phenyl pyruvic acid
d. Decrease serotonin formation

Explanation: Phenylketonuria is an inborn metabolism error wherein there is absence of phenylalanine metabolism. It results in increased levels of phenylalanine in urine which gives it a musty odor. Hydroxy phenylpyruvic acid is an intermediate product of phenylalanine metabolism. Hence it is found to be a negative statement among the options.

794. All the statement are true about phenylketonuria (PKU) EXCEPT:
a. Inability to properly break down an amino acid called phenylalanine.
b. PKU is an inherited condition
c. Phenylalanine plays a role in the body's production of melanin
d. Diet restriction play least important role in PKU

Explanation: Treatment involves a diet that is very low in phenylalanine, particularly when the child is growing. The diet must be strictly followed. All other statements are true related to PKU

795. Human has 46 chromosomes was established in the year of ...
a. 1954
b. 1955
c. 1956
d. 1957

796. In which year The Human Genome Project was completed?
a. 2001
b. 2003
c. 2005
d. 2008

797. In which year the first human gene therapy was instituted?
a. 1985
b. 1988
c. 1990
d. 1993

798. Commonest DNA variation among the following is
a. Single nucleotide polymorphism
b. Reciprocal translocation
c. Translocation
d. Mutations

799. One among the following nucleic acid bases is present only in RNA and is .....
a. Adenine
b. Uracil
c. Guanine
d. Thymine

800. The hereditary determinants of humans are received from: *(RRB Feb 2012)*
a. Allele
b. Genes
c. Nucleus
d. Cytoplasm

801. The science of betterment of human race by application of the law of inheritance is called: *(AIIMS BPL NO 2018)*
a. Genetics
b. eugenics
c. Euphenics
d. Euthenics

Explanation: Eugenics is the science of betterment of human race by application of the law of inheritance or *science* of improving the *human species* by selectively mating people with specific desirable hereditary traits.

802. Cri-du-chat syndrome is
a. Deletion involving short arm of chromosome 5
b. Addition to the long arm of chromosome 5
c. Deletion of short arm of chromosome 11
d. Addition to the long arm of chromosome 11

803. Webbing of the neck is the characteristic feature of .....
a. Edward syndrome
b. Neurofibromatosis
c. Turner Syndrome
d. Fanconi anemia

804. Karyotype of Klinefelter syndrome is .....
a. 47, YYY
b. 47, XXY
c. 47, XXX
d. 47, XYY

805. Triple screen test involves all of the following EXCEPT
a. Alpha-fetoprotein
b. Human chorionic gonadotropin
c. Estriol
d. Progesterone

Scanned with CamScanner

806. **Identify the condition in which Heterozygote (carrier) detection screening can be done**
   a. Cystic fibrosis b. Tay-Sachs disease
   c. Sickle cell disease d. All the above

807. **A normal female, whose father was color blind, marries a normal man. What are the chances of color blindness in their son?**
   a. 25% b. 50%
   c. 75% d. All the male child

808. **Among the following autosomal dominant condition is .....**
   a. Albinism b. Sickle cell anemia
   c. Thalassemia d. Hereditary spherocytosis

809. **In an autosomal dominant couple chances of having an unaffected baby is .....**
   a. 0% b. 25%
   c. 50% d. 75%

810. **Watson and Crick are associated with**
   a. Discovery of helical structure of DNA
   b. Find out the bases
   c. Explained transcription
   d. Explained translocation

811. **Identify the X-linked dominant trait among the following?**
   a. PKU b. Wilson disease
   c. Gaucher disease
   d. Vitamin D—resistant rickets

812. **X-linked recessive condition is**
   a. G6PD deficiency b. Hemophilia
   c. Thalassemia d. Both A and B

813. **Chance of occurrence of an Autosomal Dominant disorder in children if the mother is affected heterozygous and father is normal is.....**
   a. 25% affected b. 50% affected
   c. 75% affected d. 100% affected

814. **Correct statement regarding X linked recessive trait is .....**
   a. 50% of boys of carrier mother are affected
   b. 50% of girls of diseased fathers are carriers
   c. All the children will be affected
   d. None of the children will be affected

815. **Which type of chromosomal disorders are more common among males as compared to females?**
   a. Autosomal dominant b. Autosomal recessive
   c. X-linked dominant d. X-linked recessive

816. **Father has an X-linked recessive disorder and mother has a normal genotype. What is the expected outcome?**
   a. Pass the carrier state to his male children.
   b. Pass the carrier state to all of his children.
   c. Pass the carrier state to his female children.
   d. Not pass on the genetic mutation to any of his children.

817. **The first son of a couple is affected with hemophilia. Which of the following is the possible outcome of their subsequent pregnancies?**
   a. Boy will be affected with hemophilia A.
   b. Boy will be a carrier of hemophilia A.
   c. Girl child will be affected with hemophilia A
   d. 50% chance for a girl child to be a carrier of hemophilia A

818. **Trisomy 13 is identified as:** *(Recent Question 2015)*
   a. Edward's syndrome b. Patau syndrome
   c. Down syndrome d. Klinefelter's syndrome

Ref: Nelson 20th ed. p 611t

Ans.

806. d
807. b
808. d
809. b
810. a
811. d
812. d
813. b
814. a
815. d
816. c
817. d
818. b
819. d
820. b
821. c
822. a
823. a
824. c
825. b
826. c

Explanation: Trisomy 13, also called Patau syndrome, is a chromosomal condition associated with severe intellectual disability and physical abnormalities in many parts of the body. Individuals with trisomy 13 often have heart defects, brain or spinal cord abnormalities, very small or poorly developed eyes (microphthalmia), extra fingers or toes, an opening in the lip (a cleft lip) with or without an opening in the roof of the mouth (a cleft palate), and weak muscle tone (hypotonia).

819. **Mapping of genes is possible only if there is a cross between:** *(Kerala PSC, Nov 2014)*
   a. Dominant heterozygous alleles and dominant heterozygous alleles
   b. Dominant heterozygous and dominant homozygous alleles
   c. Dominant homozygous and dominant homozygous alleles
   d. Dominant heterozygous and recessive homozygous alleles

820. **Chromosome pattern in Down Syndrome is:**
   a. Trisomy 18 b. Trisomy 21
   c. Trisomy 22 d. Trisomy 23

821. **Most common cardiac lesion in Down's syndrome is?**
   a. VSD
   b. Coarctation of aorta
   c. Atrioventricular Septal Defect
   d. Transposition of great vessels

822. **Chromosome pattern in Edwards syndrome is-**
   a. Trisomy 18 b. Trisomy 21
   c. Trisomy 22 d. Trisomy 23

823. **Number of chromosomes in Turner syndrome is**
   a. 45 b. 46
   c. 47 d. 48

824. **In Klinefelter syndrome, no. of chromosomes is**
   a. 45 b. 46
   c. 47 d. 48

825. **All are true about Down's syndrome EXCEPT**
   a. Decreased humerus length.
   b. Decreased nuchal fold thickness.
   c. Mongolian face.
   d. Low set ears

Explanation: Increased nuchal fold thickness is a feature of Down's syndrome. So decreased nuchal fold thickness is not true about Down's syndrome.

Decreased humerus length, mongolian face and low set ears also some of the features of Down's syndrome.

826. **All are true about Down syndrome, except:** *(Recent Question 2014)*
   a. Mental retardation b. Brushfield spots
   c. Microcephaly d. Hypothyroidism

Ref: Nelson 20th ed. p 611

Explanation:

Table Common characteristics of Down syndrome

Characteristics	Percentage	Characteristics	Percentage
Stunted growth	100%	Short neck	50%
Mental retardation	99.8%	Shortened hands	50%
Atypical fingerprints	90%	Congenital heart disease	45%
Low-set and round ear	60%	Macroglosia (larger tongue)	43%

Contd...

Scanned with CamScanner

Characteristics	Percentage	Characteristics	Percentage
Flattened nose	60%	Epicanthic fold	42%
Small teeth	60%	Brushfield spots (iris)	35%

- Hematologic malignancies such as leukemia are more common in children with DS.
- ***In particular, acute lymphoblastic leukemia is at least 10 times more common in DS*** and the megakaryoblastic form of acute myelogenous leukemia is at least 50 times more common in DS.
- **Hypothyroidism is adults with patients of Down Syndrome.**

827. All are seen in Down's syndrome, except: *(Recent Question 2014)*

a. Low IQ b. Brachycephaly
c. Hypertonia d. Hypothyroidism

Ref: Nelson 20th ed. p 611

Explanation: Brachycepahly implies skull like an American football, due to premature fusion of the coronal suture. Therefore the brain is not able to grow and results in mental retardation.

- Overall the most common cause of mental retardation is Down syndrome.
- Thyroid abnormalities in form of either thyroid agenesis or autoimmune thyroiditis are seen in Down syndrome.
- Eye findings of Down syndrome have also been asked and should be remembered as (MEBB)
  - Mongoloid slant of eyes
  - Epicanthal folds
  - Blue dot cataract
  - Brushfield spots in the iris

828. All of the following disorders/diseases are commonly associated with Down Syndrome, Except:

a. Solid tumors b. Hirschsprung's disease
c. Congenital Heart Disease d. Leukemia

Explanation: The conditions associated with Down Syndrome are Heart defects (Congenital Heart Disease), cataracts, hearing loss, infections, hypothyroidism, Leukemia, poor muscle tone, atlantoaxial instability (spinal problem), Epilepsy, celiac disease, Hirschsprung's Disease and mental health problems.

Risk of Hirschsprung's Disease (HD) increases by 50 to 100 fold in children with Down Syndrome (DS) compare to general population. The incidence of HD in DS patients is 2-3% .

Children with Down Syndrome exhibit a 10 to 20-fold elevated risk of developing acute myeloid leukemia (AML), and acute lymphoblastic leukemia (ALL). The incidence of ALL in Down syndrome (ALL-DS) is estimated at 1 in 300 (Lange, 2000).

829. Happy puppet syndrome is also known as .....

a. Angelman syndrome b. Prader-Willi
c. Cri du chat syndrome d. Down syndrome

Explanation: Angelman syndrome is also called "happy puppet syndrome" because of the unusual gait and the unprovoked outbursts of laughter. In this condition, interstitial deletion of chromosome 15q1-q13 from maternal side will occur, if it is from the paternal side then Prader-Willi syndrome. Trisomy of 21 chromosome is known as Down syndrome

830. Short stature, neck webbing, sexual infantilism, and a shield like chest with widely spaced nipples are signs of .....

a. Turner's syndrome b. Klinefelter's syndrome
c. Down's syndrome d. Edward's syndrome

Explanation: Mentioned signs and symptoms are the typical features of turners syndrome. It occur because of missing or incomplete sex chromosome.

831. Which of the following would the nurse identify as an appropriate goal for caring a child with Down's syndrome? *(Karnataka PSC 1996)*

a. Encouraging self-care skills in the child
b. Adhere to medication regimen
c. Counseling of the family members
d. Participate them in sports activities

Explanation: Goal of caring mentally challenged children include make them independent as much as possible. So teaching them self-care activities will be more effective

832. Dietary treatment of a child with PKU includes:

a. Protein free diet b. Protein enriched diet
c. Phenylalanine free diet d. Low phenylalanine diet

Explanation: Phenylalanine is an essential amino acid, it must be provided in quantities sufficient for promoting growth while maintaining safe blood level.

833. Which is the common nutritional problem associated with down syndrome?

a. Obesity b. Kwashiorkor
c. Marasmus d. Vitamin A deficiency

Explanation: Obesity is the most common nutritional problem associated with down syndrome, it is associated with impaired growth and excessive calorie intake.

834. The enzyme deficient in Galactosemia is:

a. Galactose-1 phosphate uridyl transferase
b. Galactose kinase
c. Galactose-6-phosphate epimerase
d. All of the above

Explanation: Above mentioned all the enzymes are responsible for galactosemia. Galactose-1 phosphate uridyl transferase cause most serious and classic galactosemia.

835. Low-set ears and wide-set eyes in a child is suggestive of .....

a. Exstrophy bladder b. Tracheoesophageal fistula
c. Renal agenesis d. Congenital heart defects

Explanation: Bilateral renal agenesis is characterized by the absence of kidneys and of urine in a baby. The face usually consists of wide-set eyes; a "parrot beak" nose; a receding chin, and large low set ears deficient in cartilage

836. An inborn error of metabolism that causes premature destruction of RBC?

a. G6PD b. Homocystinuria
c. Phenylketonuria d. Pomps disease

837. A child with low blood glucose is not able to do glycogenolysis or gluconeogenesis. Which of the following enzyme is missing in the child?

a. Fructokinase b. Glucokinase
c. Glucose 6 phosphatase d. Transketolase

838. Darkening of urine on standing is associated with: *(AI 2007)*

a. Alkaptonuria b. Cystinuria
c. Fabry's disease d. Tyrosinemia

839. Which of the following is true about Asperger syndrome

a. More common in girls
b. Repetitive activity pattern
c. Subnormal intelligence is consistent feature
d. Severe language impairment is characteristic

Ans.

827. c
828. a
829. a
830. a
831. a
832. d
833. a
834. d
835. c
836. a
837. c
838. a
839. c

Scanned with CamScanner

874. **Which of the following is the preferred site of intramuscular injections in infants?** *(AIIMS BPL NO 2018)*
   a. Triceps muscle
   b. Vastus lateralis muscle
   c. Deltoid muscle
   d. Gluteal muscle

Explanation: **Vastus lateralis muscle** is the preferred site of intramuscular injections. The anterolateral thigh is the preferred site for IM injection in infants under 12 months of age.

875. **The most preferred intramuscular injection site for children is:** *(Kerala PSC, Nov 2014)*
   a. Deltoid b. Dorsogluteal
   c. Vastus lateralis d. Ventrogluteal

876. **Which one of the following hepatitis viruses have significant perinatal transmission**
   a. Hepatitis E virus b. Hepatitis C virus
   c. Hepatitis B virus d. Hepatitis A virus

877. **Only class of immunoglobulin which is transported across the placenta is**
   a. IgG b. IgM
   c. IgA d. IgD

878. **Most abundant immunoglobulin of human body is**
   a. IgG b. IgM
   c. IgA d. IgD

879. **Immunoglobulin found in large quantities in secretions e.g. Saliva, breast milk is**
   a. IgG b. IgM
   c. IgA d. IgD

880. **All are true regarding restraints EXCEPT**
   a. Restraints should be used only when it is required
   b. It should not be used in SOS basis
   c. It should be very tight so that complete immobilization can be achieved
   d. Sufficient padding must be used for extremity restraints

881. **Restraints used during upper chest/abdominal procedure which immobilize all the extremities is .....**
   a. Clove hitch restraint b. Crib-net restraint
   c. Mummy restraint d. All of the above

882. **Which among the following statement indicate that adolescent is having anorexia nervosa?**
   a. I have my mensuration every month
   b. I use to go out and eat with my friends
   c. I used to exercise three times in a day for total of five hours
   d. I always try to maintain my weight around 55-60 kg.

883. **AIDS in children is characterized by**
   a. Cryptococcus causing diarrhea
   b. Rash on extremities
   c. Kaposi's sarcoma
   d. Recurrent candidiasis seen

884. **Main reason for under five morbidity and mortality is .....**
   a. Malnutrition b. Diarrheal Disease
   c. Asphyxia d. Leukemia

885. **What is the main cause of perinatal mortality?**
   a. LBW b. Congenital anomalies
   c. Birth asphyxia d. Respiratory infection

886. **An axillary temperature should be taken for how much period:**
   a. 15 second b. 30 second
   c. 1 minute d. 3 minutes

887. **The rectal temperature should be taken in:**
   a. 30 min b. 1 min
   c. 2 min d. 3 min

888. **For a sick child 500 mL of 5% Isolyte P is to be infused over a period of 48 hrs. The drop factor is 60 gtt/ml. How many drops per minute have to be infused?**
   a. 10 drops b. 12 drops
   c. 15 drops d. 15 drops.

889. **Formula used to calculate medication in children is.....**
   a. Young's rule b. Clark's rule
   c. Fried's rule d. All of the above

890. **Length of thermometer need to be inserted while taking rectal temperature is.....**
   a. 1 inch b. 2 inch
   c. 2 ½ inch d. 3 inch

891. **Which is the recommended site of administration IM injection in children?**
   a. Left upper arm b. Deltoid
   c. Lateral aspect of thigh d. Forearm

892. **A 3-year-old child was brought to emergency room with hypovolemic shock. The initial fluid bolus should be administered at**
   a. 10 mL/kg body weight
   b. 20 mL/kg body weight
   c. 30 mL/kg body weight
   d. 40 mL/kg body weight

893. **Intraosseous drug administration is typically used for children**
   a. Under age 6 b. Over age 6
   c. Critically ill under age 6
   d. Critically ill and over age 6

894. **Drop factor of pediatric drip set is .....**
   a. 16 b. 20
   c. 30 d. 60

895. **Priority nursing concern while administering sulfonamide preparation is .....**
   a. Weigh the child daily
   b. Maintain I/O chart
   c. Administer the drug at prescribed times
   d. Monitor drug level in the blood

896. **What's the smallest amount of glucose that's considered safe and not caustic to small veins, while also providing adequate TPN?**
   a. 5% glucose b. 10% glucose
   c. 25% glucose d. 50% glucose

—Isaac Bickerstaff

8 NURSING EDUCATION

SYNOPSIS

EDUCATION

It brings change in behavior of an individual in a desirable manner. It aims at all-round development of an individual.

Philosophies of Education

The term 'Philosophy' has been derived from two words, i.e. "philos" means 'love' and "Sophia" means 'wisdom'. Philosophy means love for wisdom.

Traditional Philosophies

Table 1

Character	Naturalism	Idealism	Pragmatism (Experimentalism)	Realism
Exponents	• **Aristotle** • JJ Rousseau	• **Plato** is father of Idealism • Socrates, Kant, Hegel, Guru Nanak, Tagore, Mahatma Gandhi, Dayananda and others.	• **William James** is the father of Pragmatism • **John Dewey**, S. Kil Patrick • Margaret H and Mead	• J Friedrich Herbert • Herbert Spencer • Franklin Bobbitt
Fundamental principles	• Separate nature from God • Human life is part of nature • Emphasize 'matter and the physical world' • Ignore spirituality and supernaturalism	• Ideas or thoughts make up fundamental reality • Ultimate reality is spiritual rather than physical, mental or material • The only real things are mental entities, not physical things	• It is the product of practical experiences of life • Based on practical utility. • Emphasize is on action rather than on thought • Experimental method of science	• Correspondence and sensation (as we see it). • What is true and real in daily life is admissible • Opposes to idealism • Against spiritualism
Aims of Education	Self-realization, Self-expression, Self-preservation, Struggle for existence	Idealism emphasizes the glory and grandeur of human life.	Creation of new values, activity and experience, personal and social adjustment, reconstruction of experience, all-round personality development	Man leads a happy and comfortable life through education. To develop memory of the child.
Curriculum	No fixed curriculum. Every child has the right to determine his/her curriculum. Learn directly from nature through experience	Based upon ideas and ideals. Language, literature, social studies, science and mathematics are included	Curriculum is fixed in advance at the beginning itself. Utilitarian curriculum includes subjects that impart knowledge and various types of skills. Practical subject's likes and social studies, physics, maths and hygiene are included at later stage.	Subjects of physical world: mathematics, science and social science

Contd...

Scanned with CamScanner

Character	Naturalism	Idealism	Pragmatism (Experimentalism)	Realism
Methods of teaching	Observation and experimental methods (Learning by doing)	Self-activity, play way method, project method. **Kindergarten** method. Discussion, lecture, questioning and imitation.	Project method Practical/experiments Handling of objects, tools and making things	Demonstrate, Recite
Role of teacher	Observer, supplier of materials and opportunities (role is behind the scene)	Teacher has to be specialist in knowledge. Teacher's personality is a source of inspiration for students.	Teacher will not impose anything on child. Teacher will facilitate students to be experimenter and discoverer	Displays, imparts knowledge.

Modern Contemporary Philosophies

- **Existentialism**: This philosophy emphasizes the existence of the man as a free and responsible agent determining their own development through acts of the will. It is the youngest of all philosophy, primarily built upon the work of contemporary scholars of the 20th century. Chief exponents are **Søren Kierkegaard, Karl Jaspers** and **Jean-Paul Sartre**
- **Progressivism**: It is the advocacy of improvement of society by reform. Progressivism revolves around the students' needs, including teaching students to be good citizens as well as good learners. Exponents are John Dewey, William James, G Thomas Lawrence.
- **Behaviorism:** It believes that the learning is a result of environmental conditioning. Exponents are Ivan Pavlov (classical conditioning), Skinner (Operant conditioning), John Watson, and Edward Lee Thorndike (connectionism)
- **Humanism**: It emphasizes the value of human beings and generally prefers critical thinking and evidence (rationalism and empiricism) over superstition. The humanist emphasis on literature. Key proponents of humanism include **Carl Rogers** and **Abraham Maslow.**
- **Experimentalism:** Experimentalism believes that things are constantly changing. Chief proponent is John Dewey.
- **Eclecticism:** It is the process of pulling out and putting together of the good ideas and concepts of various philosophies of education.
- **Reconstructionism:** It emphasizes the addressing of social questions and a quest to create a better society and worldwide democracy. Theodore Brameld was the founder of reconstructionism.
- **Essentialism**: Essentialism refers to the "traditional" or "Back to the Basics" approach to education.

INDIAN NURSING COUNCIL (INC)

- Indian Nursing Council is a national regulatory body for nurses and nursing education in India. Indian Nursing Council is an autonomous body under the Government of India.
- Indian Nursing Council was established by Government of India under section 3(1) of the INC Act 1947.
- Important functions of INC
  - To maintain uniform standard of nursing education in India
  - To prescribe the syllabus and regulations for nursing programs
  - To recognize the qualifications for the purpose of registration and employment
  - To advise State Nursing Councils, Central Government, State Governments, and Examining boards regarding Nursing education in India
- Minimum required physical facilities for a nursing college with an intake of 60 students (Key points)
  - Teaching block
    - Lecture hall: 4 × 1080 = 4320 sq. ft
    - Nursing foundation lab: 1500 sq. ft
    - Other labs (nutrition, CHN, OBG/Pediatric, pre-clinical science): 900 sq. ft each
    - Library: 2400 sq. ft
    - Staff Room: 1000 sq. ft
    - Faculty Room: 2400 sq. ft
    - A.V Aids room: 600 sq. ft
    - Total area (Teaching block): 23720 sq. ft
  - Hostel Block
    - Rooms (single/double): 24000 sq. ft
    - One toilet and one bathroom for every 5 students
    - Recreation room: 500 sq. ft
    - Dining Hall : 3000 sq. ft
    - Kitchen and store: 1500 sq. ft
    - Reading room: 250 sq. ft
    - Total area (hostel block): 30750 sq. ft
  - Total area required: 23720 + 30750 = 54470 sq.ft
- Teaching faculty requirement for nursing colleges/schools
  - Teacher: Student ratio is 1:10

NURSING PROGRAMS IN INDIA

Table 2

Nursing programs	Training duration	Examinations	Registration
Auxiliary Nurse and Midwife (ANM)	2 years	Nursing Examination Board	R. ANM
General Nursing & Midwifery	3 and 1/2 years 3 years from 2015-2016	Nursing Examination Board	R.N and R.M
BSc (Basic)	4 years	University	R.N & R.M
BSc (Post Basic)	Regular: 2 years Distance: 3 years	University	Additional Qualification

Nursing programs	Training duration	Examinations	Registration
MSc	2 years	University	Additional Qualification
MPhil	1 year (Full time) 2 years (part time)	University	Additional Qualification
PhD	3-5 years	University	Additional Qualification

Source: Indian Nursing Council

NURSING EDUCATION IN INDIA

- BSc Nursing program was first started in India in the year 1946 in Christian Medical College (CMC), Vellore and Rajkumari Amrit Kaur (RAK) College of Nursing at Delhi University.
- Masters of Nursing (MSc) was started at RAK College of Nursing in 1959 and in 1969 in CMC Vellore.
- M.Phil in Nursing program was started at RAK College of Nursing in the year 1980 as a regular and part time course.
- PhD program in Nursing was first started in India in 1992

INTERNATIONAL COUNCIL OF NURSES (ICN)

- ICN was founded in 1899.
- ICN is a federation of more than 130 National Nurses Associations (NNAs). There is one voting member from each member association.

STATE NURSING COUNCILS IN INDIA

- Functions include
  - Granting recognition to nursing colleges/schools and conduct regular inspections
  - Registration of qualified nurses with valid degree/diploma/ certificates
- There are 23 state nursing councils in India.
- Tamil Nadu Nursing and Midwives council (TNMC) is the earliest Nursing Council in South-East Asia (1926).

TRAINED NURSES ASSOCIATION OF INDIA (TNAI)

- TNAI was established in the year 1908.
- TNAI got affiliated with International Council of Nurses (ICN) in the year 1912.
- The Government of India has recognized TNAI as a service organization in 1950.
- Key office bearers as on June, 2018.
  - President: Dr Roy K George
  - Secretary General: Mrs Evelyn P Kannan
- The Postal Department of the Government of India honoured TNAI by releasing a stamp in the name of TNAI in 2011

CURRICULUM

- **Curriculum:** "A systematic arrangement of the sum total of selected experiences planned by a school or a defined group of students to attain the aims of a particular educational program"
  – *Florence Nightingale*
- **The four Cs of Curriculum are**
  - Cooperative
  - Continuous
  - Comprehensive
  - Concrete
- **Levels of curriculum planning**
  - **Societal curriculum:** Planned for large group of students in a specific program, E.g. GNM or BSc Nursing
  - **Institutional curriculum:** Planned for a group of students who will study in a particular institution for specific period of time.
  - **Instructional curriculum:** Consists of content and activities planned for a specific period of time (day by day and week by week)
- **Phases of curriculum development**
  - Development phase: Planning and developing
  - Implementation phase: Management and implementation
  - Evaluate phase: Assessment of teaching and learning process

EDUCATIONAL OBJECTIVES

Educational or learning objectives is defined as "Desired end results or anticipated end results"

Taxonomy of Educational Objectives

It is a systematic organization of objectives into three domains, i.e.

- **Cognitive domain (Knowledge)**
- **Conative or psychomotor domain (Skill)**
- **Affective domain (Attitude)**

Bloom's Taxonomy of Educational Objectives (1956)

- It is one of the most widely used ways of organizing levels of expertise
- Cognitive Domain
  - The cognitive domain involves knowledge and the development of intellectual skills
  - This includes Knowledge, comprehension, application, analysis, synthesis and evaluation
- Conative (psychomotor) domain
  - Psychomotor domain includes physical movement, coordination, and use of motor-skill areas.
- Affective Domain
  - Affective domain includes the manner in which we deal with things emotionally, such as feelings, values, appreciation, and attitudes.

Figure 1 ■ Cognitive domain

Scanned with CamScanner

Figure 2 ■ Psychomotor domain (Based on Dave, 1975)

Figure 3 ■ Affective domain

AUDIO-VISUAL AID

Audio-visual-aid: It is an instructional device in which message can be heard as well as seen.

Classification of A-V Aids

Auditory Aids

Radio, recordings, mike, programs, megaphone, and gramophone

Visual Aids

- **Non-projected/ unprojected:** Model, 3-D materials, pictures, charts, flannel graph, boards, cartoons, maps, photographs, flashcards, illustrations, posters and printed materials.
- **Projected aids:** Epidiascope, slide projector, overhead projector, film projector, opaque projector.
- **Audio-visual aids:** Television, video, sound motion picture.
- **Aid through activity:** Field trip, models, collection of material and exhibition.
- **Traditional media:** Puppets, dramas, folk songs and folk dance.

Table 3

Two-dimensional AV aids	Three-dimensional AV aids
• Printed materials • Chart • Posters • Graph • Photos and map	• Model ▪ Solid model (Globe, clay model) ▪ Cutway and X-ray models, e.g. Cross sectional model of human body ▪ Working models (Circulatory system model with working motor) ▪ Sand models (community area, forest area) ▪ Scale models (models of organs of body) • Exhibit • Specimen • Mock-up • Moulage • Objects • Realia (Natural and preserved) • Diorama • Puppets

Scanned with CamScanner

Key Points

- The most commonly available aid in the classroom situation is blackboard
- **Black, Blue** and **Green** are best colors to write on the transparencies
- Flannel boards are covered with rough khadi. The cut outs, drawings and other illustrations are placed on the board.
- Epidiascope is the projected aid for projecting opaque objects
- Flash card is a method which consists of series of cards that are flashed one after another. Sizes of the cards are 10" x 12" or 22" x 28"
- Flashcards are ideal for a group of 20-30 people

Characteristic of Good Teaching A-V Aids

- Meaningful
- Purposeful
- Accuracy in every aspect
- Simple
- Cheap
- Improvised
- Large size
- Up-to-date
- Easily portable
- According to mental level of the students
- Motivates the learners

Principles of A-V Aids

- Principle of selection
- Principle of preparation
- Principle of physical control
- Principle of proper presentation
- Principle of response
- Principle of evaluation

MAXIMS OF TEACHING

- Known to unknown
- Easy to difficult
- Simple to complex
- Concrete to abstract
- Particular to general
- Analysis to synthesis
- Whole to parts
- Empirical to rational
- Psychological to logical
- Actual to representative

PEDAGOGY VS ANDRAGOGY

- **Pedagogy:** Pedagogy is the study and theory of the methods and principles of teaching. It is a child-focused teaching approach.
- **Andragogy:** It refers to method and principles used in adult education.

Table 4

Pedagogy	Andragogy
The learner is dependent upon the instructor for all learning	Self-directed learning
Teacher is responsible for what is taught and how it is learned	Learner is responsible for his own learning
Teacher evaluates learning	Self- evaluation
Experience of the teacher is most influential	Adults are rich resource for one another
Process of acquiring prescribed subject matter	Learners perform a task, solve problem relevant to real-life tasks
Motivated by external pressures	Self-motivating factors: recognition, better quality of life, etc.

PRINCIPLES OF TEACHING

- Principle of Creativity
- Principle of Looking ahead
- Principle of Flexibility and cooperation
- Principle of Diagnostic and remedial teaching
- Principle of Linking teaching with actual life
- Principle of Planning
- Principle of Aim
- Principle of Interest or motivation
- Principle of Sympathy and kind atmosphere
- Principle of Activity or learning by doing

Mnemonic tip:
CL FD L PAISA
(Cancel (**CL**) Fixed Deposit (**FD**) Loan **PAISA**)

Teaching Methods

Table 5

Teaching methods	Significance
Lecture method	• Controlled and information centered approach • Teacher talks and Students are passive listeners • The teacher transmit information to a large group (Ideal for a large group of students) • Also known as **"autocratic teaching strategy"** • **Most commonly** used method of teaching
Seminar	• Group of people coming together for the discussion and learning of specific technique and topics. • It involves paper reading of a theme and followed by the discussion to clarify the complex aspect of the theme.

Contd...

Scanned with CamScanner

Teaching methods	Significance
Symposium	• Group of individuals comes together to solve problems of a given subject in a specified time
Panel discussion	• Group of 6-8 qualified experts discuss a topic in front of an audience
Demonstration	• Taught by "exhibition and explanation" • Most commonly used Student-centered teaching method in Nursing • **Best method** to teach nursing skills
Laboratory Method	• First- hand experience of learning situation • Helps to understand and test concept • Promote insight through practical exercise
Role play	• Spontaneous acting out of roles in the context of human relations situations. Eg. Sociodrama, psychodrama • Best method for health education (attitude related awareness programs) of community people
Programd instruction	• Planned sequence of experiences, leading to proficiency in terms of stimulus response relationship (Espich JE and Williams B.)
Individualized instruction	• Learners are allowed to work/learn at their own pace. • The instructions are tailored as per the needs and abilities of the learner.
Discussion method	• A cooperative problem solving activity seeking consensus for solution of a problem • Maximum participation of students is possible
Team Teaching	• A team of teachers working together with a single group of students • Multiple talents and resources are pooled for the benefit of learners.
Simulated teaching	• A form of experiential learning • Teaching process is displayed artificially by simulating actual life situation
Microteaching	• A technique aimed to prepare student-teachers to the real classroom setting • Student-teacher teaches a small group of **4-6 learners** for a length of **5-10 minutes**
Assignment Method	• This method comprises of guided information, self-learning, writing skills, and organization of knowledge
Problem solving method	• Learners are confronted with real problems and provided opportunity and freedom to solve the problems
Project method	• Problem-oriented method which is directed and planned by the learner himself
Case study	• The most effective clinical teaching method • Comprehensive study of a patient with a disease condition
Workshop	• Experienced people and experts come together to find solutions to problems encountered in their work situations • Participants have an active role
Puppet Show	• Puppet show can help boost creativity and imaginations of the learners
Educational field trips	• Taking students on field trips (learning excursion outside the classroom) provide them opportunity to experience in real-life settings and makes learning more effective
Clinical teaching	It includes • Client family centered approach • Conference ▪ Clinical conference ▪ Staff conference ▪ Individual conference ▪ Group conference ▪ Nursing care conference ▪ Team conference • Bedside clinic • Nursing rounds • Ward-teaching program • Ward class • Ward clinics • Case method • Assignments • Brain storming method • Group discussion • Demonstration method • Laboratory method • Process recording • Health talks • Problem solving • Observation

Scanned with CamScanner

EVALUATION

- **Evaluation:** Pupil's qualitative progress and behavioural changes (value judgement) are tested. E.g. Very good, good, bad, etc.
- **Measurement:** Refers to quantitative description of pupil's attainment in a subject. E.g. Exam score in a specific subject.
- **Assessment:** "Assessment in education is the process of *gathering, interpreting, recording,* and *using* information about pupils' responses to an educational task." **– Harlen et al (1992).**
- **Criterion referenced assessment:** It determines whether each student has achieved specific skills or concepts. Each individual is compared with a pretest standard for acceptable achievement. Focus is on whether the student could perform that task with the preset criteria. E.g. Driving test
- **Norm referenced assessment:** compare students to what is normal for that age, class and course. Percentile rank is preferred.
- **Formative Assessment:** With formative assessments, students are evaluated during the work process and the focus is on improving the process. Majority of formative assessment are informal. E.g. Teacher's assessment of seminar presentation.
- **Summative Assessment:** With summative assessments, students are evaluated upon completion of the work and the focus is on the final product. **E.g. Final University exam**

The methods used for the assessment of knowledge are:

- **Subjective type:** Essay type, narrative type, comparison, amplification, precise writing, short notes.
- **Objective type:** MCQ, matching type, fill in the blanks, sentence completion type, Problem-solving type and situational.

Table 6 Methods of evaluation, instruments used for evaluation for domains of learning

Domain	Methods	Instruments/Tools
Cognitive/ Knowledge	Written	Essay type questions Short answer questions Multiple choice questions
	Oral	Viva Voice
Psychomotor/ Skill	Observation	Traditional practical examinations OSCE OSPE Checklist, nursing process
Affective/ Attitude	Observation Self-reported	Behavioural scales: anecdotal records, personal records, cumulative records, communication, group discussion, process recording, etc. Psychological scales: Likert Scale (summative scales), semantic differential scale, sociometry, Scalogram

Abbreviations: OSCE, objective structured clinical Examination; OSPE, objective structured Practical Examination

Item Analysis

It is a statistical technique which is used for selecting and rejecting the items of the objective test (MCQs) on the basis of their difficult value and discriminated power.

Statistical Method Used

1. **Difficulty Index or Facility value – (item difficulty):**
   - The facility value of an item is defined as the proportion or percentage of the examinees who have answered the item correctly
   - Difficulty Index ranges from 0 – 100%;
     - Easy – ≥ 85%
     - Medium – 51%-84%
     - Hard - ≤ 50
2. **Discriminative index (DI)–(item discrimination):** It is the ability of an item to discriminate between skilled and unskilled examinees
   - DI ranges from -> -1 to +1
   - ≥ 0.35 – GOOD
   - <0.2 – 0.35> – INTERMEDIATE
   - ≤ 0.2 - UNACCEPTABLE

- **Distracter efficiency:** Distracter should be PLAUSIBLE. Any distracter that is not picked by at least 5% of student–is not a good distracter.

CONTINUING EDUCATION

It provides the opportunity for working professionals to continue their learning and remain abreast of development which is in their field.

IN-SERVICE EDUCATION

A program of instructions or training provided by an agency or institution for its employees. The program is held in the institution or agency and is intended to increase the skills and competencies of the employees in a specific area.

Scanned with CamScanner

"The groundwork for all happiness is good health."
—Leigh Hunt

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

1. **The function of Indian Nursing Council is to**
   a. Arrange for university inspections of colleges in respective states
   b. Financial assistance to conferences and seminars conducted by nursing colleges
   c. Make policies for Nursing Education and Practice
   d. Recruit nursing personnel in hospitals
2. **In India, first MSc Nursing programme was started in RAK college in the year** *(Tutor Exam 2015, AIIMS, Rishikesh)*
   a. 1959 b. 1948
   c. 1946 d. 1970
3. **Trained Nurses Association of India (TNAI) was formed in the year**
   a. 1928 b. 1947
   c. 1908 d. 1890
4. **The International Council of Nurses (ICN) was established in the year** *(Tutor Exam 2015, AIIMS, Rishikesh)*
   a. 1869 b. 1899
   c. 1928 d. 1905
5. **In India, the first four year basic Bachelor Degree nursing program was established in**
   a. 1920 b. 1940
   c. 1946 d. 1955
6. **The International Council of Nurses (ICN) is headquartered in:**
   a. Geneva, Switzerland b. Washington, US
   c. New York, US d. London, UK

Ans.

1.	c
2.	a
3.	c
4.	b
5.	c
6.	a
7.	c
8.	b
9.	c
10.	d
11.	a
12.	a
13.	a
14.	a
15.	b
16.	a

COMMUNICATION PROCESS

7. **The nurse lean towards the patient in the communication to**
   a. Maintain eye contact
   b. To comfort the patient
   c. Show genuine interest
   d. Show courtesy
8. **Non-verbal communication includes**
   a. Phrases b. Gestures
   c. Information d. Words
9. **The communication phase that is facilitated by knowledge of the patients is known as**
   a. Message heard
   b. Thinking of a message
   c. Decoding the message
   d. All of the above
10. **All are important elements of communication process, except:** *(Safdarjung NO 2018)*
    a. Sender and receiver
    b. Referent and message
    c. Channel and feedback
    d. Time and environment

Explanation: Communication is ongoing process where time is not considered during communication

Elements of communication are sender, referent (motivates the sender or receiver to share information) receiver, message, channel of communication and feedback from receiver.

11. **Health education by a nurse to a group of people can be termed as:** *(Safdarjung NO 2018)*
    a. Small group communication
    b. Interpersonal communication
    c. Intrapersonal communication
    d. Public communication

Explanation: Health education is an example of small group communication. Where communication is between nurse and group of people

12. **Translating the message into verbal and non-verbal symbols to communicate the receiver means:** *(Safdarjung NO 2018)*
    a. Encoding
    b. Decoding
    c. Channel
    d. Feedback

Explanation: Encoding: The message is theoretical and intangible, its further passing requires use of certain symbols such as words, actions or pictures, etc. This process of conversion of message into the symbols is the process of encoding.

Decoding means interpretation. The receiver decode the encoded message to understand the meaning of it.

13. **Aspects of verbal communication includes**
    a. Vocabulary
    b. Postures
    c. Art and music
    d. Messages within message
14. **Barriers of communication includes ----------**
    a. Information overload b. Exploring
    c. Focusing d. Summarizing
15. **Communication is described as the "matrix for all thought and relationships between persons" said by**
    a. William Scott
    b Murray and Zentner
    c. GG Brown
    d. WH Newman
16. **Mental processing of the message and understanding the senders' message is ----------**
    a. Decode b. Encode
    c. Feedback d. Imagination

Scanned with CamScanner

17. **A technique whereby to repeats the main message the client has expressed is ----------**
    a. Listening b. Restating
    c. Clarification d. Reflection
18. **If a person is communicating with his friend on telephone is referred as**
    a. Intrapersonal communication
    b. Interpersonal communication
    c. Media communication
    d. Mass communication
19. **Special words or expressions used by a profession or group that are difficult for others to understand is known as**
    a. Equivocal terms b. Jargon
    c. Technical terms d. Code language
20. **An automatic psychological process of receiving aural stimuli is known as**
    a. Listening b. Hearing
    c. Understanding d. Speaking
21. **In the communication process to encode means to**
    a. Convert coded language into meaning
    b. Translate ideas into a code
    c. Infer the jargons
    d. Analyze the code
22. **Which of the following is an example of a nonverbal communication?**
    a. Vernacular language b. Smile
    c. Jargon d. Slang
23. **The one who receive the message is known as**
    a. Encoder b. Decoder
    c. Communicator d. Mediator

INTERPERSONAL COMMUNICATION AND RELATIONSHIP

24. **Another name for interpersonal communication is**
    a. Mass communication
    b. Face to face public communication
    c. Dyadic communication
    d. Virtual reality
25. **Which of the following is an example of mediated communication?**
    a. A newscaster delivers the weather report on the 6 o'clock news
    b. Two friends gossip with one another
    c. Students work on the class project together
    d. A politician addresses a nominating convention
26. **Comparing with small group communication, in organizational communication**
    a. Feedback is easier and more immediate
    b. Communication roles are more formal
    c. Message can be better adapted to the specific needs of the receiver
    d. People are closer to one another in space
27. **As per the principles of communication "interpersonal communication is irreversible" means**
    a. Once a word goes out of your mouth you can never swallow it again
    b. Once created, communication has the physical property of matter, it can't be uncreated
    c. Once communication begins, it never loops back on itself
    d. All of the above
28. **According to the statement "communication is interaction perspective", feedback is**
    a. Never intentional
    b. Sometimes unintentional
    c. Always intentional
    d. Seldom useful

HUMAN RELATIONS

29. **Maslow's Hierarchy of needs includes**
    a. Self-actualization
    b. Self-esteem
    c. Physiological
    d. All of the above
30. **According to Maslow's hierarchy of needs, the highest level is**
    a. Physiological needs
    b. Safety and Security
    c. Love and affection
    d. Self-actualization
31. **Which of the following is a characteristic of private relationships?**
    a. Extrinsic rewards
    b. Normative rules
    c. Use of particularistic knowledge
    d. Substitutability
32. **Basic components of attitude include all EXCEPT**
    a. Emotional component
    b. Informational component
    c. Behavioral component
    d. Spiritual component

GUIDANCE AND COUNSELLING

33. **Who plays a proactive role in counseling?**
    a. Counselee b. Counselor
    c. Administrator d. Referee
34. **Listening in counseling is what process?**
    a. Passive process b. Dual process
    c. Active process d. Lengthy process
35. **The final step of directive counseling is:**
    a. Prognosis b. Synthesis
    c. Follow-up d. Diagnosis
36. **The test that is intended to measure the learnt knowledge and skill is**
    a. Aptitude test b. Achievement test
    c. Ability test d. Observation
37. **Trustworthiness of the counselor is termed as**
    a. Fidelity b. Justice
    c. Autonomy d. Intelligence
38. **Number of phases in counseling process is**
    a. 2 - 3 b. 5
    c. 7 d. 8
39. **Counseling should be done by a**
    a. Teacher
    b. Parent
    c. A trained counselor
    d. Any of the above
40. **Guidance is provided by**
    a. Teachers
    b. Parents
    c. A trained guide
    d. Any experienced person

PRINCIPLES OF EDUCATION AND TEACHING-LEARNING PROCESS

41. Which of these is not a conventional philosophy?
a. Idealism b. Naturalism
c. Pragmatism d. Existentialism

42. Which philosophy believes that ultimate goal of human activities is the realization of human mind in his or herself.
a. Idealism b. Pragmatism
c. Realism d. Existentialism

43. Which of the following is not the principles of Lesson Planning
a. Flexible
b. Mastery and adequate training on the topic
c. Active student participation
d. Single teaching method

44. In which type of objectives breaking down of professional functions into components (activities) is done which together indicate the nature of the functions
a. Central b. Specific
c. Intermediate d. Tertiary

45. Which of the followings is not the maxims of teaching
a. Known to unknown b. Complex to simple
c. Concrete to abstract d. Analysis to synthesis

46. Which philosophical thought states that 'ultimate reality is spiritual rather than physical, mental rather than material'? *(Tutor Exam 2015, AIIMS, Rishikesh)*
a. Idealism b. Realism
c. Pragmatism d. Spiritualism

47. John Dewey was a proponent of
a. Spiritualism b. Idealism
c. Realism d. Pragmatism

48. Who among the following proposed that education be designed on the basis of a theory of experience?
a. Socrates b. John Dewey
c. Aristotle d. Jean Piaget

49. All of the following are traditional philosophy of education, except:
a. Idealism b. Pragmatism
c. Naturalism d. Essentialism

50. Who provided the most famous example of classical conditioning?
a. Skinner b. Guthrie's
c. Ivan Pavlov d. Maslow

51. Who stated "education is not a preparation for life; education is life itself"?
a. Jean Piaget b. Socrates
c. John Dewey d. Mahatma Gandhi

52. "Democracy and Education" (1916) was authored by
a. Sigmund Freud b. John Dewey
c. Jean Piaget d. Jawaharlal Nehru

53. The interaction analysis category system in education for increasing the teacher effectiveness was developed by
a. Amidon b. Simon
c. Flander d. Richard Over

54. Who stated that "Man is born free but every-where he is in chains"
a. Jean Jacques Rousseau
b. Sigmund Freud
c. John Dewey
d. Jean Piaget

55. "By 'Education' I mean an all-round drawing out of the best in child and man body, mind and spirit". This quotation is given by
a. Rabindranath Tagore
b. Mahatma Gandhi
c. Sarvepalli Radhakrishnan
d. Jawaharlal Nehru

METHODS OF TEACHING

56. The best method to teach a patient any skills, such as using inhale, is by: *(AIIMS BBS NO 2018)*
a. Lecture b. Demonstration
c. Discussion d. Panel session

Explanation: The best method to teach a patient any skills, is by doing and showing the things. Demonstration is the process of performing the procedure the way teacher expects the learner to practice.

57. The cognitive domain in educational objectives refers to..... *(AIIMS Raipur NO 2019)*
a. Knowledge b. Attitude
c. Skills d. Behavior

Explanation: There are three domains of educational objectives are cognitive, conative and affective.

- **Cognitive domain:** It has different levels like knowledge, comprehension, application, analysis, synthesis and evaluation.
- **Psychomotor domain:** Related to skills. Three levels are imitation, control, and automatism.
- **Affective domain:** Dealing with emotions or feelings (behavior). Three levels are attention, response, internalization.

58. Andragogy refers to
a. Child learning b. Adult learning
c. Learning by doing d. Practical learning

59. A principle of adult learning is
a. Learning is self-directed
b. Learning by doing
c. Learning by imposition
c. Learning by imitation

60. Curriculum reflects the culture of
a. Society b. College
c. School d. Home

61. Which of the followings is not an autocratic method of teaching
a. Lecture b. Demonstration
c. Discussion d. Independent study

62. Teaching method in which students learn to do critical thinking through discussion and interaction and develop higher analytical cognitive skills is
a. Seminar b. Symposium
c. Panel discussion d. Lecture

63. Which of the following is not a clinical method of teaching
a. Case methods/case study
b. Nursing rounds and reports
c. Process recording
d. Seminar

64. Method of teaching in which an excursion to the patient's area is arranged to provide learning experience to the students is
a. Case presentation b. Nursing rounds
c. Morning report d. Process recording

65. A written verbatim account of a visit for the purpose of bringing out the interplay between the patient and the nurse
a. Morning report
b. Evening report
c. Case study
d. Process recording

66. The most essential quality of an effective teacher is
a. A strict personality
b. Communication skill
c. Friendly attitude
d. Superior knowledge of the subject

67. Which method of teaching would be most suitable to teach nursing care of children with "Mental Retardation" for a class of 100 nursing students?
a. Group discussion
b. Lecture cum discussion
c. Problem solving
d. Web-based learning

68. A group of 10 people are speaking on a topic of common interest in an educational programme. This method is best known as
a. Workshop b. Panel discussion
c. Group discussion d. Lecture

69. All that is learnt during educational activities that is not a designated part of official curriculum is known as the
a. Extra curriculum
b. Observed curriculum
c. Hidden curriculum
d. Experienced curriculum

70. The demonstration on "Neurological examination" would be most useful, if done in a group of
a. 10 b. 20
c. 25 d. 30

71. Which one of the following is NOT among the maxims of Teaching?
a. Analysis to synthesis b. General to particular
c. Easy to difficult d. Concrete to abstract

72. Lesson plan is prepared by the
a. Teacher b. Administrator
c. Student d. Principal

73. Which one of the following is not a quality of a good teacher?
a. Good Motivator b. Intolerance
c. Leadership d. Mastery of the content

74. Which of the following learning domain is a skill domain?
a. Cognitive b. Affective
c. Conative d. None of the above

75. Which of the following learning domain influences nursing practice?
a. Cognitive and conative
b. Conative and affective
c. Affective and cognitive
d. Cognitive, conative and affective

76. Affective domain of Bloom's taxonomy includes all, EXCEPT
a. Valuing b. Responding
c. Organization d. Synthesis

77. Panel discussion method was introduced by
a. William James b. Harry A. Overstreet
c. W.F. Skinner d. Jean Piaget

78. Preferably, panel discussion consists of
a. 3 – 5 members
b. 4 – 8 members
c. 6 – 9 members
d. 6 – 10 members

79. Role of the participants in seminars include
a. Observe the speaker
b. Observe and note the information
c. Analyze, discuss and critique the content
d. Listen to the speeches and prepare an article for publication

80. Who decides the topic of any seminar?
a. Secretary
b. Participants
c. Chairperson
d. Organizer

81. Ideally, the duration of a seminar presentation is
a. 20-30 minutes b. 30-45 minutes
c. 45-60 minutes d. 60-120 minutes

82. The duration of micro-teaching is
a. 2-5 minutes b. 5-10 minutes
c. 10-15 minutes d. 15-20 minutes.

83. Conference is a type of
a. Discussion b. Group discussion
c. Lecture d. Work shop

84. The type of teaching method that allows learning the first hand information to the student is
a. Group discussion
b. Program instruction
c. Field trip
d. Nursing care studies

85. Case method is a
a. Lecture method
b. Clinical method
c. Individual discussion
d. Demonstration method

86. All of the following are a method of clinical teaching EXCEPT
a. Simulation
b. Nursing round
c. Case discussion
d. Case method

87. Common topics preferred for symposiums are related to
a. Recent trends in nursing
b. Controversies in nursing
c. Innovations in nursing
d. Emergency conditions

88. Which of the following is a discussion method in which the participants have the opportunity for direct conversation with the speaker?
a. Seminar b. Conference
c. Lecture d. Symposium

89. Syllabus is a part of
a. Student b. College
c. Institution d. Curriculum

90. One of the areas of 'Learning Objective' in Bloom's Taxonomy is
a. Application b. Cognitive
c. Communication d. Intellectual

91. Cognitive domain of Bloom's Taxonomy includes all EXCEPT
a. Analysis
b. Criticism
c. Evaluation
d. Synthesis

92. **Conative domain of Bloom's Taxonomy includes all, EXCEPT**
   a. Application of knowledge
   b. Skilled movements
   c. Reflex movements
   d. Perceptual activities
93. **Affective domain of Bloom's Taxonomy includes**
   a. Receive
   b. Respond
   c. Value
   d. All of the above
94. **Which of the following learning domain is skill domain?**
   a. Psychomotor
   b. Cognitive
   c. Attitude
   d. Affective
95. **Psychomotor domain of Bloom's Taxonomy includes all EXCEPT**
   a. Imitation
   b. Application
   c. Develop precision
   d. Manipulation
96. **One of the objectives of microteaching is**
   a. To learn the knowledge through peer group
   b. To learn the skills through feedback
   c. To enable the teacher trainee to learn and incorporate the new teaching skills under controlled condition
   d. To learn to complete the task within time
97. **A group of 6-8 qualified experts discusses a topic in front of an audience. This is known as**
   a. Group discussion
   b. Panel discussion
   c. Symposium
   d. Webinar
98. **The most important step to consider while giving health education to a community is**
   a. Participation of doctors
   b. Knowing of local needs
   c. Health education
   d. Community discussion
99. **Which domain of objectives is not being evaluated through our present system of examination?**
   a. Cognitive
   b. Conative
   c. Affective
   d. All of the above
100. **Which of the following would be the best teaching method to increase awareness of rural population towards small family?**
   a. Charts
   b. Role playing
   c. Film show
   d. Television
101. **Students who ask questions in the classroom should be**
   a. Advised to meet the teacher personally after the class
   b. Encouraged to find answers independently
   c. Encouraged to continue asking questions
   d. Reprimanded for misbehavior
102. **Participation of men and women factory workers together in an educational program on "Safe Sex" would first depend on the**
   a. Consideration of the factory owner
   b. Culture of that particular social group
   c. Comfort of the Health Educator
   d. Convenience of the factory manager
103. **The purpose of Lesson Planning is to**
   a. Complete the prescribed syllabus
   b. Ensure complete learning of the topic
   c. Promote attention of student
   d. Provide written notes to students

EDUCATIONAL AIDS

104. **The reproduction of the essential features of a real-life situation is called.....** *(AIIMS Raipur NO 2019)*
   a. Exhibition
   b. Module
   c. Simulation
   d. Demonstration

Explanation: A simulation is an approximate imitation of the operation of a process or system. The model is a well-defined description of the simulated subject, and represents its key characteristics. Simulation is one of the best method to teach clinical skills for nursing students.

105. **Video conferencing can be classified as one of the following types of communication:** *(AIIMS Raipur NO 2019)*
   a. Visual one-way
   b. Audio-Visual one-way
   c. Audio-Visual two-way
   d. Visual two-way

Explanation: Video conferencing means to conduct a conference between two or more participants at different sites by using networks to transmit audio-video data. So, video conferencing is an audio-visual two-way type of communication.

106. **One form of graphic presentation for health education is** *(AIIMS Nagpur NO 2018)*
   a. *Notice board*
   b. Charts
   c. Poster
   d. Blackboard

Explanation: A **chart** is a graphical representation of data, in which "the data are represented by symbols, such as bars in a bar chart, lines in a line chart, or slices in a pie chart." **Poster** consists textual and graphic elements, images which designed to be eye catching and informative.

107. **Which of the following is NOT a visual aid used in health education?** *(AIIMS-BBS SNO 2019)*
   a. Textbooks
   b. Posters
   c. Film strips
   d. Audio cassettes
108. **Facts and ideas arranged for expressing the process or development of an issue to the point of its resolution over a period of time is**
   a. Narration chart
   b. Strip chart
   c. Cycle chart
   d. Evolution chart
109. **A map that describes the political divisions of the world, continents and nations is known as**
   a. Physical map
   b. Relief map
   c. Political map
   d. Weather map
110. **Which of the followings is not an activity aid?**
   a. Field trip
   b. School museum
   c. Role play
   d. Graphs
111. **An equipment that projects the real magnified image on a screen directly from pictures and drawings on paper is**
   a. Slide projector
   b. LCD projector
   c. Episcope
   d. Microscope
112. **Most common AV aid used for educating general public is**
   a. Audio tape
   b. Radio
   c. CD system
   d. Tape recorder
113. **The most essential body language in classroom teaching is**
   a. Eye contact
   b. Controlled movement
   c. Humorous
   d. Straight posture

Scanned with CamScanner

132. Before the nursing students start their clinical postings, the supervising teacher needs to
a. Help students to identify their own 'Learning Objectives'
b. Inform students about make-up duty for their absence during clinical postings
c. Instruct students to help doctors in treating patients
d. Instruct to bring text books along with them

133. The uniform method of assessing students' overall learning would be
a. Objective structured clinical evaluation
b. Case method
c. Group Project
d. Viva Voce

134. _____ is an example of Criterion-referenced assessment.
a. IQ test
b. Wechsler Intelligence Scale for Children (WISC)
c. Driving test
d. Graduate Record Examination (GRE)

135. Which of the following is NOT a problem solving approach?
a. Inductive approach
b. Logical approach
c. Reasoning approach
d. Deductive approach

136. List of items with appropriate columns meant to be observed by the observer is known as
a. Questionnaire
b. Checklist
c. Ranking item
d. Anecdotal record

137. Problem solving evaluation enables the teacher to assess the students' _____
a. Critical thinking
b. Emotional status
c. Adaptability
d. Adjustability

138. Multiple choice questions consist of
a. A statement with a blank space
b. A problem and a list of solutions
c. Assertion and reason
d. An open ended question without distractors

139. When assessing the academic achievement of the students, which of the following factors is most important to consider
a. The students' current performance level
b. The students' interest in education
c. The students' prior opportunities to learn
d. The students' ability to learn

INFORMATION, EDUCATION AND COMMUNICATION

140. Factors that affects the human behavior are:
a. Experience, dignity, values, attitude
b. Knowledge, motivation, attitudes, values
c. Knowledge, belief, dignity, values
d. Knowledge, belief, attitudes, values

141. A set of social rules that specify appropriate and inappropriate behavior in the given specific situations is known as:
a. Beliefs
b. Rules
c. Norms
d. Moral values

142. One of the most important reinforcing factor for a behavior to happen or to avoid
a. Distant relatives influence
b. Change in the political parties of that particular area
c. Peer group
d. Imprisonment

143. Which of the following theory directly relates to behavior change?
a. PEN - 3 model
b. Health Illness continuum
c. Rogers' theory
d. McNileimers rule

144. The health communication is
a. Teacher centric
b. One of the costly method of imparting information
c. Process oriented
d. Not includes relationship building

145. An observational method used frequently in classroom or learning settings in which the observer summarizes a single developmental incident after the event has occurred is known as
a. Anecdotal report
b. Observational report
c. Contingency record
d. Incident report

146. An effective communication should be
a. One way process
b. Two way process
c. Directive
d. Three way process

147. Nursing Educational Research is required to
a. Improve self-image of nursing professionals
b. Ensure evidence-based nursing practice
c. Persuade young people to come into nursing profession
d. Uphold professional dignity

"Ill-health of body or of mind, is defeat. Health alone is victory."
—Thomas Carlyle

9 NURSING RESEARCH AND STATISTICS

SYNOPSIS

INTRODUCTION

Nursing research provides evidence used to support *nursing* practices, education, administration and management.

DEFINITION

Nursing research is a planned attempt to increase nursing knowledge by the discovery of new facts through systematic enquiry.

STEPS IN THE QUANTITATIVE RESEARCH PROCESS

Conceptual Phase

- Formulating and delimiting the problem.
- Reviewing the literature.
- Developing a theoretical framework.
- Identifying the research variables.
- Formulating hypotheses.

Design and Planning Phase

- Selecting a research design.
- Specifying the population.
- Operationalizing the variables.
- Conducting the pilot study/making revisions.

Empirical Phase

- Selecting the sample
- Collecting the data
- Organizing data for analysis

Analytic Phase

- Analyzing the data
- Interpreting the results

Dissemination Phase

- Communicating results

STEPS IN THE QUALITATIVE RESEARCH PROCESS

- Define/clarify broad topic
- Review of the literature
- Identify site/setting
- Obtain access
- Obtain and test equipment
- Begin data collection/analysis
- Identify themes/categories
- Triangulation/saturation
- Formulate hypotheses/theories
- Communicate findings

RESEARCH PROCESS

Research Problem

- It is the first step in research process.
- A research problem is a question that researcher wants to answer or a problem that a researcher wants to solve.

Review of Literature

Review of Literature (ROL) is a systematic way of presentation of relevant references along with brief findings in the specific juncture for the proposed study or research proposal.

Sources of Review of Literature

- **Primary sources:** A primary source provides direct or first-hand evidence about an event, object, person, or work of art. Examples include:
  - Historical and legal documents
  - Original research articles found in Scholarly journals
  - Published thesis
  - Eyewitness accounts
  - Results of experiments
  - Statistical data
  - Pieces of creative writing
  - Audio and video recordings, speeches, and art objects
  - Interviews, surveys, and fieldwork
  - Internet communications via E-mail, blogs, LISTSERV, and newsgroups
- **Secondary sources:** Secondary sources describe, discuss, interpret, comment upon, analyze, evaluate, summarize, and process primary sources. For example:
  - Articles in newspapers or popular magazines.
  - Book or movie reviews.
  - Articles found in scholarly journals that discuss or evaluate someone else's original research.
- **Types of sources**
  - **Print sources:** Information gathered from printed materials including journals, magazines, textbooks etc.
  - **Electronic sources:** Information gathered from electronic media such as internet, CD, online journals, blogs, etc. Some of the electronic databases for nursing research are given below.
  - **Ovid MEDLINE:** Literature in the fields of medicine, nursing, dentistry, and preclinical sciences.
  - **Ovid CINAHL (Cumulative index to Nursing allied Health Literature):** Literature related to nursing and allied health disciplines including medical records, physical and occupational therapy.

Scanned with CamScanner

- **PubMed:** The US National library of medicine database of biomedical citation and abstracts that is searchable on the website at no cost.
- **MEDLINE** is the largest component of Pubmed.
- Cochrane Library.

Research Variables

A **variable** is a measurable characteristic that varies. It may change from group to group, person to person, or even within one person over time.

- **Dependent variables:** These are the variables which changed according to the independent variable. E.g. A study to assess the effect of hand grip exercises on BP of prehypertensive client. Here dependent variable is BP of prehypertensive client
- **Independent variables:** These are the variables manipulated by the researcher. Researcher has good control over these variables. E.g. A study to assess the effect of hand grip exercises on BP of pre-hypertensive client. Here independent variable is hand grip exercises
- **Extraneous variables:** These are factors in the research environment which may have an effect on the dependent variable(s) but which are not controlled. Extraneous variables may damage a study's validity, making it impossible to know whether the effects were caused by the independent or some extraneous (not measured) factor. If they cannot be controlled, extraneous variables must at least be taken into consideration when interpreting results.
- **Confounding variables:** Extraneous variables become confounding variable if there is an academic evidence that the extraneous variable (which was not measured in the study) has influence (or relationship) on dependent variable.
- **Continuous variables;** It can take a infinite range of values along a continuum, e.g. weight in kg
- **Discrete variables:** It is having a finite number of values between two points, e.g. number of children
- **Categorical variables:** It does not represent quantity or numerical value, E.g. Nominal variable: Gender (male, female), Religion (Hindu, Muslim, Christian) etc.
- **Ordinal variable:** Severity of disease (mild, moderate, severe), Socio-Economic status, e.g. poor, middle class, upper middle class, affluent.

Examples to Explain all These Four Variables

- **Study title:** The impact of teaching style (lectures/seminars) on exam performance of students.
- **Independent variable (IV):** Teaching style (either lectures or seminars).
- **Dependent variable (DV):** Exam performance of students (statistics exam ranging from 0–100 marks).
- **Extraneous variables:** Quality of lecturer and tiredness of students; the researcher was not indented to measure these variable in his/her research.
- **Confounding variables:** If researcher found academic evidence (from research articles from scholarly journals) that quality of the teacher or tiredness of student will affect the exam performance, then **these two variables may be called confounding variables.** Because the researcher cannot be sure that only the independent variable (teaching style) have caused changes in students' performance.

Hypothesis

It is statement which reveals the expected relationship among two or more variables under study. A clearly stated hypothesis explain

- The variables under study
- Population
- Proposed outcome of the study
- Level of significance

Types of Hypothesis

Simple Vs Complex

- Simple hypothesis is one which explain the relationship between two variables. E.g. handgrip exercise among pre-hypertensive client help to decrease the BP reading.
- Complex hypothesis is one which explain the relationship between more than two variables. E.g. knowledge regarding newborn care is higher among the nurses who all are working in labor room and having more experience than the nurses who all are working in other area and less experience.

Directional and Nondirectional Hypothesis

Directional Hypothesis

- It is not only specify the existence of relationship between variables but also specify the direction of relationship between the variables.
- The direction of relationship can be positive and negative.
- The following example explain the positive relationship E.g. nurses with good knowledge regarding organ donation have positive attitude towards organ donation.

Nondirectional Hypothesis

It only specify the existence of relationship between variables and not specify the direction of relationship. There is a relationship between knowledge and attitude regarding organ donation among nurses.

Associative and Causal Hypothesis

Associative hypothesis explains the relationship between two variables in the natural setting without any manipulation. Lower the level of hemoglobin level, higher the incidence of infection among cancer patients.

Causal Hypothesis: It explains the cause and effect relationship between two or more independent and dependent variables. E.g. prevalence of ventilator associated pneumonia is less among the patient who all are receiving oral care using betadine as compared to the patient who all are receiving oral care using hydrogen peroxide.

Null Hypothesis and Research Hypothesis

Null hypothesis states that there is existence of no relationship between variables. It is used for statistical testing and interpretations. Research hypothesis states that there is existence of relationship between the variables.

- **Research hypothesis:** There will be positive correlation between LDL value and systolic blood pressure of adult patients.
- **Null hypothesis:** There will be no correlation between blood cholesterol levels and blood pressure of patients.

RESEARCH DESIGNS

- **Quantitative**
  - Experimental
    - True experimental
    - Pre-experimental
    - Quasi-experimental

Scanned with CamScanner

- Non-experimental
  - Descriptive
  - Correlational
  - Comparative
  - Case-control studies
  - Survey
  - Methodological
  - Explorative
  - Cohort studies
- Qualitative
  - Grounded theory approach
  - Phenomenological study
  - Ethnography
  - Case study method

Quantitative v/s Qualitative Research

In quantitative research, the variables are measured and quantified where as in qualitative research the variables are not quantified.

Nutshell of Experimental Designs

- **Experimental:** Manipulation + Control + Randomization
- **Quasi experimental:** Manipulation + Control/Randomization
- **Pre-experimental:** Manipulation only

Quantitative Research Approach

- The researcher plays an active role by introducing the intervention.
- Characteristics of true experiments are:
  - **Manipulation:** Experimenter does something to at least some subjects (experimental manipulation/intervention).
  - **Control:** Experimenter introduces controls over the experimental situation. Control can be achieved
  - Manipulating
    - Randomizing.
    - Carefully preparing experimental protocols.
    - And/or using a control group.
  - **Characteristics-Manipulation,Control,Randomization:** Experimenter assigns subjects to a control or experimental group on a random basis. Methods of randomization includes flipping a coin, matching, draw of lots (pulling names from a hat), table of random numbers, cluster randomization **(reduces possibility of contamination)**, and Computer-generated random numbers.

Basic Experimental Designs (True Experimental)

- Pretest post-test design (before-after design; **classic experimental design**).
- Post-test only design (after-only design).
- Solomon four- group design.
- Factorial design.
- Randomized block design.
- Crossover design (repeated measure design).

Pretest Post-Test Design

Table 1 Schematic presentation of pretest–post-test design

Group	Pretest	Intervention	Post-test
RC	O_1		O_2
RE	O_1	x	O_2

R-Randomization; C-Control; E-Experimental; O1-Pretest Observation; X-Intervention, O_2- Post-test observation

- Classic experimental design and it is most commonly used in nursing research.
- Two randomized groups; One group receives the experimental treatment and the other group receives no treatment, a placebo treatment, or the usual treatment.
- Treatment is under the control of the researcher.
- The dependent variable is measured twice, before and after the manipulation of the independent variable.
- Comparison of the post-test scores allows determining the effect of the independent variable.

Post-Test Only Design

Table 2 Post-test only design (after-only design)

Group	Pretest	Intervention	Post-test
R C			O
R E		x	O

R-Randomization; C-Control; E-Experimental; O-Post test Observation; X-Intervention

- For both the groups, observation was done only after intervention was administered to experimental group.

Solomon Four Group Design

Table 3 Solomon four group design

Group	Pretest	Intervention	Post-test
RC	O_1		O_2
RC			O_2
RE	O_1	x	O_2
RE		x	O_2

R-R Randomization; RC-Control; RE-Experimental; O_1-Pretest Observation; X-Intervention, O_2- Post-test observation

- Involves two experimental groups and two control groups.
- One experimental and one control group are administered pretest and other groups are not.
- Allows the effects of pretest measure and intervention to be segregated.

Factorial Design

Table 4

Intervention	A1	A2
B1	A1B1	A2B1
B2	A1B2	A2B2
B3	A1B3	A2B3

A1- Treatment 1; A2-Treatment 2; B1, B2, B3-Different levels of treatment

- Used to manipulate two or more independent variables simultaneously.
- Independent Variables - Factors.
- Each factor – levels (two or more).

Scanned with CamScanner

- Treatment condition – cell (Box); for e.g. A1B1 refers to subject receiving treatment 1 (A1) at the level of B1 (once a day).
- Designs can be 2 × 2, 2 × 3, 3 × 3, 3 × 4 example of factorial design.

Randomized Block Design

Table 5 Randomized block design

	Male (B1)	Female (B2)
Intervention -A1	A1B1	A1B2
Intervention - A2	A2B1	A2B2

- It is also Similar to factorial design.
- There are two treatments and two factors but one factor is not experimentally manipulated -Blocking variable: **Gender is the blocking variable in the above example**
- Designs can be 2 × 2, 2 × 3, 2 × 2 × 2.

Crossover Design (Repeated Measure or Counterbalanced Design)

- Involves exposure of same subjects to more than one experimental treatment
- Subjects are randomly assigned to different orderings of treatment.
- Subjects serve as their own control.
- **Extremely powerful design** but inappropriate for certain types of research due to problem of carry-over effects.
  E.g. patient A is randomized to receive Treatment #1 for a period of time. After completing Treatment #1, the patient then "crosses over" and receives Treatment #2.

Quasi Experiments

- Like true experiments, involve the manipulation of an IV, i.e. an intervention.
- However these designs lack either randomization or control.
- Facilitate search for knowledge and examination of causality in situations in which complete control is not possible.
- Developed to control as many threats to validity as possible.

Important Note

Design	Characteristics
Non-experimental	No manipulation
True experimental	Manipulation + Control + Randomization
Quasi Experimental	Manipulation + Some control (No randomization)
Pre-experimental	Manipulation only (no control/randomization)

Quasi Experimental Designs (Controlled Trials without Randomization)

- Non-equivalent control group pretest post-test design
- Non equivalent control group post-test only design (pre experimental).
- **Design-interrupted time series design (one group):** Information is collected over an extended period and an intervention is introduced during that period. Seasonal variations or other cyclical influences can be interpreted as treatment effects.

O1 O2 O3 O4 X O5 O6 O7 O8

- Time series non equivalent control group design (two group but not randomized).

O1 O2 O3 O4 X O5 O6 O7 O8
O1 O2 O3 O4 O5 O6 O7 O8

- Time series with multiple institutions of treatment: Multiple treatments will be implemented over an extended period of data collection.

O1 O2 X O3 O4 X O5 O6 X O7 O8

- Time series with intensified treatment: In this design treatment is intensified over a period of time.

O1 O2 X O3 O4 X O5 O6 X O7 O8
O1 O2 X O3 O4 X+1 O5 O6 X+2 O7 O8

- Time series with withdrawn and reinstituted treatment: Treatment is instituted and withdrawn alternatively between observations over a period of time.

O1 O2 X O3 O4 (-X) O5 O6 X O7 O8

Limitations of Quasi-experiments

- Several rival hypotheses competing with intervention as explanation for the results.
- Take the weaknesses into account in interpreting results.
- Conclusion depends on part of human judgment rather than more objective criteria, cause and effect inferences may be less convincing.

Note

- Single blind studies involve masking one group (either participants or investigator) and double blind studies involves masking of two groups (both participants and investigator)
- Partially randomized patient preference design involve randomizing patient without treatment preference and Randomized consent (Zelen design) randomize prior to informed consent.

MIXED METHOD RESEARCH

Mixed method research is the research involving collection,analysis and integration of both qualitative and quantitative data with in a study or series of studies often with an overarching goal of achieving both discovery and verification.

Mixed Method Designs

In general Mixed method designs are either concurrent or sequential. Here below mentioned, all capital letters for dominant strand and all lower case letters for non dominant strand sequence. An arrow is used for sequential designs and + is used for concurrent designs.

- Triangulation design (QUAL + QUAN)
- Embedded design (QUAN ⇒ qual or quan ⇒ QUAL)
- Explanatory design (QUAL (quan) or QUAN (qual)
- Exploratory design (QUAL ⇒ quan or qual ⇒ QUAN)

Scanned with CamScanner

Major Types of Data Collection Methods

- **Self-reports:** By questioning people. For e.g. Attitude, knowledge, economic status, etc.
- **Observation:** By observing people. For e.g. Non verbal communication, sleep wake cycle, facial expressions, injection technique, etc.
- **Biophysiologic measures:** requires technical instruments; most accurate method of data collection. E.g. Height, weight, Blood pressure, etc.
  - **In vivo:** Performed on or with people or living organisms.
  - **In vitro:** Data gathered and then subjected to laboratory analysis.

Types of Qualitative Self-Reports

- **Unstructured interviews:** Interview conducted without any planned/prepared questions.
- **Semi-structured interviews:** Interview conducted with open ended questions.
- **Focus group interview:** In a focus group interview, a group of four or more people is assembled for a discussion.
- **Joint interview:** In phenomena that involve a relationship between two or three people, or that requires understanding the perspective of more than one person.
- **The Think-Aloud method:** This is a qualitative method that has been used to collect data about cognitive processes, such as thinking, problem solving, and decision making.
- **Photo elicitation interview:** It involves an interview stimulated and guided by photographic images.
- **Self-report narrative on the internet:** A potentially rich data source for qualitative researcher involves narrative self-reports available on or through Internet.
- **Life histories, oral history, and critical incidents.**
- **Diaries and Journals.**

Quantitative Self-Reports

- A researcher collecting structured self-report data for a quantitative study almost always uses a **form**, written instrument.

Table 6 Types of close-ended question

Type	Examples
Dichotomous question	Question with two options Had your breakfast today? Yes No
Multiple choice question	More than two option will be there. Capital of India is ..... New Delhi, Mumbai, Kolkata, Bangalore
Cafeteria question	People with different opinion can select any answer which is matching with their idea Select your view regarding oestrogen replacement among the following Estrogen replacement should be banned Estrogen replacement has good as well as bad effect on the body Estrogen replacement has a lot of beneficial effect In long term point of view estrogen has only bad effect on the body
Rank order question	In this type of question clients will be asked to rank their interest/ opinion. Arrange the following needs of human being as per your priority? Oxygen, shelter, water, job, family
Forced choice question	It makes the respondents choose a response option that indicates a definitive opinion. Blood donation will helpful to have a healthy lifestyle Strongly agree Agree Disagree Strongly disagree
Rating question	On a scale respondent asked to rate their response Indicate your hospital satisfaction in a 1-10 scale 0 means least satisfaction 10 means highly satisfied

Contd...

Q-Sort Technique/Q-Methodology

- Q methodology **(Stephenson, 1975)** uses a **Q-sort** procedure, which involves sorting a deck of cards according to specified criteria.
  - In Q-sort participants are presented with a set of statement card
  - Participants are asked to sort the cards along a particular dimension, such as approve/disapprove.
  - The numbers of cards are typically 60 to 100.
  - Cards are sorted into 9 or 11 piles.

Delphi Technique

- The Delphi technique is used to measure the judgments of a group of experts for the purpose of making forecast.
- **Three types**
  - **Classic Delphi:** Focus is on reaching on consensus.
  - **Policy Delphi:** The aim is not consensus but rather to identify and understand a variety of view point.
  - **Decision Delphi:** The panel consists of individuals in decision making.

Likert Scale

- A Likert scale is an ordinal scale format that asks respondents to indicate the extent to which they **agree or disagree** with the opinion expressed by the statement.
- Likert scale is also called as **rating scale.**
- An ideal Likert Scale will have seven point responses.
- Likert scale with odd number of (3, 5, 7.9 and so on) points responses will have more reliability than the scale with even number of responses.

Semantic Differential Scale

- The Semantic Differential (SD) scale measures attitude and beliefs.
- A SD scale consists of two opposite adjectives such as effective/ ineffective, good/bad, important/unimportant or strong/weak that captures a person's attitudes and/or feelings about a given object.

Scanned with CamScanner

Visual Analogue Scale (VAS)

- The VAS is a straight line, the end anchors of which are labeled as the extreme limits of the sensation or feeling being measured.
- They are used to measure subjective experiences, such as pain, fatigue, nausea and dyspnea.
  E.g. pain scale (Graphical rating scale).

Figure 1 ■ Example of graphic rating scale

Validity and Reliability of Scales

- **Validity:** Validity of the scale refers to the extent to which the scale measures what is intended to be measured.
  - **Internal validity:** The extent to which it can be inferred that the independent variable caused or influenced the dependent variable.
  - **External validity:** The generalizability of the observed relationships across samples, settings, or time.
  - **Construct validity:** The degree to which key constructs are adequately captured in the tool for measuring study variable.
  - **Statistical conclusion validity:** The ability to detect true relationships statistically.
- **Reliability:** Reliability of the scale refers to consistency of the tool to measure the variable on repeated administration.
  - **Test-retest reliability:** It refers to the degree to which test results are consistent over time. In order to measure **test-retest reliability**, we must give the same **test** to the same individuals on two occasions and correlate the scores.
  - **Inter-rater reliability: Inter-rater reliability, inter-rater** agreement, or concordance is the degree of agreement among raters. It gives a score of how much homogeneity, or consensus, there is in the ratings given by judges.
  - **Split-half reliability:**. If the two halves of the test provide similar results then this would suggest that the test has internal **reliability.** A test can be **split** in **half** in several ways, e.g. first **half** and second **half**, or by odd and even numbers.
  - **Internal consistency: Internal consistency** is typically a measure based on the correlations between different items on the same test.
  - **Parallel forms reliability:** It is a measure of reliability obtained by administering different versions of an assessment tool.

SAMPLE AND SAMPLING TECHNIQUE

- **Sampling:** Sampling is the process of selecting a small number of elements from a larger defined target group of elements.
- **Population:** A complete set of persons or objects that possess some common characteristics of interest to the researcher.
- **Target population** is made up of the group of people or objects to which the researcher wishes to generalize the findings of the study.
- **Actual population** is that group that is actually available for study by the researcher.

- **Sample:** A subset of population that is selected to represent the population.
- **Sampling frame:** A sample frame is a list that includes every member of the population from which a sample is to be taken.
- **Sampling error:** It is any type of bias that is attributable to mistakes in either drawing a sample or determining the sample size.
- **Representative sample:** A representative sample has all the important characteristics of the study population from which it is drawn.

Steps of Sampling Process

Figure 2 ■ Steps of sampling process

Types of Sampling Methods

- Probability sampling
  - Simple random sampling
  - Systematic random sampling
  - Stratified random sampling
  - Cluster sampling
- Nonprobability sampling
  - Convenience sampling
  - Judgment sampling (purposive sampling)
  - Quota sampling
  - Snowball sampling

Probability Sampling

This involves random selection of elements from a population. Each subject has equal chance of being selected for the research study.

Simple Random Sampling

Researchers establish a sampling frame, from which the sample will be chosen. It is used in situations where the **number of sampling units is relatively small.** Lottery method may be used to select subjects from sampling frame.

Systematic Random Sampling

The defined target population is ordered and the sample is selected according to position using a skip interval. Skip interval (k) is the standard distance between elements chosen for the sample. For example, you want sample of 8 houses (n) from a street of 120 houses (N).

Scanned with CamScanner

Sampling interval (k) = N/n
= 120/8
K = 15

Every 15th house is chosen after a random starting point between 1 and 15. If the random starting point is 11, then the houses selected are 11, 26, 41, 56, 71, 86, 101, and 116.

Stratified Random Sampling

- The population is divided into different subgroups and samples are selected from each subgroups.
- The population is divided into groups, based on some characteristic. The groups are called **strata.**
- Divide the target population into homogeneous strata.
- Draw random samples from each stratum.
- Combine the samples from each stratum into a single sample of the target population.

Example: Suppose we conduct a national survey. We might divide the population into groups or strata, based on geography —North, East, South, and West. Then, within each stratum, we might randomly select survey respondents.

Cluster Sampling

- The entire population of interest is divided into groups, or clusters.
- With cluster sampling, every member of the population is assigned to one and only one group.
- Each group is called a cluster. Each cluster must be mutually exclusive.
- A sample of clusters is chosen, using a probability method.
- Only individuals within sampled clusters are surveyed.
- After clusters are selected, then all units within the clusters are selected.

Note

Difference between Stratified sampling and Cluster sampling: With stratified sampling, the sample includes elements from each stratum. With cluster sampling, in contrast, the sample includes elements only from sampled clusters.

Nonprobability Sampling

Non-probability sampling technique is a method, where sample is selected by nonrandom method.

- **Convenient sampling:** Researcher selects a sample which is most readily or more conveniently available to the researcher. This kind of sampling technique is also called **accidental sampling** technique. This is considered to be the weakest method of sampling technique.
- **Snowball sampling:** participants or the members of sample are requested to refer other people who may meet the eligibility criteria set by the researcher to participate in the research study but are inaccessible to the researcher. This method is also referred as **chain sampling** or **network sampling.** E.g. The researcher may identify, one or two **drug addicts** and then ask them to get more **drug addicts** through their contacts.
- **Quota sampling:** The researcher divides the population into various homogenous segments or quotas or subgroups. The researcher selects sample from each segment or each quota by convenient sampling technique.
- **Purposive sampling (Judgmental sampling):** The researcher draws a sample with a specific purpose that is associated with the research study.

Sampling in Mixed Method Research

- Identical sampling
- Parallel sampling
- Nested sampling

Determinants of Sample Size

- Type of analysis to be employed
- The level of precision needed
- Level of significance for testing hypothesis
- Population homogeneity/heterogeneity
- Available resources
- Sampling technique used.
- Effect size of previous similar studies.

ETHICS IN RESEARCH

Ethics: What is right and what is wrong.

- **Principle of beneficence**
  - Establishing the positive risk benefit ratio.
  - A potential risk of the research study must be carefully assessed.
  - Participants are protected from any harmful effect of research activity.
- **Principle of respect of human dignity**
  - This principle emphasizes on the freedom of choice, where participants have right to accept or reject to be a part of the research study.
  - Participants have full right to question the researcher for any additional information.
  - Participants have right to quit from the study at any stage of the research study.
  - A fully informed consent must be obtained from the participant. In case of the fetus, child, psychological, neurological or physical inability the informed consent can be obtained from parents or legal guardians.
- **Principle of justice**
  - This ethical principle directs the researchers to abide by the participant's right of fair treatment and maintenance of privacy.
- **Principle of non-maleficence:** Do no harm
- **Principle of autonomy:** Participants can make his own decisions about whether to participate in research.

DATA ANALYSIS AND INTERPRETATION

Types of Data

- **Ungrouped and grouped**
  - **Ungrouped data** is presented individually. E.g. Weight of 11 patients visited OPD. Mr. Ram, 60 kg; Kapoor, 55 kg; Amit-72 kg, etc.
  - **Grouped data** presented as groups consisting of identical data by frequency. E.g.

Systolic blood pressure	Frequency
90–100	5
101–110	9
111–120	12
121–130	10

Class Interval

While grouping the data, there are two types of class intervals used. i.e.

- Inclusive class interval
- Exclusive class interval

Scanned with CamScanner

Inclusive Class Interval

When the lower and the upper class limit is included in the class interval

E.g.: class A 0–15 B 16–30 C 31–45

For Class B,

Lower class boundary = 15.5 Upper class boundary = 30.5

Inclusive class interval = Upper class boundary – lower class boundary = 30.5 – 15.5 = 15

Exclusive Class Interval

When the lower limit is included, but the upper limit is excluded

E.g.: class A 0–15 B 15–30 C 30–45

For Class B

Lower class limit (LCL) = 15

Upper class limit (UCL) = 30 (not included)

Exclusive class interval = UCL – LCL = 30 – 15 = 15

Difference: In Exclusive class intervals, the upper class limit is excluded from the class (It is added to the next class).

In inclusive class intervals, both lower and upper class limit is included in the same class. i.e it will fall between upper and lower class boundaries.

Qualitative and Quantitative Data

- **Qualitative:** Non numerical, based on nominal or ordinal scale. E.g. Gender (male/female), religion (hindu/muslim/Christian).
- **Quantitative:** Numerical or based on numbers. E.g. Height in cm, weight in kg.

Continuous and Discrete

- **Continuous:** Data for which unlimited number of possible values exist, e.g. Height, weight. (includes decimals).
- **Discrete:** Data for which distinct categories and a limited number of possible values exist, e.g. Number of children in a family.

Variables

- A **variable** is **defined** as anything that has a quantity or quality that varies from person to person. For example. Age of the patients.
- **Qualitative variables:** Variables that can take a few values, that are not measurable, but are only attributes or qualities and are called 'Qualitative Variables'. E.g. Gender (male, female), Religion (Hindu, Muslim, Christian, etc).
- Since Qualitative variables can take a few values or categories, they are also called **Categorical variables.**
- **Quantitative variables:** Quantitative variables are measurable and can take any value on a continuous spectrum. They are also called
- **Continuous variables. Examples:** Blood sugar, serum creatinine, age, income, height, weight, etc.

Types of Variables

Scales of Measurements

- Categorizing subjects into different groups (*grouping by gender, religion*), then ***Nominal* scale** is the way to go. **Dichotomous scale:** Where data is divided into only two categories or group. E.g. Male or female.
- If you can rank ordering people along some dimension, then ***Ordinal* scale** is best (*ranking basketball teams, SES*).
- To quantify a trait on a scale where the distance between ranks is same, then the ***Interval* scale** is the way (*temperature*).
- To measure something on a scale where there is a true zero point, then a ***Ratio* scale** should be used (*weight, pulse, Hb*).

Strength of Measurement Scales

Weaker ← Nominal – Ordinal – Interval – Ratio → Stronger

OK to compute....	Nominal	Ordina l	Interval	Ratio
Frequency distribution	Yes	Yes	Yes	Yes
Median and percentiles	No	Yes	Yes	Yes
Add or subtract	No	No	Yes	Yes
Mean, SD, standard error of the mean	No	No	Yes	Yes
Ratio, or coefficient of variation	No	No	No	Yes

Scanned with CamScanner

NUMERICAL DATA PROPERTIES AND MEASURES

Central Tendencies

Mean

Stable average, which is based on all observations. Calculated for quantitative data, measured in interval /ratio level.

Median

Score that divides a distribution exactly in half. Exactly 50% of the data fall above the median and 50% below. To determine the median, sort the data and find the midpoint.

Mode

Mode is the **most frequently** occurring observation. Mode is not affected by extreme values.

Variation

Measures of Dispersion

- **Range:** Difference between the highest and lowest data points.
- **Variance, SD:** Standard Deviation is the square root of variance. SD gives us an idea of 'spread' of dispersion. Larger the SD, greater the dispersion of values about mean.
  It is the best and **most frequently used measure of dispersion.**

Probability Curve; Normal Curve

In a normally distributed data, **Mean = Median = Mode**

Normal Distribution: Standard Normal Curve or Gaussian Curve

- *Smooth, bell-shaped, perfectly symmetrical curve, based on an infinitely large number of observations.*
- Total area of the curve is 1; its mean is zero; and its standard deviation is 1.
- *Mean, median and mode all coincide.* Mean divides the area under the curve into 2 equal halves.
- A random variable (x) is standardized when it has been adjusted so that its mean = 0 and SD = 1.
- ***Standardization*** = (x-)/σ.

Shape

Kurtosis and Skewness

Table 7

Skewness	Interpretation
Positive (Mean>Median)	Tail is toward right. Large number of low scores and small number of high scores.
Negative (Mean<Median)	Tail is toward left. Large number of high scores, small number of low scores.

Scanned with CamScanner

Histogram

Presentation of Statistical Data

- It is a pictorial diagram of frequency distribution used for continuous and ordered data.
- It has a series of blocks adjacent to each other *with no intervening space and area of each block is proportional to the frequency.*
- Class intervals are given along the horizontal axis and frequencies along the vertical axis.
- **Frequency polygon** (an area diagram) *is formed by joining the mid-points of the histogram blocks.*
- Frequency curve
  - If number of observations is very large and group interval is reduced and frequency polygon loses its angulations resulting in a smooth curve known as frequency curve.

Figure 3 ■ Histogram

Line Diagram

- Line diagrams are used to show the trend of events with the passage of time.

Figure 4 ■ Line diagram

- **Cumulative frequency curve or *Ogive***
  - *It is a line diagram, showing cumulative frequency distribution of quantitative data.*
  - Curve is plotted by taking the variable on X axis and cumulative frequency on Y axis.
  - Median can be calculated from Ogive.

Figure 5 ■ Cumulative frequency curve

Pie Charts

Serum Sodium concentration 1000 people

- Areas of segments of a circle (*depends upon the angle at centre*) are compared.
- Considered inferior to bar charts. It is often necessary to indicate percentages in segments.

Figure 6 ■ Pie chart

- Pictogram (a form of bar chart):
  - Used to present data to "man on street" or lay man who cannot understand orthodox charts.
  - Small pictures or symbols are used to present data.
  - Fractions of picture can be used to represent numbers smaller than the value of a whole symbol.

Scanned with CamScanner

APPLICATION OF INFERENTIAL STATISTICS

Test of Significance

Table 8

Attribute	Types of data	Distribution	Number of groups	Statistical test
Unpaired groups or ≥2 independent sample/ group	Quantitative	Parametric	2 groups	Unpaired 't' test
			>2 groups	One way ANOVA
		Nonparametric	2 groups	Mann Whitney
			>2 groups	Kruskal wallis
	Qualitative (Categorical)		2 groups	Chi Square, Fisher exact
	>2 groups		Chi Square	
Paired Groups (E.g. Before and After)	Quantitative	Parametric	2 groups	Paired 't' test
			>2 groups	Repeated measures ANOVA
		Nonparametric	2 groups	Mann Wilcoxon
			>2 groups	Friedman's test
	Qualitative (Categorical)		2 groups	Mc Nemar test
	>2 groups		Cochran's Q test	
Looking for an association between two variables	Quantitative	Both variables are parametric	Pearson's Correlation Coefficient 0 = No correlation, +ve=Direct Correlation, -ve = Inverse coorelation	
		Both variables are nonparametric	Spearman's rank correlation coefficient, **Kendall's** test	
	Qualitative (Categorical)	2 × 2 data	Risk Ratio	
		Otherwise	Chi square for trend, Logistic regression	

Student 't' Test (Devised by WS Cassette)

- Based on *"t" distribution* (a continuous, symmetrical, bell shaped, unimodal distribution of infinite range similar in shape to normal distribution, but more spread out).
- Used to find the significance of difference between two means, when sample size is less than 30.
  - **Student t test for single small sample** → compares a single sample mean with population mean.
  - **Student t test for independent samples (Unpaired t test)** compares mean of 2 small samples
  - **Student t test for paired samples (Paired t test)** compares mean of 2 small paired samples (before and after)
- Used to evaluate the null hypothesis for continuous (quantitative) variables (e.g. height, weight, BP).

Chi-Square Test (χ^2) -Developed by Karl Pearson

- It is a nonparametric test *used for qualitative data* in form of proportions.
- It is an alternate method of testing the significance of difference between two proportions.
- Used as a test of goodness of fit (whether observed frequency distribution differs from theoretical distribution (i.e. normal, binomial or Poisson) by chance or sample is from a different population)
- *Advantage*: This can also be used when more than two groups are to be compared.

Yates correction: Applied when the expected frequency in any cell of the 2 × 2 contingency table is less than 5. It decreases the likelihood of type I error

Spearman's Rank Correlation Coefficient (RHO)

- Used when measurements are in terms of ranks
- *It is used* to determine whether there is a *monotonic relation between 2 variables* (i.e. Increase in one is associated with increase or decrease in other)
- Value of Rho ranges between - 1 [Inverse or negative relationship] and + 1 [Positive relationship]
  - Values between – 0.1 to – 0.3 and 0.1 to 0.3 → indicate *weak relationship*
  - Values between – 0.3 to – 0.5 and 0.3 to 0.5 → indicate *moderate relationship*
  - Values < – 0.5 and > 0.5 → indicate *strong relationship*

Degree of Freedom [DF]

- In chi square test, ***DF = (c - 1) (r - 1)***; c = Number of columns; n = Number of rows
- In unpaired 't' test, DF = n1+ n2 – 2, where n1 and n2 are number of observation in each series.
- In paired 't' test, DF = n-1
- In testing the significance of correlation, DF = n – 2, n is the number of paired measurements.

Scanned with CamScanner

p Value

- 'p' value is the actual probability of committing type 1 error. It is based on statistical calculation.
- If, $p < \alpha$ (usually taken as 5% or 0.05), the association is statistically significant and null hypothesis is rejected.

Null hypothesis assumes no significant difference between 2 samples, whatever difference occurs is by chance.

Null Hypothesis	Accepted	Rejected
True	Correct conclusion	Type I (α) error
False	Type II (β) error	Correct conclusion

Type I Error or α Error

- *Rejecting a null hypothesis when actually it is true* (a statistically significant difference is found between two groups when actually there is no difference).
- If null hypothesis is false there can be no type I error.
- Probability of a type I error is equal to alpha.
- Multiple comparisons and repeated testing for significance increase likelihood of type I error. Type I error is important in *sample size determination and* statistical testing for significance.

Type II Error or β Error

- *Acceptance of a null hypothesis as true when actually it is false.*
- The study fails to find a statistically significant difference when actually there is a difference.
- If null hypothesis is true there can be no type II error.
- Probability of a type II error is equal to beta.
- *It is inversely related to type I error.*

Type II error or β error is used to determine the power of study = 1 – β

Power of a trial *is the probability that the study would reject a null hypothesis as false when it is actually false.*

- It is the ability to detect a true difference in outcome between control arm and intervention arm
- *Conventionally power of a study is taken as 0.8* Q, i.e. a study that has less than 80% chance of detecting a false null hypothesis is unacceptable.

As sample size increases power of study increases. Power is a determinant of sample size in clinical trials.

Cronbach's α (alpha) is a measure of *internal consistency or reliability.* Alpha varies from 0 to 1.

Cronbach's	≥ 0.9	0.9 > α ≥ 0.8	0.8 > α ≥ 0.7	0.7 > α ≥ 0.6	0.6 > α ≥ 0.5	α < 0.5
Internal consistency	Excellent	Good	Acceptable	Questionable	Poor	Unacceptable

Parametric and Nonpharametric Test

Parametric tests are those test which makes assumptions about parameters of population distribution from which ones data are drawn, while non parametric tests is that which make no such assumptions

Table 9

Parametric tests	Nonparametric test
Z test, 1-sample t test	Wilcoxon Signed Rank
Paired (Dependent)sample t test	Mann-Whitney
2(independent) sample t test	Kruskal-Wallis
1-way Anova	Friedman
2-way Anova	Chi-square test of independence

Golden points to remember

- **A research proposal** is a document proposing a research project.
- **Reliability** refers to degree of consistency or accuracy with which an instrument measures for which it is designed to measure.
- **Validity**: Degree to which an instrument measures what it is intended to measure.
- **Attrition** means progressive loss of data in research. It occurs when cases are lost from a sample over time or over a series of sequential processes.
- Hawthorne effect: The subject in a research study behaves in a particular manner because they are aware that they are being observed.
- Realistic expectation which is something that we believe to be true is known as **Assumption.**
- **Hypothesis** is a statement of tentative prediction of relationship between two variables.
- **Simple hypothesis** – predicts relationship between two variables.
- **Complex hypothesis** – predicts relationship between more than two variables.
- **Null hypothesis** – states that there is no relationship between variables.
- **Directional hypothesis** – Statement specifies the direction of change, e.g. exercise therapy will **reduce** weight in obese individuals.
- **Non-directional hypothesis** – statement does not specify the direction of change. For example, Vitamin C administration **affects** iron absorption in the guts.
- **A literature review is** everything that is known about subject.
- In quantitative research studies, the literature review should occur early in the research process.
- The aggregate of individuals who are accessible to the researcher from which the samples are selected for the research study is known as **accessible population.**
- The aggregate of individuals for which the researcher wants to generalize the findings of research study is known as **target population.**
- **External validity** denotes the results of a study which can **be generalized across the situations**, stimuli and people.
- **Internal validity** refers to the extent in which the evidence supports the claim in regard to cause and effect, **within the context of that study.**
- A "Research Design" is a framework or blueprint for conducting the research.
- Experimental research methods are useful in establishing cause and effect relationship.
- True experimental research is the most accurate form of experimental research design.
- Correlational research is a type of descriptive research.
- Qualitative research designs include phenomenology, ethnography, grounded theory, historical research, and case study.
- **Triangulation** refers to the use of multiple **methods** or data sources in qualitative **research** to develop a comprehensive understanding of phenomena.
- A pilot study is a research study conducted on a small scale before the intended study.
- Bio-physiological method of data collection is most reliable and accurate method.
- A dichotomous variable is a nominal variable that have only two categories or values. Example: Gender (male and female).
- A careful appraisal of the strengths and weaknesses of the study is known as **Research critique.**
- Conceptual definition provides the theoretical meaning of a variable and is often derived from a theorist's definition of a related concept.
- **Hawthorne effect:** Tendency of subjects to perform better when they are aware that they are being observed.
- **Experimental effect:** Researcher's characteristics, mannerisms or behavior may influence subject behavior.
- **Reactive effect:** Reactive effect of pretest occurs when subjects have been sensitized to the treatment because of taking a pretest.
- **Novelty effect:** When a treatment is new, subjects and researcher might behave in different ways.
- The word statistics was first used by a German scholar Gottfried Achenwal.
- **Nominal** measurement consists of categories that are not more or less than each other but are different from one another. Example: **gender:** male, female. **Religion:** Hindu, Muslim, Christian.
- **Ordinal** level of measurement ranks items based on their relative standing on a specific attribute. The degree of difference between items cannot be measured. **Examples:** Income: low, middle, upper. Disease status: Mild, Moderate, Severe.
- **Interval scale:** The degree of difference between items can be measured but the ratio between them cannot be measured. Zero is arbitrary. **Examples**: temperature, pH.
- **Ratio** represents continuous values. The degree of difference and ratio between each item can be measured. **Examples:** height, weight, distance.
- Ratio scale has a constant interval and a true zero point.

Contd...

Scanned with CamScanner

- Mean, median and mode are **measures of central tendency.**
- **Median** is the point on a numerical scale above which and below which 50% of cases falls.
- 50th percentile is equivalent to Median.
- Median is the middle value of a data set. Commonly used for description of data with non-normal distribution.
- IQR refers to Inter-Quartile Range. It is the deference between 25th percentile and 75th percentile of a data set.
- Mode is the value which has highest frequency.
- Mean is the average of all the values. Most commonly used parameter in a normally distributed data.
- Range, standard deviation and variance are **measures of dispersion.**
- The **range** of a set of data is the difference between the highest and lowest values in the set.
- The **standard deviation** is a statistic that measures the dispersion of a dataset relative to its mean.
- Standard deviation is square root of variance; or variance is square of standard deviation.
- If mean is less than the median, then the data is said to be **Negatively skewed.**
- In a negatively skewed data distribution **Mean < median < Mode.**
- If mean is more than the median, then the data is said to be positively skewed.
- In a positively skewed data distribution **Mode < median < Mean.**
- Chi-square test is a non-parametric test used to find out association between two unrelated categorical variables.
- McNemer test is used to find out relationship between two related categorical variables.
- Independent sample 't' test or student's t test or unpaired 't' test is used to compare means of two independent groups. For example, to compare the mean haemoglobin level of males and females.
- One-way ANOVA is used for comparison of means between three or more independent groups.
- Sphericity assumption in repeated measures one-way ANOVA is tested using the **Mauchly's test.**
- **The *F-statistic* is calculated in ANOVA.**
- Paired 't' test is used for comparison of means of two related (paired) observation from the same group. For example, to compare pre-test and post-test haemoglobin level of same group.
- Repeated measures ANOVA is used for comparison of means of three or more observation of same group.
- t-test and ANOVA (F test) are parametric tests.
- Chi-square test, Mann-Whitney U test, Wilcoxon rank sum test, Kruskal-Wallis H test are non-parametric tests.
- The formula to calculate degree of freedom (df) in Chi-square test is **(c – 1) (r – 1).**
- The formula to calculate degree of freedom (df) in t-test is n-1.
- Pearson correlation is used to find linear relationship between two normally distributed continuous variables.
- Spearman correlation is used when the data is not normally distributed.
- Scatter plot diagram is used to illustrate correlation.
- Correlation values fall on scale between -1 and +1. Value close to ±1 indicates strongest correlation. The value that is farthest from ±1 indicates weakest or no correlation.
- Probability values fall on scale between **0 and 1.**
- **Type I error (α) occurs** when a true null hypothesis is rejected.
- A type-I error refers to **False positive (similar to wrong diagnosis).**
- Type II error (β) occurs when one fail to reject a null hypothesis that is actually false.
- A type-II error refers to **False negative (Similar to missed diagnosis).**
- p value refers to probability of type-1 error (α).
- The sensitivity of a statistical test is measured by its power. Power refers to 1 – β.

Image-Based Questions

1. **In an agreement between SpO_2 of two groups with and without micropore in a pediatric population the values spotted is as below. Which of the following is true?**
[AIIMS November 2016]

a. There is no agreement between the two groups
b. The two groups have a constant relation with a variation of 3%
c. The is no association between the two groups
d. The curve shows a regression line means correlation

2. **Identify the statistical diagram shown in photograph**
[Recent Question 2017]

a. Pie chart
b. Pictogram
c. Scatter diagram
d. OGIVE

3. **In the diagram depicted here, how much is the area between points A & B, on either side of the mean?**
[Recent Question 2016]

a. 68.3%
b. 95.4%
c. 99.7%
d. 102.5%

4. **In the following type of distribution**
[Recent Question 2016]

a. Mean = Median = Mode
b. Mean > Median > Mode
c. Mode > Median > Mean
d. Median > Mode > Mean

5. **Identify the epidemiological study design**
[Recent Question 2014]

a. Cohort study
b. Case Control study
c. Cross Sectional study
d. Nested Case Control study

6. **Identify the epidemiological study design**
[Recent Question 2013]

a. Cohort study
b. Case Control study
c. Cross Sectional study
d. Nested Case Control study

Ans.

1. d
2. a
3. c
4. b
5. a
6. b

[Courtesy: PHOTON-20® 4th ed. by Vivek Jain, CBS Publishers and Distributors Pvt Ltd]

7. Identify the epidemiological study design

a. Prospective Cohort study
b. Case Control study
c. Retrospective Cohort study
d. Nested Case Control study

8. Identify the epidemiological study design

a. Prospective Cohort study
b. Cross Sectional study
c. Retrospective Cohort study
d. Nested Case Control study

9. Identify the epidemiological study design

a. Prospective Cohort study
b. Meta-analysis
c. Retrospective Cohort study
d. Randomized Control Trial

10. Identify the statistical diagram shown in photograph *[AIIMS November 2015] [Recent Question 2015]*

a. Funnel plot
b. Forest plot
c. Stem and Leaf plot
d. Box and Whisker plot

11. Type of sampling shown in figure is *[Recent Question 2015]*

a. Simple random sampling
b. Systematic random sampling
c. Stratified random sampling
d. Cluster random sampling

12. Identify parameter represented by 'Black arrow'

a. Mean
b. Median
c. Mode
d. Range

Ans.

7.	c
8.	b
9.	d
10.	d
11.	d
12.	b

Scanned with CamScanner

13. Identify the statistical diagram shown

a. Frequency polygon
b. Histogram
c. Line diagram
d. OGIVE

14. Identify the statistical diagram shown *[Recent Question 2014, 2016]*

a. Scatter diagram
b. Cumulative frequency diagram
c. Line diagram
d. Pictogram

15. In the given scatter diagram, correlation coefficient 'r' will lie between *[Recent Question 2014]*

a. 0 and 1
b. 0 and −1
c. 1 and -1
d. 0 and 100

16. Identify the statistical diagram shown *[Recent Question 2013]*

a. Histogram
b. Pie chart
c. Bar diagram
d. OGIVE

17. Identify the statistical diagram shown

a. Simple bar chart
b. Multiple bar chart
c. Cluster bar chart
d. Component bar chart

18. Identify the diagram shown *[Recent Question 2012]*

a. Stem and leaf plot
b. Pie chart
c. Venn diagram
d. Flow chart

Ans.

13. d
14. a
15. b
16. c
17. d
18. c

19. Identify the diagram shown

a. Stem and leaf plot
b. Box and Whisker plot
c. Venn diagram
d. Pictogram

20. Identify the diagram shown

a. Histogram
b. Line diagram
c. Box and Whisker plot
d. Kaplan Meier plot

21. Identify formula shown in picture

$$\chi_c^2 = \Sigma \frac{(O_i - E_i)^2}{E_i}$$

a. Paired Students' t test
b. ANOVA test
c. Mean test
d. Chi square test

22. Identify the Statistical diagram shown

a. Funnel plot
b. Forest plot
c. Spaghetti plot
d. Mosaic plot

23. Identify the Statistical diagram shown

a. Funnel plot
b. Dot plot
c. Spaghetti plot
d. Q-Q plot

24. A study was conducted to see the effect of pulse oximeter readings in neonates with and without micropore. A plot between the two values was made as shown in the figure below. What conclusion can be drawn from the plot?

[AIIMS November 2016]

a. There is a positive correlation with constant 3% increase in Y-axis value
b. There is a constant negative correlation between two variables
c. There is a constant positive correlation between two variables
d. There is no correlation

Ans.

19. b
20. d
21. d
22. b
23. d
24. c

Scanned with CamScanner

25. Identify the distribution shown

[Recent Question 2015]

a. Normal distribution
b. Right skewed distribution
c. Left skewed distribution
d. Poisson's distribution

26. Identify the statistical diagram shown

a. Histogram
b. Frequency polygon
c. Line chart
d. OGIVE

27. Identify the statistical diagram shown

[Recent Question 2014]

a. Frequency polygon
b. Histogram
c. Frequency curve
d. OGIVE

28. Identify the statistical diagram shown

[Recent Question 2014]

a. Frequency polygon
b. Histogram
c. Line diagram
d. OGIVE

29. Type of sampling shown in figure is:

a. Simple random sampling
b. Systematic random sampling
c. Stratified random sampling
d. Cluster random sampling

30. Identify the diagram shown in figure:

a. Simple bar chart
b. Frequency diagram
c. Component bar chart
d. Histogram

Ans.

25.	b
26.	b
27.	c
28.	c
29.	c
30.	d

"Health is the greatest of all possessions; a pale cobbler is better than a sick king. "

—Isaac Bickerstaff

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

NURSING RESEARCH

1. The terminology used to explain the number of subjects recruited to participate in a study decline during a course of the project *(AIIMS Raipur NO 2019)*

a. Variability
b. Heterogenetic
c. Homogeneity
d. Attrition

Explanation: Attrition means "wearing away" or progressive loss of data in research. It occurs when cases are lost from a sample over time or over a series of sequential processes. Sample attrition is commonly expected in a longitudinal studies or experimental studies..

2. Probability sampling includes all the following techniques, except *(AIIMS Raipur NO 2019)*

a. Systematic sampling
b. Simple random sampling
c. Purposive sampling
d. Cluster sampling

Explanation: Purposive sampling or judgmental sampling is a nonprobability sampling technique. Subjects are chosen with a specific purpose in mind. **Example:** A study is focused on the victims of a sexual assault. Purposive sampling technique is used to find and collect the subjects who were victims of sexual assault.

Other options are type of probability sampling technique where each of the subject in the population gets equal chance to be selected as a sample.

3. The subject in a research study behaves in a particular manner because they are aware that they are being observed. This is called *(AIIMS Raipur NO 2019)*

a. Hawthorne effect
b. Experimental effect
c. Reactive effect
d. Novelty effect

Explanation: Hawthorne effect refers to the tendency of subjects to perform better when they are aware that they are being observed.

Experimental effect: Researcher's characteristics influence subject behavior.

Reactive effect: Reactive effect of pretest sensitivity on the posttest.

Novelty effect: Subjects and researcher might behave in different ways when exposed to new treatment.

4. The evidence to assert, whether or not, experimental treatment/condition has made the difference refers to: *(NCFL 2019)*

a. External validity
b. Internal validity
c. Criterion validity
d. Construct validity

Explanation: Internal validity is the validity refers to the extent in which the evidence supports the claim in regard to cause and effect, within the context of that study.

External validity refers to generalizability of the study findings across the situations, stimuli and people.

5. All the following are qualitative research methods, EXCEPT: *(AIIMS BBS NO 2018)*

a. Phenomenology
b. Ethnography
c. Grounded theory
d. Correlation

Explanation: Qualitative research designs include historical research, phenomenology, ethnography, grounded theory, case study, and triangulation method.

Correlation research is a quantitative, non-experimental research, which involves the study of two variables and their correlation with each other in natural settings.

6. Examining cause and effect relationship between variables under highly controlled conditions is: *(AIIMS BBS NO 2018)*

a. Correlational research
b. Experimental research
c. Descriptive research
d. Quasi-experimental research

Explanation: Cause and effect refer to a relationship between two variable in which one variable causes change in the other variable. Example. Regular exercise (cause) leads to weight loss (effect).

Experimental research methods are useful in establishing cause and effect relationship. True experimental research is the most accurate form of experimental research design to establish cause and effect.

Quasi-experimental does not have controlled conditions. Correlational and descriptive researches are non-experimental researches

7. A blueprint for the conduction of study is: *(Daman & Diu NO 2018)*

a. Pilot study
b. Research hypothesis
c. Research design
d. Data collection tool

Explanation: A research design is a framework or blueprint for conducting the research. It specifies the details of the procedures necessary for obtaining the information.

Ans.

1. d
2. c
3. a
4. b
5. d
6. b
7. c

Scanned with CamScanner

8. From which of these populations does a researcher select the actual study samples? *(Daman & Diu NO 2018)*

a. Accessible
b. Target
c. Universal
d. Scientific

Explanation: Accessible population: The aggregate of individuals who are accessible to the researcher from which the samples are selected for the research study. In simple words, it is a population the researchers get access for study. Target population refers to aggregate of individuals to which the researcher wants to generalize the findings of research study.

9. Which of these designs is used to estimate the prevalence of osteoporosis? *(Daman & Diu NO 2018)*

a. Cross-sectional
b. Quasi experimental
c. Cross-over
d. Factorial

Explanation: Quasi experimental, cross-over and factorial designs are methods of experimental research in which the researcher is interested to test the effectiveness of an intervention. Whereas cross-sectional studies collect data from subjects at only one point in time. It is usually carried out to assess the prevalence of specific disease or awareness on specific variable under study.

10. The extent (or degree) to which a tool measures what it is supposed to measure is known as? *(Daman & Diu NO 2018)*

a. Reliability
b. Validity
c. Specificity
d. Stability

Explanation: Validity is the extent to which an instrument or test or tool measures what it is supposed to measure. An instrument is said to be valid if it measures what the researcher intends to measure.

Reliability refers to the consistency of measurement.

11. The accuracy and consistency in measurement of an instrument refers to *(AIIMS Raipur NO 2019)*

a. Validity
b. Analysis
c. Appropriability
d. Reliability

12. The degree of consistency with which an instrument measures the attribute it is supposed to be measuring is called:

a. Validity
b. Reliability
c. Sensitivity
d. Objectivity

Explanation: Reliability refers to degree of consistency or accuracy with which an instrument measures for which it is designed to measure.

Validity: Degree to which an instrument measures what it is intended to measure.

Analysis: Method of organizing, sorting, scrutinizing data to answer research question.

Appropriability is a distractor.

13. A literature review is: *(RAK MSc 2018)*

a. Everything that is known about subject
b. An analytical summary of research findings
c. All approved data on a research topic
d. A compilation of all positive results of research

Explanation: A literature review is everything that is known about subject.

The purpose of a good literature review is to get thorough familiarity with available evidence about the subject of study.

Review of literature is NOT an analytical summary of research findings or the positive results

14. In quantitative research process, the literature review should occur: *(RAK MSc 2018)*

a. Near the end of research process
b. Shortly before the analysis of the problem
c. Early in the research process
d. None of the above

Explanation: Investigators usually undertake a thorough literature review as an early step in a research study. Once the researcher has identified a potential research problem, the next step is to review the related literature. The main purpose of literature review is to keep the reader up-to-date with the research done on the selected topic.

15. Which of the following is NOT a method of data collection? *(RAK MSc 2018)*

a. Interviews
b. Experiments
c. Questionnaires
d. Observations

Explanation: Observation, interview, questionnaires and bio-physiological measures are the common methods of data collection in research whereas the term experiment refers to a type of research study.

16. A careful appraisal of the strengths and weaknesses of the study is: *(RAK MSc 2018)*

a. Research proposal
b. Action research
c. Research critique
d. Evidence-based practice

Explanation: Research critique is a systematic way of objectively reviewing a research study to highlight both its strengths and weaknesses.

A research proposal is a document proposing a research project. **Action research** is a type of research method and **evidence-based practice** refers to the use of current research evidences in nursing/medical practice.

17. The final step of the research process for a researcher is to: *(Safdarjung NO 2018)*

a. Utilize the findings
b. Analyze the data
c. Interpret the findings
d. Communicate the findings

Explanation: As per the phases and steps of research process, the options given above can be sequentially organized as – *analyze the data, interpret the findings, communicate the findings and then utilize the findings.*

Utilization of the research findings is the final step a researcher can do.

Ans.

8.	a
9.	a
10.	b
11.	d
12.	b
13.	a
14.	c
15.	b
16.	c
17.	a

Scanned with CamScanner

18. Which of the following is NOT the element of an informed consent? *(Safdarjung NO 2018)*
a. Purpose of study
b. Offer answer only for selected questions
c. Subject selection process
d. Alternative procedures if any, are disclosed

Explanation: Informed consent is a voluntary agreement to participate in research. It is not merely a form that is signed but is an educational process, in which the subject has an understanding of the research and its risks. Offering answers only for selected questions will not complete the educational process of understanding of the research process.

Informed consent is essential before enrolling a participant and ongoing once enrolled.
The basic elements of the consent process include:
- Full disclosure of the nature of the research, **purpose of study** and the participant's involvement
- **Subject selection process** and adequate comprehension on the part of the potential participant, and
- The participant's voluntary choice to participate.

19. Which of the following is NOT true about the characteristics of a good research? *(Safdarjung NO 2018)*
a. Conducted using large amount of funds
b. Orderly and systematic process
c. Finding solution of problem
d. Begin with clearly defined purposes

Explanation: Parsimony is one of the characteristics of scientific research. Research must be conducted in simple and economic manner. Using large amount of funds to conduct research is not cost effective and feasible.

20. A nurse who reads research articles and incorporates research findings into clinical practice is a _____
a. Consumer
b. Primary investigator
c. Co-investigator
d. Collaborator

21. Contributions of Florence Nightingale to nursing research is
a. Case study approach
b. Conceptual Framework for research
c. Data collection and analysis
d. Qualitative research method

22. Which of the following is an example of inductive reasoning?
a. Reasoning from all hypertensive patients to a single hypertensive patient
b. Reasoning from a single depressive patient to all depressive patients
c. Using a standard nursing care plan for a specific patient
d. All of the above

23. Quantitative and qualitative research approaches are particularly useful in nursing because they
a. Require less resources
b. Are easy to implement
c. Generates different types of nursing knowledge
d. Are both process oriented

24. Which of the following is NOT a common feature of both research process and nursing process?
a. Identifies new information
b. Involves critical thinking
c. Has a broader focus
d. Utilizes complex thinking

Explanation: Research has a broader focus and involves generalizability of findings whereas nursing process is client-focused and not generalized to all patients/population. Other three features are common to research and nursing process.

25. The specific aim or goal of the research study based on the identified problem is termed as
a. Purpose
b. Assumptions
c. Operational definition
d. Methodology

26. Study participants in a research study of quality of life (QOL) in Older Adults living in Nursing homes were asked to fill a questionnaire. Which of the following would be a likely assumption the researcher made in relation to this study?
a. Subjects will complete every item on the questionnaire
b. All older adults who are asked to fill the questionnaire will complete the questionnaire
c. Participants are able to identify a personal awareness of QOL
d. QOL is an important issue among older adults in living in nursing homes

27. A researcher conducts a smaller study of the planned study to identify any problematic areas before implementing a planned large scale research investigation. This smaller study is known as
a. Abstract study
b. Exploratory study
c. Pilot study
d. Pretest

28. The researcher uses which portion of the research report to capture the reader's attention?
a. Abstract
b. Methodology
c. Results
d. Review of Literature

29. The sentence "The purpose of this study was to examine the relationship between knowledge and preoperative anxiety among patients undergoing abdominal surgery" would most likely be found in which chapter of a research dissertation?
a. Introduction
b. Review of Literature
c. Methodology
d. Data Analysis and Interpretation

30. The purpose statement of a research study should identify the study variable(s) and _____
a. Design of the study
b. Data collection tools
c. Statistical methods
d. Population

31. The most important source for identification of a research problem is
a. Nursing practice
b. Nursing practice guidelines and protocols
c. Nursing textbooks
d. Nursing code of ethics

32. In the review of literature report of a study on elder abuse, the researcher stated two previous studies suggesting that older persons aged above 80 years are more likely to be abused than older persons aged less than 80 years. This information suggests the current study is significant because it
a. Influences policy making on older persons
b. Challenges existing evidence on elder abuse.
c. Builds on previous research.
d. Addresses multidisciplinary concerns on elder abuse.

Ans.

18.	b
19.	a
20.	a
21.	c
22.	b
23.	c
24.	c
25.	a
26.	c
27.	c
28.	a
29.	a
30.	d
31.	a
32.	c

Scanned with CamScanner

33. Feasibility of a research study is determined by examining
a. Investigator's credibility
b. Availability of subjects
c. Importance of research problem
d. Previous research evidences

34. The researcher has written in his research proposal that written permission has been obtained from two local hospitals to access their staff nurses for data collection. This is an example of what aspect of a research
a. Reliability b. Validity
c. Ethics d. Feasibility

Explanation: Validity and reliability are related to assessment of measurement tools for its appropriateness and consistency respectively. Obtaining permission from a hospital to access their employees for data collection is part of feasibility in conducting the research. Obtaining permission from study participants and institutional ethical committee (including hospital ethics committee) are related to ethical aspect of a research study. So obtaining permission from hospitals is more closely associated with feasibility than ethics.

35. A research study framework reflects the .....
a. Researcher's "theory" or idea about the study
b. Study design
c. Methodology
d. Data collection plan

36. "Abstract" in research is defined as
a. Specific and particular
b. General and not well-defined
c. Precise and well-defined
d. Concrete and specific

37. The process of drawing a specific conclusion from a set of ideas is known as
a. Inductive reasoning b. Deductive reasoning
c. Idealism d. Logical reasoning

38. The first step of the Research Process is to:
a. Prepare the Research Design
b. Complete Data Collection and Analysis
c. Formulate the Research Questions
d. Prepare the Report

39. As a professional, a nurse can do research for varied reason except:
a. Professional advancement
b. To validate the results of new nursing modalities.
c. For financial gains
d. To improve nursing care

40. Who is the first nurse researcher?
a. Martha Rogers b. Dorothea Orem
c. Florence Nightingale d. Sr. Callista Roy

41. Which of the following is not the purpose of pilot study?
a. Tool refinement
b. Fine tune the data collection process
c. Help in sample size calculation
d. Drawing final inferences

42. Likert scale is:
a. Ordinal scale b. Normal scale
c. Variance scale d. Categorical scale

43. Which of the following describes what a problem is?
a. Usually a question that needs to be answered
b. The aim of the study
c. Direction and form of the study
d. Predictor of relationship between two or more variable

44. PICO means _____
a. Population, intervention, comparison, outcome
b. Prevalence, incidence, cohort, observation
c. Polio, influenza, chickenpox, ovulation
d. Patient, injection, catheterization, operation

45. Discrepancy between what is known and what ought to be known is described as
a. Research results b. Research phenomenon
c. Research objective d. Research problem

46. Which of the following is TRUE?
a. Problem statement is why study is being done
b. Research purpose is what will be examined in the study
c. Research questions provide greater focus to research
d. Research feasibility ignores the money aspect

47. The initial and one of the most significant steps in conducting the research process is:
a. Defining the research variables
b. Identifying the research problem
c. Stating the research purposes.
d. Determining the feasibility of the study

48. Which of the following is not the element of a research statement?
a. Research design b. Research instrument
c. Population d. Setting

49. Problem identification in the research process would be equivalent to which step in the nursing process?
a. Nursing assessment b. Planning
c. Implementation d. Evaluation

50. The central concepts of conceptual models in nursing includes
a. Head, heart and hand
b. Human, health, disease and environment
c. Man, health, environment and nursing
d. Agent, host, reservoir and environment

51. The major objective of conducting a basic research is to
a. Develop knowledge for immediate use
b. Develop theories and principles
c. Make a decision
d. Provide a solution for existing problems

52. The development of a solid foundation of reliable knowledge is typically built from
a. Action research
b. Basic research
c. Developmental research
d. Methodological research

53. Which of the following is characteristic of qualitative research?
a. Generalization to the population
b. Random sampling
c. Unique case orientation
d. Application of statistics for analysis

54. Research in which the investigator plays an active, interactive role is called
a. Action research
b. Interventional research
c. Inferential research d. Interactive research

55. Which of the following would be in the introduction section of a research proposal?
a. Data analysis procedure
b. Description of an instrument
c. A time frame
d. Statement of purpose

Ans.

56. The deductive approach in writing protocol involves
a. Moving from general concept to a specific one
b. Moving from specific and then expands to overall plan
c. Moving from precise to wide-ranging
d. Moving from meticulous to specific

57. Which of the following would not be in a research proposal?
a. Budget
b. Time frame
c. Methods
d. Results

58. A research proposal is best described as a:
a. Framework for data analysis
b. Written account of the plan for the intended study
c. Description of ethical perspective of the study
d. Argument for the merit of the study

59. Which of the following is the purpose of a research proposal?
a. Guide for conducting study
b. Saves money of the funding agency
c. Prevents evaluation by others in doing study
d. Helps in solving problems after conclusion of data analysis

60. A good research proposal will always
a. Focus on addressing the research objectives
b. Focus on specific style of writing references
c. Consider all possible research that had previously been done on the topic
d. Provide researchers names and address

61. Which scientific method focuses on testing hypotheses developed from theories?
a. Deductive method
b. Inductive method
c. Hypothesis method
d. Pattern method

62. Which scientific method often focuses on generating new hypotheses and theories?
a. Deductive method
b. Inductive method
c. Hypothesis method
c. Pattern method

63. Which of the following type of studies is an example of qualitative research method
a. Cross sectional design
b. Correlational studies
c. Ethnography
d. Survey design

64. Which of the following types of research study involve at least some control by the researcher to evaluate the intervention?
a. Correlational
b. Descriptive
c. Cohort study
d. Quasi-experimental

65. Which of the following type of research involves high researcher control, random sampling, and laboratory setting?
a. Cohort study
b. Case control study
c. True Experimental
d. Quasi experimental

66. Research questions: "Does motivational counseling before discharge by nurses improve patients' compliance with their drug regimens?".
Which of the following research is appropriate to answer this research question?
a. Applied research
b. Basic research
c. Descriptive research
d. Phenomenological research

67. A researcher investigates the effect of foot massage on sleep quality of patients. This study would be described as:
a. Applied research
b. Basic research
c. Grounded theory approach
d. Phenomenological research

68. Applied research seeks to solve a clinical problem in
a. Natural setting
b. Laboratory setting
c. Controlled setting
d. Simulated setting

69. A researcher is using random sampling method to decrease the sampling bias in a research study. This is done to achieve
a. Manipulation
b. Data collection
c. Control
d. Encourage participation of subjects

70. Which of the following is the best way to achieve scientific rigor in quantitative research?
a. Following a strict time frame
b. Extent of precision and control exerted by the methodology
c. Degree of determination in data collection
d. Analytical methods used to interpret and conclude the study

71. A researcher is planned to study mistreatment of older persons. The research designs the study where data collection is to be conducted at older person's home. Which type of setting is this?
a. Partially controlled, clinical
b. Highly controlled, clinical
c. Natural, field
d. Highly controlled, field

72. Problem identification in the research process is similar to which step of the nursing process?
a. Data interpretation
b. Goal identification
c. Nursing diagnosis
d. Identifying solutions

Explanation: Identification of a research problem is the first and most important step in research process. It can be compared to assessment and nursing diagnosis step of the nursing process.

73. The planning step in the nursing process is similar to which step in the research process?
a. Data collection
b. Design
c. Implementation
d. Goal identification

74. Quantitative research is a process to
a. Describe lived experiences of people
b. Develop theories and hypothesis
c. Evaluate theories and hypothesis
d. Obtain feelings and beliefs of the people

75. Identify the type of hypothesis from the following statement "Two hourly position change is more effective than four hourly position change in prevention of pressure ulcer in bed-ridden patients."
a. Simple, research
b. Simple, directional
c. Complex, casual
d. Complex, associative

76. Identify the type of hypothesis from the following statement "Emotional wellbeing is influenced by the self-esteem, degree of social support and financial status in women breast cancer survivors."
a. Simple, research
b. Simple, directional
c. Complex, nondirectional
d. Complex, directional

Ans.

Scanned with CamScanner

77. **Identify the type of hypothesis from the following statement "The lower the blood sugar level, the lesser is the risk of infection among diabetic patients"**
   a. Simple, associative
   b. Simple, causal
   c. Causal, null
   d. Causal, directional

78. **Identify the type of the following hypothesis. "Hypertensive patients who receive exercise therapy report better blood pressure control and require less drug dose than hypertensive patients not receiving exercise therapy."**
   a. Simple, directional hypothesis
   b. Simple, non-directional hypothesis
   c. Complex, non-directional hypothesis
   d. Complex, directional hypothesis

79. **What type of hypothesis is the following? "High-fiber diet is related to increased bowel movement and lower cholesterol levels."**
   a. Complex, directional, causal
   b. Complex, directional, associative
   c. Simple, nondirectional, research
   d. Simple, directional, causal

80. **Which of the following level of evidence is placed at the top of the hierarchy of evidence?**
   a. A consensus of opinion from experts of the subject
   b. Meta-analysis of multiple randomized clinical trials
   c. Results from a single well-controlled experimental study with a large sample size
   d. Results from a well-designed cohort studies

81. **A method of integrating the findings of prior research studies using statistical procedures is**
   a. Meta-analysis
   b. Content analysis
   c. Secondary analysis
   d. Systematic analysis

82. **All of the following are the purpose of evidence-based practice EXCEPT**
   a. To abolish wrong practices
   b. To improve quality of patient care
   c. To obtain more research funds from agencies
   d. To improve the patient-care outcome

83. **Barriers of evidence-based practice includes all of the following EXCEPT**
   a. Lack of knowledge
   b. Lack of scientific literature
   c. Lack of skills in conducting computer based literature search
   d. Lack of time to read literature

Explanation: The most important individual barriers to implementation of EBP are lack of time to read literature (due to higher work load), lack of ability to work with computer, lack of knowledge or language proficiency are the common barriers of evidence based practice. There is no dearth of scientific literature in nursing science with online and printed sources. So it is not a barrier in EBP.

84. **All of the following are steps of quantitative research, EXCEPT**
   a. Formulation of research problem
   b. Formulation of research questions
   c. Data analysis
   d. Systemic review of research study

85. **Which of the following research steps is completed first?**
   a. Determining the population
   b. Identification of a problem
   c. Formulation of research question or hypothesis
   d. Literature review

86. **The only step involved in qualitative research process is**
   a. Getting entry into research setting
   b. Random selection of sample
   c. Using a structured questionnaire for data collection
   d. Using inferential statistics for analysis of data

87. **Condition or characteristic that can take on different values or categories is called a**
   a. Constant
   b. Variable
   c. Cause-and-effect relationship
   d. Descriptive relationship

88. **A variable that is presumed to cause a change in another variable is called**
   a. Dependent variable
   b. Independent variable
   c. Intervening variable
   d. Active variable

89. **The variable in an experiment that is known from the start and does not change is called:**
   a. Dependent variable
   b. Extraneous variable
   c. Independent variable
   d. Confounding variable

90. **The variable which is influenced by the intervention of the researcher is called**
   a. Independent
   b. Dependent
   c. Discrete
   d. Extraneous

91. **The variable that is manipulated in an experiment is called**
   a. Independent variable
   b. Dependent variable
   c. Criteria variable
   d. Controller variable

92. **A researcher studied the effect of a scheduling assignment on nurses' morale, the scheduling assignment would be referred to as**
   a. Active variable
   b. Independent variable
   c. Dependent variable
   d. Interfering variable

93. **Identify the dependent variable in the following statement: "Hypertensive patients who receive exercise therapy report better blood pressure control and require less drug dose than hypertensive patients not receiving exercise therapy."**
   a. Blood pressure
   b. Exercise therapy
   c. Hypertensive patients
   d. All of the above

94. **Identify the independent variable in the following research statement: "A study on effectiveness of exercise therapy on sleep hygiene among undergraduate nursing students"**
   a. Exercise therapy
   b. Sleep hygiene
   c. Undergraduate students
   d. Students

95. **Variable that is irrelevant in an investigation and needs to be controlled is called**
   a. Indirect variable
   b. Active variable
   c. Dependent variable
   d. Extraneous variable

96. **Biasness of a study can be reduced by controlling which of the following variables?**
   a. Extraneous
   b. Independent
   c. Dependent
   d. Demographic

97. **_____ refers to the influence of a single independent variable.**
   a. Confounding effect
   b. Main effect
   c. Extraneous effect
   d. Proactive effect

98. **Which of the following is NOT considered as component of the research problem?**
   a. Research instruments
   b. Variables of the study
   c. Study population
   d. Research setting

99. **Find the odd one out regarding the typical characteristics of a research objective**
   a. Observable
   b. Measurable
   c. Achievable
   d. Verifiable

100. Which of the following statement is TRUE?
a. An aim can have only one objective
b. Objectives have no link with methodology
c. Objectives have no link with study title
d. Objectives are subsidiary to aims

101. What the acronym SMART specifies, that the objectives should be
a. Specific, measurable, achievable, realistic, and timely
b. Simple, modifiable, applicable, realistic, technical
c. Small, measurable, applicable, reliable, timely
d. Sensitive, matching, affordable, robust, testable

102. All the following statements are correct regarding objectives except
a. An objective is a statement in specific and measurable terms
b. Objectives have a broader perspective than aims.
c. Objectives lay out how the researcher plans to accomplish the aims
d. A research study may include a number of objectives

103. The statement "to compare the knowledge of primigravida and multigravida women regarding breast feeding practices" is described as research _____
a. Assumption b. Hypothesis
c. Objective d. Problem

104. In research, how a variable or concept will be defined and measured in the study is termed as
a. Assumption b. Hypothesis
c. Operational definition d. None of the above

105. The statement below is an example of which of the following? "In this study, patient satisfaction is reflected as a score between 0 and 100 on nursing care satisfaction scale"
a. Problem statement
b. Assumption
c. Associative hypothesis
d. Operational definition

106. Variable that changes due to the influence of another variable is known as the
a. Independent variable b. Dependent variable
c. Extraneous variable d. Confounding variable

107. The variables that are not studied in the experiment but may affect the dependent variable are known as
a. Independent variable b. Extraneous variable
c. Dependent variable d. Categorical variable

108. Statement of the expected relationship between two or more variables is known as the
a. Assumption b. Hypothesis
c. Problem statement d. Research question

109. The hypothesis that begins with specific observations and move towards generalizations, is called as
a. Inductive b. Deductive
c. Simple d. Complex

110. Hypothesis does not
a. Explain the relationship between variables
b. Measures the differences between variables
c. Give direction to data collection
d. Give direction to data analysis

111. Which of the following is not true for hypothesis?
a. It is a prediction of relationship between variables
b. It is the researcher's anticipation regarding the study
c. A hypothesis is a tentative generalization
d. It cannot be tested

112. Which of the following statements meets the criteria for the complex hypothesis?
a. There is significant negative correlation between years of experience and level of burnout symptoms of nurses
b. Music therapy reduces the anxiety among postoperative CABG patients
c. Balanced diet and regular exercise decrease the incidence of postpartum depression
d. Female nurses have higher job satisfaction compare to male nurses

113. Pair of hypotheses that are similar to each other is
a. Simple and complex
b. Associative and causal
c. Directional and non-directional
d. Research and null

114. 'Demonstration method of teaching is more effective than video assisted teaching to teach nursing procedures' is an example of
a. Directional hypothesis
b. Complex hypothesis
c. Non-directional hypothesis
d. Null hypothesis

115. 'There is no difference in the anxiety level of children of high IQ and those of low IQ' is an example of a:
a. Directional hypothesis
b. Non-directional hypothesis
c. Null hypothesis
d. Simple hypothesis

116. Which of the followings statement best describes the term 'research hypotheses'
a. It is formulated prior to a review of the literature
b. It is a statement of predicted relationships between two or more variables
c. It is a statement of known fact
d. All of the above

117. Hypotheses are often generated as the data are collected, interpreted, and analyzed in which type of research studies?
a. Quantitative research studies
b. Qualitative research studies
c. Prospective cohort studies
d. Comparative studies

118. The statement of beliefs and ideas which are considered to be true are known as: *(RAK MSc 2018)*
a. Hypothesis
b. Assumption
c. Conceptual definition
d. Operational definition

119. Realistic expectation which is something that we believe to be true is *(AIIMS Raipur NO 2019)*
a. Hypothesis
b. Conceptual framework
c. Assumption
d. Concepts

Explanation: Assumption is a statement on principles that are taken as truth based on a person's values and beliefs. In simple terms, it is a statement that is taken for granted or are considered to be true, even though they have not been actually scientifically tested or validated.

Hypothesis: It is a formal tentative statement of the expected relationship between two or more variables

---

Scanned with CamScanner

120. Basic principles that are accepted as being true on the basis of logic or reason, without proof or verification is referred as
a. Hypothesis b. Assumptions
c. Constructs d. Propositions

121. Which of the following section of research report describes the study subjects in detail?
a. Introduction
b. Background
c. Methodology
d. Data analysis and Discussion

122. All of the following are component of a research hypothesis EXCEPT
a. Independent variables b. Dependent variables
c. Study population d. Extraneous variables

123. Which of the following term describes the boundaries that the researcher has set for the study?
a. Assumption
b. Hypothesis
c. Conceptual framework
d. Delimitation

124. Those restrictions that the researcher places on the study before gathering data are called
a. Assumptions b. Limitations
c. Delimitations d. Hypothesis

125. Which of the following is true about delimitations?
a. These are the shortcomings of a study.
b. These are the boundaries we set to our study before its start
c. These are the potential weaknesses in the study.
d. These include the drop out of the subjects.

126. The purpose of a literature of reyiew is to
a. Define the problem
b. Identify strengths and weaknesses of previous studies
c. Help in operational definition
d. All of the above

127. Which of the following is considered to be the highest quality type of literature?
a. Research articles in a peer-reviewed journal
b. Secondary sources
c. Books
d. Research reports in a conference proceedings.

128. The most useful abstracting index for nursing literature is
a. ERIc
b. CINAHL
c. Pubmed
d. Psych INFO

129. Index that provide the largest number of relevant nursing sources is
a. International Nursing Index
b. Cumulative Index to Nursing & Allied Health Literature
c. Nursing Studies Index
d. Cochrane Database

130. In the following APA formatted reference, what does the 23 refer to? "Derwing, T. M., Rossiter, M. J., & Munro, M. J. (2002). Teaching native speakers to listen to foreign-accented speech. Journal of Multilingual and Multicultural Development, 23(4), 245-259."
a. Volume number b. Issue number
c. Page number d. Chapter number

Ans.

Explanation: The components of APA reference style is depicted in the image below.

131. In a peer-reviewed journal, the articles are published on the basis of
a. Subjective discretion of the editors
b. Number of authors listed
c. Sincerity of the authors listed
d. Comments of the reviewers

132. Which of the following is the criteria of primary source of literature?
a. Interview based primary data only
b. Record based data
c. Original articles published in a journal
d. Meta-analysis data published in a journal

133. A critical aspect of beginning a database search for relevant literature on a topic of interest involves identifying:
a. Reference management software
b. Electronic journals
c. Keywords
d. Existing knowledge

134. Which of the following is TRUE regarding writing review of literature?
a. Avoid long paragraphs
b. Avoid short paragraphs
c. Avoid link between connected paragraphs
d. Avoid pointing out gaps between literature

135. Which of the following is NOT TRUE of computer based Pubmed search.
a. Keywords are unrelated to MeSH
b. Boolean operators 'AND' or 'NOT' can be used
c. Google search for Pubmed then proceed further
d. Search can be limited by years

136. All of the following techniques deals with extraneous variables in quantitative research EXCEPT
a. Randomization
b. Repeated measures
c. Homogeneity
d. Bracketing

Scanned with CamScanner

137. **Which of the following is considered as a bibliography database for biomedical literature**
   a. Google b. Medline
   c. MSN search d. SAFARI
138. **Which of the following is considered as a nursing and allied health sciences database?**
   a. Medline b. Pubmed
   c. CINAHL d. Ovid plus
139. **The word theory is derived from**
   a. Theoria b. Theoryia
   c. Theoretical d. Theorium
140. **All of the following are the building blocks of theory EXCEPT?**
   a. Conceptual definition
   b. Theoretical propositions
   c. Construct
   d. Concept
141. **All of the following are examples of grand theory EXCEPT?**
   a. Interpersonal Model
   b. Community Empowerment Model
   c. Health Belief Theory
   d. Maslow's Hierarchy Needs Theory
142. **Who proposed the theory of interpersonal relationship?**
   a. Orem b. Abdullah
   c. Peplau d. Jean Watson
143. **Theory of theory is termed as**
   a. Grand theory b. Meta theory
   c. Systematic theory d. Middle range theory
144. **The sources to develop a conceptual framework includes all of the following EXCEPT**
   a. Researcher's own experiences
   b. Historical evidences
   c. Previous research evidences
   d. Theoretical concepts
145. **The theories are**
   a. Based on preexisting facts
   b. Testable
   c. Formulated prior to research
   d. Derived from issues
146. **Inductive theories are based on conclusion drawn by**
   a. Testing theories
   b. Moving from general to specific
   c. Moving from specific to general
   d. General observations
147. **Development of conceptual framework in quantitative research is mainly**
   a. Before literature review b. During literature review
   c. Before data analysis d. After data analysis
148. **Theories are**
   a. Already existing
   b. Formulated and keep on changing
   c. Stagnant and never change
   d. None of the above
149. **Research paradigm is**
   a. Conceptual framework
   b. Theoretical framework
   c. Study framework
   d. None of the above
150. **Nursing research can be based on**
   a. Only nursing theories
   b. Theories from other disciplines
   c. Both A and b. d. None of the above

151. **The principles of ethics in nursing research include**
   a. Beneficence
   b. Respect for human dignity
   c. Justice
   d. All of the above
152. **Code of Ethics for Nurses in India is given by**
   a. Indian Nursing Council
   b. Nursing Research Society of India
   c. Indian Professional Nurses Association
   d. Trained Nurses Association of India
153. **An explicit guarantee by a researcher to a subject whereby the subject is assured that any information provided to the researcher cannot be attributed back to that subject**
   a. Anonymity b. Blinding
   c. Confidentiality d. Confrontation
154. **After the research is completed, a meeting of a researcher with study participants that ensures their understanding of the reasons for the procedures used in the study is known as**
   a. Explanation b. Debriefing
   c. Informing d. Research meeting
155. **Which of the following term refers to the process of obtaining a 12-year-old child's agreement for participation in the study?**
   a. Informed assent b. Consent of a minor
   c. Collateral consent d. Minor agreement
156. **Which one is not the Fundamental guiding principles of ethics:**
   a. Respect for patient and their autonomy
   b. Maleficence
   c. Beneficence
   d. Justice
157. **Which of the following is not required in consent form?**
   a. Address of researcher
   b. Name of researcher
   c. Phone no. of the researcher
   d. Income of the researcher
158. **Which of the following variable can be measured on a nominal scale?**
   a. Height of the patient in cm
   b. IQ score of the patient
   c. Gender of the patient
   d. Hemoglobin level of the patient
159. **Marital Status and religion are measured on:**
   a. Nominal scale of measurement
   b. Ordinal scale of measurement
   c. Interval scale of measurement
   d. Ratio scale of measurement
160. **Which of the following scale of measurement has an absolute zero?**
   a. Nominal b. Ordinal
   c. Interval d. Ratio
161. **Which of the following scale of measurement is appropriate to measure the weight (in kg) of the patient?**
   a. Ordinal scale b. Nominal scale
   c. Ratio scale d. Interval scale
162. **Measurement of body temperature is an example of**
   a. Physiological measurement
   b. Biological measurement
   c. Biophysical measurement
   d. All of the above
163. **Age is an example of**
   a. Continuous variable b. Discrete variable
   c. Categorical variable d. Nominal variable

Scanned with CamScanner

164. **Gender is an example of**
   a. Dichotomous variable
   b. Discrete variable
   c. Ordinal variable
   d. Quantitative variable

165. **Which of the following variables is measured on the ordinal scale?**
   a. Type of anemia b. Severity of anemia
   c. Hemoglobin in gm% d. Serum ferritin level

166. **Which of the following is an example of dichotomous variable?** *(AIIMS M.Sc Nursing Entrance 2008)*
   a. Age b. Gender
   c. Educational status d. Occupation

167. **Which of the following is a characteristic of a qualitative research?**
   a. Deductive process b. Inductive process
   c. Fixed research design d. Manipulation

168. **Which of the following design is involved in Qualitative research?**
   a. Emergent design b. Comparative design
   c. Prospective cohort d. Quasi design

169. **Theoretical sampling is considered as a critical feature of**
   a. Grounded theory b. RCT
   c. Methodological design d. Developmental research

170. **Phenomenological study involves all the following features, EXCEPT**
   a. Bracket out b. Manipulation
   c. Description d. Analysis

171. **The method that focuses on description and interpretation of cultural behavior is referred as**
   a. Phenomenology
   b. Ethnography
   c. Grounded theory
   d. Symbolic interactionism

172. **The research design in which the area of inquiry is the manner by which people make sense of social interactions**
   a. Symbolic interactionism
   b. Phenomenology
   c. Grounded theory
   d. Case study

173. **The area of inquiry in grounded theory approach is**
   a. Lived experiences
   b. Social structural processes within social setting
   c. Holistic view of culture
   d. All of the above

174. **Use of multiple referents to draw conclusions about what constitutes the truth is termed as** *(INC consoritium PhD Entrance 2011)*
   a. Data verification b. Cross reference
   c. Error measurement d. Triangulation

175. **Who coined the term 'triangulation' in research?**
   a. Hungler b. Stuart
   c. Denzin d. Polit

176. **The guiding principle to decide sample size in qualitative research is**
   a. Data saturation b. Number of variables
   c. Power of the study d. Theme identification

177. **The method of deriving a complex array of data from a variety of sources, using variety of methods in qualitative research is referred as**
   a. Triangulation b. Bricolage
   c. Verification d. Cross-analysis

178. **The primary objective of an experimental research is to detect the effect produced by _____**
   a. Extraneous variable b. Confounding variable
   c. Independent variable d. Dependent variable

179. **A small-scale trial run of a research study is referred to as**
   a. Minor project b. Pilot study
   c. Miniature study d. Sample study

180. **Which of the following research design mandatorily requires randomization, control and manipulation?**
   a. Explorative study
   b. Quasi-experimental design
   c. True experimental design
   d. Pre-experimental design

181. **Properties of true experimental research study are the following except**
   a. Manipulation b. Control
   c. Matching d. Randomization

182. **The type of research that has a control over variables, manipulates variables and uses purposive sampling, is known as**
   a. Non-experimental b. Pre-experimental
   c. Quasi experimental d. True experimental

183. **A method of data collection in which several rounds of questionnaires are mailed to a panel of experts, focusing on their opinions or judgment concerning a specific topic of interest is**
   a. Focus group interview b. Meta-analysis
   c. Delphi technique d. Systematic analysis

184. **Study participants (subjects) are randomly assigned into two groups. One group of subjects is administered a treatment and is then compared, on the dependent variable, with another group of subjects who did not receive the treatment. This research design is known as**
   a. Pretest-posttest design
   b. Posttest-only design
   c. Pre-experimental design
   d. Time series design

185. **A type of observational study that involves data collection from a population, or a representative subset, at one specific point in time is known as**
   a. Cross-sectional study
   b. Longitudinal study
   c. Retrospective study
   d. Prospective cohort study

186. **A survey measuring individuals across a period of time is called:**
   a. Longitudinal Survey b. Cross-sectional Survey
   c. Intervention Survey d. Experimental Survey

187. **Rate of incidence is best studied by**
   a. Retrospective studies b. Prospective studies
   c. Cross sectional d. Case control

188. **Which of the following is involved in quantitative research?**
   a. Phenomenology b. Ethnography
   c. Clinical trial d. Grounded theory

189. **The type of research focused on finding a solution to an immediate practical problem is termed as:**
   a. Basic research b. Applied research
   c. Explanatory research d. Descriptive research

190. **A study of experiences is called:**
   a. Phenomenology
   b. Ethnography
   c. Action research d. Grounded theory

Scanned with CamScanner

191. Case studies may concern an in depth examination of:
a. Individuals
b. Groups of people
c. Institutions
d. All of the above

192. Repeated-measures design is also known as:
a. Crossover design
b. Solomon four-group design
c. Time series design
d. With-in subjects design

193. Which of the following statement is true about cross-sectional survey study?
a. High in internal validity and low in reliability
b. High in reliability but low in internal validity
c. High in reliability and internal validity
d. Low in reliability and internal validity

194. Which type of validity of any test/tool is determined by comparing it with a Gold Standard?
a. Content validity
b. Criterion validity
c. Concurrent Validity
d. Construct validity

195. The terms repeatability, precision, reproducibility, and consistency are used to indicate:
a. Validity
b. Sensitivity
c. Specificity
d. Reliability

196. A Likert scale is best described as a list of:
a. Open-ended items (questions) with unlimited responses
b. Closed-ended items with a fixed number of alternative responses
c. Open-and closed-ended items with variable responses
d. Closed-ended items with a dichotomous response

197. The degree with which all items on a scale measure the same variable is:
a. Validity
b. Equivalence
c. Homogeneity
d. Stability

198. Reliability is mostly a matter of _____, while validity is mostly about _____
a. Consistency, accuracy
b. Accuracy, consistency
c. Similarity, dissimilarity
d. Similarity, consistency

199. The degree to which the researcher feels that this was a worthwhile project is known as
a. Reliability
b. Internal validity
c. External validity
d. Concurrent validity

200. Cronbach's α measure of reliability indicates which of the following characteristics of a research tool
a. Equivalency reliability
b. Stability reliability
c. Internal consistency
d. Inter-rater reliability

201. Which of the following procedures used to derive the stability index of a research tool
a. Inter-rater reliability
b. Internal consistency
c. Cronbach's alpha
d. Test-retest reliability

202. The adequacy of an instrument in differentiating between the performance or behavior on some future criterion is termed as:
a. Predictive validity
b. Concurrent validity
c. Content validity
d. Construct validity

203. Which of the following is considered as a threat to internal validity of a research?
a. The Hawthorne effect
b. Maturation effect
c. Experimenter effects
d. All of the above

204. Which of the following data collection method is most reliable?
a. Self-reports
b. Observation
c. Biophysiologic measures
d. Questionnaires

205. Identify the correct sequence of data collection.
a. Contact, inform, consent, collect
b. Contact, consent, inform, collect
c. Inform, contact, consent, collect
d. Contact, inform, collect, consent

206. The term which refers to the validity of a research in which the difference in the dependent variable is actually a result of the independent variable:
a. Construct validity
b. Conclusion validity
c. Internal validity
d. External validity

207. In research, Maturation threat is a threat to
a. External validity
b. Internal validity
c. Factor validity
d. Content validity

208. The term which refers to the extent to which the results of the study can be generalized to the larger population:
a. Internal validity
b. Predictive validity
c. External validity
d. Content validity

209. An approach to construct validity that involves assessing the degree to which two methods of measuring a construct are similar is referred as
a. Discriminant validity
b. Concurrent validity
c. Convergent validity
d. Divergent validity

210. The degree to which scores of an instrument are correlated with some external criterion measured at the same time:
a. Factor validity
b. Construct validity
c. Content validity
d. Concurrent validity

211. The criteria for validity of a screening test is:
a. Accuracy
b. Predictability
c. Sensitivity and specificity
d. Cost effectiveness

212. Internal consistency measures include:
a. Split-half reliability
b. Kuder-Richardson coefficient
c. Cronbach's alpha
d. All of the above

213. A statistical measure of inter-rater reliability is:
a. Cohen's Kappa
b. Cronbach's α
c. Kuder-Richardson coefficient
d. Odds-ratio

214. Which of the following differentiate true experimental research from quasi-experimental research?
a. Manipulation of independent variable
b. Use of non-probability sampling technique
c. Random allocation of subjects to groups
d. Large sample size

215. Sensitization of research participants to a pretest can be controlled by _____ research design
a. Cross over design
b. Solomon four-group
c. Case control study
d. Pre-experimental

216. Ex-post facto studies are known as
a. Experimental study
b. Causal comparative
c. Cross-sectional study
d. Retrospective

217. 'Lived experience of surviving an earth quake'. This title would indicate which of the following types of qualitative research?
a. Historical
b. Ethnographic
c. Grounded theory approach
d. Phenomenological

218. When a researcher starts with the dependent variable and moves backward in time, it is called as
a. Prospective research
b. Retrospective research
c. Cross sectional research
d. Ex-post facto research

219. The group of study participants that does not receive the intervention is known as
a. Control group b. Experimental group
c. Randomized group d. Subjects

220. Subset of a population is called as
a. Study population b. Target population
c. Sample d. Unit

221. The process of selecting a small group from a larger group is known as
a. Triangulation b. Cross matching
c. Sampling d. Trimming

222. Whole group of people or objects to which the researcher wishes to generalize the study findings and which meet a set of criteria of interest to researcher is known as
a. Study population b. Sample population
c. Target population d. Sampling frame

223. Which of the following is NOT TRUE of probability sampling technique?
a. Each unit has an equal chance of selection
b. Generate unbiased estimation of population
c. Produce a sample that resembles population as closely as possible
d. Avoids use of sampling frame

224. All of the following are random sampling methods EXCEPT
a. Snow ball sampling b. Simple random sampling
c. Stratified sampling d. Cluster sampling

225. Which is TRUE of the stratified random sampling technique as compared to Simple Random Sampling (SRS)?
a. It is used for homogenous population
b. It is less accurate than simple random sampling.
c. It is time consuming
d. Its analysis is easier than simple random sampling.

226. A sample in which each element has an equal likelihood of inclusion is a:
a. Biased sample b. Snowball sample
c. Probability sample d. Quota sample

227. A sample which involves a random start and then proceeds with every kth element from then onwards is
a. Simple random sampling
b. Stratified random sampling
c. Systematic sampling
d. Snowball sampling

228. Which of the following sampling methods is the best way to select a group of people for a study if one is interested in generalizing it to the larger population?
a. Convenience sampling
b. Quota sampling
c. Purposive sampling
d. Random sampling

229. Which of the following is NOT a form of nonprobability sampling?
a. Snowball sampling b. Convenience sampling
c. Quota sampling d. Systematic sampling

230. A type of non-probability sampling is
a. Simple random b. Systematic
c. Purposive d. Cluster

231. Cluster sampling technique is also known as
a. Simple random sampling
b. Multistage sampling
c. Quota sampling
d. Snow ball sampling

232. Snowball sampling is also known as
a. Chain sampling b. Cluster sampling
c. Quota sampling d. Stratified sampling

233. A non-probability sampling technique where research participants recruit other participants?
a. Stratified b. Convenience
c. Cluster d. Snowball

234. In a study to establish "Relationship between hypertension and cardiac disease", the participants are the inpatients of a Cardiac Clinic, who are willing to participate in the study. The 'Sampling Technique' should be:
a. Convenience sampling b. Simple random sampling
c. Stratified sampling d. Cluster sampling

235. Assumption and delimitation are identified in which stage of research process?
a. Planning b. Implementing
c. Writing report d. Critiquing

236. When each member of a population has an equal probability of being selected for a sample, it is called:
a. Convenient sampling
b. Purposive sampling
c. Simple random sampling
d. Cluster sampling

237. For a research study, a total of 30 nursing faculties are randomly selected from of a random sample of three nursing collages in a region. This is an example of:
a. Simple random sampling
b. Cluster sampling
c. Purposive sampling
d. Snow ball sampling

238. A researcher has decided to assess blood pressure from all of the patients who attended the Medicine OPD over a month period of time. This is an example of
a. Stratified random sampling
b. Snow ball sampling
c. Convenience sampling
d. Quota sampling

239. Large sample size is required for
a. Ethnography research
b. Correlational research
c. Grounded theory approach
d. Phenomenological research

240. Which of the following is a non-probability sampling?
a. Cluster sampling b. Systematic sampling
c. Quota sampling d. All of the above

241. Which of the following sampling technique is least likely to draw a representative sample from the population?
a. Cluster sampling
b. Convenience sampling
c. Systematic sampling d. Stratified random sampling

Scanned with CamScanner

242. The power analysis is used to determine _____ in quantitative research studies.
   a. The level of significance
   b. The sample size
   c. The Internal validity
   d. The reliability

243. In qualitative research, the sample size is determined by
   a. Power analysis
   b. The 'rule of 30'
   c. The 'rule of 60'
   d. Data saturation

244. The reliability that indicates the consistency of test scores over time is referred to
   a. Parallel form reliability
   b. Inter-rater reliability
   c. Test-retest reliability
   d. Internal consistency

245. All of the following are type of reliability EXCEPT
   a. Inter-rater
   b. Internal consistency
   c. Concurrency
   d. Test-retest

246. Linear relationship between two quantitative (continuous) variables can be best presented by
   a. Frequency polygon
   b. Scatter plot diagram
   c. Histogram
   d. Pie diagram

247. The characteristics of an ideal curve is/are
   a. It is bell shaped
   b. Mean, median and mode do not coincide
   c. It is asymmetrical around the mean
   d. All of the above

248. The validity that refers to the extent to which a measure is related to an outcome is
   a. Convergent validity
   b. Expert validity
   c. Criterion-related validity
   d. Content reliability

249. The consistency of measurement based on the correlation between scores on two similar forms of the same test taken by the same subject is known as
   a. Test-retest reliability
   b. Equivalent forms reliability
   c. Inter-rater reliability
   d. Internal consistency

250. Which of the following is NOT an advantage of the observation method?
   a. There is no recall bias provided it is planned
   b. It provides direct information about behavior of the individuals and groups
   c. It permits evaluators to enter into and understand circumstances/context
   d. It introduces the subjective bias

251. A process that renders data into numbers that can be entered into a database is
   a. Matrixing
   b. Coding
   c. Transcribing
   d. Editing

252. A method in which several rounds of questions are given to a panel of experts is called
   a. Q-methodology
   b. Meta-analysis
   c. Delphi technique
   d. Content analysis

253. Which of the following terms best describes data which was originally collected at an earlier time by a different person for a different purpose?
   a. Primary data
   b. Secondary data
   c. Experimental data
   d. Basic data

254. Which of the following could not be measured directly?
   a. Blood pressure
   b. Hope
   c. Temperature
   d. Weight

255. When constructing a questionnaire which of the following is NOT one of the principle?
   a. Do not use "leading" or "loaded" questions
   b. Avoid double barreled questions
   c. Avoid double negative questions
   d. Avoid using multiple items to measure single construct

256. Secondary data may include which of the following?
   a. Official documents
   b. Personal documents
   c. Archived research data
   d. All of the above

257. Open-ended questions provide primarily which of the following type of data?
   a. Confirmatory data
   b. Qualitative data
   c. Predictive data
   d. None of the above.

258. The interview technique that allows the questions to emerge from the immediate context or course of things is known as
   a. Structured quantitative interview
   b. Formal interview guide approach
   c. Informal conversational interview
   d. Standardized open-ended interview

259. A nurse researcher get herself transferred to pediatric ICU (PICU) to be able to observe and collect data from nurses of PICU on needle stick injury. The researcher is using the role of
   a. Participant-as-observer
   b. Complete participant
   c. Complete observer
   d. Formal observer

260. Qualitative data analysis requires the categorization and indexing of texts or videos. The labels that are given to sections of the text and video material are known as
   a. Data points
   b. Memos
   c. Data codes
   d. Units of analysis

261. Section of research report that includes interpretation and evaluation of the results of the research is
   a. Abstract
   b. Methods ad material
   c. Results
   d. Discussion

262. Which of the following is NOT one of the seven major parts to the research report?
   a. Results
   b. Footnotes
   c. References
   d. Discussion

263. Which of the following is true about writing a conclusion of a research report?
   a. Can introduce new information.
   b. Must be based only on material presented in the report.
   c. It is the same as the abstract.
   d. Should focus only on the objectives of the research.

264. Which is TRUE of the abstract?
   a. Is usually placed after the methods
   b. It summarizes the study
   c. Is generally of >500 words
   d. Does not mention methods and objectives

265. The discussion section is characterized by which one of the followings?
   a. The researcher's reporting of the statistical results.
   b. A brief conclusion and description of statistical tests
   c. Repeating all of the literature listed in the literature review
   d. The researcher's interpretation of the results.

Scanned with CamScanner

266. In which section the reporting accuracy of numerical information is most critical?
a. Discussion
b. Review of literature
c. Limitations
d. Results

267. Identify the correct order of a quantitative research report?
a. Literature review, results, methods, discussion
b. Literature review, methods, results, discussion
c. Discussion, Literature review, methods, results
d. Methods, results, literature review, discussion

268. Which of the followings is in a research report but not in a proposal?
a. Title page
b. Abstract
c. Findings
d. Supporting material

269. Which of the following parts of a journal article is read the most?
a. Results
b. Discussion
c. Introduction
d. Abstract

270. Ideally the abstract of the research article should be limited to
a. 100 words
b. 100 – 150 words
c. 150 – 250 words
d. 250-500 words

271. In Vancouver's style of reference writing, et. al. is used if the author number exceeds
a. 1
b. 2
c. 6
d. 7

272. Which of the following communication channel is appropriate for dissemination of research finding to largest target group?
a. Thesis/dissertation
b. Oral or poster presentation in conference
c. Newsletter
d. Scientific Journal articles

273. Best strategy to promote research utilization among nurses is
a. Train and equip nurses with the knowledge of evidence based practice
b. Research collaboration among nurse researcher and nurses clinicians.
c. Motivating nurses to read, review, participate in research
d. All of the above.

274. Studies that produce basic estimates of the rates of disorder in a general population and its subgroups is referred as
a. Qualitative epidemiology
b. Analytic epidemiology
c. Experimental epidemiology
d. Descriptive epidemiology

275. Which of the following type of research focused on finding a solution to an immediate practical problem
a. Basic research
b. Applied research
c. Explanatory research
d. Descriptive research

276. Cohort study is also known as
a. Prospective study
b. Forward looking study
c. Incidence study
d. All of the above

277. The first annotated index of nursing research was the work of
a. Dorothea Orem
b. Florence Nightingale
c. Denise Polit
d. Virginia Henderson

278. The most objective approach to obtain nursing knowledge is through
a. Experience
b. Text books
c. Trial and error
d. Scientific research

279. A coefficient of correlation value of "r = +0.8" indicates
a. Strong direct relationship between two variables
b. Strong inverse relationship between two variables
c. Insignificant association between two variables
d. One variable is the cause of the other variable

280. Type of graphical presentation data used to explain correlation between dependent and independent variable is
a. Bar diagram
b. Histogram
c. Scatter plot
d. Frequency polygon

STATISTICS

281. Who was the first to use the word "Statistics"? *(Safdarjung NO 2018)*
a. Gottfried Achenwall
b. Prof. Horace Secrist
c. Croxton and Cowden
d. Gelan

Explanation: The word statistics was first used by a German scholar Gottfried Achenwall in the middle of the 18th century as the science of statecraft concerning the collection and use of data by the state.

282. Which of the following scale of measurement has an absolute zero? *(RAK MSc 2018)*
a. Nominal
b. Ordinal
c. Interval
d. Ratio

Explanation:
- **Ratio scale:** This scale has a constant interval and a true zero point. Example: height, weight, hemoglobin level.
- **Interval scale:** It has equal unit with an arbitrary zero point. There is a natural order that exists, no absolute zero and has negative value. Example: Fahrenheit scale of temperature, pH and intelligence score.
- **Nominal scale:** Categorical scale with non-numerical characteristics. E.g. gender, blood group, religion etc.
- **Ordinal scale:** These variables are dealt with their relative differences rather than with quantitative differences. The data can be ordered. e.g. mild, moderate, severe.

283. Which measurement denotes subjects from the heaviest to the lightest *(AIIMS Raipur NO 2019)*
a. Ordinal
b. Ratio
c. Nominal
d. Interval

Explanation:
- Ordinal level ranks objects based on their relative standing on a specific attribute. Ordinal scale is that reports the ranking and ordering of the data without actually establishing the degree of variation between them.
  Example: Income: low, middle, upper

284. Which of the following is an example of dichotomous variable? *(RAK MSc 2018)*
a. Age
b. Gender
c. Educational status
d. Occupation

Ans.

266.	d
267.	b
268.	c
269.	d
270.	c
271.	c
272.	d

274.	d
275.	b
276.	d
277.	d
278.	d
279.	a
280.	c
281.	a
282.	d
283.	a
284.	b

Scanned with CamScanner

Explanation:

- A dichotomous variable is a nominal variable that have only two categories or values. Among the given options, gender has only two categories, i.e. male and female.
- Age is a continuous (quantitative) variable which can take any number of values.
- Educational status and occupation are considered as categorical variables but can take more than two values.

Clue: 'Di' means two. Dichotomous variables have only two levels in the category.

285. Which is the point on a numerical scale above which and below which 50% of cases falls? *(AIIMS Raipur NO 2019)*

a. Central Tendency b. Mode
c. Median d. Mean

Explanation:

- **Median** is the middle most value when data is arranged in ascending order of magnitude. The middle value divides the number of observation in the data into two equal parts. M = n + 1/2
- **Mean:** Most commonly used, it is sum of all the values, divided by number of values.
- **Mode:** Value which has the highest frequency.
- Mean, median and mode are the parameters of central tendency.

Ans.

285. c
286. c
287. a
288. c
289. b
290. d
291. b
292. b
293. b
294. a
295. a
296. a
297. b

286. Which of the following is a measure of dispersion? *(Daman & Diu NO 2018)*

a. Mean b. Mode
c. Standard deviation d. Median

Explanation: The measures of dispersion refers to variation among the values in the given set of data. The most commonly used measures of dispersion are range, mean deviation and standard deviation. Other options given are parameters of central tendencies.

287. The value of highest frequency in the data is: *(AIIMS Nagpur NO 2018)*

a. Mode
b. Mean
c. Standard deviation
d. Median

Explanation: Mode is the number which appears most often (Highest frequency) in a set of numbers.

Example: in {6, 3, 9, 6, 6, 5, 9, 3} the Mode is 6 (it occurs most often).

288. Identify the mode of the following values: *(RAK MSc 2018)*

6, 3, 5, 6, 8, 9, 4, 6, 7, 6, 8, 6

a. 3 b. 8
c. 6 d. 7

Explanation: Dataset: 6, 3, 5, 6, 8, 9, 4, 6, 7, 6, 8, 6

Step 1: arrange it in an ascending order
3, 4, 5, 6, 6, 6, 6, 6, 7, 8, 8, 9

Step 2: Identify the most frequently occurred value in the dataset
Value '6' repeated 5 times in the given dataset.

So, the mode is '6'

289. The measure of central tendency that represents the score most occurring in a distribution of scores is called: *(RAK MSc 2018)*

a. Mean b. Mode
c. Variable d. Median

Explanation: The mode is the most frequently occurring score value in a given dataset.

- For example, in the following dataset
- 5, 8, 12, 13, 15, 15, 15, 16, 16, 18 19
- 15 is the most frequently occurring value (3 times). So, number 15 is considered as mode in this dataset.
- Mean is the average of a given dataset.
- Median is a middle value of a given dataset.
- Variable is defined as any value which varies and is not related to central tendency.

290. Which of the following is the formula for range? *(RAK MSc 2018)*

a. H + L b. L × H
c. L – H d. H – L

Explanation: Range is a measure dispersion of a dataset. The **range** of a set of data is the difference between the highest and lowest values in the set. To find the **range**, first order the data from least to greatest. Then subtract the smallest (L) value from the largest value (H) in the set. It is given in formula as H-L.

Example:
Question: Calculate range for a given data set: 9, 8, 5, 3, 6, 11, 13, 18.
Answer:
Step 1: arrange it in ascending order
i.e. 3, 5, 6, 8, 9, 11, 13, 18
Highest value (H) = 18
Lowest value (L) = 3
Range = H - L
Range = 18- 3 = 15

291. Relative risk is calculated in *(ESIC 2019)*

a. Cross sectional study b. Cohort study
c. Case control study d. None

292. Spread of dispersion is expressed by *(AIIMS Jodhpur SNO 2018)*

a. Mean b. SD
c. Mode d. Median

293. Relationship between weight in kg and height in cm can be showed in *(AIIMS Jodhpur SNO 2018)*

a. Bar diagram b. Scattered plot
c. Histogram d. Pie chart

294. Correlation is strongest *(AIIMS Jodhpur SNO 2018)*

a. – 1.00 b. – 0.95
c. + 0.90 d. + 0.10

295. The square root of the variance is

a. Standard deviation b. Standard error
c. Z Score d. Variance

296. Which of the following is not a measure of variability?

a. Median b. Variance
c. Standard deviation d. Range

297. A type-II error refers to

a. False positive b. False negative
c. True positive d. True negative

Scanned with CamScanner

298. Which of the following statement is true about 95% Confidence Interval (CI)?
a. 95% probability the population parameter lies within the interval
b. 95% probability the population parameter lies outside the interval
c. 5% probability the population parameter lies within the interval
d. All of the above statements are true

299. In exclusive type of class interval the value 30 will be put under
a. 20-30 b. 30-40
c. Either A or B d. Both A and B

300. The indices calculated from a sample is called as
a. Parameter b. Statistics
c. Conclusion d. Inference

301. The method of statistics that is used to draw conclusion from a data collected from a sample of population instead of entire population is referred as
a. Descriptive statistics b. Inferential statistics
c. Census statistics d. Population survey

302. The statistical approach used to test whether the outcome of the study is a result of factors planned within design of the study is called
a. Analytical statistics b. Descriptive statistics
c. Inferential statistics d. All of the above

303. The sensitivity of a statistical test is measured by its
a. Sample size b. Power
c. Type of hypothesis d. Sampling technique

304. Which of the following component is NOT required for estimating power (1-beta) of a study
a. The effect size
b. Sample size
c. Standard deviation
d. Level of significance (alpha)

305. Identify the mode of the following series: 6, 3, 5, 6, 7, 8, 9, 4, 3, 6, 6, 8, 9, 6
a. 3 b. 6
c. 8 d. 9

306. Calculate the mean of 2, 4, 5, 6, 7
a. 4.2 b. 4.4
c. 4.6 d. 4.8

307. What is the median of the following ungrouped data: 18, 6, 12, 10, 14, 5, 9
a. 10 b. 9
c. 12 d. 18

308. Which of the following is NOT a measure of dispersion?
a. Variance b. Mode
c. Standard deviation d. Range

309. The measure of central tendency measures the following characteristic
a. Dispersion b. Asymmetry
c. Average d. Spread

310. The degree of flatness or peakedness of a graph of a frequency distribution is termed as
a. Kurtosis b. Skewness
c. Standard deviation d. Variance

311. Standard deviation is a measure of:
a. Chance
b. Central tendency
c. Deviation from mean value
d. None

312. If mean is less than the median, then the data is said to be:
a. Positively skewed b. Negatively skewed
c. Equitable distribution d. Normal distribution

313. Which of the following is true about a negatively skewed data distribution?
a. Mean < median < Mode
b. Mode > median > Mean
c. Median > Mean > Mode
d. Mean = Median = Mode

314. 50th percentile is equivalent to –
a. Mean b. Median
c. Mode d. Range

315. Probability values fall on scale between:
a. 0 and 1 b. –1 to +1
c. 0.001 to 1 d. 0.05 to 0.001

316. A nurse researcher wanted to compare the male and female patients on their level of satisfaction of nursing care provided to them. The level of satisfaction was measured as 'satisfied' or 'not-satisfied'. Which of the following statistical method is appropriate to associate the gender and satisfaction level of patients?
a. t-test b. Chi-square test
c. Correlation coefficient d. ANOVA

317. Linear relationship between height (in cm) and weight (in kg) of the patients can be analysed
a. t-test
b. Range of variation
c. Correlation coefficient
d. ANOVA

318. Association between height (short, average or tall) and weight (underweight, normal or overweight) can be calculated using
a. t-test
b. ANOVA
c. Chi Square test
d. Correlation coefficient

319. Which of the following is a measure of dispersion
a. Mean b. Median
c. Mode d. Variance

320. A large standard deviations in a data set suggest that
a. Scores are probably widely scattered.
b. There is very little difference among scores.
c. Mean, median and mode are the same
d. The scores are normally distributed.

321. The square root of the variance is the:
a. Standard deviation b. Standard error
c. Z-score d. Mean deviation

322. Which of the following is NOT a characteristic of normal distribution?
a. Symmetric b. Bell-shaped
c. Mean = median = mode
d. Negative skewness

323. The proportion of observations fall above the median is:
a. 60% b. 50%
c. 75% d. 95%

324. A measure of central tendency which is calculated by numbers arranged in ascending or descending order is
a. Standard deviation b. Range
c. Median d. Mode

325. Which measure of central tendency is Influenced by extreme scores and skewed distributions?
a. Mean b. Median
c. Mode d. Range

Ans.

298. a
299. b
300. b
301. b
302. c
303. b
304. c
305. b
306. d
307. a
308. b
309. c
310. a
311. c
312. b
313. a
314. b
315. a
316. b
317. c
318. c
319. d
320. a
321. a
322. d
323. b
324. c
325. a

Scanned with CamScanner

326. A statistic which describes the interval of scores bounded by the 25th and 75th percentile ranks is:
   a. Inter quartile range
   b. Confidence Interval
   c. Range
   d. Variance

327. Which of the following measures of central tendency is most appropriate to be considered when the data has significant variability?
   a. The Mean
   b. The Median
   c. The Mode
   d. Variance

328. The measure of central tendency that represents the score most occurring in a distribution of scores is called:
   a. Mean
   b. Mode
   c. Variable
   d. Medium

329. X is the symbol of
   a. Median
   b. Mode
   c. Mean
   d. Range

330. The measure of Central Tendency that represents the exact middle of a set of scores is:
   a. Mode
   b. Mean
   c. Normal Distribution
   d. Median

331. The Measure of Central Tendency that is computed by summing all the scores of a study and dividing by the number of subjects is called the:
   a. Medium
   b. Mode
   c. Normal Distribution
   d. Mean

332. In a normal distribution curve, how many percentage of the data (area) fall within two standard deviation of the mean
   a. 68.2%
   b. 90.6%
   c. 95.4%
   d. 99.6%

333. In a normally distributed data, approximately what percentage of score fall within one standard deviation of the mean?
   a. 34%
   b. 68%
   c. 95.4%
   d. 99.6%

334. The statistical method that is used to explain and summarize a specific set of data is known as
   a. Inferential statistics
   b. Descriptive statistics
   c. Theme identification
   d. None of the above

335. The most frequently occurring number in a set of values is called the _____.
   a. Variance
   b. Mean
   c. Mode
   d. Median

336. The Census is conducted once in every
   a. 5 years
   b. 8 years
   c. 10 years
   d. 15 years

337. The process of transforming qualitative research data from written or tape recorded interviews into typed text is called
   a. Segmenting
   b. Coding
   c. Transcription
   d. Memoing

338. The measure of central tendency that is preferred when the data is severely skewed is
   a. Mean
   b. Mode
   c. Median
   d. Variance

339. All of the following are the measures of dispersion EXCEPT
   a. Variance
   b. Median
   c. Standard deviation
   d. Range

340. Formula to calculate range is
   a. H - L
   b. H X L
   c. H/L
   d. H + L

341. The two most important parameters used for describing a normally distributed continuous variable are
   a. Mean and standard deviation
   b. Median and Range
   c. Mean and Variance
   d. Median and standard deviation

342. The mean and standard deviation (SD) for following data: 12, 16, 18, 14, 10, 20
   a. 15 and 3.7, respectively
   b. 14 and 3.7, respectively
   c. 15 and 2.7, respectively
   d. 14 and 2.7, respectively

343. The best measure of central tendency in a normally distributed continuous data is
   a. Mean
   b. Median
   c. Mode
   d. Range

344. Correlation is a method used to determine if
   a. Variable X Causes variable Y
   b. Variable Y causes variable X
   c. Variable X and Y vary together
   d. Variable X and Y are parallel

345. A researcher reported the correlation between variables X and Y is r = 0.6. Which of the following interpretation is correct?
   a. The X-variable explains 60% of the variability in the Y-variable.
   b. The X-variable explains 40% of the variability in the Y-variable.
   c. The X-variable causes negative changes in 60% of the Y-variable.
   d. The X-variable is equal to 60% of the Y-variable.

346. Regression line is used to
   a. Determine if any x-values are outliers
   b. Determine if any y-values are outliers
   c. Estimate the change in y for every ten unit change in x
   d. Estimate the change in y for a one-unit change in x

347. Correlation is measured between
   a. −1 to +1
   b. 0 to 1
   c. 0 to −1
   d. 0.001 to 0.05

348. Statistical procedure that is used to predict the value of a dependent variable based on the value of one or more independent variable is known as
   a. Repeated measures ANOVA
   b. Regression analysis
   c. General linear model
   d. Q-Sort Analysis

349. Which of the following correlation coefficients would indicate the strongest relationship between anxiety and exam performance?
   a. r = 0.50
   b. r = −0.50
   c. r = −0.55
   d. r = −1.20

350. The values that mark the boundaries of the confidence interval is
   a. Margin of error
   b. Standard error
   c. Confidence limits
   d. Confidence intervals

Ans.

326.	a
327.	b
328.	b
329.	c
330.	d
331.	d
332.	c
333.	b
334.	b
335.	c
336.	c
337.	c
338.	c
339.	b
340.	a
341.	a
342.	a
343.	a
344.	c
345.	a
346.	d
347.	a
348.	b
349.	c
350.	c

Scanned with CamScanner

351. Which of the following statement is NOT TRUE about confidence intervals (CI)
a. The intervals give a range of values within which the true value will lie.
b. A 95% confidence interval has a 0.95 probability of containing the population mean
c. A 95% confidence interval does not mean that 95% of the sample data lie within the interval
d. The intervals give estimation about relationship between two variables with 95% confidence

352. Confidence Interval (CI) will be the widest for a particular data set if it is calculated for _____
a. 50% CI b. 90% CI
c. 95% CI d. 99% CI

353. 95% confidence interval refers to:
a. Considering 1 out of 20 chances are taken to be wrong.
c. Considering 95 out of 100 chances are taken as wrong
b. Considering 1 out of 100 chances are taken as wrong.
d. Considering 5 out of 20 chances are taken as wrong.

354. To analyse the relationship between Systolic blood pressure (in mm of hg) and weight (in kg) in a sample of 100 patients, we could use
a. Paired t-test
b. Correlation coefficient
c. Chi-squared test
d. One way ANOVA

355. Which of the following is a nonparametric test?
a. ANOVA b. Chi-squared test
c. Independent t-test d. Paired t-test

356. Which of the following is a parametric test?
a. Paired t-test
b. Chi-squared test
c. Mann Whitney U test
d. Wilcoxon signed rank sum test

357. Which of the following is NOT an assumption made by parametric tests?
a. Sample scores a have been drawn from a normally distributed population
b. The samples are assumed to have the same variance
c. Outcome variable is measured on an interval or ratio scale
d. Outcome variable is measured on a nominal or rational scale

358. Which of the following is a true statement about non-parametric tests?
a. They are used to analyze data that are normally distributed.
b. Paired t-test is a nonparametric test.
c. They are used to analyze data that are not normally distributed.
d. They can be used only when the data is collected from a random sample of subjects

359. While testing the hypothesis, fail to reject the null hypothesis when the null hypothesis is actually false is known as
a. Type-I error b. Type-11 error
c. Sampling error d. Standard error

360. Type I errors in research occur when
a. The null hypothesis is rejected but it should have been retained.
b. The null hypothesis is accepted but it should have been rejected
c. The null hypothesis is not rejected due to sampling error
d. The obtained p-value is higher than 0.05.

361. While testing the hypothesis, rejecting the null hypothesis when the null hypothesis is actually true is known as
a. Type-I error
b. Type-11 error
c. Sampling error
d. Standard error

362. Which of the following is a NOT a parametric statistical test?
a. t-test
b. ANOVA
c. Pearson Correlation
d. Mann-Whitney U-test

363. What is NOT true about Yate's Correction in Chi-square test?
a. Applied when there is two categorical variable are compared.
b. Applied when there is 2 × 2 contingency table is used
c. Recommended when there is less than 5 numbers are there is contingency cells
d. It is used when normality assumption is not satisfied.

364. The correct formula to calculate degree of freedom (df) in Chi-square test is
a. n – 1 b. n – 2
c. (c – 1) (r – 1) d. n (n – 1)

365. The degree of freedom (DF) while computing Chi-square test for a 3 × 3 contingency table is
a. Two b. Four
c. Six d. Nine

366. How many degrees of freedom would a table with 2 rows and 3 columns have?
a. 1 b. 2
c. 3 d. 4

367. Chi-square test, how many degrees of freedom would a table with 2 rows and 2 columns have?
a. 1 b. 2
c. 3 d. 4

368. All of the following are the method of obtaining vital statistics EXCEPT
a. Registration method
b. Census enumeration
c. Operational research method
d. Analytical method

369. In biomedical research survival analysis is typically used to evaluate
a. Incidence of a disease b. Point Prevalence
c. Lifetime Prevalence d. Life expectancy

370. Which of the following is a measurement of fertility?
a. Maternal Mortality rate b. Reproductive rate
c. Under fiver mortality rate d. Maternity morbidity rate

371. A systematic method for continuous monitoring of diseases in a population, in order to be able to detect changes in disease patterns and then to control them is:
a. Surveillance b. Conditional probability
c. Screening d. Prevalence

372. Incidence Rate as a measure of morbidity includes the occurrence of:
a. All old cases of disease
b. All new cases of disease
c. All old and new cases of disease
d. All of the above

373. Which of the following value of Relative Risk indicates the strong association between cause and effect.
a. 1 b. –1
c. 0 d. None of the above

Ans.

351.	d
352.	d
353.	a
354.	b
355.	b
356.	a
357.	d

369.	d
370.	b
371.	a
372.	b
373.	a

Scanned with CamScanner

416. Mean and standard deviation can be worked out only if the data is on:
a. Interval/Ratio scale
b. Dichotomous scale
c. Nominal scale
d. Ordinal scale

417. Frequency distribution in quantitative data is studied by?
a. Histogram
b. Line diagram
c. Pie diagram
d. Ski diagram

418. Graph to correlate two quantitative data is
a. Histogram
b. Scatter diagram
c. Line diagram
d. Frequency curve

419. Best method to show trend of events with passage of time is:
a. Line diagram
b. Bar diagram
c. Histogram
d. Pie chart

420. Best way to plot the change of incidence of disease over time is:
a. Histogram
b. Line chart
c. Scatter diagram
d. Ogive

421. The diagram that is used to visually examine the linear relationship between two continuous variables is known as
a. Pie chart
b. Frequency polygon
c. Scatterplots
d. Histogram

422. Distribution of continuous data can be best represented by
a. Pie chart
b. Pictogram
c. Histogram
d. Line diagram

423. Which of the following is a type of bar graph?
a. Polygon
b. Pie chart
c. Histogram
d. Line graph

424. Which of the following data presentation method uses angle for construction?
a. Table
b. Pie graph
c. Bar chart
d. Frequency

425. Descriptive and inferential studies fall into which of the following type of result?
a. Qualitative
b. Quantitative
c. Correlation
d. Central tendency

426. Content Analysis refers to
a. Reading books time and again for in-depth content
b. Interpretation of qualitative data
c. Interpretation of quantitative data
d. Presentation of quantitative data

427. Categorization scheme refers to
a. Overlapping of groups to find a result
b. Set groups in order that do not overlap
c. Cross checking of groups
d. All of the above

428. Coding, data reduction, theme, and data saturation are the terms associated with
a. Quantitative study
b. Qualitative study
c. Cross-over study
d. Randomized control trial

Explanation: Coding refers to break down and labeling of large amounts of data. Data reduction means using coding to reduce data. Theme is abstract idea or concept. Data saturation means information gets redundant. The above said terms are associated with qualitative research studies.

429. Study title: "The effects of gender and smoking habits compared to amount of dental caries dental caries are the...
a. Constant variable
b. Independent variable
c. Dependent variable
d. Extraneous variable

"Better ten times ill than one time dead."

—Yiddish

10 NURSING ADMINISTRATION AND MANAGEMENT

SYNOPSIS

ORGANIZATION

A systematic arrangement of people brought together to accomplish some specific purpose/goal.

ADMINISTRATION

It is the organization and direction of human and material resources to achieve desired goals. (Pfiffner & Presthus)

MANAGEMENT

Process of getting things done efficiently and effectively through and with other people.

Levels of Management

- Top Managers
- Middle Managers
- First-Line Managers

Theories of Management

1. Classical Management Perspective
2. Behavioral Management Perspective
3. Quantitative Management Perspective

1. Classical Management Perspective

It includes both scientific management and administrative management.

- Concerned with improving the performance of individual workers (i.e., efficiency).
- A theory that focuses on managing the organization as a whole.

Scientific Management

Frederick Taylor

- Father of scientific management
- Replaced the old rule-of-thumb method.
- Believed in selecting, training, teaching and developing workers.
- Used time study, standards planning, exception rule of management, slide-rules, instruction cards, incentives, etc.

Frank and Lillian Gilbreth

- Reduced number of movements in bricklaying, resulting in increased output of 200%

Henry Gantt

- Developed other techniques, including the Gantt chart, to improve working efficiency through planning/scheduling.

Administrative Management Theory

- Focuses on managing the organization

Henri Fayol

- Wrote General and Industrial Management
- Helped to systematize the practice of management
- First to describe management as planning, organizing, leading and controlling.

Fayol's 14 Principles of Management

- Division of labor
- Authority
- Discipline
- Unity of command
- Unity of direction
- Subordination of individuals to the common good
- Remuneration
- Centralization
- Scalar chain
- Order
- Equity
- Stability
- Initiative
- *Esprit de corps*

2. Behavioral Management Perspective

- Emphasizes individual attitudes and behaviors and group processes.
- Recognizes the importance of behavioral processes in the workplace.
- **The Hawthorne Studies**
  - *Conducted by Elton Mayo and associates at Western Electric (1927–1935)*
  - *Group study: The effects of a piecework incentive plan on production workers*
    - Workers established informal levels of acceptable individual output.
    - Over-producing workers were labeled "rate busters" and under-producing workers were considered "chiselers."
  - *Interview program*
    - Confirmed the importance of human behavior in the workplace.

Scanned with CamScanner

- ***Human Relations Movement***
  - Perspective that workers respond primarily to the social context of work
  - Abraham Maslow
    - Posited a hierarchy of needs

Figure 1 ■ Hierarchy of needs

Douglas McGregor

- Proposed Theory X and Theory Y concepts of managerial beliefs

Theory X

- People do not like work and try to avoid it.
- People do not like work, so managers have to control, direct, coerce, and threaten employees to get them to meet organizational goals.
- People prefer to be directed, to avoid responsibility and to want security; they have little ambition.

Theory Y

- Work is a natural part of people's lives.
- People are internally motivated by commitment.
- People are committed to goals to the degree they receive rewards.
- People will seek and accept responsibility.
- People have the capacity to be innovative.
- People are bright, but mostly under-utilized.

Max Weber Theory of Bureaucracy

Used to describe a structure based on sociological concept of rationalization of collective activities.

Features of Bureaucracy

- Clear division of labor
- Hierarchical management of position
- Formal rules and regulation
- Impersonal relationship
- Employment based entirely on technical competence.

Organizational Behavior

- A contemporary field focusing on behavioral perspectives of management.
- Organizational behavior research
  - Job satisfaction
  - Job stress
  - Motivation and leadership
  - Group dynamics and organizational politics
  - Interpersonal conflict
  - Design of organizations
- **Five Functions of Management**
  - Planning
  - Organizing
  - Coordinating
  - Directing
  - Controlling
- **Organizing**
  - Management function of setting up the group, allocating resources, and assigning work to achieve goals.
- **Organization chart**
  - Uses boxes to represent the various positions or departments in an organization.
  - Lines connecting the boxes indicate who reports to whom.
- **Authority**
  - The right to perform a task or give orders to someone else.
- **Line Authority**
  - The right to carry out tasks and give orders related to the organization's primary purpose.
- **Staff Authority**
  - The right to advise or assist those with line authority.
- **Functional Authority**
  - The right given by higher management to specific staff personnel to give orders concerning an area in which the staff personnel have expertise.
- **Delegating:** Giving another person the authority and responsibility to carry out a task.

Elements of Administration

As per Luther Gulick elements of administration are POSDCORB

P	planning
O	organization
S	staffing
D	directing
Co	coordinating
R	reporting
B	budgeting

Comparing Formal and Informal Organization

Table 1

Characteristics	Formal organization	Informal organization
Structure		
• Origin	Planned	Spontaneous
• Rationale	Rational	Emotional
• Characteristics	Stable	Dynamic
Position terminology	Job	Role
Goals	Profitability of service to society	Member satisfaction

Cont

Scanned with CamScanner

Characteristics	Formal organization	Informal organization
Influence		
• Base	Position	Personality
• Type	Authority	Power
• Flow	Top-down	Bottom-up
Control mechanisms	Threat of firing, demotion	Physical or social sanctions (norms)
Communication		
• Channels	Formal channels	Grapevine
• Networks	Well defined, follow formal lines	Poorly defined, cut across regular channels
• Speed	Slow	Fast
• Accuracy	High	Low
Charting the organization	Organization chart	Sociogram
Miscellaneous		
• Individuals included	All individuals in work group	Only those "acceptable"
• Interpersonal relations	Prescribed by job description	Arise spontaneously
• Leadership role	Assigned by organization	Result of membership assignment
• Basis for interaction	Functional duties or position	Personal characteristics, ethnic background, status
• Basis for attachment	Loyalty	Cohesiveness

3. Quantitative Management Perspective

- This theory is concerned with applying quantitative management tools focusing on decision making, economic effectiveness, mathematical models and the use of computer.
- Management science, operations management, and management informational system are its branches.

LEADERSHIP

Theories on Leadership

- **Trait theories:** Individual with certain trait or characteristic become leader.
- **Leadership style theories:** leadership style form most significant basis for effective leadership
- **Trait and situational match theory:** When certain trait match with particular situation leadership become most effective
- **Leadership style and situational theory:** When certain leadership style match with particular situation leadership become effective.
- **Greatman theory:** According to this certain people are born with certain characteristics to become a leader.
- **Charismatic theory:** People become leaders because they have charisma, because of this other people feels better in their presence and they will get emotional support and inspiration from leaders.
- **Situational theory:** Different situation require different trait to become leaders. So a person who is leader at one situation may become follower at another situation
- **Contingency theory:** According to this leader's role depends upon three situation and are—(1) leader-member relation, (2) task structure and (3) position power
  - Leader-member relation means the faith and loyalty group members possessed towards the leader.
  - Task structure is said to be high if it is easy to define and measure a task in terms of goal clarity, extent to which the decision can be verified, multiplicity of goal path and specificity of solution. If not then task structure is low.
  - Position power: It means the power which they are obtaining by sitting in a specified position or a chair
- **Path goal theory:** As per this leader facilitate the followers to accomplish goal by minimizing the obstruction and rewarding them for the accomplishment of the task.

Leadership Styles

- **Autocratic leadership:** Leader has strong control over the group and takes decision.
- **Democratic leadership:** Leader acts as a facilitator and encourages the group to take decision
- **Laissez fare leadership:** Leader participates minimally and acts as a resource person or consultant.
- **Participative leadership:** In this style functions are distributed among all the group members

Leadership Style in Nursing

- Charismatic leadership
- Authoritarian leadership
- Democratic or participative leadership
- Laissez fare leadership
- Situational leadership
- Transactional leadership

MATERIAL MANAGEMENT

It is a scientific technique, concerned with Planning, Organizing and Control of flow of materials, from their initial purchase to destination.

Aims of Material Management

To Get

- The right quality
- Right quantity of supplies
- At the Right time
- At the Right place
- For the Right cost

Purpose of Material Management

- To gain economy in purchasing
- To satisfy the demand during period of replenishment
- To carry reserve stock to avoid stock out
- To stabilize fluctuations in consumption
- To provide reasonable level of client services.

Objectives of Material Management

Primary

- Right price
- High turnover
- Low procurement
- Storage cost
- Continuity of supply
- Consistency in quality

Scanned with CamScanner

- Good supplier relations
- Development of personnel
- Good information system

Secondary

- Interdepartmental
- Forecasting
- Product improvement
- Standardization
- Make or buy decision
- New materials and product
- Favorable reciprocal relationship

Basic Needs of Material Management

- To have adequate stock of material when required
- To spend minimum money for high quality material
- To reduce the inventory investment and to operate it efficiently.

Functional Areas of Material Management

- Purchasing
- Central service supply
- Central stores
- The print shops
- The pharmacy
- Dietary and linen services

INVENTORY CONTROL

It means stocking adequate number and kind of stores so that the materials can be available whenever and wherever required. Scientific inventory control results in optimal balance.

Functions of Inventory Control

- To provide maximum supply service, consistent with maximum efficiency and optimum investment.
- To provide cushion between forecasted and actual demand for a material

Always Better Control (ABC) Analysis

Items are divided into three categories named A, B and C
A items are high value items, B items are intermediate value and C items are low value items0

- **Item A:** These are important items and it is about 10-20% of inventory items and consume 50-60% of the inventory cost. These items are having tight control and is managed by top level manager.
- **Item B:** These are 30-40% of all inventory items and consume 30-40% of the total inventory cost. These are important items but not critical. **These items are having moderate control and is managed by middle level manager.**
- **Item C:** Item C account for 40-50% of all inventory items and needs 5-10% of the total inventory cost. These items are having low level control and is managed by low level manager.

VED Analysis

V	=	Vital
E	=	Essential
D	=	Desirable

- Vitals means shortage of the item cannot be tolerated
- Essential items are those items its shortage can be tolerated for a short period
- Desirable items are those items shortage of the items will not adversely affect.

FSN Analysis

Based on Utilization

- Fast moving
- Slow moving
- Nonmoving

Nonmoving items must be periodically reviewed to prevent expiry and obsolescence.

HML Analysis

Based on Cost Per Unit

- Highest
- Medium
- Low

This is used to keep control over consumption at departmental level for deciding the frequency of physical verification.

STAFF DEVELOPMENT

Activities involved in staff development are as follows:

- Induction training
- Job orientation
- In-service education
- Continuing education

Induction Training

During the first 2-3 days of duty the employee is given with brief explanation of policies, regulations, philosophy and standard.

Job Orientation

New employee is given with orientation regarding job responsibilities. work place, client and coworker.

In-service Education

Ongoing job instructions are given to employee to enhance their work performance.

Continuing Education

It's a planned activity directed towards meeting learning needs of a the nurse following basic nursing education exclusive of full time formal post basic education

QUALITY MANAGEMENT

Quality is defined as proper performance (according to standards) of interventions that are known to be safe, that are affordable to the society in question, and that have the ability to produce an impact on mortality, morbidity, disability and malnutrition.

- **Quality management** can be considered to have four main components: quality planning, quality control quality assurance and quality improvement.

Scanned with CamScanner

- **Quality management** uses quality assurance and control of processes as well as products to achieve more consistent quality.

Principles of Quality Management

- Customer focus
- Leadership
- Involvement of people
- Process approach
- System approach to management
- Continual improvement
- Factual approach to decision making
- Mutually beneficial supplier relationships

Approaches for a Quality Assurance Programme

- Credentialing
- Licensure
- Accreditation
- Certification

Credentialing

Credentialing refers to a type of designation, award, status, recognition, or "*seal of approval*" to the individuals or organizations.

It is the formal reorganization and establishing qualification of licenced individual.

Licensure

It is granting permission to the individual for the entry and exit from a particular profession. Licensure help to ensure the quality professional practice.

Accreditation

Accreditation is a process in which certification of competency, authority, or credibility is awarded to an agency or organization.

Assessment is done by an independent agency.

Agency's physical structure, organizational structure and personnel qualifications are assessed.

The aim of accreditation is to encourage organizational development.

Example: NABH and NAAC accreditation for Hospitals and Univer-sities /educational institutes respectively.

Certification

It is a process of providing with an official document attesting to a status or level of achievement.

- **Example:** Professional certification, trade certification, etc.

Quality Assurance Methods

Peer Review

It means quality of work or a product is cross-checked by the members of same professional group. Peers can identify errors or problem fastly and easily than any other one and can be corrected.

Standards can be classified and formulated according to frames of references used for setting and evaluating nursing care services.

Structure Standard

A structural standard involves the 'set-up' of the institution. They refer to the organizational structure in which nursing is implemented. In this it will measure whether the structure is adequate, reliable and desirable.

Process Standards

Process standards describe the behaviors of the nurse at the desired level of performance.

A process standard involves the activities concerned with delivering patient care.

Outcome Standards

- Outcome standards refers to the description of the results of nursing activity in terms of the change that occurs in the patient.
- This change may be due to nursing care, medical care or as a result of variety of services offered to the patient.
- Outcome standards reflect the effectiveness and results rather than the process of giving care.

NURSING AUDIT

- Method which systematically examine the quality of nursing care (Elison).
- Nursing audits evaluate the nursing functions to help to appraise and improve the quality of patient care as per the standards and criteria laid down by the experts.
- Nursing audit committee.
- Audit committee is needed to establish criteria and process for quality assurance and to evaluate care, make recommendations and do follow ups.

NORMS OF STAFFING (SIU—STAFF INSPECTION UNIT)

- Nurse patient ratio as per SIU norms

Table 2

Ward	Nurse patient ratio
General Ward	1 : 6
Special Wards (pediatrics, burns, neurosurgery, cardiothoracic, neuromedicine, nursing home, spinal injury, emergency wards attached to casualty)	1 : 4
ICU	1:1 (Nothing mentioned about the shifts)
OT	Major: 2 nurses per table Minor: 1 nurse per table
Labor Room	1 nurse per table

- One Nursing sister (in-charge) for every 3.6 staff nurses.
- One ANS for every 4.5 nursing sisters.

Scanned with CamScanner

- One DNS for every 7.5 ANS.
- Nursing superintendent for every 250–500 beds.
- CNO for 500 or more bedded hospital.

NORMS OF (AS PER INC AND TNAI)

Chief nursing officer	1:500
Nursing superintendent	1:400 or above
DNS	1:300 and additionally one for every 200 beds
ANS	1 for 100-150 beds or 3-4 wards
Ward sister	1 for 25-30 bed or one ward. 30% leave reserve
Staff nurse	
General ward (teaching hospital)	1:3
General ward (non-teaching hospital)	1:5–30% leave reserve
OPD and emergency	1:100
ICU	1:1

- It is suggested that for 250 bed hospital there should be One Infection Control Nurse (ICN).

TEACHER-STUDENT RATIO FOR NURSING PROGRAMS AS PER INDIAN NURSING COUNCIL (INC)

- 1 teacher: 10 students for BSc Nursing and GNM courses.
- 1 teacher: 5 students for MSc Nursing courses.

Target High Extra Edge

- Mission statement is a broad statement of an organization that specifies how it will achieve its goals.
- Father of Scientific Management is **Frederic Winslow Taylor.**
- **Henri Fayol:** 14 principles of management.
- **Max Weber:** Theory of Bureaucracy.
- Performance appraisal is the way of acknowledging the performance of an employee.
- "Esprit de corps" refers to **Sense of belonging.** It is one of the Fayol's 14 principles of management.
- Source of income in budgeting terms is called **Revenue.**
- **Inventory Control:** Stocking adequate numbers and kinds of stores, so that the required material is available whenever necessary.
- **Procurement:** Process of selecting vendors, establishing payment terms, selection, negotiation, and purchasing of goods.
- Headquarters of International Nursing Council is in **Geneva.**
- The leadership style in which the leader alone determines policies and makes plans is **Autocratic.**
- Whole team is involved in formulating decision is **democratic leadership.**
- **Laissez-faire leadership** (delegative leadership): Leader is hands-off and allows group members to make the decisions. The leader has absolutely no control.
- Patient care method in which patient care areas provide various levels of care Progressive patient care. E.g. Step down units.
- Purpose of recruitment is to provide a pool of potentially qualified candidates for job.
- Individuals who do NOT make decision unit they are aware of all the facts pertaining to a certain situation are called **open minded.**
- SWOT stands for strengths, weaknesses, opportunities and threats.
- The communication in which managers interact with people in other departments in the organization who are NOT at the same level in the hierarchy as them is called **diagonal communication.**
- Assertiveness allows for objective responses.
- **Vertical communication:** Information flows between or among subordinates and superiors of the organization.
- **Horizontal communication:** Exchange of information across departments at same level in an organization (similar hierarchical departments).
- Horizontal communication is also known as **lateral communication.**
- **Upward communication:** Communication proceeds from lower level to upper level.

Contd...

Scanned with CamScanner

- The most crucial phase of group dynamics is storming phase.
- **Cost-benefit analysis** is the most popular economic evaluation tool used for program priority setting.
- The cost covering the salaries of the staff and machinery/equipment is termed as **Fixed cost.**
- Inventory control is the process of maintaining the optimum needed quantity that is sufficient for the smooth operation of the organization.
- The time that elapses between placement of an order and delivery of the material is termed as **Lead Time.**
- **VED** stands for Vital, Essential and Desirable.
- **FSN** stands for fast-moving, slow-moving and non-moving items.
- In FSN analysis, items are classified on the basis of rate of consumption.
- Ward in-charge Nurse (head nurse) is responsible for inventory control at lower managerial level.
- **Replacement:** There must be a regular system of replacing certain items when they are broken or of no use before new ones are supplied.
- **Procurement:** Process of selecting vendors, establishing payment terms, strategic vetting, selection, negotiation and purchasing of goods.
- **Storage:** Materials stored in an appropriate place in a correct way.
- **Democratic leadership**: Whole team is involved in formulating decision.
- **Autocratic leadership:** Leader alone establishing policies and making plans. The criteria used by him is "Do what I say or else..."
- **Laissez-faire leadership:** This is also known as delegative leadership in which leaders are hands-off and allow group members to make the decisions. The leader has absolutely no control.
- Leaders have followers whereas managers do not have followers.
- Delegation refers to assignment of any responsibility or authority to another person to carry out specific activities.
- World Health Organization (WHO) was constituted in the year 1947.
- WHO is headquartered in Geneva, Switzerland.
- The International Council of Nurses (ICN) was established in the year 1899.
- The International Council of Nurses (ICN) is headquartered in Geneva, Switzerland.
- The purpose to conduct staff training is to improve communications, staff morale, and quality of work.
- Quality indicators is the best to determine whether high quality care is being delivered.
- An organization's ability to meet analytical specifications for precision and accuracy is referred to as **quality control.**
- Quality assurance is concerned with standard of practice.
- Procedure manual is a written document which guides rationalized nursing measures.
- A planned schedule of duty hours of nurses is referred to as Duty Roaster.
- **The INC standard for Teacher:** UG Students ratio for nursing colleges is 1:10.
- National Health Policy is announced by Government of India in the year 1982.

"As I see it, every day you do one of two things: build health or produce disease in yourself."

—Adelle Davis

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

1. Which of the following is not the principle of organization? *(RAK MSC 2018)*

a. Hierarchy
b. Delegation
c. Span of control
d. Pervasiveness

Explanation: Pervasiveness is not the principle of the organization. There are six principles of organization given by Henri Fayol (1947)

- Hierarchy
- Span of control
- Integration Vs Disintegration
- Centralization Vs Decentralization
- Unity of Command
- Delegation

2. The level of conversation in which no sharing of oneself occurs is: *(AIIMS-BBS SNO 2019)*

a. Level 1: Open conversation
b. Level 5: Cliché conversation
c. Level 4: Reporting of facts
d. Level 2: Spontaneous conversation

Explanation:

- **Level 5 (cliché' conversation):** It is very superficial communication, where there is no communication about their self and everyone remains safe in conversation.
- **Level 1 (Open conversation):** This happens in emotionally open and honest communication.
- **Level 2 (Spontaneous conversation):** spontaneous thought like what is felt about situation is shared.
- **Level 3 (My ideas or judgment):** own ideas and opinion are shared.
- **Level 4 (Reporting of facts):** Share facts and expose almost nothing about personal.

3. Which of the following function the LEAST important to a nurse manager? *(RAK MSc 2018)*

a. Decision-making
b. Manipulating people
c. Monitoring subordinates
d. Effective leading

Explanation: Role of Nurse as a Manger include all except manipulating the people, as manipulation involves managing or influence skillfully, especially in an unfair manner.

4. The collection of information from nursing records and through other evidences about patient care is called: *(AIIMS BPL NO 2018)*

a. Nursing audit
b. Medical audit
c. Inspection
d. Accreditation

Explanation: Nursing Audit is a systematic evaluation of nursing records and evidences about patient care. Medical audit refers to audit of medical care from medical care. : Systematic review of medical care in order for improvement and analysis.

5. A public health nurse in the health center behaves like a dictator and uses position power to get her work done. She makes all the decisions and does not involve her subordinates in decision making. Which style of leadership BEST describes her? *(RAK MSC 2018)*

a. Autocratic
b. Democratic
c. Bureaucratic
d. Laissez faire

Explanation: In Autocratic leadership style, the leader assumes complete control over the decisions and activities of the group.

6. The leadership style in which the leader alone determines policies and make plans is: *(AIIMS Raipur NO 2019)*

a. Democratic
b. Autocratic
c. Rewarded
d. Laissez-faire

Explanation: Leadership styles:

- **Autocratic:** Leader alone establishing policies and make plans. The criteria used by him is "Do what I say or else..."
- **Democratic:** Whole team is involved in formulating decision.
- **Laissez-faire** (Delegative leadership): Leaders allows group members to make the decisions. The leader has absolutely no control.
- **Rewarded** is not a type of leadership style.

7. Leadership is important for the success of any organization. The following are important elements in leadership, except: *(RAK MSC 2018)*

a. There must be a leader and followers in the organization
b. The leader is usually autocratic
c. There is unequal distribution of power between the leader and the followers
d. Leaders can influence the followers by their behavior.

Explanation: Leadership is an ability to influence an individual or group in order to maintain the morale of the group. Leader has followers. Leaders counsel the employees and develop team spirit. Here they have considerable freedom of action, which is usually not there in autocratic type of leadership.

8. Who has given 14 principles of management? *(RAK MSC 2018)*

a. Daniel Fraud
b. Mary Follett
c. Henri Fayol
d. Florence Nightingale

Ans.

1. d
2. b
3. b
4. a
5. a
6. b
7. b
8. c

Scanned with CamScanner

Explanation: Henri Fayol described the 14 principles of management.

1. Division of work
2. Centralization
3. Authority and Responsibility
4. Scalar Chain
5. Discipline
6. Order
7. Unity of Command
8. Equity
9. Unity of direction
10. Stability of Tenure
11. Interest
12. Initiative
13. Remuneration
14. Esprit De Corp

9. Two-factor theory (Motivation-Hygiene theory) of management was proposed by *(AIIMS-BBS SNO 2019)*

a. Frederick Herzberg b. W. Edwards Deming
c. Frederick Taylor d. Elton Mayo

Explanation:

Name	Contribution
Max Weber	Theory of Bureaucracy
Henri Fayol	14 principles of management
Frederic Winslow Taylor	Father of scientific management
Elton Mayo	Human relation motivation theory-including **Hawthorne effect.**

10. Which of the following theories stresses the importance of change within organizations? *(AIIMS-BBS SNO 2019)*

a. Neoclassical Theory
b. Classical Theory
c. System Theory
d. Chaos Theory

Explanation: Chaos theory incorporates principles of quantum mechanics. It stresses the importance of change within organizations.

11. Which of the following action guiding theory explains that the rightness or wrongness of an action depends on the consequences of the action? *(AIIMS BBS NO 2018)*

a. Utilitarian b. Deontological
c. Nonmaleficence d. Beneficence

Explanation: **Utilitarian** (ethical) theory is proposed by Jeremy Bentham and John Stuart Mill. This theory guides an individual to what to do in specific situation. An action is right if promotes happiness and will be considered wrong if it is against happiness. So, this theory explains about rightness and wrongness of any action depends on its consequences.

12. The ethical principle, which shows obligation to tell the truth is: *(AIIMS Raipur NO 2019)*

a. Autonomy b. Veracity
c. Fidelity d. Beneficence

Explanation:

- The ethical principle which shows obligation to tell the truth is **veracity.**
- **Autonomy:** Refers to the right to make one's own decisions.
- **Fidelity:** It means to keep a promise.
- **Beneficence:** Refers to taking positive actions to help others.

13. Acknowledging the performance of an employee is through the way of : *(AIIMS Raipur NO 2019)*

a. Self-assessment b. Performance appraisal
c. Rewards d. Appreciation

Explanation: Acknowledging the performance of an employee is through the way of **Performance appraisal. Performance appraisal** is a periodic formal evaluation of how well personnel have performed their duties during a specific period. The outcome of performance appraisal is used to determine the reward, promotion etc.

14. Professional negligence is legally termed as: *(AIIMS Raipur NO 2019)*

a. Crime b. Assault
c. Malpractice d. Slander

Explanation:

- Malpractice is a professional liability based on negligence and includes professional misconduct, breach of duty or standard of care, illegal or immoral conduct or failure to exercise reasonable skill, all of which lead to harm.
- **Crime** is an offence and is punishable by law.
- An assault is the act of inflicting physical harm or unwanted physical contact upon a person
- **Slander** refers to crime of making false spoken statement damaging to a person's reputation.

15. Hospital has to keep MLC record up to: *(AIIMS Raipur NO 2019)*

a. One year b. Five years
c. Ten years d. Fifteen years

16. "Esprit de corps" refers to *(AIIMS Raipur NO 2019)*

a. Sense of achievement b. Sense of humor
c. Sense of belonging d. Sense of morality

Explanation:

- "Esprit de corps" refers to **Sense of belonging.** It means promotion of team spirit brings the organization a feel of unity. It is one of the Fayol's 14 principles of management.

17. Source of income in budgeting terms is called: *(AIIMS Raipur NO 2019)*

a. Capitation b. Cash flow
c. Profit d. Revenue

Explanation: Source of income in budgeting terms is called as **Revenue.**

Cash flow refers to projecting how and when cash comes in and flows out of a business within a specified time period. **Capitation** means Fixed, prearranged monthly payments. **Profit** refers to projected net revenue that will permit the company in attaining its goals.

18. Stocking adequate numbers and kinds of stores, so that the required material is available whenever necessary is: *(AIIMS Raipur NO 2019)*

a. Replacement b. Procurement
c. Storage d. Inventory control

Explanation:

- **Inventory control** is the process of maintaining the optimum needed quantity (stocks) that is sufficient for the smooth operation of the organization.
- **Replacement:** System of replacing certain items.

Ans.

9.	a
10.	d
11.	a
12.	b
13.	b
14.	c
15.	c
16.	c
17.	d
18.	d

Scanned with CamScanner

- **Procurement:** Process of purchasing of goods.
- **Storage:** Storage of materials at an appropriate place.

19. Patient care method in which patient care areas provide various levels of care: *(AIIMS Raipur NO 2019)*

a. Team nursing
b. Progressive patient care
c. Case method
d. Primary nursing care

Explanation: Progressive patient care units also called as intermediate care or step-down units, provide a transition between the ICU and the general unit or discharge.

20. Purpose of recruitment is to *(AIIMS Raipur NO 2019)*

a. Provide a pool of potentially qualified candidates for job
b. Interview and promote the candidate
c. Do staff promotion and training
d. Minimize labor turns over in the organization

Explanation: Recruitment means providing a pool of potentially qualified candidates for job situation. It is the process of actively seeking out or attracting applicants for existing positions.

21. Individuals who do not make decision until they are aware of all the facts pertaining to a certain situation are called: *(AIIMS-BBS SNO 2019)*

a. Introvert
b. Open minded
c. Extrovert
d. Judgmental

Ans.

19.	b
20.	a
21.	b
22.	d
23.	c
24.	c
25.	b
26.	a
27.	a

Explanation: Open-minded individuals have willingness to try new things, or to hear or consider new ideas. They do not make decision unit they are aware of all the facts pertaining to a certain situation.

22. Which of the following is INCORRECT about SWOT analysis for decision making? *(AIIMS-BBS SNO 2019)*

a. S is for strengths
b. W is for weaknesses
c. O is for opportunities
d. T is for time

Explanation:

23. The communication in which managers interact with managers, physicians and groups of people in other departments in the organization who are NOT at the same level in the hierarchy as them is called: *(AIIMS-BBS SNO 2019)*

a. Vertical communication
b. Horizontal communication
c. Diagonal communication
d. Upward communication

Explanation: Diagonal communication is held between different structures of a business firm. It is between higher and lower sectors of a business firm. It is also known as cross-functional communication.

24. A surgical patient in his unit has a fall from his bed on the 2nd post-operative day and accidentally the feeding tube dislodged from the nose; on assessment the patient was looking irritable and reported pain in the area of surgical incision. The above-mentioned issue was to be documented as an unusual event as it occurred at the health care facility. Being a nurse, which of the following report do you consider in reporting? *(AIIMS BPL NO 2018)*

a. Employee incident report
b. Offense incident report
c. Patient incident report
d. Shift incident report

Explanation: Patient incident report is also known as accidental report which is the documentation of the incidence or any accident in detail that has to be filled in the nursing superintendent cabin and should contain complete information of the patient (name and age) along with the place and time of accident and whether any preventive actions were taken or not by the nurse. This can be used for preventing reoccurrence of such accidents in future.

25. During a performance appraisal, if the head nurse commits an error, it is called: *(AIIMS BPL NO 2018)*

a. Horns effect
b. Halo effect
c. Paired comparison
d. Central tendency error

Explanation: During performance appraisal there are several errors that take place by supervisor, one of them is Halo effect. When a single positive or negative dimension of a subordinate's performance is allowed to influence the supervisor's rating of that subordinate on other dimensions, a halo effect is operating. For example: the supervisor likes Tom because he is very cooperative.

26. The process that enables one to access a nurse or a physician via telephone or computer is called: *(AIIMS BPL NO 2018)*

a. Telehealth
b. E-Medicine
c. Quality assurance
d. Distant consultation

Explanation: Telehealth involves the distribution of health-related services and information via electronic information and telecommunication technologies. Distance consultation comes under the ambit of telehealth. **E-medicine** refers to electronic collection of medical information and record about the person that can be stored in the computer.

27. The commission or omission of an act that a reasonably prudent person would have performed in a similar situation thus causing harm to another person is called: *(AIIMS BPL NO 2018)*

a. Negligence
b. Libel
c. Slander
d. Assault

Explanation: An unintentional tort is one that is negligent, as opposed to intentional torts, which are torts done deliberately. Intentional torts include assault, battery, false imprisonment, intentional infliction of emotional distress, libel, slander and trespassing.

Scanned with CamScanner

28. Which of the following is NOT a step of planning? *(AIIMS BPL NO 2018)*

a. Briefing
b. Execution
c. Strategic healthcare planning
d. Needs identification

Explanation: Briefing, strategic health care planning and need identification are all the part of planning process. Execution refers to implementation of plan.

29. Group strength and group bonding that hold the group members together, thereby sustaining them, are together known as: *(AIIMS BPL NO 2018)*

a. Group structure
b. Group goals
c. Cohesiveness
d. Temporal change

Explanation: Group cohesiveness (also called group cohesion and social cohesion) arises when bonds link members of a social group to one another and to the group as a whole.

30. The phenomenon of a nurse respecting a patient's rights to make decisions about his health and health care is called: *(AIIMS BBS NO 2018)*

a. Human dignity
b. Integrity
c. Autonomy
d. Altruism

Explanation: Autonomy is the right to self-determination, and it is one of the ethical principle of nursing. Autonomy refers to the right of patients to make decisions about their medical care without their health care provider trying to influence the decision.

31. Experienced nurse introducing an employee to new responsibilities through teaching and guidance is called: *(AIIMS BBS NO 2018)*

a. Mentorship
b. Preceptorship
c. Professionalism
d. Leadership

Explanation: Preceptorship is termed when an experienced person instructs and guides a person about his duties and skills in a particular field.

Mentorship is defined as guiding someone to improve skills.

32. Leader assuming complete control over the decisions and activities of the group is called: *(AIIMS BBS NO 2018)*

a. Transformational leadership
b. Laisser-faire leadership
c. Autocratic leadership
d. Democratic leadership

Explanation: Autocratic leadership is one kind of leadership in which leader controls the group and all decisions are taken by leader without getting inputs from group members.

33. All the following are conflict resolution strategies except: *(AIIMS BBS NO 2018)*

a. Collaborating
b. Resistance
c. Smoothing
d. Avoiding

Explanation: Resistance is the refusal to accept or comply with something. Resistance increases conflict by increasing dissatisfaction in group. Conflict resolution strategies are avoiding, collaborating, smoothing, repression, and sharpening.

34. VED stands for: *(AIIMS Nagpur NO 2018)*

a. Valuable, Essential, Desirable
b. Valuable, Estimated, Desirable
c. Vital, Essential, Desirable
d. Vital, Estimated, Desirable

Explanation: VED analysis is a technique in inventory control. It divides inventory into three groups: **vital items, essential items and desirable items.**

35. There are several differences between a leader and a manager. Which of the following manager does not have: *(RAK MSc 2018)*

a. Formal authority
b. Subordinates
c. Followers
d. Responsibility

Explanation: The manager never has any followers whereas the leader has followers.

Table Differences between leader and manager

Characteristics	Leader	Manager
Formal rights	A leader has no formal rights	A manager has certain formal rights
Followers/ subordinates	**A leader has followers**	A manager has subordinates
Functions	A leader is to guide and motivate his followers	A manager is to plan, organize, staff direct, motivate and control
Necessity	Leadership is not a necessity for an organization	Managership is a necessity for an organization

guidance on how to work, hence this is not the characteristic of supervision. All other statements are related to functions of a supervisor.

38. Who should write the report of a patient having a fall in the bathroom? *(RAK MSc 2018)*

a. The registered nurse in charge
b. The assistant nurse who witnessed the incident
c. The family member who assisted the patient to the bathroom
d. The nurse manager in charge of the unit.

Explanation: Incident reporting when a patient having a fall in the bathroom is very important and it has to be reported by a registered nurse on duty.

The registered nurse in charge on shift duty have the full responsibilities of all patient in her unit. Hence, she is responsible for reporting the incident report.

39. The skill required for managing an institution is: *(RAK MSc 2018)*

a. Controlling
b. Dictating
c. Directing
d. Supervising

Explanation: Managing any work or institution needs certain skills and abilities since this process cannot be done by everyone. Directing is a process in which manager instructs, guides and oversees the performance of the worker which gives the overall view of control, dictate, supervision, hence directing is suitable skill.

40. In case of absconding patient in night duty, a nurse will inform immediately to: *(RAK MSc 2018)*

a. Head nurse
b. Nursing superintendent
c. Nursing shift supervisor
d. Security officer

Explanation: Absconding is considered as legal case and need to be reported immediately. In the night, in absence of head nurse, **shift supervisor** is responsible for the entire hospital, hence need to report immediately. She is the in charge or senior especially in night shift time, hence reporting immediately has to be done to her.

41. The number of people directly reporting to any one manager or officer is known as: *(RAK MSc 2018)*

a. Line organization
b. Scalar chain
c. span of control
d. Staffing

Explanation: Span of control is one of the principles in organization, where span of control depicts the number of employees that can be handled by a single manager; the number of people who report to one manager in the hierarchy.

42. An answerability of a subordinate to his/her superior for performance of the assigned tasks is known as: *(RAK MSc 2018)*

a. Responsibility
b. Accountability
c. Authority
d. Delegation

Explanation: An answerability of a subordinate to his/her superior for performance of the assigned tasks is known as Accountability. Accountability, means that the employee or subordinate is held responsible for successfully completing the task and will have to at least explain why they failed to do so.

43. The assessment method that occur after the patient has been discharged is: *(Safdarjung NO 2018)*

a. Concurrent Evaluation
b. Auditing
c. Retrospective evaluation
d. Quality assurance

Explanation: Retrospective evaluation is a type of assessment that is done to find out whether goals are met in hospital after the discharge of the patient.
Concurrent evaluation: continuous assessment process when patient is in the hospital
Auditing: systematic assessment of records, documents of a unit or organization
Quality assurance: Evaluation of patient care by developing standards of care and implementing mechanisms to see whether they met.

44. Which of the following situation is considered as an intentional tort: *(Safdarjung NO 2018)*

a. Nurse miscounts the gauze pads during a surgery
b. Nurse divulges private information about the patient to media.
c. Nurse causes a burn when applying a warm soak to legs
d. Nurse fails to monitor blood pressure when administering an anti-hypertensive to drugs

Explanation: Nurse divulges private information about the patient to media is to be considered as intentional tort. Intentional tort is a civil wrong performed by a person knowingly and the person was also aware of the possible consequences of his/her act.

Miscounting the gauze pads, failure to monitor the vital signs and causing burns while applying warm soakage are examples of negligence or malpractice.

45. The manager gives incentive for one employee on their extra effort on new project, the power which is used in this situation is: *(Safdarjung NO 2018)*

a. Coercive
b. Reward
c. Legitimate
d. Expert

Explanation: Reward is when employee is provided with monitory or non-monitory incentives for good performance as a positive reinforcement.

46. Which of following rate is applied to calculate "The total number of deaths occurring in a hospital after 48 hours of admission for a period (divided by) total number of discharges including death (minus) death under 48 hours for the same period in a hospital multiplied by 100": *(Safdarjung NO 2018)*

a. G.D.R.
b. N.D.R.
c. T. B.O.R
d. 0.R.

Explanation: NDR: Net Death Rate (institutional death rate): The ratio of the total number of deaths occurring in the hospital, 48 hours or more after admission, for a period to the total number of discharges and deaths, 48 hours and over, for that period.

The formula for figuring the percentage is

$$\frac{\text{Deaths (including newborn) minus those under 48 hours for a period}}{\text{Total number of discharges (including deaths and newborn) minus deaths less than 48 hours for the period}} \times 100$$

GDR (Gross death rate or hospital death rate): The proportion of inpatient hospitalizations that end in death, usually expressed as percentage.

47. Who is known as the Father of Scientific Management? *(AIIMS-BBS SNO 2019)*
a. Max Weber b. Henri Fayol
c. Frederic Winslow Taylor d. Elton Mayo

48. Theory X and theory Y of management was proposed by
a. William Ouchi b. Douglas McGregor
c. Mary Follett d. Frederick Taylor

49. Hawthorne experiments were conducted by
a. Edwards Deming b. Elton Mayo
c. Henry Ford d. F.W Taylor

50. "When managers make a decision, they must take into account all aspects of the current situation and act on those aspects that are key to the situation at hand". This is stated by which of the following management theory?
a. Theory X b. Contingency Theory
c. Chaos Theory d. Frederick Taylor

51. Mr Anoop is a person who has natural dislike for work. He avoids responsibility and has to be forced to do his work. He also has ambition. Which of the following theory best explains this scenario his character?
a. Theory X b. Theory Y
c. Contingency theory d. Two factor theory

52. Mrs Renuka, a CHC head nurse, is highly motivated to work. She will take responsibility is also very open and will make changes if necessary. She needs very little or no direction and will work on her own. Which of the following theories best describes her character?
a. Theory X b. Theory Y
c. Contingency theory d. System theory

53. The style of leadership that dominates and commands the group is: *(DSSSB PHN, 2015)*
a. Autocratic b. Democratic
c. Situational d. Laissez-faire

54. Which of the following teaching methods is useful for learning a skill? *(Kerala PSC, Nov 2014)*
a. Lecture b. Demonstration
c. Seminar d. Symposium

55. False harmful written report is called: *(Kerala PSC, Nov 2014)*
a. Libel b. Slander
c. Tort d. Felony

56. Checking the equipment and supplies periodically is known as
a. Item analysis b. Investigation
c. Inventory d. Indent

57. Characteristics of good reporting includes
a. Fact b. Accuracy
c. Legibility d. All of the above

58. With reference to elements of administration, POSDCORB stands for
a. Planning, Observing, Staffing, Directing, Controlling, Reporting, and Budgeting
b. Preparation, organizing, staffing, Directing, Controlling, Reporting and Budgeting
c. Planning, Organizing, Staffing, Directing, Coordinating, Reporting, and Budgeting
d. Preparation, Observation, Staffing, Directing, coordinating, Reporting and Budgeting

59. Which of the following is a characteristics of Theory X?
a. Highly motivated employees
b. Employees will take their own responsibility and does not need to be coerced to work
c. Employees inherently dislikes work
d. Employees will do his work no matter what

60. Which type of leadership theories considers that the people inherit certain qualities that make them better suited to leadership?
a. Learning theories b. Trait theories
c. Behavioral theories d. "Great Man" theory

61. The process of linking each item of expenditure to its justified purpose is known as
a. Cost analysis b. Cost Saving
c. Cost Accounting d. Value Analysis

62. The tendency to over-rate an employee's performance is known as
a. Positive effect b. Halo Effect
c. Hawthorn Effect d. Biasness

63. In a health camp conducted in a rural area, the function of the nurse manager includes all of the following, EXCEPT
a. Maintaining Records and Reports
b. Writing Prescriptions dictated by physicians
c. Organizing Physical Facilities
d. Conducting a health awareness program

64. The most important skill to be possessed by a nurse administrator working in a community set-up is
a. Documentation b. Communication
c. Coordination d. Organization

65. The method of setting formal guidelines before starting a work is known as
a. Planning b. Coordinating
c. Execution d. Assessment

66. A broad statement of an organization that specifies how it will achieve its goals is
a. Aims and goals b. Policy statement
c. Vision statement d. Mission statement

67. The group effort required to achieve a common organizational goal is
a. Supervision b. Direction
c. Coordination d. Organization

68. While planning for a new Hospital, the most important factor to keep in mind is the
a. Organizational profits
b. Health Care System
c. Patients' Comfort
d. Unit Facilities and organizational convenience

69. The responsibilities of employees that is standardized by an organization is referred as
a. Job specification b. Job analysis
c. Job description d. Job standardization

70. A type of patient care assignment, which requires giving complete nursing care to a specific number and category of patients, during the scheduled duty hours is known as
a. Team nursing b. Task nursing
c. Individual Care Assignment
d. Organizational Nursing

71. The type of nursing care assignment that is best suited in an Intensive Care Unit is
a. Functional method b. Case method
c. Task method d. Team method

Scanned with CamScanner

153. Human resource planning does not includes
a. Staff appraisal
b. Demand forecasting
c. Supply forecasting
d. Preparing a plan of action

154. Which of the following is NOT a characteristic of an authoritarian leader?
a. Do not consult subordinates to make decision
b. Listen to the employees of the organization
c. One way communication is preferred
d. Instruct his employees exactly what he wants

155. All of the following are the skills required by a supervisor, EXCEPT:
a. Problem-solving
b. Decision-making
c. Manipulating employees
d. Planning, organizing and staffing

156. Which of the following is not a role of supervisors?
a. Informing employees regarding organizational policies
b. Train the employees
c. Authoritative
d. Mentor to juniors

157. Evaluation is done
a. At the end of the program
b. At regular intervals
c. By drawing comparison between planning and achievement
d. To determine whether the policy is being correctly implemented

158. The cost covering the salaries of the staff, and machinery/equipment is termed as
a. Total cost
b. Flexible cost
c. Operative cost
d. Fixed cost

159. What is the most popular economic evaluation tool used for program priority setting?
a. Risk-benefit analysis
b. Cost-efficiency analysis
c. Cost-benefit analysis
d. Cost analysis

160. The type of budget that compares the performance of the activities with the budget utilization is known as
a. Operating budget
b. Utilization budget
c. Program performance budget
d. Incentive budget

161. The type of budgeting technique that requires items to be justified from the beginning without regarding the expenditure in the past is called as
a. Incremental budgeting
b. Operating budgeting
c. Rolling budget
d. Zero-based budgeting

162. Mrs. Seema, the Nursing Superintendent of the hospital, has just finished a meeting with her subordinates. The minutes are prepared the next day. Which of the following activity is to be done next
a. Prepare the agenda for the next meeting
b. Send a notice for next meeting with a schedule
c. Follow up the activities discussed in meeting
d. Identify who contributed in the previous meeting

163. Which of the following attributes is least likely to be cause of conflict in administration
a. Authority
b. Needs
c. Perception
d. Power

164. A team member who does not want to contribute out of a fear of making a mistake is referred as
a. Pleaser
b. Passive member
c. Criticizer
d. Active member

165. The most crucial phase of group dynamics is
a. Forming
b. Norming
c. Storming
d. Performing

166. The team member who gets the team members moving in the right direction is known as
a. Coordinator
b. Controller
c. Recorder
d. Mobiliser

167. A team member who always prefers everyone in the group to follow what he propose is a
a. Active member
b. Criticizer
c. Pleaser
d. Controller

168. Once a problem is formulated, the next step is to
a. List all possible solutions
b. Decide what is critical in the decision
c. Select an alternative choice
d. Compare all possible solutions

169. When a nurse pays attention to what a patient is saying, this is termed as
a. Reflecting
b. Attending
c. Focusing
d. Responding

170. Which of the following term refers to communication between similar hierarchical departments?
a. Downward
b. Lateral
c. Diagonal
d. Vertical

171. Which of the following is an appropriate action by a nurse while communicating with elderly clients?
a. Request their family member to interpret details to them
b. Speak in a loud voice
c. Ensure that they are focused on you
d. Stand close to the client while facing them

172. Assertiveness allows for
a. Apologetic responses
b. Passive responses
c. Objective responses
d. Aggressive responses

173. Assertive communication is a way of communicating that allows a person to
a. Avoid problems by being submissive
b. Underestimate the rights of the other person
c. Express themselves in direct and honest ways, without violating the rights of others
d. Avoid conflict by remain silent

174. All of the following are characteristics of assertive techniques, EXCEPT
a. Ability to express honestly
b. Winning the situation
c. Mutual respect and their rights
d. Objectiveness in interaction

175. Advantages of being assertive includes all, EXCEPT
a. It helps an individual to achieve goals
b. It helps an individual to win
c. It helps an individual to communicate without hurting others
d. It helps to recognize their one's rights

176. All of the following are styles of behavior, EXCEPT
a. Aggression
b. Assertion
c. Passive
d. Conflict

177. Characteristics feature of passive person is that they are
a. Defensive
b. Emotionally expressive
c. At a loss for words
d. Too demanding

MICROBIOLOGY

11

SYNOPSIS

THE NORMAL BACTERIAL FLORA OF HUMAN BODY

Resident Flora

These organisms are relatively fixed and regular type of organism found at a given body site. They perform functions such as synthesis of vitamin K, absorption of nutrient, breakdown of nutrients, etc.

Transient Flora

These are nonpathogenic and potentially pathogenic organisms. These microorganisms do not produce disease under normal circumstances. But if normal flora is destroyed and immune system is weak then they may produce disease.

Normal Flora

Table 1

Body site	Name of normal flora
Eye (conjunctiva)	*Corynebacterium xerosis*, coagulase negative staphylococci, nonhemolytic streptococci,
Mouth and upper respiratory tract	*Streptococcus viridans*, diphtheroids coagulase negative staphylococci, anaerobic cocci, anaerobic spirochaetes, bacteroides, anaerobic cocci, *fusobacterium sp.*
Gastrointestinal (GI)	Lactobacilli, anaerobic streptococci, *Clostridium*, *Bacteroides*, *Salmonella*, *Shigella*, *Yersinia*,
Genitourinary	*Mycobacterium smegmatis*, alpha hemolytic streptococci, lactobacilli, *Gardnerella vaginalis*, and *Bacteroides spp*, *Chlamydia* trachomatis, β-hemolytic streptococci, anamerobic streptococci, clostridia, *Ureaplasma urealyticum*

STAINING TECHNIQUES

- **Simple stain**: Methylene blue
- **Negative stain**: Negative stain produces uniform colored background against which uncolored organism strands out. E.g. **India ink**
- **Impregnation stains**: Cells and structures that are too thin to be visualized by the light microscope can be rendered visible by impregnation of silver on their surface.

Differential Stain

- Gram's stain
- Acid-fast stain
- Albert's stain

Gram's Stain

- Found by Christian Gram in 1884
- It is used to study morphology of bacteria
- When bacteria are treated with basic dyes such as methyl violet, crystal violet or gentian violet and then with iodine, retain their color even after decolorization with alcohol/ acetone. The microorganisms retain the color and appear violet in color are called Gram-positive bacteria. On the other hand the microorganism decolorized will be seen with the help of a counter stain that give them red/pink color and are called Gram-negative.

Acid-Fast Stain

- Normal dyes will not be able to penetrate **Mycobacterium** eps. So the dye containing phenol and application of heat make it to penetrate the cell wall of mycobacteria. Once the bacteria are stained then they will withstand the action of powerful decolorizing agent for a considerable duration of time.
- Acid-fast bacilli (AFB) will be seen as **bright-red** structure whereas tissue, other organism are seen as blue/green depending upon the counter stain.

Albert Stain

- It is used to stain the volutin granules of **diphtheria bacilli**.
- These granules have intense affinity towards basic dyes.

TYPES OF MICROSCOPE

- Light microscopes (Compound microscope)
- Fluorescence microscope
- Dark ground microscope
- Phase contrast microscope
- Interference microscope
- Electron microscope

CULTURE MEDIA

Solid Media, Liquid Media and Semi-solid Media

- In culture media agar is the agent used for solidifying purpose.
- By varying the concentration of sugar, media can be prepared as solid/semi-solid.
- Solid media, e.g. blood agar, chocolate agar, MacConkey's agar,

Scanned with CamScanner

- Liquid media, e.g. nutrient broth, peptone water, sugar media and enrichment media.

Aerobic and Anaerobic Media

Aerobic

- To promote the growth of aerobic organism aerobic media is used.
  Example: *Bacillus subtilis, Azotobacter Mycobacterium*

Anaerobic

- Organisms that are unable to use oxygen are known as anaerobic organisms.
- Roberston's cooked meat media is used to grow anaerobic organism of anaerobic organisms:
  Examples: *Clostridium* species, *Bacteroides, Peptococcus, Peptostreptococcus*
  Examples of anaerobic media: Leaked blood agar, brain heart infection broth with thioglycollate.

Enriched Media

- Substances like blood (The most common sheep blood), serum and egg are added to basic media to prepare enriched media.
  Example: Blood agar, chocolate agar, Lowenstein- Jensen Peptone water media.

Selective Media

- As the name indicates this media selectively hinder the growth of some microorganisms and also facilitates the isolation of some other microorganisms.
  Example: Thiosulphate citrate bile sucrose (TCBS): This medium isolates *Vibrio cholerae.*
  Mannitol salt agar (MSA): This medium facilitates isolation of *Staphylococcus aureus*

Enrichment Media

- This media stimulate the growth of some microorganisms and hinder the growth of others.
  Example: Selenite F broth: Promotes *Salmonella typhi* usually in the liquid format.

Indicator/Differential Media

- When microorganisms are incorporated to these kind of media different microorganisms show different characteristics.
  Example: In MacConkey's medium, lactose fermenters like *E. coli* grows as pink while non-lactose fermenters like *S. typhi* as colorless pale colonies.

Transport Media

- This media promotes the growth of microorganisms and prevents the growth of contaminants during the transport to the laboratory.

Sugar Media

- To a basal medium any fermentable substances such as glucose, lactose or glycerol is added then it is known as sugar media.

Storage Media

- To maintain the bacterial culture for a prolonged period of time this media is used.
  Example: Nutrient agar slopes.

BIOCHEMICAL REACTIONS

Table 2

Reaction	To know
Carbohydrate fermentation test	Ability of an organism to ferment
Indole test	Ability of an organism to decompose amino acid tryptophan to indole
Citrate test	Ability of an organism to utilize citrate as sole source of carbon for metabolism with resulting alkalinity.
Klinger's agar/triple sugar iron agar test	Ability of an organism to use specific carbohydrate incorporated into the media
Phenylalanine Deaminase test	Ability of an organism to deaminate phenylalanine to phenyl pyruvic acid
Urease test	Ability of an organism to split urea using urease with resulting alkalinity
Nitrate reduction test	To determine the presence of enzyme nitrate reductase in an organism
Oxidase test	Used to determine the presence of enzyme oxidase in an organism
Catalase test	Used to check the presence of enzyme catalase in an organism

GENERAL GUIDELINES FOR COLLECTING CULTURE SPECIMEN

- Try to obtain specimen always from the patient before the initiation of antimicrobial agent.
- Personal protection needs to be ensured by the health care professional whoever is collecting the specimen.
- Quantity of the specimen should be adequate to carry out the specific test ordered.
- Blood culture bottle should not be refrigerated once the blood sample is added to it.
- CSF sample (except those for viral culture) should not be refrigerated. Keep it in the incubator at 37°C.
- Midstream urine sample needs to be collected as sample and if any delay in sending to the laboratory, keep it refrigerated.
- Sample collected for viral culture need to be transport in ice medium.

Guidelines for other samples like throat, stool sample, sputum sample needs to be incorporated.

Types of Disinfectant/Antiseptic

Table 3

Types	Examples
Alcohol	70% alcohol
Aldehydes	Formaldehyde (3–8%), gluteraldehyde (2%)
Biguanides	Chlorhexidine
Halogen releasing agent	Hypochlorites (1–2%), povidone-iodine
Phenols	Chloroxylenol, hexachlorophene
Heavy metal derivatives	Salt of heavy metal such as silver and mercury
Peroxygen	Hydrogen peroxide

Scanned with CamScanner

- All the articles are to be cleaned with soap and water before disinfecting it.
- **Sterilization:** It destroys or removes all microorganisms including spores
- HIV, HBV and HCV are the three important blood-borne disease conditions that affect the health care workers (HCWs).
- Immunity is a state of resistance to microorganism and their products.
- WBCs are responsible for immune response.
- T cells are responsible for cell-mediated immunity.
- B lymphocytes are responsible for humoral immunity or antibody-mediated immunity.
- Immunity against disease condition can be natural (innate) or acquired (adaptive).

CLASSIFICATION OF BACTERIA

Shapes and Arrangement of Bacteria

Figure 1 ■ Bacterial morphology

Gram-Positive and Gram-Negative Bacteria

Table 4

Gram-positive bacteria	Gram-negative bacteria
• *Staphylococcus*	• *Neisseria gonorrhoeae*
• *Streptococcus*	• *Neisseria meningitides*
• *Pneumococcus*	• *Pseudomonas*
• *Mycobacterium*	• *Vibrio cholera*
• *Clostridium tetani*	• *Salmonella*
• *Bacillus anthracis*	• *Escherichia coli*
• *Lactobacillus*	• *Shigella*
	• *Brucella*

Scanned with CamScanner

The Medically Important Cocci

Table 5

Cocci	Types	Diseases
Staphylococcus	Gram-positive	*Staphylococcus aureus:* breast abscess, wound infection, pneumonia, acute osteomyelitis, meningitis, endocarditis, renal abscess, food poisoning,
Streptococcus	Gram-positive	Sore throat, scarlet fever, pyoderma, rheumatic fever, glomerulonephritis, pharyngitis,
Enterococcus	Gram-positive	Bacteremia, surgical wound infection, urinary tract infection, endocarditis
Pneumococcus	Gram-positive	Acute bacterial meningitis, otitis media, conjunctivitis, sinusitis, empyema, peritonitis
Meningococcus	Gram-negative	Septicemia, meningitis,
Gonococcus	Gram-negative	Lower genital tract infection, urethritis, cervicitis, salpingitis, endometritis, epididymitis, pharyngitis

The Medically Important Bacilli and Vibrios

Bacilli associated with respiratory tract infection

Table 6

Microorganisms	Types
Corynebacterium diphtheria	Gram-positive
Haemophilus influenzae	Gram-negative
Bordetella pertussis	Gram-negative
Legionnaire's disease	Gram-negative
Klebsiella species	Gram-negative

Bacilli Associated with Infections of Intestinal Wall

Table 7

Microorganisms	Types
E. coli	Gram-negative
Typhoid, paratyphoid	Gram-negative
Dysentery bacilli (*Shigella* sp)	Gram-negative
Proteus normal	Gram-negative
Pseudomonas normal	Gram-negative

Spore-bearing Medically Important Bacilli

Table 8

Microorganisms	Types	Diseases
Clostridium tetani	Gram-positive	Tetanus
Clostridium perfringens	Gram-positive	Gas gangrene
Clostridium botulinum	Gram-positive	Botulism (food poisoning)
Clostridium difficile	Gram-positive	Pseudomembranous colitis
Bacillus anthracis	Gram-positive	Anthrax

Bacilli Derived from Infected Animal

Table 9

Microorganisms	Types	Diseases
Plague bacillus	Gram-negative	Plague
Brucellosis bacilli	Gram-negative	Brucellosis

The Causative Organisms

Table 10

Microorganism	Types	Disease
Vibrio cholera	Gram-negative	Cholera
Campylobacters	Gram-negative rods	Diarrhea
Helicobacter pylori	Gram-negative	Gastric/Duodenal ulcer
Bacteroides	Gram-negative	Abdominal, brain and lung abscess

Diagnostic Tests Done

Table 11

Diagnostic tests	Diseases
Paul-Bunnel	Infectious Mononucleosis
Mantoux test	Tuberculosis (TB)
Schick test	Diphtheria
Widal test	Typhoid
VDRL	Syphilis
Dick Test	Scarlet fever
Weil-felix	Typhus fever

Golden points to remember

- **Louis Pasteur** (1822-1895) is considered as the father of microbiology.
- **Joseph Lister** introduced antiseptic surgery.
- **Louis Pasteur introduced sterilization** technique and stem sterilizer, auto-clave and hot air oven.
- **Louis Pasteur** introduced first live-attenuated vaccine.
- **Robert Koch** is known as **father of bacteriology.**
- Robert Koch introduced **staining technique.**
- **Robert Koch** discovered anthrax bacillus, tubercle bacillus and the cholera vibrios.
- **Karl Landsteiner** discovered **ABO blood groups.**
- **Alexander Fleming** discovered the drug **penicillin.**
  Bacterial cell division occur by **binary fission.**
- **Hot air oven is a dry heat** sterilization method while **autoclave is moist heat** sterilization method.
- Temperature and time required in **hot air oven is 160°C for 2 hours** for sterilization.
- Temperature and time required in **autoclave** is **121°C for 30 minutes at a pressure of 15 pounds** per square inch.
- **Filtration** is a method adopted to sterilize sera, sugar and antibiotic solutions.
- A **parasite** is a microorganism which lives on a living host and derives nutrition from the host without any benefits to the host.
- **Artificial active immunity** may be produced by vaccination.
- **Artificial passive immunity** is through the parenteral administration of antibodies.
- **Herd immunity** is the overall resistance in a community.
- **Antigen** is a substance introduction of this into the body evoke immune reaction.
- **IgG** is the major serum immunoglobulin and is the only immunoglobulin which can cross the placenta.
- **IgA** is the main immunoglobulin which is present in body secretions.
- **Presence of IgM** antibody in the serum of a newborn baby suggestive of congenital infection.
- **IgE** mediate type-1 hypersensitivity reactions.
- **IgM** is the macro immunoglobulin.
- **Clostridial pathogenicity** is mainly because of the production of **exotoxin**
- Mycoplasma differ from other bacteria because they lack a rigid cell wall.
- **Mycoplasma** are the **smallest free living** microorganism.
- **Poxvirus are the largest** and most complex of all viruses.
- **Hepatitis B** is caused by **DNA virus** and all other type of hepatitis is caused by RNA virus.
- **HBsAg** is also called as Australia antigen.
- **Definitive host** in which **sexual** replication of parasite occur.
- **Intermediate host** in which **asexual** replication of parasite occurs
- **Louis Pasteur** proposed the **germ theory** of disease.
- **Robert Koch** proved/confirmed the germ theory of disease.
- **Mycobacterium leprae** was the first bacterium identified causing disease in humans.
- Mycobacterium tuberculosis is also known as **Koch's bacillus.**
- **Dapsone** was the **first drug** discovered to treat **leprosy.**
- **Antony Van Leeuwenhoek** developed **microscope** first time.
- **Knoll and Ruska** developed **electron microscope.**
- In bacteria, **mesosome** is responsible for **respiration**, cell division and sporulation.
- Capsule of the bacteria helps it to enable adherence to surface, protection against phagocytosis, and prevents desiccation and provides nutrients.
- Bacteria that are unable to synthesize their own food materials are called **Heterotrophs.**
- Mesophilic bacteria grow best between 25 and 40°C temperature.
- **Transport medium** is a special medium inhibits self-destruction and multiplication of microbes but maintains "status quo" condition.
- **Differential staining** gives different color to different bacteria.
- **Hanging Drop Method** is used to observe the **motility of a microbe.**
- **Blood and Bone Marrow Sample** should be incubated at **37°C** during storage prior to processing.
- **Pleomorphic Bacteria** have variable shape (Bacteria with changeable shape).
- Bacteria that thrive in high temperature (40°C - 70°C) are called **thermophilic.**

Contd...

Scanned with CamScanner

- Spherical bacteria occurring in clusters are called *staphylococcus*
- **Non-motile small appendages** on the surface of bacteria which help in transfer of DNA from one cell to another during conjugation are called as **pili.**
- **Nosocomial infection** are those infection acquired by a person after 48 hours of hospital stay.
- The interval between exposure to infection and the appearance of the first symptoms is called **Incubation period.**
- When a patient is already suffering from an infection acquires another infection from another patient or source is called **cross infection.**
- Organisms that live in an intimate non-parasitic relationship with the host are called **commensal.**
- **Bacteremia** is the presence of pathogenic bacteria in the blood.
- A disease transmitted by direct contact is called as **contagious infection.**
- **Physician-induced infections** resulting from investigative, therapeutic and other procedure like surgery is called **iatrogenic infection.**
- A chemical agent that inhibits bacterial growth is called **bacteriostat.**
- **Autoclaving** is the **most reliable** method of sterilization.
- **Culture media** is sterilized by autoclaving method.
- **Vibrio cholera** are **coma-shaped** bacteria.
- ***Clostridium perfringens*** causes gas **gangrene.**
- ***Clostridium botulism*** is spore forming, nonmotile, encapsulated bacteria and causing **food poisoning.**
- **Bacillary dysentery** is commonly caused by ***Shigella.***
- ***Salmonella typhi*** causes **typhoid fever.**
- **Widal test** is the specific diagnostic test for **typhoid fever.**
- ***Staphylococcus epidermidis*** is normal skin commensal but may act as an opportunistic pathogen in prosthetic heart valves, intraperitoneal catheters leading to septicemia and sub acute endocarditis.
- **Leprosy** also known as **Hansen's disease.**
- ***T. pallidum*** is the causative agent of **syphilis.**
- **VDRL** (Venereal Disease Research Laboratory) test is done for the **diagnosis of syphilis.**
- ***Coxiella burnetii*** is the causative agent of **Q fever.**
- **Rubella infection to mother in the first trimester** of pregnancy may cause **fetal death or congenital defect** in the child.
- **Tsetse fly (Sandfly)** transmit the condition known as **Sleeping sickness** which is caused by ***Trypanosoma brucei.***
- **Vector** is responsible for spreading disease from one to another
- **Filariasis** is caused by ***Wuchereria bancrofti.***
- ***Plasmodium*** is an organism of group **Sporozoa.**
- **Intact skin, Mucous membrane and their secretions and Normal microbial flora** are body's nonspecific **first line resistance** against an infection.
- **Inflammation, Fever and Phagocytic WBC** are body's non-specific **second line defense** mechanism.
- **Antibodies** are the part of specific **third line defense.**
- Neutrophils and monocyte have **phagocytic action.**
- **Basophils release histamine** to play role in inflammatory reaction.
- When the cells are invaded by a virus, they produce **Interferon.**
- A person acquire immunity after suffering from an infectious disease, this type of immunity is known as **Natural active immunity.**
- **Natural passive immunity** occurs when infant gets antibodies from his mother through placenta and colostrum.
- Diphtheria caused by *Corynebacterium diphtheriae.*
- **Intradermal route** is used for **diphtheria toxin injection** in Schick test. It is injected in Left forearm.
- Tuberculin test is based on type 4 hypersensitivity.
- **Ziehl Neelsen** stain is also known as **acid-fast stain.**
- In **Mantoux test,** purified protein derivative (PPD) is injected intradermaly. Erythema, Edema and Induration suggestive of positive mantoux test.
- Organisms that originate from outside the body of the patient are known as **exogenous.**
- **Fomites:** The objects contaminated with pathogenic micro-organisms.
- **Mutation** is the alteration in genetic material.
- **Acetone** is the decolorizing agent used in Gram staining.
- ***E. coli*** is a Gram negative motile bacilli.
- **Pasteurization of milk:**
  - **HTST (High Temperature Short Time) of flash method:** The milk is heated to 72°C (161°F) for 15 seconds.
  - **Holder method: The milk is heated to 63°C** and holding this for 30 minutes.
- **Black, yellow, red and blue** are the color codes used in biomedical waste management.
- ***Staphylococcus aureus*** is a motile organism.
- Hepatitis A, polio, typhoid are mainly transmitted by **feco-oral route.**
- ***Ascaris lumbricoides*** is also known as round worm.
- ***P. ovale*** is a species which is not reported in India.

Image-Based Questions

1. **Microbiologist shown in photograph is credited with discovery of** *[Recent Question 2013]*

a. Sarcoma virus
b. Mycobacterium tuberculosis
c. HIV virus
d. Mycobacterium leprae

2. **Identify the instrument shown in the photograph**

a. Electron microscope
b. Compound microscope
c. Dissecting microscope
d. Confocal microscope

3. **Identify the scientist shown in photograph** *[Recent Question 2013]*

a. Edward Jenner
b. Louis Pasteur
c. James Lind
d. Antonie van Leeuwenhoek

4. **Identify the bacterial shape as shown in the photograph**

a. Bacillus
b. Vibrio
c. Spirillum
d. Spirochaete

5. **Identify the type of Flagellar arrangement in Bacterium depicted in photograph**

a. Monotrichous
b. Peritrichous
c. Lophotrichous
d. Amphilophotrichous

6. **Identify the following culture media?**

a. Nutrient agar
b. Blood agar
c. Chocalate agar
d. MacConkey agar

Ans.

1. b
2. c
3. d
4. b
5. c
6. a

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

1. Which of the following pioneers of Microbiology is credited with the discovery of microorganisms using high quality magnifying lenses (early microscopes)? *(Safdarjung NO 2018)*

a. Antonie van Leeuwenhoek
b. Louis Pasteur
c. Robert Hooke
d. Robert Koch

Explanation: Antonie Philips van Leeuwenhoek discovered microorganism. He used a simple single lens device with good magnification. By using magnifying lenses, he discovered micro-organisms and also known as Father of Microbiology and therefore known as the first microbiologist. He discovered protozoa and also improved the microscope

2. A cluster of polar flagella is called: *(Safdarjung NO 2018)*

a. Lophotrichous b. Amphitrichous
c. Monotrichous d. Peritrichous

Explanation:

- **Lophotrichous:** The flagella are present in the form of cluster at one pole.
- **Amphitrichous:** When a single or clusters of flagella are present at both ends.
- **Monotrichous:** When a single polar flagellum is present on a bacteria.
- **Peritrichous:** When flagella are lateral and surround whole surface of bacteria.
- **Atrichous:** No flagella

Figure ■ Types of flagellar arrangement in bacteria

Ans.

1. a
2. a
3. b
4. a
5. c
6. a
7. d

3. Depending upon their oxygen requirement and metabolism Vibrio Cholerae species are: *(Safdarjung NO 2018)*

a. Obligate aerobes
b. Facultative anaerobes
c. Obligate anaerobes
d. Microaerophilic

Explanation: *Vibrio cholerae* are aerobes and facultative anaerobes. Facultative anaerobe is organism which forms ATP by aerobic respiration in presence of oxygen, but is capable of switching to fermentation or anaerobic respiration in absence of oxygen.

4. All of the following occur in the stationary phase of bacterial growth curve, except: *(Safdarjung NO 2018)*

a. Cells show uniform and regular staining
b. Cells show presence of intracellular storage granules
c. Spores are seen
d. Exotoxins are formed

Explanation: In the stationary phase the bacteria may turn Gram negative from Gram positive. All other statements regarding stationary phase of bacterial growth are true.

5. Which of the following is the unit of measurement in bacteriology? *(AIIMS BPL NO 2018)*

a. Joule b. Newton
c. Micron d. Pascal

Explanation: 1 micron = one thousandth of a millimeter. It is the unit used in bacteriology.

6. Nutritional dependent bacteria are called: *(AIIMS BPL NO 2018)*

a. Heterotrophs b. Autotrophs
c. Chemotrophs d. Phototrophs

Explanation: Heterotrophs do not make their own food so depend on other sources of energy.

Autotrophs make their own food. Chemotrophs use chemicals to prepare their food. Phototrophs use photosynthetic pigments to prepare food.

7. A food item commonly associated with Bacillus cereus food poisoning is: *(AIIMS-BBS SNO 2019, ESIC 2019)*

a. Honey b. Green beans
c. Baked potato d. Fried rice

Explanation: *Bacillus cereus* is a toxin-producing bacteria that is one of the most common causes of food poisoning, also called "fried rice syndrome". The bacteria are contacted from fried rice dishes that have been kept at room temperature for hours.

Scanned with CamScanner

8. Warts are caused by _____. *(AIIMS Nagpur NO 2018)*

a. Protozoa
b. Fungus
c. Viruses
d. Bacteria

Explanation: Warts are common benign skin tumors caused by infection with Human Papilloma Virus (HPV), which belongs to the DNA virus group. Warts occur most frequently between the ages of 12 years and 16 years.

9. An example of type IV hypersensitivity is: *(AIIMS-BBS SNO 2019)*

a. Arthus reaction
b. Tuberculin-type reaction
c. Atopy
d. Anaphylactic reaction.

Explanation: Type IV hypersensitivity are cell mediated reactions, initiated by T-lymphocytes and mediated by effector T-cells and macrophages. It takes 48-72 hours or longer, after contact with antigen.

- Tuberculin skin test, granulomatous inflammation, etc.

10. In a laboratory cultures, most human pathogens grow best at: *(AIIMS-BBS SNO 2019)*

a. 30 to 37°C
b. 15 to 20°C
c. 38 to 50°C
d. 20 to 30°C

Explanation: Since normal human body temperature is 37 degree Celsius, the majority of human pathogens grow at this temperature. If the temperature gets hot enough the organisms are denatured and stop functioning.

11. The division of bacterial cells and the exponential increase in their number are indicative of which phase? *(AIIMS BPL NO 2018)*

a. Lag phase
b. Stationary phase
c. Phase of decline
d. Logarithmic phase

Explanation: Logarithmic phase, also known as exponential phase is a period described by cell doubling. The number of new bacteria appearing per unit time is proportional to the present population.

12. The following method is used to observe the motility of a microbe

a. Wet mount technique
b. Hanging drop method
c. Dry mount lamination method
d. All the above

Explanation: Hanging drop method is a special type of wet mount in which a drop of medium containing organism is placed on a microscope cavity slide, often is used to observe motility of bacteria.

13. Antibiotic sensitivity is usually done on: *(Safdarjung NO 2018)*

a. Blood agar
b. MacConkey Agar
c. Mueller-Hinton Agar
d. Chocolate agar

Explanation: Media for antibiotic sensitivity testing is cation-adjusted Mueller-Hinton Agar and is used to test antibiotics like trimethoprim and sulfonamides. It usually contains: 2.0 g beef extract.

14. Schick test is used in confirming the diagnosis of: *(Safdarjung NO 2018; DSSSB PHN, 2015)*

a. Tuberculosis
b. Diphtheria
c. Syphilis
d. Scarlet fever

Explanation: Schick test is intradermal test used to assess the immune status of a person susceptible to diphtheria. It is based on the neutralization reaction between specific antigen and antibody against diphtheria toxin.

15. The most unreliable method of sterilization is: *(AIIMS Raipur NO 2019)*

a. Sunlight
b. Drying
c. Heating
d. Filtration

Explanation: Sunlight is a natural method of sterilization. Microbicidal activity is due to presence of UV rays. It is not sporicidal, hence does not sterilize. So it is most unreliable sterilization method.

16. Lethal effect of moist heat is due to: *(AIIMS BPL NO 2018)*

a. Cutting off of nutrient supply
b. Damage to DNA
c. Denaturation of proteins
d. Toxic to mitochondria

Explanation: Moist heat kills microorganisms by denaturing their proteins as it causes proteins and enzymes to lose their three-dimensional functional shape.

17. The endotoxic activity of the gram-negative bacteria is due to: *(AIIMS BPL, AIIMS BBS NO 2018)*

a. Cell wall
b. Glycolipids
c. Aminoglycosides
d. Lipopolysaccharides

Explanation: Lipoprotein are the toxin released on cell wall destruction by the Gram-negative bacteria within its own cell.

18. The pressure set in autoclave for sterilization is: *(DSSSB PHN, 2015)*

a. 15 lb
b. 5 lb
c. 10 lb
d. 20 lb

19. The immunoglobulin found in mother's breast milk is: *(DSSSB PHN, 2015)*

a. IgA
b. IgM
c. IgD
d. IgE

20. Widal test is performed for identifying: *(DSSSB PHN, 2015)*

a. Clostridium
b. Salmonella
c. Staphylococcus
d. Meningococcal

21. In majority of the cases the causative organism for sore throat is: *(Banaras HU 2015)*

a. Gonococci
b. Staphylococci
c. Meningococci
d. Streptococci

22. The vaccination was first performed by *(Banaras HU 2015)*

a. Jonas Salk
b. Edward Jenner
c. Louis Pasteur
d. Alexander Fleming

23. The optimum temperature for the growth of most pathogenic bacteria is: *(Banaras HU 2015)*

a. 25°C
b. 30°C
c. 37°C
d. 42°C

24. **Which one of the disease is not caused by an acid fast bacilli (AFB)?** *(Banaras HU 2015)*
    a. Leprosy b. Tuberculosis
    c. Nocardiosis d. Typhoid
25. **All are parts of the light microscope except:** *(Banaras HU 2015)*
    a. Condenser b. Eye-piece
    c. Slide with cover slip d. Objective lens
26. **Electron microscope use electron for their which property:** *(Kerala PSC, Nov 2014)*
    a. Wave nature
    b. Spin
    c. Negative charge of electron
    d. None
27. **Tissue fixation for electron microscopy is done with .....**
    a. Formaldehyde
    b. Glutaraldehyde
    c. Ziehl–Neelsen stain
    d. Magnesium sulfate
28. **Biological pesticides are produced by:** *(Staff Nurse G II 2014)*
    a. Bacillus thuringiensis
    b. Agrobacterium tumefaciens
    c. Pseudomonas
    d. Bacillus anthracis
29. **Infection with group A beta hemolytic streptococci can lead to:** *(JIPMER 2012)*
    a. Hepatitis b. Meningitis
    c. Rheumatoid arthritis d. Rheumatic fever
30. **ELISA test is used to detect:** *(ESIC Chennai May 2012)*
    a. HIV infection b. Malaria infection
    c. Lung infection d. Cholera infection
31. **Viruses are:** *(ESIC Chennai May 2012)*
    a. One-cell microorganisms with a simple cellular organization whose nucleus lacks a membrane.
    b. Pieces of nucleic acid (DNA or RNA) wrapped in a thin coat of protein that replicate only within the cells of living hosts
    c. Multicellular organisms that live in or on a host to obtain nourishment without providing any benefit to the host
    d. None of the above
32. **The Widal test is positive if two antigen titer is more than:** *(ESIC Chennai May 2012)*
    a. 1: 70 in an active infection
    b. 1: 160 in an infection
    c. 1: 80 in an active infection
    d. 1: 90 in an active infection
33. **VDRL test is performed to diagnose** *(ESIC Chennai May 2012)*
    a. Syphilis b. Pregnancy
    c. All the above d. Myasthenia gravis
34. **Common cold is caused by:** *(ESIC Chennai May 2012)*
    a. Rhinovirus b. Staphylococcus aureus
    c. Shigella d. Escherichia coil
35. **The most common early symptom of hepatitis 'A' is:** *(LNJP H D 2012)*
    a. Loss of appetite b. Abdominal distention
    c. Shortness of breath d. Ecchymosis
36. **Example of acid fast bacilli?** *(RRB Feb 2012)*
    a. E. coli b. Mycobacterium
    c. Clostridium d. None
37. **The method of reducing the number of pathogens from any article, surface or medium is known as** *(ISRO)*
    a. Sterilization b. Incineration
    c. Disinfection d. Lysis
38. **Father of antiseptic surgery is .....**
    a. Louis Pasteur
    b. Robert Koch
    c. Antonie van Leeuwenhoek
    d. Lister
39. **Which among the following is a contribution by Louis Pasteur in the field of microbiology?**
    a. Techniques of Pasteurization
    b. Process of Fermentation
    c. Rabies, cholera and anthrax vaccine
    d. All of the above
40. **Mycobacterium leprae is also known as .....**
    a. Golden bacilli b. Koch's bacillus
    c. Magical bacilli d. Hansen's bacilli
41. **Drug of choice to treat leprosy is .....**
    a. Rifampicin b. Acyclovir
    c. Zidovudine d. Dapsone
42. **Mycobacterium tuberculosis is also known as .....**
    a. Golden bacilli b. Koch's bacillus
    c. Magical bacilli d. Hansen's bacilli
43. **Correct statement regarding microscope is .....**
    a. Electrons are used as a source of illumination in Electron microscope
    b. Antonie Van Leeuwenhoek developed microscope first time
    c. Knoll & Ruska developed electron microscope
    d. All of the above
44. **All of the following are acid-fast organisms EXCEPT**
    a. Mycobacterium tuberculosis
    b. Nocardia
    c. Isospora belli
    d. Staphylococcus
45. **Bacterial structure involved in respiration is**
    a. Ribosome b. Pili
    c. Mesosome d. Flagella
46. **Identify correct statement regarding bacteria**
    a. Respiration, cell division and sporulation are the functions of mesosome in bacteria
    b. Capsule in bacteria enables adherence to surface and protection against phagocytosis
    c. Heterotrophs are the bacteria that are unable to synthesize their own food materials
    d. All of the above
47. **Correct regarding cocci are .....**
    a. Cocci are spherical shaped bacteria
    b. Cocci present in chain is known as streptococci
    c. Cocci present in the shape of grapes is known as staphylococci
    d. All of the above
48. **Coma shaped bacteria are known as .....**
    a. Staphylococci b. Streptococci
    c. Vibrio d. Bacillus
49. **Which of the following is most resistant to sterilization?**
    a. Tubercle bacilli b. Viruses
    c. Spores d. Prions
50. **Endoscope is sterilized by:**
    a. Glutaraldehyde b. Formaldehyde
    c. Atuoclaving d. Hot air oven

51. **Which of the following item is NOT sterilized by antiseptic solution** *(ESI 2009)*
   a. Suction catheter b. Enema tube
   c. Surgical scissor d. Nasogastric tube
52. **Recommended transport medium for stool specimen suspected a contain Vibrio cholerae is:**
   a. Buffered glycerol saline medium
   b. Venkatraman-Ramakrishanan medium
   c. Nutrient broth
   d. Blood agar
53. **Which is an enriched media?**
   a. Selenite F broth b. Peptone water
   c. MacConkey agar d. Chocolate agar
54. **Which of the following factor does not affect microbial growth?** *(RPSC Nursing Tutor 2009)*
   a. Moisture b. Disinfection
   c. Darkness d. Temperature
55. **Agar concentration required to prepare nutrient agar is:**
   a. 1-2% b. 4-6%
   c. 0.25-0.5% d. 0.5-1%
56. **HIV is a:**
   a. Retrovirus b. DNA virus
   c. Fungus d. Bacteria
57. **Mechanism of direct transfer of free DNA:**
   a. Transformation b. Conjugation
   c. Transduction d. Transposition
58. **Phage-mediated transfer of DNA from one bacterium to another bacterium is known as?**
   a. Transformation b. Transduction
   c. Transmission d. Conjugation
59. **Northern blotting is used for separation of**
   a. DNA b. RNA
   c. Proteins d. None
60. **MRSA is mediated due to**
   a. Plasmid b. Chromosome
   c. Transposons d. None
61. **All of the following are vector bone diseases except**
   a. Malaria b. Filariasis
   c. Rubella d. Chagas disease
62. **Which of the following about active immunity is correct?**
   a. No lag phase
   b. Booster doses are useful
   c. Useful in immunodeficient people
   d. No memory cells
63. **Primary immune response – the correct statement is:**
   a. Involves IgG
   b. Antibody producing cells- Memory B cell
   c. No lag period
   d. Slow and sluggish
64. **Which antibody crosses placenta?**
   a. IgA b. IgG
   c. IgE d. IgM
65. **Which is an example of surface Ig?**
   a. IgA b. IgG
   c. IgE d. IgM
66. **Type I hypersensitivity is mediated by which of the following immunoglobulins?**
   a. IgA b. IgG
   c. IgM d. IgE
67. **Wheal and flare is which type of hypersensitivity reaction:**
   a. Type I b. Type II
   c. Type IV d. Type V
68. **Type I hypersensitivity includes all of the following except:**
   a. Autoimmune hemolytic anemia
   b. Anaphylaxis
   c. Extrinsic asthma
   d. Hay fever
69. **A positive tuberculin test is an example of:**
   a. Type I hypersensitivity b. Type II hypersensitivity
   c. Type III hypersensitivity d. Type IV hypersensitivity
70. **Which of the following statement regarding graft rejection is incorrect?**
   a. First-set rejection usually occurs within 2 weeks after transplantation
   b. Second-set rejection occurs months to year
   c. Second-set rejection occurs due to immunological memory
   d. Hyperacute rejection occurs within minutes to hours
71. **Transplantation between members with same genetic constitution is known as:**
   a. Autograft b. Isograft
   c. Allograft d. Xenograft
72. **All of the following are live-attenuated vaccines except:**
   a. MMR b. Yellow fever 17D vaccine
   c. Salk polio vaccine d. Sabin polio vaccine
73. **Which of the following infectious agents can be transmitted through blood transfusion?**
   a. HIV b. Treponema pallidum
   c. Toxoplasma gondii d. All of the above
74. **Which one of the following is post streptococcal sequelae:**
   a. Acute rheumatic fever b. Cellulitis
   c. Pharyngitis d. Impetigo
75. **A positive tuberculin test is indicated by and area of induration of:**
   a. <5 mm in diameter b. 6-9 mm in diameter
   c. >10 mm in diameter d. No induration
76. **Widal test belongs to which of the following types?** *(AIIMS BBS NO 2018)*
   a. Precipitation test b. Bacteriolysin
   c. Neutralization d. Agglutination test

Explanation: Agglutination reaction is when a particulate antigen combines with its antibody, the particles are clumped or agglutinated. Widal test is an agglutination test that helps in differentiating the serotypes of non-enteric Salmonella from enteric ones.

77. **Diagnostic test used for typhoid fever is .....**
   a. Blood culture b. Dick test
   c. Schick test d. Widal test
78. **Diagnostic test used for TB is .....**
   a. Mantoux test b. Dick test
   c. Schick test d. Widal test
79. **Diagnostic test used for scarlet fever is .....**
   a. Mantoux test b. Dick test
   c. Schick test d. Widal test
80. **Diagnostic test used for typhus fever is .....**
   a. Mantoux test b. Dick test
   c. Schick test d. Weil Felix
81. **Route of injecting chick test toxin/ purified protein derivative (Mantoux test) is .....**
   a. Intra vascular b. Intradermal
   c. Intra muscular d. Subcutaneous
82. **Site for injecting test toxin/purified protein derivative (Mantoux test) is .....**
   a. Right upper arm b. Left upper arm
   c. Right forearm d. **Left forearm**

Scanned with CamScanner

83. Most accurate method of diagnosis of Helicobacter pylori is:
a. Culture
b. Biopsy urease test
c. Histopathology
d. Urea breath test

84. All of the following viruses are transmitted by respiratory route except:
a. Influenza virus
b. Rota virus
c. Respiratory syncytial virus
d. Rhinovirus

85. Acid fast staining is used to detect .....
a. Mycobacterium TB b. C. tetani
c. HIV/AIDS d. Meningococci

86. Chemical used for sterilization of heart lung machine is .....
a. Hypochlorite b. Ethylene oxide
c. Cidex d. Korsolex

87. Zero dose of OPV is given:
a. At one month
b. At birth
c. When child is having diarrhea
d. When child is having polio

88. During the window period of patient with AIDS, best diagnostic test is;
a. ELISA b. Western Blot
c. Rapid test d. RT-PCR

89. Best indicator of HIV prognosis
a. CD4T cell count b. CD8 T cell count
c. HIV RNA d. ELIS

90. Most effective mode of transmission of HIV:
a. Sexual b. Blood product
c. Needle/syringe d. Mother of fetus

91. Most common malignancy in AIDS is:
a. Kaposi sarcoma b. B-cell lymphoma
c. Leukemia d. Burkitt's lymphoma

92. The most common viral cause of gastroenteritis:
a. Rotavirus
b. Norwalk virus
c. Adenovirus
d. Hepadnavirus

93. All are true about SARS EXCEPT:
a. Epidemic is seen in India
b. Spreads by droplet
c. Diagnosed by PCR
d. Caused by a type of coronavirus

94. Perinatal Hepatitis B transmission is maximum in:
a. 1st trimester b. 2nd trimester
c. 3rd trimester d. During delivery

95. Which Hepatitis virus is associated with highest mortality in pregnancy?
a. Hepatitis A b. Hepatitis B
c. Hepatitis C d. Hepatitis E

96. Hepatitis virus that spreads by fecal-oral route:
a. Hepatitis A b. Hepatitis B
c. Hepatitis C d. Hepatitis D

97. Acute hepatitis B infection is best diagnosed by:
a. HBsAg
b. HBeAg
c. IgM Anti HBc antibody
d. HBcAg

98. Which parameter is not included in HAI surveillance?
a. CA-UTI (catheter associated urinary tract infection)
b. CLABSI (central line associated bloodstream infection)
c. VAP (ventilator associated pneumonia)
d. Open wound infections

99. Hand rub should not be used in which condition?
a. Before touching patient
b. After touching patient
c. After touching patient's surrounding
d. Hands are visibly soiled

100. How many moments of hand hygiene have been laid down by WHO?
a. 5 b. 6
c. 7 d. 8

101. Father of modern microbiology is
a. Robert Koch
b. Edward Jenner
c. Louis Pasteur
d. Joseph Lister

102. Microorganisms are living structures of microscopic size, belongs to
a. Prokaryotes b. Eukaryotes
c. Both (a) & (b) d. None of the above

103. Chemical method of sterilization include .....
a. Ethylene oxide b. Formaldehyde
c. hypochlorite d. All of the above

104. Amoebic dysentery is caused by .....
a. Vibrio cholera b. Shigella
c. Entamoeba histolytica d. Plasmodium

105. Amoebiasis is caused by: *(AIIMS-BBS SNO 2019)*
a. Entamoeba histolytica
b. Toxoplasma gondii
c. Leishmania donovani
d. Trypanosoma cruzi

106. Who is known as "Father of Antiseptic Surgery"
a. Robert Koch b. Joseph Lister
c. Paul Ehrlich d. Antony Van Leeuwenhoek

107. Who is known as "Father of Bacteriology"
a. Robert Koch b. Joseph Lister
c. Paul Ehrlich d. Antony Van Leeuwenhoek

108. The most common staining technique used to distinguish between Gram+ve and Gram-ve bacteria is
a. Gram staining b. Ziehl–Neelsen staining
c. Acid Fast staining d. Albert's staining

109. The most common staining technique used to stain Mycobacteria species is
a. Gram staining
b. Ziehl-Nelsen staining
c. Albert's staining
d. Eosin staining

110. Which of the following is most reliable and commonly employed method of sterilization.
a. UV rays b. Heat
c. X-rays d. All of the above

111. Which of the following is moist heat method of sterilization?
a. Autoclave b. Hot air oven
c. Ultraviolet radiation d. Incineration

112. Gas gangrene is caused by .....
a. Clostridium tetani
b. Clostridium botulism
c. Corynebacterium diphtheriae
d. Clostridium perfringens

113. Food poison is caused by .....
a. Clostridium perfringens
b. Clostridium botulism
c. Corynebacterium diphtheriae
d. Clostridium tetani

114. Which of the following is used for sterilization of cystoscopes, endoscopes and bronchoscopes?
a. Glutaraldehyde b. Ethanol
c. Methanol d. Ethylene oxide

115. Method of sterilization used for culture media is...
a. Autoclave b. Hot air oven
c. Pasteurization d. None of the above

116. Which of the following is live attenuated vaccine?
a. BCG vaccine b. Rabies vaccine
c. Diphtheria toxoid d. Tetanus toxoid

117. Which of the following single dose is sufficient for immunization
a. Live attenuated vaccine b. Killed vaccine
c. Toxoid s d. None of the above

118. The method of killing all microorganisms including their spores is known as
a. Sterilization b. Disinfection
c. Incineration d. Lysis

119. The method of reducing the number of pathogens from any article, surface or medium is called
a. Sterilization b. Disinfection
c. Incineration d. Lysis

120. Lysol and Dettol are
a. Buffers b. Disinfectants
c. Salt solution d. None of the above.

121. Chemical agent that inhibit the growth of microorganism is .....
a. Disinfection b. Sterilization
c. Asepsis d. Hygiene

122. Incubation period for primary syphilis
a. 1 – 2 days b. 1 – 2 weeks
c. 1 month d. 3 months

123. The causative agent of Tuberculosis (TB) is *(RPSC Nsg. Tutor 2009)*
a. Mycobacterium tuberculosis
b. Mycobacterium leprae
c. Treponema pallidum
d. Borrelia species

124. The causative agent of Syphilis is
a. Mycobacterium tuberculosis
b. Mycobacterium leprae
c. Treponema pallidum
d. Borrelia species.

125. Jarisch-Harxheimer reaction is common in
a. Tuberculosis b. Gonorrhea
c. Chlamydia d. Syphilis

126. Which of the following is moist heat method of sterilization?
a. Boiling b. Autoclaving
c. Hot air oven d. Both a & b

127. Temperature range used for autoclaving is .....
a. 100°C for 10 min b. 100°C for 30 min
c. 121°C for 15 min d. 121°C for 30 min

128. Lyme disease is caused by
a. Borrelia vincenti
b. Borrelia burgdorferi
c. Borrelia recurrentis
d. Leptospira interrogans

129. The infection acquired after 48 hours of admission to the hospital is
a. Hospital Acquired Infection
b. Hospital Associated Infection
c. Nosocomial Infection
d. All of the above

130. Alcohols, Aldehydes, phenols, etc. are
a. Chemical methods of sterilization
b. Physical methods of sterilization
c. Dry heat method of sterilization
d. Moist heat method of sterilization

131. Interval between exposure to infection and occurrence of sign and symptoms is known as.....
a. Incubation period b. Prodromal stage
c. Incidence d. Surveillance

132. Pathogenic organism in the blood is known as .....
a. Toxemia b. Septicemia
c. Bacteremia d. Hemangioma

133. The main difference between Prokaryotic and Eukaryotic cell is absence of
a. True Nucleus b. Genetic material
c. Plasma membrane d. Flagella

134. The typical bacterial growth curve shows
a. 5 phases b. 4 phases
c. 3 phases d. 2 phases

135. Which of the following is used for passive immunization?
a. Human sera and Animal sera
b. Killed vaccine
c. Toxoid
d. Live attenuated vaccine

136. Which of the following burns the waste at very high temperatures and thus reduces its volume.
a. Incinerator b. Autoclave
c. Hot air oven d. All of the above

137. The disadvantage of incinerator is that it generates
a. Highly toxic gases b. UV rays
c. Radioactive rays d. X-rays

138. Infectious waste after treatment can be disposed of by
a. Land – filling or deep burial
b. UV rays
c. Radioactive rays
d. X-rays

139. The causative agent of AIDS is
a. Human immunodeficiency virus (HIV)
b. Mycobacterium tuberculi
c. Mycobacterium leprae
d. Treponema pallidum

140. Study of bacteria requires the use of
a. Microscopes
b. Telescopes
c. Cystoscopes
d. Endoscopes

141. The media used to grow the microorganisms is known as
a. Culture media b. Culture plate
c. Culture Tube d. All of the above

142. The resistance exhibited by the host against any foreign antigen including microorganisms is
a. Immunity b. Antigenicity
c. Antibodies d. None of the above

143. Which is the only antibody that can cross placenta?
a. IgG b. IgA
c. IgD d. All of the above

Scanned with CamScanner

144. Which antibody is responsible for allergic responses?
a. IgG b. IgA
c. IgD d. IgE

145. When the patient is acquiring infection from another patient it is known as .....
a. Cross infection
b. Iatrogenic infection
c. Opportunistic infection
d. Nosocomial infection

146. Infection occurred as a result of investigation or therapeutic procedure is known as .....
a. Cross infection b. Iatrogenic infection
c. Opportunistic infection d. Nosocomial infection

147. When the patient is acquiring infection during low immunity state is known as .....
a. Cross infection
b. Iatrogenic infection
c. Opportunistic infection
d. Nosocomial infection

148. Disease transmitted by direct contact is known as .....
a. Cross infection b. Contagious infection
c. Opportunistic infection d. Nosocomial infection

149. Which of the following substances are formed in the serum and tissue fluids in response to an antigen?
a. Antibodies b. Hormones
c. Enzymes d. All of the above

150. The causative agent of plague is
a. Mosquito
b. Yersinia pestis
c. Mycobacterium tuberculi
d. Mycobacterium lepare

151. The discovery that led to the development of first antibiotic was made by
a. Robert Koch b. Alexander Fleming
c. Joseph Lister d. Antonie van Leeuwenhoek

152. Who accidently discovered fungus Penicillium that produces a substance which destroys staphylococci? *(AIIMS BPL NO 2018)*
a. Alexander Domagk b. Eduard Buchner
c. Karl Popper d. Alexander Fleming

153. Penicillin was discovered by
a. Robert Koch b. Alexander Fleming
c. Joseph Lister d. Antonie van Leeuwenhoek

154. Name the first organic acid produced by microbial fermentation.
a. Acetic acid b. Lactic acid
c. Butyric acid d. None of the above

155. Artificial active immunity is produced by
a. Vaccination b. Immunoglobulins
c. Human and animal sera d. None of the above

156. The overall resistance in a community is referred as
a. Herd immunity b. Active immunity
c. Passive immunity d. Innate immunity

157. ELISA stands for
a. Enzyme Linked Immunosorbent Assay
b. Enzyme Lipase Immunosorbent Assay
c. Enzyme Linked Immunity Assay
d. Enzyme Lipase Immunity Assay

158. The microorganism that can be acid-fast stained is
a. Tubercle bacilli b. Lepra bacilli
c. Nocardia d. All of the above

159. Antiviral protein is known as .....
a. Antibody b. Interferon
c. Antigen d. Antibody

160. Substance used for decolorizing gram stain is .....
a. Acetone b. Formaldehyde
c. Glutaraldehyde d. Cidex

161. Temperature range in pasteurization of milk by holder method is .....
a. 75°C for 15 min b. 75°C for 30 min
c. 63°C for 30 min d. 63°C for 15 min

162. Characteristic feature of staphylococcus aureus is .....
a. It is aerobic
b. It produces golden yellow colonies.
c. Non-sporing
d. All of the above

163. Dental caries are caused by .....
a. E. Coli b. Lactobacilli
c. Shigella d. Staphylococci

164. The microorganism closely associated with dental caries is *(AIIMS-BBS SNO 2019)*
a. Corynebacterium species
b. Urea plasma species
c. Candida albicans
d. Streptococcus sanguis

165. Thermophilic bacteria grow at ..... *(ESI Jaipur Exam. 2009)*
a. 25°C b. 30°C
c. 35°C d. 50°C

166. Sterilization of endoscope is done *(ESI Jaipur Exam. 2009)*
a. Carbolic acid b. savlon
c. Hypochlorite d. By 2% glutaraldehyde

167. Pathogen Means *(RPSC Nurse Grade II Exam.2010)*
a. Microorganism which causes disease
b. Microorganism which are found in animals
c. Microorganism which helps in digestion
d. Microorganism which are found in plants

168. Asepsis means- *(RPSE NG-II Exam.2010)*
a. Freedom from infection b. Freedom from sterility
c. Freedom from isolation d. Freedom from pain

169. "Klebs Loeffler bacillus" is the name of *(RPSC NG-II Exam. 2007)*
a. Streptococci
b. Salmonella typhi
c. Corynebacterium diphtheriae
d. Meningococci

170. Life cycle of malarial parasite was first described by- *(RPSC NG-II Exam. 2007)*
a. Joseph Lister b. Alexander Fleming
c. Robert Koch d. Ronald Ross

171. HIV virus belongs to *(RPSC NG-II Exam. 2007)*
a. Adenovirus b. Retrovirus
c. Flavivirus d. Cyclovirus

172. Bacteria belongs to
a. Prokaryotes b. Eukaryotes
c. Both d. None of the above

173. Most Often cells from blood infected by HIV is- *(RPSC Nursing Tutor- 2009)*
a. CD4 T. Lymphocytes b. Red Blood Cells
c. Monocytes d. b. Lymphocytes

174. Antibodies are produced by: *(AIIMS-BBS SNO 2019)*
a. NK cells b. Neutrophils
c. T lymphocytes d. B lymphocytes

175. SARS virus is a:
a. Coronavirus
b. Lentivirus
c. Calicivirus
d. Arenavirus

176. Urine sample for culture is collected from- *(RPSC Nursing Tutor- 2009)*
a. First-void urine
b. Last-void urine
c. Either First or Last void urine
d. Midstream urine

177. The process of prevention of infection, by inhibiting the growth of bacteria in wounds or tissues is called
a. Antisepsis b. Sterilization
c. Disinfection d. Decontamination

178. The following is not sterilized by gamma radiation
a. Gloves b. Cadgut
c. Catheter d. Autoclave

179. Holder's method of sterilization is
a. Moist heat at 63°C for 30 mins
b. Moist heat at 72°C for 15 seconds
c. Dry heat at 63°C for 30 mins
d. Dry heat at 72°C for 15 seconds

180. An example for artificial passive immunity
a. Interferon b. Tetanus immune globin
c. Hepatitis B vaccine d. BCG vaccine

181. True about live vaccination are all except
a. Latent phase
b. No negative phase
c. Both humoral and cellular response
d. Immunological memory

182. Germ theory was proposed by
a. Pasteur b. Koch
c. Landsteiner d. Lister

183. Site of respiration in bacteria is: *(Q wave Vol 2)*
a. Mitochondria b. Golgi apparatus
c. Cell membrane d. Cell Wall

184. Stain used in acid fast staining is: *(Q wave Vol 2)*
a. Dilute carbol fuchsin
b. Concentrated carbol fuchsin
c. Methyl violet
d. Iodine

185. Stain used in electron microscopy
a. Carbol fuchsin
b. Phosphotungstic acid
c. Luxol fast blue
d. Thioflavin T

186. Amphitrichous flagella means
a. Flagella all-round the cell
b. Flagella at both ends
c. Flagella at one end
d. Flagella in tufts

187. When Flagella is present all around the cell it is called
a. Amphitrichous b. Monotrichous
c. Peritrichous d. Lophotrichous

188. India ink is used to demonstrate the following part of bacteria
a. Cell wall b. Nucleus
c. Capsule d. Flagella

189. Reflected light is used in
a. Light microscope b. Phase contrast microscope
c. Dark field microscope d. Electron microscope

190. Bacteria that grow between 25 and 40°C are
a. Capnophilic b. Psychrophilic
c. Thermophilic d. Mesophilic

191. Shape of cocci
a. Rod b. Spherical
c. Comma d. Spiral

192. Best way of sterilizing disposable plastic syringes is: *(Q wave 2 &3)*
a. UV rays b. Autoclave
c. Gamma rays d. Hot air oven

193. The most suitable disinfectant for decontamination of HIV contaminated endoscope is *(MH 2014)*
a. 1% sodium hypochlorite b. 2% glutaraldehyde
c. 5% phenol d. 70% ethanol

194. Flexible fibre optic endoscopes are sterilized by
a. Auto clave b. Cetrimide
c. 2% glutaraldehyde d. Gamma-radiation

195. Which of the following organism can survive pasteurization by Holder method?
a. Mycobacterium b. Brucella
c. Salmonella d. Coxiella burnetii

196. Temperature and duration for Flash process of Pasteurization
a. 77°C for 20 seconds b. 100°C for 20 seconds
c. 63°C for 20 seconds d. 63°C for 30 minutes

197. Sterilization of heat labile media is done by
a. Filtration b. Pasteurization
c. Autoclaving d. Tyndallization

198. Immunoglobulin that is inactivated at high temperature
a. IgG b. IgA
c. IgM d. IgE

199. Immunoglobulins are
a. Glycolipids
b. Glycoproteins
c. Polypeptides
d. Proteoglycans

200. Exotoxins are usually
a. Protein b. Heat labile
c. More antigenic d. Non-enzymatic

201. True about exotoxins
a. Produced only by gram positive bacteria
b. Neutralized by antitoxin
c. Less potent than endotoxin
d. Pyrogenic

202. The function of an adjuvant in a vaccine is to enhance its:
a. Distribution
b. Immunogenicity
c. Absorption
d. Shelf life

203. The immunity resulting in the infant, as a result of immunization of a pregnant woman with tetanus toxoid is called
a. Innate immunity
b. Natural active immunity
c. Artificial active immunity
d. Natural passive immunity

204. Anti-D given to a Rh negative pregnant woman with Rh-positive fetus, before delivery is an example of
a. Artificial active immunity
b. Artificial passive immunity
c. Natural passive immunity
d. Adoptive immunity

205. Injection of lymphocytes in the treatment of lepromatous leprosy is an example of
a. Innate immunity
b. Adoptive immunity
c. Natural passive immunity
d. Artificial passive immunity

206. Which of the following is a Gram-positive cocci? *(AIIMS 2015)*
a. Streptococcus b. Neisseria
c. Escherichia d. Corynebacterium

207. Population doubling time in coliform bacilli is *(PGI May 2015)*
a. 20 seconds b. 20 minutes
c. 20 hours d. 20 days

208. Resolving power of electron microscope
a. 1 nm b. 0.1 nm
c. 0.01 nm d. 0.001 nm

209. An example for negative staining
a. Gram staining b. Fontana's staining
c. India ink preparation
d. Ziehl-Neelsen technique

210. The following organism is arranged in cubical pockets of eight cocci
a. Micrococcus b. Sarcina
c. Aerococcus d. Peptostreptococcus

211. The temperature and duration required to kill spores in autoclave
a. 63°C for 12 minutes b. 72°C for 12 minutes
c. 121°C for 12 minutes d. 160°C for 12 minutes

212. The chemical disinfectant which acts by plasma membrane damage
a. Chlorine b. Formaldehyde
c. Alcohol d. Phenol

213. The following are disinfectants except
a. 100% alcohol b. Acridine dyes
c. Isopropyl alcohol d. Halogens

214. Glass wares and syringes are sterilized by
a. Autoclave b. Steamer
c. Flaming d. Hot air oven

215. Operation theatres are sterilized by
a. Formaldehyde gas b. Ethylene oxide
c. Carbolic acid d. Chlorine gas

216. Nondisposable syringes are sterilized by
a. Hot air oven b. Autoclave
c. Incineration d. Steamer

217. Identify correct statement regarding Robert Koch
a. He is known as father of bacteriology
b. The causative organism of cholera, Vibrio cholera was identified by him
c. He discovered hypersensitivity phenomenon
d. All of the above

218. Heart lung machines are best sterilized by
a. Acridine dyes b. Ethylene oxide gas
c. Isopropyl alcohol d. 100% alcohol

219. The principle of autoclave is
a. Oxidative damage
b. Increased level of electrolytes
c. Denaturation and protein coagulation
d. Denaturation and oxidation

220. Plastic syringes are sterilized by
a. Glutaraldehyde b. Autoclave
c. Hot air oven d. Ionizing radiation

221. ABO antibodies are
a. IgG b. IgA
c. IgM d. IgE

222. Anaphylaxis is
a. Type I Hypersensitivity
b. Type II Hypersensitivity
c. Type III Hypersensitivity
d. Type IV Hypersensitivity

223. Contact dermatitis is
a. Type I Hypersensitivity b. Type II Hypersensitivity
c. Type III Hypersensitivity d. Type IV Hypersensitivity

224. Kupffer cells are seen in
a. Thymus b. Spleen
c. Liver d. Lymph node

225. Gram-positive bacteria is which is usually sensitive to penicillin is
a. Staphylococcus aureus
b. Enterococcus faecalis
c. Streptococcus pyogenes
d. Staphylococcus epidermidis

226. Streptococci causing neonatal meningitis
a. Group-A b. Group-B
c. Group-C d. Group-D

227. Which of the following gram positive bacteria is responsible for food poisoning?
a. Mycoplasmas b. Pseudomonas
c. Clostridia d. All of the above

228. Methicillin resistance bacteria are
a. Streptococci b. Pseudomonas
c. Haemophilus d. Staphylococci

229. The organism causing UTI in sexually active women
a. Staphylococcus aureus
b. Staphylococcus epidermidis
c. Staphylococcus saprophyticus
d. Streptococcus viridans

230. Antibiotic used in Toxic shock syndrome
a. Vancomycin b. Cephalosporins
c. Streptomycin d. Clindamycin

231. Grave's disease belongs to
a. Type I hypersensitivity b. Type II hypersensitivity
c. Type III hypersensitivity d. Type IV hypersensitivity

232. Type of hypersensitivity involved in Rh incompatibility
a. Type I hypersensitivity
b. Type II hypersensitivity
c. Type III hypersensitivity
d. Type IV hypersensitivity

233. Chemically an antigen may be
a. Lipid b. Polysaccharide
c. Protein d. Any of the above

234. Example of cell mediated hypersensitivity
a. Transfusion reactions b. Arthus reactions
c. Type II lepra reaction d. Tuberculin test

235. Tuberculin test is an example of
a. Type I hypersensitivity
b. Type II hypersensitivity
c. Type III hypersensitivity
d. Type IV hypersensitivity

236. Organism that has considerable resistance to antiseptics, disinfectants and antibiotics
a. E. coli b. Pseudomonas
c. Staphylococci d. Streptococci

237. Endocarditis in a patient with colon cancer is caused by
a. Staphylococcus epidermidis
b. Streptococcus bovis
c. Streptococcus sanguis
d. Streptococcus mutans

238. Which is a lactose fermenter?
a. Pseudomonas b. Salmonella
c. Klebsiella d. Shigella

239. Rice water stool is associated with? DNB 2015
a. Cholera b. Bacillary dysentery
c. Salmonella infection d. Pseudomembranous colitis

240. Bacteria associated with dental caries
a. Streptococcus mutans b. Streptococcus pyogenes
c. Streptococcus faecalis d. Streptococcus agalactiae

241. Dose of human tetanus Ig for post exposure prophylaxis
a. 250-500 units b. 500-750 units
c. 750-1000 units d. 1000-1200 units

242. Most important cause of traveler's diarrhea is *(MAH 14)*
a. Enterotoxigenic Escherichia coli
b. Enteroinvasive E. coli
c. Enterohemorrhagic E. coli
d. Enteropathogenic E. coli

243. A food commonly associated with bacillus cereus food poisoning is
a. Fried rice b. Baked potato
c. Green beans d. Honey

244. Gastroenteritis with high fatality is caused by
a. Campylobacter jejuni b. Anthrax
c. Salmonella d. Giardia

245. Organism causing peptic ulcer
a. H. pylori b. C. jejuni
c. Cl. tetani d. E. coli

246. Vibrio cholerae was first isolated by
a. Hoffman b. John Snow
c. Koch d. Ogston

247. Clostridium tetani is
a. Gram-positive, non-sporing
b. Gram-negative, non-sporing
c. Gram-positive, spore forming
d. Gram-negative, spore forming

248. Increased risk of food borne botulism is associated with
a. Commercially canned foods
b. Restaurant prepared foods
c. Home canned foods
d. Fried foods

249. The first symptom of tetanus
a. Trismus b. Risus sardonicus
c. Opisthotonos d. Convulsions

250. Waterhouse–Friederichsen syndrome is caused by
a. Neisseria meningitidis b. Staphylococcus aureus
c. Pseudomonas aeruginosa d. Hemophilus influenza

251. Percentage of sodium hypochlorite used for disinfecting HIV infected liquid waste:
a. 1% b. 2%
c. 5% d. 10%

252. The main cell affected in HIV infection is:
a. CD4 T cell b. CD8 T cell
c. B cell d. Macrophages

253. Which one of the following agents can be used to prevent malaria?
a. Chloroquine b. Albendazole
c. Attenuated vaccine d. Chloramphenicol

254. Range of incubation period in typhoid
a. 3–21 days b. 10–30 days
c. 1–3 months d. 3–6 months

255. Route of administration of influenza vaccine
a. Intradermal b. Subcutaneous
c. Per oral d. Intranasal

256. Incubation period for influenza pandemic H1N1
a. 12–24 hours b. 1–3 days
c. 1–7 days d. 5–10 days

257. Incubation period of mumps
a. 1–7 days b. 7–14 days
c. 12–24 days d. 21–28 days

258. Who discovered Oral polio vaccine which is used nowadays
a. Koprowski b. Cox
c. Salk d. Sabin

259. Usual dose of purified protein derivative in Mantoux test is
a. 5 IU b. 50 IU
c. 100 IU d. 500 IU

260. Corneal beading is a complication of
a. Leprosy b. AIDS
c. Herpes simplex keratitis d. Acanthamoeba keratitis

261. Most common site of extra thoracic TB in children
a. Lymph node b. Skeleton
c. Central nervous system d. Heart

262. Mantoux +ve is induration measuring
a. >10 mm b. 6–9 mm
c. <5 mm d. >20 mm

263. The botulism intoxication occurs due to
a. An endotoxin b. An exotoxin
c. Neurotoxin d. Mycotoxin

264. Smallest virus is: *(Q wave)*
a. Pox virus b. Herpes virus
c. Parvo virus d. Adeno virus

265. Incubation period of measles
a. 1 – 2 days b. 3 – 6 days
c. 1 – 7 days d. 9 – 11 days

266. Dengue is caused by
a. Alphavirus b. Bunyavirus
c. Flavivirus d. Hantavirus

267. Yellow fever is caused by
a. Flavivirus b. Alphavirus
c. Calcivirus d. Bunyavirus

268. Infective period of Aedes mosquitoes in dengue
a. 1- 2 days b. 8- 10 days
c. Till next bite d. Till death

269. Scrub typhus is transmitted by:
a. Louse b. Trombiculid mite
c. Rat flea d. Soft tick

270. Tinea pedis is caused by
a. E. floccosum b. T. rubrum
c. Microsporum d. T. schoenleinii

271. Tenia pedis is more common among
a. People of cold countries
b. Those wearing occlusive shoes and socks
c. Hospitalized people
d. People who eats fermented food

272. Chances of perinatal HIV infection to the baby
a. 0.5 – 1% b. 30%
c. 50% d. 90%

273. VDRL is used in the diagnosis of
a. Syphilis b. HIV
c. Typhoid d. Tuberculosis

BIOCHEMISTRY AND NUTRITION

12

SYNOPSIS

BIOCHEMISTRY

INTRODUCTION

- Biochemistry is the study of chemical processes within a body and related to the living organisms
- The first enzyme discovered was 'diastase' (now called 'amylase') in the year 1833
- James Watson, Francis Crick, Maurice Wilkins, and Rosalind franklin (1950s) co-discovered the **helix structure of DNA.**

THE CELL

- The cell is the structural and functional unit of life
- Living cells are divided into two groups
  - Prokaryotes, e.g. Bacteria (unicellular)
  - Eukaryotic cells, e.g. Animal cells, plant cells, fungi and protozoa (unicellular or multicellular)

Table 1 Difference between prokaryotic cells and eukaryotic cells

Parameters	Prokaryotic cells	Eukaryotic cells
Cell size	Small (1 – 10 nm)	Large (1 to 10000 times larger in size than prokaryotic cells)
Overall organization	Simple	Complex
Cell wall	Present	Absent
Cell membrane	Present sometimes surrounded by capsule	Present
Nucleus	Single nucleus which contains double helix DNA that is present in a poorly defined region called nucleoid	Well defined nucleus with a membrane and multiple DNA double helices organized into chromatin
Reproduction	Asexual	Sexual
Examples	Bacteria, blue green algae	Animal and plant cells

Figure 1 ■ Animal cell structure

Key Points

Cell Organelles

Nucleus

- **Nucleus** is the largest component of the cell, containing DNA organized into separate chromosomes
- Nucleus is surrounded by nuclear membrane. Nuclear membrane consists of two layers
- The intermembrane space between inner and outer membrane is known as **perinuclear space (cisterns)**
- The nucleus is filled with nucleoplasm which contains **nucleolus** and **chromatin.**
- Function of nucleus includes control of cell division (DNA replication), protein synthesis
- DNA and DNA polymerase are the markers of the nucleus.

Endoplasmic Reticulum

- Cisternae have a role in the exchange of materials between the cell and the extracellular fluid
- **Rough Endoplasmic reticulum (RER):** Also called granular type of endoplasmic reticulum. It contains ribosomes

Contd...

Scanned with CamScanner

- **Smooth Endoplasmic reticulum (SER):** Also called agranular type of endoplasmic reticulum. It does not contain ribosomes.
- SER has enzymes for biosynthesis of lipids and glycoproteins.
- SER is important in hepatocytes for oxidative metabolism and detoxification of many drugs
- Glucose-6-phosphatase is a marker enzyme for Endoplasmic reticulum.

Ribosomes
- Ribosomes on the RER are involved in synthesis of proteins for export from the cell
- Free ribosomes present in the cytoplasm synthesize proteins for use within the cell.

Golgi Apparatus (Golgi complex, Golgi body)
- Golgi apparatus moves molecules from endoplasmic reticulum to their destination
- It is the site where secretions from other organelles are brought and assembled
- Newly synthesized proteins are transferred from RER and stored in Golgi apparatus temporarily.

Mitochondria
- Mitochondria are the major organelle of a eukaryotic cell
- Mitochondria contains its own DNA
- Mitochondrion produces energy in the form of ATP (Adenosine Triphosphate). So it is called as a **"power house of the cell".**

Lysosomes
- It is a membrane-bound cell organelle and are structurally and chemically spherical vesicles
- Lysosomes are absent in RBC
- Lysosomes act as **waste disposal system of the cell**
- They are responsible for cellular homeostasis
- They are responsible for autolysis, so it is called as Suicide-bags.

Peroxisomes
- Major function of peroxisomes is in hepatocytes, involved in oxidation of fatty acids.

Cytosol
- It is a colloidal solution of proteins containing nearly 70% water.

Plasma Membrane (cell membrane)
- It is the outer membrane of the cell
- It is composed of lipids, proteins and carbohydrates
- Functions include compartmentalization, providing cell shape, cell movement, transport of substances and signal transduction.

TRANSPORT MECHANISMS

There are three types of transport systems, i.e. Diffusion, Facilitated diffusion and Active transport.

- **Diffusion (simple diffusion or passive diffusion):** It is a process in which molecules of a material that move from an area of higher concentration to an area of lower concentration. Some solutes like O_2, N_2, CO_2 and NO, urea move across cell membrane by diffusion. The net movement of molecule from one side to the other side of the cell membrane continues until concentration on both sides is at equilibrium
  - **Channels** are pore-forming membrane proteins which facilitates flow of ions across secretary and epithelial cells
  - **Osmosis:** It refers to the spontaneous net movement of solvent molecules through partially permeable (semipermeable) membrane into a region of higher solute concentration. **Aquaporin** selectively conduct water molecules in and out of the cell
  - **Ionophores:** These are a lipid-soluble molecules which facilitate transport of ions across the lipid bilayer of the cell membrane
- **Facilitated Diffusion:** Transport of solutes through membrane transport proteins (carrier molecules) without expenditure of metabolic energy, e.g. Glucose transporters (GLUT), Cl^-/HCO_3 exchanger, ATP-ADP translocase
- **Active Transport:** Transport protein moves a specific molecule against the concentration gradient (lower concentration to higher concentration). This process requires energy provided by ATP. It is classified into primary and secondary active transport.

Transport of Large Molecules

- **Endocytosis:** It is a mechanism for the uptake of large molecules such as proteins, polysaccharides, or polynucleotides
  - **Phagocytosis (cell eating):** Ingestion of bacteria, viruses, etc. It occurs only in specialized cells like macrophages and granulocytes
  - **Pinocytosis:** Ingestion of liquid into a cell by the budding of small vesicles from the cell membrane
- **Exocytosis:** It is reverse of endocytosis. It involves release of macromolecules to the exterior of cell.

Key Points

Dialysis
Dialysis is the process of separating molecules in solution by the differences in their rates of diffusion through a semipermeable membrane.

pH, BUFFERS AND ACID-BASE BALANCE

pH

pH is defined as the negative logarithm ($-\log_{10}$) of the hydrogen ion (H^+) concentration. Low pH indicates higher concentration of H^+ ions; high pH indicates lower H^+ concentration. The scale of pH measurement varies from 0 to 14.

- pH below 7 is considered acidic
- pH equal to 7 is considered neutral
- PH above 7 is considered alkaline.

Acid: It is a substance which releases hydrogen (H^+) ions on dissociation in water.

Base: It is a substance which releases hydroxyl (OH^-) ions in an aqueous solution. The OH^- ions reduce H^+ (acidity) by binding with free H^+ ions.

Amphoteric substances: The substances (E.g. Some Amino acids and proteins) that can act as acid as well as base are called as Amphoteric substances, e.g. Glycine.

Buffers

Buffer is a solution, which resists change in pH

- **Plasma Buffers:** Blood plasma has three major buffers
  - **Phosphate buffer:** Important buffer in the urine
  - **Protein buffer:** It is the largest buffer in the body, e.g. Albumin (blood plasma) and Hemoglobin (intracellular)
  - **Bicarbonate buffer:** Significant buffer in buffering pH in extracellular fluid.

Scanned with CamScanner

Maintenance of Acid-Base Balance

- Lungs and kidneys stabilize extracellular fluid pH
- **Lungs**: Respiratory system **controls** pCO_2 that minimize pH changes in arterial blood
- **Kidney**: Regulates acid-base balance by controlling **bicarbonate reabsorption** and **secreting acid.**

Acid-Base Imbalance

- Normal pH of blood: 7.35 – 7.45
- Blood pH < 7.35: Acidemia or acidosis
- Blood pH > 7.35: Alkalemia or alkalosis.

Table 2 Compensatory responses in different types of acid-base imbalances

Acid-base imbalance	Arterial blood			Compensatory response
	pH	pCO_2	HCO_3	
Respiratory Acidosis	↓	↑	↑	Kidney increases H^+ excretion which in turn increases plasma HCO_3^-
Respiratory Alkalosis	↑	↓	↓	Kidney increases HCO_3^- excretion which in turn decreases plasma HCO_3^-
Metabolic Acidosis	↓	↓	↓	Alveolar hyperventilation
Metabolic alkalosis	↑	↑	↑	Alveolar hypoventilation

Anion Gap = $(Na^+ + K^+) - (Cl^- + HCO_3^-)$

- **Anion gap is a difference between the sum cations** $(Na^+ + K^+)$ **and anions** $(Cl^- + HCO_3^-)$
- **Normal value** anion gap is 12 – 16 mEq/L
- It is most commonly used parameter to establish differential diagnosis for metabolic acidosis.

ENZYMES AND COENZYMES

- All enzymes are protein in nature and have large molecular weights
- Enzymes are organic molecules that are produced in the living organisms and increase the rate of biochemical reaction
- Enzymes are not dialysable, colloidal and thermolabile proteins with highly specific catalytic activity.
- Intracellular enzymes: produced and function within the cell of particular tissue, e.g. Enzymes of citric acid cycle, glycolysis, fatty acid synthesis.
- Extracellular enzymes: Produced by the cells of particular tissue but are liberated and function in other tissues, e.g. Trypsin, Chymotrypsin.

Proenzymes

- Enzymes secreted in their active form are called **zymase**
- Enzymes secreted in their inactive form is known as **proenzyme** or **zymogen**
- Proenzyme is converted to active enzyme when it comes in contact with certain activating agents, e.g. Pepsinogen (inactive) is activated into pepsin (active form) by H^+ of gastric juice.

Coenzymes

- A coenzyme is a dialyzable, thermostable, low-molecular weight and organic substance
- Generally, coenzymes are derivatives of the B complex group of vitamins, e.g. FMN and FAD (derivates of B_2), CoA (derivatives of pyridoxine), Tetrahydrofolate (Folate), etc.

Isoenzymes

- Isoenzymes are generally multiple forms of enzymes. Each of two or more enzymes with identical function but different structure, e.g. Lactate Dehydrogenase, Creatine Phosphokinase.

Cofactors

- Some enzymes require certain metal ions for their activity. These metal ions are called **cofactors, e.g.** Mg^{2+}, Zn^{2+} or Cl^-.

Classification of Enzymes

- **Oxidoreductase**: Involved in oxidation (addition of oxygen) and/or reduction (removal of hydrogen or electrons) of the substrate, e.g. Alcohol dehydrogenase, Glutathione reductase
- **Transferase:** catalyze transfer of a particular group from one substrate to another, e.g. Hexokinase, Oxaloacetate transaminase
- **Hydrolase:** It brings about hydrolysis of a substrate with the addition of a water molecule, e.g. Glucose-6-phosphatase, amylase, pepsin
- **Lyase:** It catalyse splitting of a substrate into two products without the addition of water molecule, e.g. Pyruvate decarboxylase, fumarase
- **Isomerase**: catalyze the conversion of one isomeric form of a the substrate into another, e.g. Alanine racemase
- **Ligase**: Involved in the synthesis of a product by linking two substances together, e.g. Glutamine synthetase.

Key Points

Enzymes

- **Increase in temperature** increases the rate of enzyme catalyzed reaction
- **Optimum pH** for most of the enzymes is in the neutral range, i.e. around 7.0
- Optimum pH for pepsin is about 2.0 and pancreatic juice is near 8.0
- Reaction velocity is proportional to the concentration of the enzyme present in the reaction mixture.

Contd...

Table 3 Major enzymes, their principal sources and diagnostic significance

Enzymes	Principal sources	Increased conditions	Decreased conditions
Acid phosphatase	Prostate and RBC	Carcinoma of prostate	–
Alkalaine phosphatase	Liver, bone, placenta and kidney	Obstructive jaundice, rickets, Paget's disease, hyperparathyroidism	–
Aldolase	Skeletal muscle and heart	Muscular dystrophies, acute liver disease	–
Amylase	Salivary glands, pancreas and ovaries	Acute pancreatitis, intestinal obstruction and acute parotitis	Acute liver failure
Ceruloplasmin	Liver	Cirrhosis of liver	Wilson's disease
Choline esterase	Liver	Nephrotic syndrome, organanophosphorous poisoning	Acute liver diseases
Creatine Phosphokinase (CPK)	Skeletal muscles, brain and heart	Myocardial Infarction and muscular dystrophies	–
Glutamate oxaloacetate Transaminase (GPT)	Liver, skeletal muscle, heart, kidney and RBCs	Mycocardial infarction, toxic liver cell necrosis, acute liver diseases, and muscle diseases	–
Gamma-Glutamyl transferase	Liver and kidney	Alcoholism and hepatobiliary diseases	–
Lactate dehydrogenase (isoenzyme)	Heart, liver, skeletal muscle, RBCs and platelets	Acute myocardial infarction, acute hepatitis and muscle disorders	–
Lipase	Pancreas	Acute pancreatitis and pancreatic carcinoma	Liver diseases and diabetes mellitus
5'-Nucleotidase	Hepatobiliary tract	Liver diseases, obstructive jaundice and hepatic carcinoma	–
Trypsin	Pancreas	Acute pancreatic disease	–

CARBOHYDRATES

- Carbohydrates are the most abundant biological molecules containing Carbon (C), Hydrogen (H) and Oxygen (O) molecules
- Energy production from carbohydrates is 4 kcal/g.

Classification

Figure 2 ■ Classification of carbohydrates

- Aldoses: Has aldehyde (–CHO) group on carbon-1, e.g. Glucose
- Ketoses: Has ketone (–CO) group at carbon-2, e.g. Fructose
- Trioses are the smallest monosaccharide with 3 carbon atoms, e.g. Glyceraldehyde
- Glucose (dextrose), galactose (constituent of lactose) and fructose are known as **hexoses**
- **Disaccharides (consist of two monosaccharides)**

Scanned with CamScanner

- **Sucrose (Cane sugar):** (D-Glucose + D-Fructose)
- **Maltose** = D-Glucose + D-Glucose
- **Lactose (Milk sugar)** = D-Galactose + D-Glucose

- **Polysaccharides**
  - Starch is stored as reservoir of food in cereals and tubers in plant
  - Starch consists of two polysaccharide units, i.e. amylase and amylopectin
  - **Glycogen (animal starch)** is found in animals
  - **Cellulose** is a component of cell wall of plants.

Uses of Carbohydrates

- Carbohydrates are the main sources of energy in the body. Brain cells and RBCs are entirely dependent on glucose, an energy source
- Storage form of energy in the body. Stored as glycogen in animals and as Starch in plants
- Glycoproteins and glycolipids are components of cell membranes and receptors.

Digestion of Carbohydrates

Table 4 Digestive enzymes and its action on carbohydrates

Enzymes	Site of action	Action
Salivary amylase	Mouth	Breaks starch/Glycogen into partially hydrolyzed dextrins, oligo-saccharides, isomaltose and maltose
Pancreatic amylase	Small intestine	Breaks partially hydrolysed dextrins/oligosaccharides into dextrins, maltose, isomaltose, maltotriose
α – Dextrinase	Small intestines	Breaks α – limit dextrins into Maltotriose, glucose
Disaccharidases	Small intestines	
Sucrase	Small intestines	Breaks sucrose into glucose and fructose
Lactase	Small intestines	Breaks lactase into glucose and galactose
Maltase	Small intestines	Maltose into glucose
Isomaltase	Small intestines	Isomaltose into Glucose

Carbohydrate Metabolism

Glycolysis (Embden-Meyerhof Parnas Pathway)

- Glycolysis is the process of breakdown of glucose into pyruvic acid (aerobic glycolysis) or lactate (anaerobic glycolysis)

- Under **aerobic conditions**, total yield of **ATP is 10** while the **net yield is 36 per** molecule of glucose
- **Under Anaerobic state,** net energy yield per molecule of glucose is 2 ATP.

Gluconeogenesis

- Process of formation of glucose from non-carbohydrate sources such as glucogenic aminoacids, glycerol, lactate etc.
- Gluconeogenesis takes place in fasting state, thus enables maintenance of blood glucose
- Does not take place in muscle.

TCA Cycle (Tricarboxylic Acid Cycle)

- Alco called Citric acid cycle or Krebs cycle
- It is a process of oxidation of Acetyl CoA to CO_2 and H_2O
- **Total ATP yield is 12 ATP** per molecule of acetyl CoA.

Glycogenesis

- Process of conversion of glucose to glycogen
- Glycogenesis is stimulated by insulin.

Glycogenolysis

- Process of conversion of glycogen to either glucose-6-phosphate (in muscle) or free glucose (in liver and kidney).

Regulation of Blood Glucose

- Insulin is the only hormone which has hypoglycemic action
- Insulin lower blood glucose by facilitating uptake of glucose by extrahepatic tissues and also suppressing glycogenolysis.
- Glucagon promotes glycogenolysis and gluconeogenesis, thus increasing blood glucose concentration
- Other hyperglycemic hormones are glucocorticoids, growth hormone, and thyroxine.

Glucose Tolerance Test (GTT)

- GTT is performed to confirm diagnosis of diabetes
- Fasting blood sample is drawn in fluoride-oxalate tube
- 75 gm of glucose (1g/kg of body weight) is given in 200-300 ml of water
- Blood sample are again drawn after 1 hours and 2 hours. Urine sample may also be collected
- Each sample is analyzed and glucose level is plotted against time (glucose tolerance curve)
- In normal individual, the fasting blood sugar should be normal; it increases about 50% within an hour and thereafter returns towards fasting after two hours
- If glucose tolerance curve is normal but there is glycosuria (glucose in urine), it is referred as **renal glycosuria.**

LIPIDS

- Lipid is a heterogeneous group of hydrophobic organic molecules
- Lipids are insoluble in water and soluble in organic solvent (acetone, alcohol, ether, etc.).

Scanned with CamScanner

Classification

Figure 3 ■ Classification of lipids

Key Points

Lipids

- At room temperature, short chain fatty acids are liquid and long chain fatty acids are solid.
- **Salts of various fatty acids** are used as **soaps** and **emulsifying agents.**
- Hydrogenation of vegetable oil results in the formation of vegetable ghee.
- **Saturated fatty acids** end in word "**-anoic**". e.g. Octadecanoic acid.
- **Unsaturated fatty acids** end with **"-enoic".** e.g. Octadecenoic acid.
- **Polyunsaturated fatty acids (PUFA),** i.e. Linolenic acid, linoleic acid and arachidonic acid, form essential component of the diet. They care called **essential fatty acids.** The major sources of PUFA are soybean oil, sunflower oil, groundnut (peanut) oil etc.
- **Phospholipids** are predominant lipids of a cell membrane. Phospholipids (lecithin) are component of lung surfactants.
- **Phospholipids** are essential component of the bile. It helps in regulation of serum cholesterol.
- **Triacylglycerol** stored in adipose tissue releases free fatty acids during fasting and starvation.
- **Lipids** act as electric insulators in myelin sheath of nervous system.

Enzymes Catalyzing the Digestion of Lipids

- **Lingual lipase** is secreted in mouth which converts triglycerides into fatty acids monoglycerides and glycerol
- Lipase/Colipase, phospholipase, Cholesterol esterase and Retinyl ester hydrolase are secreted in pancreas
- Monoglyceride lipase and licithinase are secreted in small intestine.

Metabolism of Lipids

- The major pathway for catabolism (β-oxidation) of fatty acids occur in the **mitochondria.**
- In β-oxidation, a total of **131 ATP** molecules are produced from one molecule of palmitic acid, however, the **net yield is 129 ATP** because 2 ATPs are used during activation of the fatty acid
- The process of formation of ketone bodies is called ketogenesis. **Acetoacetate, β-hydroxybutyrate and acetone** are collectively known as ketone bodies
- **Acetoacetate and β-hydroxybutyrate** are strong acids. Accumulation of these two will lead to metabolic acidosis (ketoacidosis). This occurs in severe diabetes, starvation or on high fat, low carbohydrate diet
- **Cholesterol** is a metabolic precursor of various substances such as steroid hormones vitamin D and bile acids and salts.

PROTEINS

- Proteins are nitrogenous organic compounds that are composed of one or more than one long chains of amino acids
- Amino acids are also called building blocks of proteins.

AMINO ACIDS

Amino acids are important dietary source of nitrogen.

Classification

Based on Structure of their Side Chain

- Neutral amino acids
  - Aliphatic amino acids, e.g. Glycine, Alanine
  - Aromatic amino acids, e.g. Phenylalanine, tyrosine, tryptophan.
- Acidic amino acids, e.g. Asparagine, Glutamine
- Basic Amino acids, e.g. Lysine, arginine, histidine
- Imino acids, e.g. Proline.

Based on Polarity

- Amino acids with Polar side chain, e.g. Serine, threonine, tyrosine
- Amino acids with nonpolar side chain, e.g. Glycine, alanine, valine, leucine etc.

Based on Dietary Requirement

- Essential amino acids
- Semi-essential amino acids
- Non-essential amino acids.

Based on Nutritional Requirement

Essential Amino acids
(Cannot be synthesized in the body; to be essentially included in the diet)

- Isoleucine
- Leucine
- Lysine
- Methionine (Sulfur-containing)
- Phenylalanine
- Threonine
- Tryptophan
- Valine

Semi-essential amino acids
(To be essentially included in the diet in certain conditions, e.g. Pregnancy, lactation, high grade fever etc.)

- Arginine
- Histidine

Scanned with CamScanner

Non-essential amino acids
(Synthesized in the body; not dietary essential)

- Alanine
- Asparagine
- Aspartate
- Cysteine (sulfar-containing)
- Glutamate
- Glutamine
- Glycine
- Proline
- Serine
- Tyrosine

Classification

Table 5 Classification of proteins

Simple proteins	Conjugated proteins (Conjugated with non-protein substances)	Derived proteins (Derivates of simple proteins)
• Albumins • Globulins • Glutelins • Prolamines • Sclero-proteins	• Glycoproteins • Lipoproteins • Nucleoproteins • Phosphoproteins • Metalloproteins	• Primary derived proteins (denatured or coagulated proteins • Secondary derived proteins (by cleavage of the peptide bonds)

Transport Proteins and its Functions

Table 6 Molecules transported by transport proteins

Transport proteins	Molecules transported
Albumin	• Copper, Iron, bilirubin, free fatty acids, steroids, heme
Transferrin, ferritin, hemosiderin	• Iron
Ceruloplasmin	• Transport of Copper
Haptoglobin, Hemopexin	• Free hemoglobin
Thyroid binding globulin	• T thyroid hormone
Cortisol binding globulin	• Cortisol
Sex hormone binding globulin	• Androgens, Estrogens

Digestion, Absorption and Metabolism of Proteins

- Digestion of proteins begins in the **stomach** by the action of enzyme pepsin at acidic pH (1.5 – 2.5) of gastric juice
- Proteolytic enzyme **Pepsin** in secreted in the form of **pepsinogen** (zymogen) by the cells of gastric mucosa. Pepsinogen is activated into pepsin by hydrogen ions of the gastric juice (HCl)
- Trypsin (as trypsinogen), chymotrypsin (as chymotrypsinogen) and carboxypeptidases are secreted by pancreas. These enzymes act on proteolytic products of pepsin I the small intestines
- The end production of digestion of proteins, i.e. amino acids are absorbed from the small intestines
- α-amino group of amino acids can be removed either by **transamination** or **deamination**
- Transamination refers to transfer of α-amino group from an amino acid to keto acid
- Deamination refers to removal of the α-amino group from amino acids
- Ammonia is removed as glutamine from the brain
- Ammonia is removed as urea from the liver (urea cycle)
- **Urea cycle** is the process of converting high toxic ammonia into urea in the liver. Urea is less toxic, water soluble and excretory waste product
- **Phenylketonuria** is a condition due to deficiency of hepatic phenylalanine hydroxylase (autosomal recessive disorder)
- Deficiency of ***tyrosinase*** in the melanocytes causes albinism.

Key Points

Proteins

- Plasma contains over 300 proteins
- Albumin, globulin and fibrinogen are the major plasma proteins
- Total plasma protein concentration range is 6.3 – 8.0 g/dl; Albumin – 3.7 to 5.3 g/dl; globulin – 1.8 to 3.7 g/dl
- Albumin/Globulin ratio (A/G ratio) is 1.2–2.0:1
- **Albumin** maintains plasma colloidal **osmotic pressure**
- **Hypoalbuminemia** (low plasma albumin) may arise due to protein malnutrition (kwashiorkor/marasmus), malabsorption, chronic liver disease, proteinuria (nephrotic syndrome) or increased catabolism
- **Hyperglobulinemia** (increase in globulin) occurs commonly in advanced liver disease, chronic infectious diseases or multiple myeloma
- Some proteins (e.g. Pepsin and amylase) act as enzymes
- Proteins act as transporters (e.g. Hemoglobin), receptors (e.g. Hormone receptors), storage molecules (e.g. Ferritin).
- On heating or adding strong acids, protein loses its natural structure and gets precipitated. This is known as **denaturation** of proteins
- **Chromatography** is a separation technique used for separating a mixture of chemical substances into its individual components
- **Electrophoresis** is movement of charged particles in solution under the influence of an electric field. This technique is used for separation and quantitative analysis of specific serum proteins, lipoproteins, etc.

VITAMINS, MINERALS AND ELECTROLYTES

Vitamins

- Vitamins are called protective accessory food factors since they are essential for life and well-being
- Vitamins are classified into water soluble and fat soluble.

Table 7 Classification of vitamins

Water soluble vitamins	Fat soluble vitamins
Vitamin C (Ascorbic acid) Vitamin B1 (Thiamin) Vitamin B2 (Riboflavin) Vitamin B3 (Niacin) Vitamin B5 (Pantothenic acid) Vitamin B6 (Pyridoxine) Vitamin B7 (Biotin) Vitamin B9 (folic acid) Vitamin B12 (cyanocobalamin) Cholin	Vitamin A (Retinol) Vitamin D • D2 – Ergocalciferol • D3 – Cholecalciferol Vitamin E (Tocoferol) Vitamin K (Menadione)

Scanned with CamScanner

Note

Sources, Functions and Deficiency diseases are given in a table form in Appendices (Page no. A-70).

Minerals

Sodium

- Sodium (Na^+) is the major extracellular cation
- Normal serum sodium level is 135 – 145 mEq/L
- Na^+ is freely filtered in glomeruli. The filtered sodium is reabsorbed by:
  - Proximal tubules – 70%
  - Loop of Henle – 15%
  - Distal convoluted tubule – 5%
  - Collecting duct – 10%.
- **Functions of sodium:**
  - Fluid and electrolyte balance.
  - Plays a major role in the maintenance of osmotic pressure of body fluids
  - Regulation of acid base balance
  - Maintenance of neuromuscular irritability and excitability (nerve transmission).
  - Maintenance of blood viscosity
  - Helps in absorption of monosaccharide and amino acids.
- **Daily requirement (as sodium chloride) is 5 – 15 g**
- **Sources:** Main source is common salt. Meat, seafoods, milk and cheese are also good source of sodium.

Potassium

- Potassium (K^+) is the chief intracellular cation
- Maintenance of normal level of K^+ is essential for life.
- Normal serum potassium level is 3.5 – 5.2 mEq/L
- **Functions**
  - Water and electrolyte balance
  - Regulation of pH of body fluids
  - Maintenance of neuromuscular irritability and excitability
  - Storage of glycogen and cell protein requires K^+
- **Recommended Daily Requirement of potassium for an adult is 4 g.**
- **Sources:** Most of the vegetables (e.g. potato, tomato), dairy products, coffee, cocoa, dried beans, wheat bran, eggs, meat, and fruits (banana, peach, orange).

Calcium

- **Calcium (Ca)** is found in highest concentration in the body
- An adult man contains nearly 1.0 – 1.2 kg of calcium (99% of it present in skeletal tissue)
- Normal serum calcium level is 9 – 11 mg/dl.
- **Calcium absorption**
  - Calcium is absorbed by all parts of small intestine. Most rapid absorption occurs in the acidic medium (duodenum) compare to alkaline medium (remaining part of small intestines).
  - Calcium absorption is impaired in vitamin D deficiency
  - Excess of phosphate reduces calcium absorption.
- **Regulation of serum calcium**
  - Vitamin D increases serum Calcium by promoting intestinal absorption
  - Parathyroid (PTH) hormone plays a vital role in regulation of Ca^{2+}. Low serum calcium leads to increase in the PTH secretion. PTH acts on osteoclasts and promotes transfer of calcium from **bone** tissue to the blood (known as bone resorption)
  - PTH increases reabsorption of calcium by the kidneys
  - Calcitonin lowers serum calcium by promoting deposition of calcium by osteoblasts (opposite to PTH action).
- **Functions**
  - Calcification of growing bones and teeth
  - Maintenance of mature bone
  - Calcium is essential for **blood clotting**
  - Activator for several enzymes
  - Required for contraction of muscles
  - Role in citric acid cycle and glycogen break down.
- Decrease in blood calcium level may result in tetany (abnormal muscle spasm)
- Deficiency of calcium results in rickets in children and osteomalacia in adults
- **Recommended daily requirement is 800 mg for an adult; 1.2 g/day during pregnancy.**

Table 8 Minerals, their major functions, sources, RDA, deficiency disorders and toxicity symptoms

Minerals	Biological functions	Sources	Daily requirement	Deficiency disorders	Toxicity symptoms
Calcium (Ca)	Calcification of teeth and bone, blood clotting and cofactor for enzymes, such as adenylate cyclase, glycogen synthase, etc.	Milk and milk products, legumes and dry fruits	800–1200 mg	Tetany, osteoporosis	Renal stones
Phosphorus (P)	Calcification of teeth and bone, component of nucleic acids, regulation of blood pH and activator for enzymes involved in phosphorylation/ dephosphorylation	Milk and milk products, eggs, meat, legumes and cereals	1.0–1.5 g	Neuromuscular, skeletal and renal manifestations	—
Iron (Fe)	Component of heme and non-heme proteins, e.g. hemoglobin, catalase, cytochromes, etc.	Meat, green leafy vegetables	10–20 mg	Anemia	Hemosiderosis

Contd...

Scanned with CamScanner

Minerals	Biological functions	Sources	Daily requirement	Deficiency disorders	Toxicity symptoms
Copper (Cu)	Component of many enzymes, such as cytochrome oxidase, ceruloplasmin, tyrosinase, etc., also helps in iron metabolism	Meat, egg and legumes	2–3 mg	Menke's disease, anemia, neutro-penia	Wilson disease
Zinc (Zn)	Cofactor for various enzymes, such as carbonic anhydrase, DNA and RNA polymerases, alkaline phosphatase; also has role in insulin secretion and taste development	Meat, seafoods and legumes	10–15 mg	Poor wound healing, growth retardation	Gastrointestinal irritation
Iodine (I_2)	Synthesis of thyroid hormones	Iodized salt, seafoods	50–100 µg	Endemic goiter, myxedema, cretinism	Thyrotoxicosis
Fluoride (F)	Promotes normal bone and teeth development	Drinking water and tea	2–3 mg	Dental caries	Fluorosis
Magnesium (Mg)	Component of the bone structure, in nerve impulse transmission, also acts as cofactor for various ATP-dependent enzymes	Cereals, sea-foods, coffee and tea	250–300 mg	Depression, muscle weakness and tetany	Drowsiness and lethargy
Manganese (Mn)	Cofactor for various enzymes, such as hydrolases, decarboxylases, transferases, etc.	Nuts, whole grains and tea	2–5 mg	Bone deformities	Psychotic symptoms
Chromium (Cr)	Regulation of blood glucose	Mushrooms, nuts and black pepper	50–100 µg	Glucose intolerance	Lung cancer
Selenium (Se)	Component of selenoproteins such as glutathione peroxidase	Cereals, fish and meat	50–100 µg	Liver necrosis	Hair loss
Cobalt (Co)	Component of vitamin B_{12}	Liver meat	1–2 µg	Pernicious anemia	Polycythemia, hypothyroidism
Molybdenum (Mo)	Component of flavoprotein containing oxidases such as xanthine oxidase	Pulses and cereals	100–200 µg	Affects growth, causes mental retardation	Anorexia and diarrhea

NUTRITION

- **Food**: Any substances that are consumed by human or animal for maintaining the health and wellbeing
- **Nutrition**: Nutrition is the intake of food, considered in relation to the body's dietary needs
- **Dietetics**: It is the science that deals with the study of nutrition in health and disease
- **Nutrients**: Nutrients are the components of food that are essential for normal growth and maintenance of health
- **Malnutrition**: Insufficient, excessive, or imbalanced consumption of nutrients
- **Under nutrition**: Deficient bodily nutrition due to inadequate food intake (hyponutrition)
- **Over nutrition**: Excessive intake of nutrients (hyperalimentation).

CALORIE

- The energy (heat) required to raise the temperature of 1 gram of water through 1°C. It is equal to 4.1868 joules
- 1 Kilocalorie (Kcal) = 1000 Calories. i.e. The energy (heat) required to raise the temperature of 1000 gram (1 kg) of water through 1°C (4.1868 Kilojoules)
-

Table 9 Caloric values of macronutrients per gram

Macronutrients	Kilocalorie (kcal)/gram
Carbohydrates	4
Proteins	4
Fat	9

METABOLISM

- **Catabolism**: Biochemical processes that break down molecules in an organism are known as catabolism
- **Anabolism**: Processes that build up complex materials from simpler substances are known as anabolism
- **Basal Metabolic Rate** (BMR): It is the amount of energy (in calories) that is required to maintain vital body functions while at rest, for example, breathing, blood circulation, cell growth, nerve functions etc.
- **Facts about BMR**
  - BMR is greatest during first few years of life
  - Females have 2 to 12% less BMR as compared to males. BMR is increased in Pregnancy and lactation
  - BMR increases in cold climate. BMR increases by 7% with a rise in body temperature by each degree Fahrenheit

Scanned with CamScanner

- Nonvegetarians have 11% more BMR than vegetarians
- BMR increases when adrenaline and nonadrenaline is released
- Certain drugs (e.g. Caffeine, nicotine) increases BMR
- Increased BMR: Hyperthyroidism, Cushing's syndrome, diabetes insipidus, leukemias, polycythemia
- Decreased BMR: Hypothyroidism, Addison's disease, hypopituitarism and shock.

Formula to Calculate BMR

Men:

BMR = 66 + (13.7 × weight kg) + (5 × height in cm) – (6.8 × age in years)

Women:

BMR = 65 + (9.6 × weight kg) + (1.8 × height in cm) – (4.7 × age in years)

CLASSIFICATION OF FOODS

Based on chemical composition

- Macronutrients
  - Protein
  - Fat
  - Carbohydrate
- Micronutrients
  - Vitamins
  - Minerals

Based on Origin of food

- Animal origin (E.g. Meat, seafood etc.)
- Plant origin (E.g. Vegetables).

Based on Predominant function

- Body building food, e.g. Milk, meat, Egg, Pulse, etc. (Protein)
- Energy giving food, e.g. Sugar, Root, tubers, fats and oils (Carbohydrates and fat)
- Protective food, e.g. Vegetables, fruits, milk (Rich in Vitamin and minerals).

Figure 4 ■ The food pyramid showing the amount of food products that should be consumed as a balanced diet

FOOD PRESERVATION METHODS

Table 10

House hold methods	Commercial methods
• Refrigeration • Heating • Pickles and Jams • Drying • Smoking • Chemical • Sealing	• Canning and bottling • Machine drying • Preservatives • Freeze drying • Cold storage • Irradiation • Use of antibiotics • Pasteurization

COMMON ADULTERANTS USED IN FOOD MATERIALS

Table 11

Food materials	Common adulterants
Cereals such as wheat and rice	Mud, grits, soapstone bits
Dals	Coal tar dyes, khesari dals
Haldi (Turmeric powder)	Lead chromate powder
Dhania powder	Starch, cow dung or horse dung powder
Black pepper	Dried seeds of papaya
Chilli powder	Saw dust, brick powder
Tea dust/leaves	Black gram husk, tamarind seeds powder, saw dust, used tea dust
Coffee powder	Date husk, tamarind husk, chicory
Asafetida (Hing)	Sand, grit, resins, gums, soap stones
Mustard seeds	Seeds of prickly poppy, argemone
Edible oils	Mineral oil, argemone oil
Butter	Starch, animal fat
Ice-creams	Cellulose, starch, non-permitted colors
Fresh green packed peas	Green dye
Milk	Extraction of fat, addition of starch and water
Ghee	Vanaspati, mashed potatoes, sweet potatoes
Sweet wines	Diethylene glycol
Honey	High fructose syrup, cane sugar, jaggery
Alcoholic liquors	Methanol
Wheat flour	Excessive sand, dirt, bran and chalk powder
Cumin seeds	Grass seeds colored with charcoal dust

Contd...

TESTS TO DETECT COMMON ADULTERATION

Table 12

Food items	Test to detect adulteration
Honey	• **Aniline Chloride test** (starch mixed honey turns orange red in colour if mixed aniline chloride)
Ghee	• **Iodine solution test** (boil sample and add a drop of iodine solution; sample turns blue if starch was mixed; colour disappears if cooled and reappears on heating again)
Black pepper	• Papaya seeds float on **carbon tetra chloride** solution while pure black pepper seeds settles down.
Coriander powder	• Soak in water. Dung will float and can be detected by its foul smell
Pulses	• Heat with **diluted HCL** on simmer for 15 mins. Pink colour indicates presence of kesari dal
Chilies	• Add sample in a beaker of **Chloroform+carbon tetrachloride.** Brick powder will settle at the bottom
Wheat flour	• Shake sample with dilute Hydrochloride; effervescence indicates chalk
Turmeric powder	• Dissolve sample in 1:7 **sulphuric acid** and filter it. Add 1 to 2 drops of 0.1% **diphenylcarbazide**; A pink colour indicates presence of lead chromate
Asafoetida (Hing)	• Shake a small quantity with water. **Soap stone** or **other earthly matter** will settle at bottom
Cumin seeds (Jeera)	• Rub the cumin seeds on palms. If palm turns black, adulteration is indicated.

Scanned with CamScanner

"Ill-health of body or of mind, is defeat. Health alone is victory."
—Thomas Carlyle

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY OF CELL AND TISSUES

1. Pyknosis is characterized by: *(Safdarjung NO 2018)*
a. Nuclear basophilia b. Nuclear shrinkage
c. Nucleus disintegration d. Nucleolus disintegration

Explanation: Pyknosis is irreversible cell death characterized by nuclear condensation/shrinkage and clumping of chromatin.

2. The activation of caspases is likely to lead to: *(Safdarjung NO 2018)*
a. Apoptotic cell death
b. Blood coagulation
c. Mitotic cell division
d. G1 and S phase of cell cycle

Explanation: Activation of enzymes called Caspases leads to apoptosis which is a pathway of cell death. Caspases are cysteine proteases that helps in cleavage of proteins.

3. Mitosis is a condition of *(Banaras HU 2015)*
a. Cell breakdown
b. Cell division without reduction
c. Cell death
d. Cell division with half chromosomes

4. Powerhouse of the cell is: *(ESIC Chennai May 2012)*
a. Mitochondria b. Nucleus
c. Golgi bodies d. Cell wall

5. Chief components of a cell are.....
a. Carbon, hydrogen, nitrogen and oxygen
b. Hydrogen, nitrogen, sodium and potassium
c. Magnesium, potassium, carbon and hydrogen
d. Helium, nitrogen, calcium and carbon

6. The aqueous component of the cell, within which various organelles and particles are suspended, is
a. Cytosol b. Cytoplasm
c. Nucleus d. Cytoblast

7. Number of mitochondria is less in .....
a. Red fibers b. Myosin
c. White fibers d. Actin

8. Storage house of iron in a cell is .....
a. WBC
b. Reticuloendothelial system
c. Platelet
d. Ribosome

9. Cytokines are responsible for .....
a. Pain b. Touch
c. Sensation d. Inflammation

10. Largest organelle of a cell is .....
a. Golgi apparatus b. Nucleus
c. Ribosome d. Endoplasmic reticulum

11. Suicidal bag of cell is .....
a. Ribosome b. Lysosomes
c. Vacuole d. Nucleus

12. Plasma membrane of eukaryotic organisms made up of .....
a. Phospholipid bilayer
b. Phospholipid monolayer
c. Carbohydrate, protein and fat
d. Carbon, nitrogen and oxygen

13. Structure and motility of the cell is maintained by .....
a. Cartilage b. Microtubules
c. Nucleus d. Golgi apparatus

14. Power house of human body is .....
a. Nucleus b. Ribosome
c. Mitochondria d. Lysosome

15. Produced form of energy is .....
a. ATP b. ADP
c. GTP d. Actin

16. Cytoplasm refers to
a. Contents of the cell including nucleus
b. Contents of the cell excluding nucleus
c. Nucleus of the cell
d. Nucleus and cytosol of the cell

17. Protein factory in human cell is
a. Ribosome b. Nucleus
c. Cytoplasm d. Golgi apparatus

18. _____ has no nucleus
a. RBCs b. WBCs
c. Lymphocytes d. Monocytes

19. Pinocytosis are .....
a. Drinking b. Phagocyting
c. Moving d. RNA production

20. Which of the following mechanism facilitates transfer of large particles across cell membrane?
a. Active transport b. Facilitated transport
c. Passive diffusion d. Phagocytosis

21. Phagocytosis is the responsibility of .....
a. Eosinophil b. Neutrophils
c. Monocyte d. Lymphocyte

22. Which of the following order is correct about phases of mitosis cell division?
a. Prophase - Anaphase - Telophase - Metaphase
b. Prophase - Anaphase - Metaphase - Telophase
c. Prophase - Metaphase - Telophase - Anaphase
d. Prophase - Metaphase - Anaphase - Telophase

23. Name the tissue which is widely and abundantly distributed in human body
a. Connective tissue b. Cartilaginous tissue
c. Lymphoid tissue d. Epithelial tissue

Ans.

1.	b
2.	a

Scanned with CamScanner

24. All are loose connective tissue EXCEPT
a. Areolar b. Reticular
c. Adipose d. Epithelial

25. ..... epithelium is most efficient in allowing simple of substances across cell.
a. Squamous epithelium b. Simple stratified epithelium
c. Transitional epithelium d. Stratified epithelium

26. Regenerating capacity is more in ..... tissue.
a. Muscle b. Epithelial
c. Cartilaginous d. Bone

27. Identify the function of epithelium
a. Absorption b. Protection
c. Secretion d. All of the above

28. Among the following cuboidal epithelium is seen in
a. Skin b. Trachea
c. Esophagus d. Thyroid gland

29. Lining the uterus is made up of .....
a. Simple columnar epithelium
b. Ciliated columnar epithelium
c. Simple squamous epithelium
d. Simple cuboidal epithelium

30. Lining of the trachea is made up of .....
a. Simple stratified epithelium
b. Stratified columnar epithelium
c. Columnar epithelium
d. Pseudostratified columnar epithelium

31. Epithelium which allows the stretching and distention of hollow organ and help to accommodate the content .....
a. Simple epithelium b. Squamous epithelium
c. Transitional epithelium d. Cuboidal epithelium

32. Among the following transitional epithelium is present in .....
a. Esophagus b. Trachea
c. Urinary bladder d. All of the above

33. Formation of scar tissue is .....
a. Fibrosis b. Granulation
c. Adhesion d. Keloid

34. The major function of ciliated epithelium present in the uterine tubes is to facilitate
a. Implantation of fertilized ova
b. Movement of ova in uterine tube
c. Release of ova from fallopian tube
d. Secretion in endometrium

35. The mucous, serous and synovial membranes are formed by sheets of
a. Epithelial tissue b. Connective tissue
c. Fibrous tissue d. Nervous tissue

36. Efficient regenerating capacity is more after mechanical friction in .....
a. Simple epithelium b. Squamous epithelium
c. Transitional epithelium d. Stratified epithelium

37. Maturation of B-cell lymphocytes takes place at .....
a. Blood b. Bone marrow
c. Brain d. Base of the skull

38. Maturation of T-cell lymphocytes takes place at .....
a. Thyroid b. Thymus
c. Trachea d. Liver

39. Memory cells are formed from .....
a. Neutrophil b. Eosinophil
c. Lymphocytes d. Monocyte

40. The most abundant plasma protein is
a. Albumin b. Fibrinogen
c. Gelatin d. Globulin

41. Building block of protein is .....
a. Glucose b. Lipids
c. Fatty acids d. Amino acids

42. Cisternae are the part of ..... cellular organ
a. Endoplasmic reticulum b. Golgi apparatus
c. Lysosome d. Both A and B

43. Cellular organ responsible for destroying foreign material and microorganism is .....
a. Nucleus b. Lysosomes
c. Mitochondria d. Vacuole

44. Physiological mechanism behind the elimination of carbon dioxide from the body is .....
a. Osmosis b. Facilitated diffusion
c. Simple diffusion d. Active transport

45. The mucous, serous and synovial membranes are formed by sheets of
a. Epithelial tissue b. Connective tissue
c. Muscle tissue d. Nervous tissue

46. The type of epithelium that is most efficient in allowing simple of substances across cell is the
a. Squamous epithelium
b. Columnar epithelium
c. Transitional epithelium
d. Stratified epithelium

47. Simple cuboidal epithelium is seen in
a. Skin b. Trachea
c. Esophagus d. Thyroid gland

48. Which type of epithelium is efficient in generating new cells to replace dead cells damaged by mechanical friction?
a. Squamous epithelium
b. Columnar epithelium
c. Transitional epithelium
d. Stratified epithelium

49. The type of epithelium which lines a hallow structure and allows stretching distention to accommodate its content is the
a. Squamous epithelium
b. Columnar epithelium
c. Transitional epithelium
d. Stratified epithelium

50. Mucous membrane of vagina is lined by
a. Nonkeratinized stratified squamous epithelium
b. Keratinized Stratified Squamous epithelium
c. Columnar cells
d. Cuboidal epithelium

51. Which of the following is both endocrine and exocrine gland?
a. Thyroid b. Pituitary
c. Pancreas d. Adrenal

52. Shrinkage of cell size is known as .....
a. Atrophy b. Metastasis
c. Necrosis d. Hypertrophy

53. Identify cellular adaptation among the following .....
a. Hypertrophy b. Atrophy
c. Hyperplasia d. All of the above

54. Correct regarding metaplasia is .....
a. It is a reversible change
b. It results from the reprogramming of stem cells
c. It makes the cells more resistant to the stem cells
d. All of the above

Ans.

54.	d

Scanned with CamScanner

55. Adult basal metabolic rate decreases with an increase in: *(AIIMS-BBS SNO 2019)*

a. Muscle mass
b. Fever
c. Body fat
d. Body surface area

Explanation: BMR rate is the number of calories required to keep your body functioning at rest. BMR decreases with an increase in body fat. Normal BMR in women 1493 calories, normal BMR in men is 1662 calories.

56. Due to glycolysis in postmortem muscles there is accumulation of: *(Safdarjung NO 2018)*

a. Carbon
b. Oxygen
b. Lactic acid
c. Blood

Explanation:

- In post-mortem muscles, homeostasis is maintained by preservation of ATP concentration.
- Absence of oxygen in the muscles results in anaerobic glycolysis of muscle glycogen resulting in post-mortem glycolysis, decreased level of ATP, glycogen lactic acid accumulation and decreased muscle pH.

57. 'Transportation of triglycerides from liver to adipose tissues' is the function of which of the following lipoproteins? *(AIIMS BPL NO 2018)*

a. Low density lipoprotein
b. Intermediate density lipoprotein
c. Very low density lipoprotein
d. High density lipoprotein

Explanation: Liver is mainly responsible for the synthesis of triglycerides. Apo B100 is synthesized by liver around peripheral triglycerides resulting in formation of VLDL secreted from liver into the blood. Thus, VLDL transports triglycerides from liver to peripheral tissues.

58. All of the following are good sources of vitamin A, except: *(AIIMS Raipur NO 2019)*

a. White potatoes
b. Carrots
c. Apricots
d. Egg yolk

Explanation:

- White potatoes do not contain Vitamin A. It is rich in carbohydrates.
- Carrots, eggs, apricots are rich sources of Vitamin A.

59. Absorption of dietary Iron is enhanced by: *(AIIMS Raipur NO 2019)*

a. Dietary fibers
b. Tea
c. Vitamin C
d. Calcium

Explanation: Absorption of dietary Iron is enhanced by **Vitamin C.** Iron absorption is inhibited by intake of tea and calcium. Iron absorption is unaffected by dietary fibers.

60. The extra amount of calories required during pregnancy is: *(NCFL 2019)*

a. 300 kcal
b. 440 kcal
c. 550 kcal
d. 600 kcal

Explanation:

Calories required for a sedentary women	Additional calories in pregnancy	Total
1875 (depends on her physical activity)	300	2175
	Additional calories in breastfeeding	
1875 (depends on her physical activity)	500	2375

61. A nurse must be aware that eating Maize alone may lead to: *(NCFL 2019)*

a. Beriberi
b. Pellagra
c. Scurvy
d. Phrynoderma

Explanation:

- Pellagra occurs due to the deficiency of the vitamin niacin.
- Maize is rich in vitamins A, B (except niacin), C & folic acid and is a poor source of niacin and tryptophan. Hence, people only on maize diet will suffer from pellagra.

62. The nurse is providing a teaching session to a client who has ulcerative colitis. The nurse will instruct the client for which diet? *(NCFL 2019)*

a. Carbohydrate-consistent diet
b. High-calorie, high-protein diet
c. High-calcium and high potassium diet
d. Low-residue, low-fiber diet

Explanation:

- Ulcerative colitis is the inflammatory bowel disease mainly affects the large intestine or colon. Symptoms will mimic like irritable bowel syndrome and Crohn's disease. Low residue diet is a low-fiber foods such as egg, fish, white rice, bread, well cooked vegetables without skin/seeds, daily products, poultry etc. Avoid foods that are high in fiber, whole grains and foods that contain nuts or seeds.
- Low residue diet helps in easy digestion and decreases the bowel movements and thereby it decreases diarrhea.

63. The pathway through which a cell produces the maximum number ATP molecules is: *(AIIMS-BBS SNO 2019)*

a. Pentose phosphate pathway
b. Glycolysis
c. Lactic acid fermentation
d. TCA cycle

Explanation: TCA cycle produces 38 ATPs (34 ATP from oxidative phosphorylation + 4 ATP from substrate level phosphorylation).

64. The optimum fluoride concentration in drinking water in India is recommended to be: *(AIIMS-BBS SNO 2019)*

a. 1-2 ppm
b. 3-5 ppm
c. 0.3-0.5 ppm
d. 0.1-0.2 ppm

65. Diffusion through a cell membrane does NOT depend on: *(AIIMS BPL NO 2018)*

a. Kinetic energy of the particle
b. Charge of the particle
c. Concentration gradient
d. Size of the particle

Ans.

55.	c
56.	b
57.	c
58.	a
59.	c
60.	a
61.	b
62.	d
63.	d
64.	a
65.	a

Scanned with CamScanner

Explanation: Diffusion is a passive process that does not dependent on the kinetic energy of the particles. Diffusion mostly depends on the carrier proteins embedded in the cell membrane which helps in diffusion. Diffusion depends on the charge and size particle and concentration gradient.

66. The best way of increasing the nutritive value of pulses is: *(AIIMS BBS NO 2018)*

a. Mixing pulses
b. Fortification
c. Parboiling
d. Germination

Explanation: The sprouting breaks down the macromolecules into low molecular weight molecules, which can be easily digested and absorbed in body. Sprouting increases the bioavailability of iron, zinc and calcium. Sprouting reduces the phenol and tannin content in foods.

67. All the following are foods rich in iron except: *(AIIMS BBS NO 2018)*

a. Spinach
b. Fish
c. Milk
d. Liver

Explanation:

- 100 gm of raw spinach contains 2.71 mg of iron
- 100 gm of fish contains 28 mg of iron
- 100 gm of Liver contains 17 mg of iron
- 100 gm of milk contains 0.04 mg of iron

Ans.

66.	d
67.	c
68.	a
69.	d
70.	b
71.	d
72.	d
73.	a
74.	d
75.	b
76.	d

68. Ketone bodies are synthesized from: *(AIIMS Nagpur NO 2018)*

a. Acetyl CoA
b. Cholesterol
c. Phospholipids
d. Triglycerides

Explanation: Ketogenesis is the biochemical process through which organisms produce ketone bodies through breakdown of fatty acids and ketogenic amino acids. The 3 ketone bodies, each synthesized from acetyl-CoA molecules, are acetoacetate, acetone, and β-hydroxybutyrate

69. How many calories are there in one gram of fat? *(Safdarjung NO 2018)*

a. 4
b. 12
c. 8
d. 9

70. Highest energy yielding food group is? *(Safdarjung NO 2018)*

a. Carbohydrates
b. Fats
c. Sugars
d. Protein

Explanation:

Food group	Calories/gram
Fats	9
Carbohydrate (sugars)	4
Protein	4

71. IARI stands for: *(Safdarjung NO 2018)*

a. Institute of Agro and Revenue Investigation
b. Indian Agriculture Research Institution
c. India Agriculture Research Institute
d. Indian Agricultural Research Institute

Explanation: IARI stands for Indian Agricultural Research Institute or Pusa Institute. It is meant for research and education in the field of agriculture. It's headquarters in New Delhi.

72. Tissue forms lactic acid from glucose. This phenomenon is termed as: *(Safdarjung NO 2018)*

a. Aerobic glycolysis
b. Oxidation
c. Oxidative phosphorylation
d. Anaerobic glycolysis

Explanation: Tissues from lactic acid form glucose. This phenomenon is termed as Anaerobic Glycolysis. Under anaerobic conditions lactate or lactic acid is produced as end product from pyruvate.

73. Primary structure of proteins represents: *(Safdarjung NO 2018)*

a. Linear structure of proteins joined by peptide bonds
b. 3-dimensional structure of proteins
c. Helical structure of proteins
d. Sub unit structure of proteins

Explanation:

- Primary structure of proteins represents linear sequence of proteins (known as primary structure) joined by peptide bonds. The structure of proteins is complex and has been divided into four levels, according to organization: primary, secondary, tertiary and quaternary.
- Tertiary structure of proteins is three dimensional.
- Secondary structure of proteins is helical.
- Subunit structures of proteins is polypeptide chains.

74. Lecithin on hydrolysis yields all the following, except: *(Safdarjung NO 2018)*

a. Glycerol
b. Fatty acid
c. Choline
d. Glucose

Explanation: Lecithin is present in brain, lungs, nerve cells, sperm and egg yolk. Lecithin is surface active agent and helps in emulsification of fat. Lecithin on hydrolysis produce two molecules of fatty acids, one molecule of glycerol, one molecule of choline and one molecule of phosphoric acid. Glucose is not produced in lecithin hydrolysis.

75. NADPH required for fatty acid synthesis can come from: *(Safdarjung NO 2018)*

a. Hexose monophosphate shunt
b. Oxidative decarboxylation of malate
c. Extra mitochondrial oxidation of isocitrate
d. All of these

Explanation: The fatty acids are synthesized with starting material as Acetyl CoA and NADPH in the presence of enzyme fatty acid synthases. The NADPH required for this process of fatty acid biosynthesis comes from oxidative decarboxylation of malate. Malate gets oxidized to pyruvate and CO_2, and $NADP^+$ gets reduced to NADPH.

76. Differentiate the essential amino acid in the following: *(DSSSB PHN, 2015)*

a. Proline
b. Tyrosine
c. Glycine
d. Valine

Scanned with CamScanner

77. Which one of the following is an essential amino acid? *(Banaras HU 2015)*
a. Alanine b. Serine
c. Tryptophan d. Glutamic acid

78. Synthesis of glucose from noncarbohydrate source is referred as: *(DSSSB PHN, 2015)*
a. Glycolysis b. Gluconeogenesis
c. Glycogenolysis d. Glycogenesis

79. BMI greater than 30 is considered as: *(DSSSB PHN, 2015)*
a. Overweight b. Bulimia
c. Obese d. Stout

80. Which of the following vitamins is soluble in water? *(RRB SSNE 2015)*
a. Vitamin A b. Vitamin C
c. Vitamin K d. Vitamin D

81. Identify which is NOT an antioxidant?
a. Vitamin K b. Vitamin E
c. Vitamin A d. Beta carotenes

82. Which nutrient is not found in eggs? *(RRB SSNE 2015)*
a. Carbohydrate and Vitamin-C
b. Protein and calcium
c. Fat and Vitamin-D
d. Protein and Iron

83. Vitamin B1 is also known as: *(RRB SSNE 2015)*
a. Niacin b. Thiamine
c. Riboflavin d. Pyridoxine

84. In which organ does the maximum absorption of Iron take place? *(RRB SSNE 2015)*
a. Stomach b. Small Intestine
c. Colon d. Liver

85. Select the pair which has the same relationship as the pair Iodine : Goitre. *(RRB SSNE 2015)*
a. Mango : Anemia b. Insulin : Diabetes
c. Hormones : Cancer d. Fat : Obesity

86. Which of the following is significantly different between human and cow's milk? *(RRB SSNE 2015)*
a. Proteins and Fat b. Proteins and sugar
c. Proteins and Lactose d. Minerals
